6. Concentrations to which the dust must be reduced in order to be safe have not been absolutely determined.

7. Industrial dusts, containing silica, are frequently not all silica, being mixed with other materials. It is possible that some of these nonsilica components may prevent or modify the action of silica in the body and may alter the tendency toward complicating silicosis.

8. Asbestos, which is a silicate, is the only dust other than free silica which has been shown to cause a lung fibrosis with disability.

9. Simple—that is, uncomplicated—silicosis, as seen in industries in the United States, causes relatively little severe disability.

Control of silicosis calls for adequate medical and engineering measures.

A practical program of preemployment examination of all workers exposed to dust containing silica is essential. Such examinations should include a complete physical examination of each individual, a careful history of past occupational exposure to dust, and a chest roentgenogram with standard technique.

The value of such procedure may be summarized as follows:

1. Protection of prospective employees, who may have diseased lungs, from silica exposure.

2. Discovery of the hazardous jobs, as a result of finding the silicosis cases, in order to eradicate these hazards.

3. Discovery of active and open cases of tuberculosis which are in contact with other employees, especially protecting the younger workers who are susceptible to contact infection.

4. Discovery, through periodic examination of those with inactive tuberculosis, of any reactivation of their tuberculosis before they have been active too long, so as to protect especially the younger employees. This also offers the infected individual a better chance for a cure of his tuberculosis.

5. Discovery of early cases of simple silicosis through periodic examination to give them added protection from further excessive dust exposure.

6. Determination, through periodic physical examination, of the adequacy of the dust control program.

A careful consideration of the foregoing summary as well as the varied experiences of the members of the Medical Committee clearly indicate that there is a wide field for research still in this matter of pulmonary dust diseases.

The following research projects are listed, therefore, for the consideration of Air Hygiene Foundation:

(a) Relationship between silicosis and tuberculosis, with especial reference to the question of activation or reactivation of tubercle infection consequent upon exposure to silica, especially in massive doses, over a short period in the absence of definite evidence of silica action (nodulation) in the tissues.

(b) The effect of other substances upon the action of silica in the body. It has been claimed that where other substances are present in the dust with silica, they may retard the action of silica so as to actually prevent, or, at least, delay the development of silicosis. Meanwhile, certain other substances have been credited with greatly intensifying the action of silica.

(c) Study of the mechanism by which silica exerts its injurious effects upon the body. The pathologist can demonstrate what silica does in the pulmonary and other

tissues of the body, but so far no reasonable explanation has been offered or demonstrated as to why silica acts as it does.

(d) Research in the technique of roentgenography. In the last few years the technique of taking x-ray films has greatly improved. Inasmuch as it would appear that to an ever-increasing extent preemployment medical examinations will include chest roentgenograms, a man may be hired or rejected on the basis of his x-ray film. It is, therefore, evident that the very best technique that can be evolved is the least with which industry can be satisfied.

H. B. MILLER, *Managing Director.*

Concerning heavy incidence of bovine tuberculosis in California.*

CALIFORNIA TUBERCULOSIS ASSOCIATION

February 19, 1937.

To the Editor:—California is the black spot . . . of the nation in bovine-tuberculosis control. By July first of this year it will be the only state not a modified accredited area (i. e., less than 0.5 per cent of cattle infected). This state has more diseased cattle than the rest of the United States combined. Other states are threatening quarantines against California dairy products. The public health is still menaced by bovine tuberculosis.

Your participation is needed at a state-wide conference of leaders of economic, public health and public welfare organizations and groups which has been called by the California Tuberculosis Association for the purpose of crystallizing public sentiment for an adequately financed and rapidly moving program for the reduction of bovine tuberculosis to a point that will entitle California to become a modified accredited area.

California is so far behind other states in this movement that it is absolutely essential the State Legislature, which will reassemble next month, shall make adequate financial provision for the program. Unless this is done, the clean-up of the State will be long drawn out. We are confident, however, that if the legislature can be sufficiently impressed with the weight of public interest in this matter, it will respond to public sentiment by making the necessary appropriation.

We regard the situation as acute and important enough to justify you in attending this conference, which will be held in the auditorium of the Pacific Gas and Electric Company, 245 Market Street, San Francisco, on Wednesday morning, March 3, at ten o'clock.

Sincerely yours,

CALIFORNIA TUBERCULOSIS ASSOCIATION.

W. F. HIGBY, *Executive Secretary.*

45 Second Street, San Francisco.

Has Teaching Improved?—An excerpt from *Actions and Reactions: An Autobiography of Roger W. Babson*, 1935, follows:

I think that the success of teaching is nine-tenths in the teacher, and one-tenth in the buildings and textbooks. I would much rather have my grandchildren have teachers with a few diplomas and big hearts than teachers with many diplomas and little hearts. The present fad, that a school principal must have a Ph.D. in order to get a position is all rot. I would much rather know he loves his work and his pupils.

Ph.D.'s do not necessarily make good teachers.

A thousand years from now no building or curriculum will ever take the place of a conscientious and praying school teacher.

I do feel that the health of a teacher is an important factor: in many instances the teacher is cross and impatient because not in good physical condition.

I should give teachers regular physical examinations, and insist that they keep in good condition physically and nervously.

I should forget the Ph.D.'s and turn them over to the M.D.'s.

* The subject of Tuberculosis, in recent numbers of CALIFORNIA AND WESTERN MEDICINE was mentioned in the following issues: Vol. 44, No. 5, May, 1936, advertising page 7; Vol. 45, No. 1, July, 1936, advertising page 26; Vol. 46, No. 1, January, 1937, advertising page 30; and Vol. 46, No. 2, February, 1937, advertising page 44.

MEDICAL JURISPRUDENCE†

By HARTLEY F. PEART, ESQ.
San Francisco

If a sponge or drainage tube is allowed to remain in a patient after a surgical operation, the patient may commence an action for malpractice after the expiration of one year from the time of the operation.

In *Huysman vs. Kirsch*, 6 Cal. (2d) 302, plaintiffs (husband and wife) brought a suit against a surgeon for malpractice alleged to have resulted from the failure of the surgeon to remove from the body of the wife a drainage tube used by the surgeon during an operation on the wife. The plaintiffs alleged that the defendant surgeon negligently allowed the drainage tube to remain in the wife's body after its purpose had been fully accomplished, and that the plaintiffs had no knowledge of this. The operation was performed in January, 1931. The drainage tube was removed in September, 1932. The action for malpractice was commenced in January, 1933. The defendant contended that because of the one-year statute of limitations applicable in malpractice cases, the action had been filed too late. The trial court agreed with the defendant's contention and gave judgment for defendant. From this judgment the plaintiffs appealed. The District Court of Appeal affirmed the judgment, relying upon the prior decision in *Gum vs. Allen*, 119 Cal. App. 293 (where it was held that a plaintiff could not sue for malpractice based upon negligence in leaving a sponge in her body after the expiration of one year from the date of the operation). The opinion of the District Court of Appeal is the subject of a comment in the *Journal of the American Medical Association*, February 1, 1936, at page 410.

Huysman vs. Kirsch was then heard by the Supreme Court. The Supreme Court reversed the District Court of Appeal, overruled *Gum vs. Allen*, and held that the action was not barred by the statute of limitations. The Court adopted the view that the statute of limitations did not start to run until the drainage tube was removed, because the act of negligence involved was the surgeon's failure to remove the tube from the abdominal cavity after it had fully served its purpose. This was said to be a continuing negligent omission lasting until the removal of the tube in September, 1932. In arriving at this conclusion, the Court cited and relied upon a New York case and an Ohio case. The following is quoted from the opinion of the California Supreme Court and indicates the Court's attitude toward this problem:

The case now before us is much stronger than either of the cases from the New York and Ohio courts. In each of those cases, the negligent act consisted in not removing the sponge from the body of the patient at the time of the operation. It might be well said that the negligence involved in those cases occurred in the performance of the operation. In the present case the operation, up to the closing of the wound and the leaving of the drainage tube therein, was entirely proper. The negligence occurred thereafter, by reason of the surgeon neglecting to remove the tube left in the patient's wound after it had served its purpose. This negligence continued during the entire time the tube was left in the body of the patient, and only ended upon the removal of said tube. With much greater reason than that which prompted the Ohio and New York courts to hold as they are shown to have done, cannot this court now hold that the surgeon's negligence continued up to the removal of said tube, and that the appellants' cause of action then accrued and would not be barred until one year thereafter? Such is the holding of this court which necessitates the overruling of the case of *Gum vs. Allen*, *supra*.

The New York and Ohio cases seem to adopt the theory that there was a continuous obligation to remove the sponge upon the part of the surgeon *so long as the employment continued*. Both courts were aware that the

action was one of tort rather than of contract, and concluded that the operation was uncompleted until the sponge had been removed. The California Supreme Court adopts as the first ground of its decision the theory that the negligent act was the failure to remove the tube after it had served its purpose. The negligence, therefore, continued until removal. Then, as a separate ground for its decision, the Court relies upon a doctrine which seems but another way of stating the continuing tort theory. The Court states:

There is another principle supported by eminent authority upon which it might be held that appellants' cause of action is not barred, and that is, that an operation like that performed upon Mrs. Huysman is not complete until the wound has been closed and all appliances used in the operation have been removed.

Evidently feeling none too sure of its position, the Court then goes further and adopts a third ground for its decision. This third ground is based upon the decision in *Marsh vs. Ind. Accident Comm.*, 217 Cal. 338. In this latter case the Court held that the statute of limitations did not begin to run against employees injured by inhaling dust-laden atmosphere until the employees knew, or by the exercise of reasonable diligence should have known, that their injuries were due to their exposure to the dust-laden air.

The reasoning of the Court with respect to its third theory is disclosed in the following quotation from its opinion in the *Huysman* case:

If we apply this principle to the facts in the present action, the same results will follow, as the appellants in this action had no knowledge of the presence of the drainage tube in the body of Mrs. Huysman until it was removed therefrom by the respondent on September 26, 1932. During all this time she was under the exclusive care of the respondent, a reputable and skillful physician and surgeon, and both Mrs. Huysman and her husband relied solely upon him for information as to her physical condition and as to her failure to regain her health. It cannot be said, therefore, that they had any knowledge whatever of the cause of her failure to recover from the operation, or that they could have gained that knowledge by the exercise of due care and diligence prior to September 26, 1932. Before that date they were as completely in the dark as to the cause of Mrs. Huysman's injury as were Marsh and his fellow workers while they were inhaling the dust-laden air in their employer's factory and until the disease resulting therefrom had reached such a stage as to indicate its cause. We can see no good reason why, if the statute of limitations did not begin to run in one case, that it should run in the other.

The actual decision in the case may thus be summarized as follows:

Where a patient does not know of the surgeon's failure to remove a drainage tube from the patient's body after its useful purpose has been fully performed, the patient's cause of action for the negligent failure to remove such tube is not barred by the statute of limitations even though the action is not brought until more than one year after the tube should first have been removed.

An important problem remains unanswered and the language of the Court will undoubtedly create confusion.

If the first and second grounds relied upon by the Court are alone considered, then the negligent omission is the failure on the part of the surgeon to remove the appliance, and knowledge upon the part of the patient would logically seem to have no possible bearing upon the running of the statute of limitations. However, there will undoubtedly be controversy as to this point because of the third ground of the decision, which was the reliance upon the doctrine of *Marsh vs. I. A. C.* It will undoubtedly be argued in future cases where the patient has acquired knowledge that the one-year period should commence from the date upon which knowledge was acquired or upon the date when knowledge could have been acquired by the use of reasonable diligence upon the part of the patient. The fact that the Court adopted a third ground for its decision which was not raised by counsel for either side, would tend to indicate that the Court might carefully consider the proposition that the statute should begin to run at the time when the patient acquires knowledge, or by the use of reasonable diligence should acquire knowledge, of the true source of his trouble.

† Editor's Note.—This department of CALIFORNIA AND WESTERN MEDICINE, containing copy submitted by Hartley F. Peart, Esq., has been established by the California Medical Association Council. Each issue will contain excerpts from and syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

SPECIAL ARTICLES

PROPOSED CALIFORNIA LAWS: HAVING RELATIONSHIPS TO PUBLIC HEALTH AND MEDICAL PRACTICE*†

As Submitted in the January, 1937, Period of the
Fifty-Second Session of the California
Legislature

Board of Health
(Fifteen Bills)

General

A. B. 2532, by Donihue (referred to Committee on Governmental Efficiency and Economy). Relating to organization, powers, and duties of Department.

Crippled Children

A. B. 1308, by Laughlin (referred to Committee on Public Charities and Correction). Amending Sections 2979b and 2979c.

S. B. 569, by Slater (referred to Committee on Education), amending School Code.

S. B. 607, by Schottky (referred to Committee on Social Security). Care, treatment, etc., physically defective and handicapped persons.

Miscellaneous

A. B. 1014, by Lyon (referred to Committee on Public Health and Quarantine), relating to canned tomatoes.

A. B. 1251, by Tenney (referred to Committee on Public Health and Quarantine), relating to sterilization of bottles and containers.

A. B. 1252, by Tenney (referred to Committee on Public Health and Quarantine), relating to sanitation of canneries.

A. B. 1253, by Tenney (referred to Committee on Public Health and Quarantine). Misbranding of drugs.

A. B. 1334, by Muldoon (referred to Committee on Manufactures), relating to adulterating, misbranding, false advertising and sale of foods.

A. B. 2143, by Call (referred to Committee on Public Health and Quarantine). Sterilization of containers.

A. B. 2182, by Voigt (by request) (referred to Committee on Public Health and Quarantine). Fumigation of containers.

A. B. 2676, by Patterson (referred to Committee on Public Health and Quarantine). Pollution of waters.

A. B. 2718, by Glick (referred to Committee on Public Health and Quarantine). Pollution of waters.

A. B. 2723, by Lyon (referred to Committee on Public Health and Quarantine). Sterilization of used containers.

A. B. 2724, by Lyon (referred to Committee on Public Health and Quarantine). Preservation, care and display of foods.

Chiropody

(Two Bills)

A. B. 1171, by Gannon (referred to Committee on Medical and Dental Laws), relating to advertising.

A. B. 1173, by Gannon (referred to Committee on Medical and Dental Laws). Companion bill to A. B. 1171.

Chiropractors

(One Bill, One Constitutional Amendment)

A. B. 2731, by Reeves (referred to Committee on Medical and Dental Laws), amending Sections 3, 4, 5, 6, 7, 9, 10, 12, 16, 17, and 19 of the Initiative Act.

A. C. A. 35, by Reeves (referred to Committee on Constitutional Amendments). Proposed amendment to Article IV of Constitution by adding Section 25¼, relating to the practice of chiropractic.

* This list was compiled by the Committee on Legislation and Public Policy of the California Medical Association, Dr. Junius B. Harris, Chairman, in conjunction with the Public Health League of California, Ben H. Read, Executive Secretary.

† See also editorial comment on page 145.

Clinical Laboratories

(One Bill)

S. B. 118, by Parkman (referred to Committee on Public Health and Quarantine). Similar to 1935 bill.

Codes

(Nine Bills)

A. B. 880, by Gannon (referred to Committee on Judiciary—General), establishing Business and Professions Code.

A series of codes introduced by McGovern and all referred to Committee on Public Health and Quarantine:

S. B. 132—Medical Code

S. B. 134—Dental

S. B. 288—Nursing

S. B. 289—Trained Attendants

S. B. 290—Medical Library

S. B. 291—Blindness at Childbirth

S. B. 253, by Nielsen (referred to Committee on Governmental Efficiency), relating to Department of Professional and Vocational Standards.

S. B. 254, by Nielsen (referred to Committee on Governmental Efficiency). Companion bill to S. B. 253.

Compensation Act

(Eight Bills)

A. B. 2011, by Burns, Hugh M. (referred to Committee on Insurance). Adds Section 4600, repeals Sections 4601 and 4602.

Patients' Records

A. B. 384, by Clark, Lore, Peek, Hawkins, Hornblower, and Pelletier (referred to Committee on Hospitals and Asylums). Records to be exhibited to patient and to any person authorized in writing by patient to examine same. Applies to compensation cases.

A. B. 385, by Clark, Peek, Hornblower, Lore, Pelletier, Hawkins, and Rosenthal (referred to Committee on Hospitals and Asylums). Companion bill to A. B. 384.

Medical Treatment

A. B. 488, by Boyle (referred to Committee on Medical and Dental Laws). Skeleton bill.

A. B. 643 by Clark (referred to Committee on Insurance), amending Section 9 of Act relating to right of an employee to select anyone licensed to treat the type of injury he has sustained.

A. B. 644, by Clark (referred to Committee on Insurance). Companion bill to A. B. 643.

A. B. 2236, by Rosenthal (referred to Committee on Insurance), adding Section 9.5 relating to treatment of injuries.

A. B. 2249, by Flint (referred to Committee on Insurance). Adding paragraph (a½) to Section 9, relating to medical treatment.

County Hospitals

(Three Bills, One Constitutional Amendment)

A. B. 51, by Heisinger (referred to Committee on County Government). Refer to copy of bill.

A. B. 1196, by Turner (referred to Committee on Governmental Efficiency and Economy). Refer to copy of bill.

A. B. 1695, by Turner (referred to Committee on Hospitals and Asylums). Refer to copy of bill.

S. C. A., by Crittenden (referred to Committee on Constitutional Amendments). Refer to copy of bill.

Dental Practice Act

(Twenty-two Bills)

A. B. 489 and A. B. 493, by Boyle, skeleton bills (referred to Committee on Medical and Dental Laws).

A. B. 609, 610, 611, 612, by Dawson, skeleton bills (referred to Committee on Medical and Dental Laws).

A. B. 724, 725, 726, 727, by Dawson, skeleton bills (referred to Committee on Medical and Dental Laws).

A. B. 1258, by Cronin (referred to Committee on Medical and Dental Laws), relating to suspension and revocation of dental licenses.

A. B. 1259, by Cronin (referred to Committee on Medical and Dental Laws), relating to dental hygienists.

A. B. 1260, by Cronin (referred to Committee on Medical and Dental Laws), relating to the practice of dentistry.

A. B. 1261, by Cronin (referred to Committee on Medical and Dental Laws), relating to registration of licenses with county clerks.

A. B. 1929, by Garibaldi (referred to Committee on Medical and Dental Laws), relating to appointment of members of State Board of Dental Examiners.

A. B. 2266, by Hunt (referred to Committee on Medical and Dental Laws). Amends Section 12 of Dental Practice Act, relating to unprofessional conduct.

A. B. 2267, by Hunt (referred to Committee on Medical and Dental Laws). Companion Bill to A. B. 2266.

A. B. 2453, by McMurray (referred to Committee on Medical and Dental Laws). Amends Section 13 of Dental Practice Act, relating to suspension and revocation of licenses.

A. B. 2454, by McMurray (referred to Committee on Medical and Dental Laws), relating to unprofessional conduct.

A. B. 2586, by Cronin (referred to Committee on Medical and Dental Laws), relating to the practice of dentistry.

A. B. 1262, by Cronin (referred to Committee on Governmental Efficiency and Economy). Amends Section 372 of Political Code, relating to State Board of Public Health.

S. B. 1021, by Williams (referred to Committee on Public Health and Quarantine). Adds to Section 13a to the Dental Practice Act, relating to places of practice.

Dental Advertising

(Two Bills)

A. B. 845, by Cassidy (referred to Committee on Medical and Dental Laws). Deletes reference to advertising professional superiority or the advertising to perform services in a superior manner.

A. B. 2604, by Laughlin (referred to Committee on Medical and Dental Laws). Amends Sections 11 and 13, relating to advertising.

Reciprocity

(Dental: One Bill)

S. B. 243, by Seawell (referred to Committee on Public Health and Quarantine). Amends Sections 6 and 7, relating to the qualifications and examination of applicants.

Expert Testimony

(Two Bills)

S. B. 446, by McGovern (referred to Committee on Judiciary). Refers to compensation for expert testimony. C. M. A. bill.

S. B. 593, by Olson (referred to Committee on Judiciary), relating to reasons for opinion.

Health Insurance

(Five Bills)

A. B. 1283, by Welsh (referred to Committee on Insurance). Identical with Williams Bill, S. B. 121.

A. B. 1491, by Cronin, McMurray, and Boyle (referred to Committee on Medical and Dental Laws). C. M. A. bill. Refer to copy of bill.

S. B. 121, by Williams (referred to Committee on Insurance). Refer to copy of bill.

S. B. 605, by McGovern (referred to Committee on Public Health and Quarantine). C. M. A. bill. Refer to copy of bill.

S. B. 886, by Nielsen (referred to Committee on County Government). Relates to life, health and accident insurance for county employees.

Hospitalization and Insurance

(Nine Bills)

A. B. 936, by Cronin (referred to Committee on Insurance), amending Insurance Code, relating to nonprofit hospital service insurance.

A. B. 937, 938, 1132, by Cronin (referred to Committee on Hospitals and Asylums), relating to nonprofit hospital service plans.

A. B. 1640, 1641, by Gannon (referred to Committee on Hospitals and Asylums), relating to nonprofit hospital service plans.

A. B. 2160, by Voight (referred to Committee on Public Charities and Corrections). Provides hospitalization and financial aid for mothers and expectant mothers.

S. B. 142 and 143, by McColl (referred to Committee on Governmental Efficiency and Committee on Insurance, respectively). Provides hospitalization and hospital insurance for state employees.

Injunctions

(One Bill)

A. B. 1783, by Gannon (referred to Committee on Judiciary, General). Adds Section 114 to the Business and Professions Code, relating to injunctions.

Insurance

(Two Bills)

A. B. 547, by Donnelly (referred to Committee on Insurance). Relates to disability insurance.

A. B. 2423, by Desmond (referred to Committee on Insurance). Companion bill to Nielsen's S. B. 886, relating to insurance for county employees.

Insane

(Twenty Bills)

A. B. 619, by Lyon (referred to Committee on Judiciary—Codes), relating to arrest and detention.

A. B. 651, by Tenney (referred to Committee on Crime Problems), relating to alienists.

A. B. 791, by Redwine (referred to Committee on Public Charities and Corrections). Liability of estates of psychopathic parole patients for maintenance.

A. B. 930, by Dannenbrink (referred to Committee on Hospitals and Asylums), relating to discharge of patients from State institutions.

A. B. 1025, by Tenney (referred to Committee on Crime Problems), relating to sanity of defendant in a criminal prosecution.

A. B. 1045, by Welsh (referred to Committee on Judiciary—General), relating to procedure in the trial and release of the criminally insane.

A. B. 1368, by Clark, Scudder, and Peek (referred to Committee on Prisons and Reformatories). To provide for special treatment for insane and feeble-minded prisoners.

A. B. 1447, by Gannon and others (referred to Committee on Hospitals and Asylums). Appropriation for construction of a neuropsychopathic hospital.

A. B. 1540, by Rosenthal (referred to Committee on Hospitals and Asylums). Sterilization of inmates of State hospitals for insane.

A. B. 1834, by Lyon and Latham (referred to Committee on Judiciary—General). Relates to persons mentally disordered and bordering on insanity but not dangerously insane.

A. B. 1844, by Lyon (referred to Committee on Judiciary—General), relating to persons mentally disordered or otherwise incompetent.

A. B. 2148, by Williamson (referred to Committee on Judiciary—Codes), relating to guardians of insane or incompetent persons.

A. B. 2709, by Daley (referred to Committee on Social Service and Welfare). Relates to Department of Institutions.

A. B. 2710, by Daley (referred to Committee on Hospitals and Asylums), relating to uniforms of patients in State hospitals for insane.

S. B. 353, by Holohan and Allen (referred to Committee on Prisons and Reformatories). To provide special treatment of insane and feeble-minded prisoners.

S. B. 512, by Quinn and others (referred to Committee on Military Affairs). Appropriation for construction of a neuropsychopathic hospital.

Alcoholics

A. B. 1932 and 1933, by Dannenbrink (referred to Committee on Public Morals).

Inebriates

A. B. 2313, by Cunningham, Clark, Watson, and Miss Miller (referred to Committee on Public Morals). Care and treatment of inebriates.

Private Psychopathic Institutions

A. B. 2147 by Williamson (referred to Committee on Hospitals and Asylums).

Itinerant Vendors of Drugs

(Seven Bills)

A. B. 716, by Patterson (referred to Committee on Public Health and Quarantine). Licenses.

A. B. 743, by Fulcher (referred to Committee on Public Health and Quarantine). Licenses.

A. B. 744, by Fulcher (referred to Committee on Judiciary—General). Licenses.

S. B. 386 and 387, by Tickle (referred to Committee on Revenue and Taxation). Licenses.

S. B. 637 and 638, by Jespersen and Garrison (referred to Committee on Revenue and Taxation). Licenses.

Medical Practice Act

(Thirty-Three Bills)

A. B. 158 to 167, inclusive, skeleton bills by Voigt (referred to Committee on Medical and Dental Laws).

A. B. 494 and 495, skeleton bills by Boyle (referred to Committee on Medical and Dental Laws).

A. B. 598 and 599 and 603 to 608, inclusive, skeleton bills by Dawson (referred to Committee on Medical and Dental Laws).

A. B. 1004 and 1005 and 1006 and 1008, bills by Gannon (referred to Committee on Medical and Dental Laws). Apparently introduced by osteopaths.

A. B. 1015 and 1016, by Lyon (by request) (referred to Committee on Soldiers and Sailors Affairs). Refer to copies of bills.

A. B. 1319 and 1320, by Gannon (referred to Committee on Medical and Dental Laws). Relate to unlawful use of degrees and unprofessional conduct.

S. B. 781, 782, 783, by McGovern (referred to Committee on Public Health and Quarantine). Remedies and disciplinary proceedings under Medical Practice Act.

Advertising

S. B. 497, by Fletcher (referred to Committee on Governmental Efficiency). Relates to advertising. California Medical Association bill from San Diego County Medical Society.

S. B. 731, by Fletcher (referred to Committee on Public Health and Quarantine). Companion Bill to S. B. 497.

Naturopaths

(One Bill)

A. B. 1472, by Pelletier (referred to Committee on Medical and Dental Laws). Creates Board of Naturopathic Examiners independent of Board of Medical Examiners, etc.

Narcotics

(Eight Bills)

S. B. 8, 18, 19, 58, 59, 62, 98, 237, all by Young, relating to changes and amendments.

Nursing

(Two Bills)

A. B. 2125, by Dannenbrink (referred to Committee on Medical and Dental Laws). Amends Nursing Act, relating to the exemption of certain schools of nursing and of graduates thereof, conducted by certain universities or colleges, from certain provisions of said Act.

S. B. 673, by Nielsen (referred to Committee on Finance). Appropriation for Bureau.

Optometry

(Nine Bills)

A. B. 1137 to 1143, inclusive, by Cronin and Boyle (referred to Committee on Medical and Dental Laws).

A. B. 2349 and 2350, by Reeves (referred to Committee on Medical and Dental Laws).

Pharmacy and Drugs

(Fifty-Nine Bills)

A. B. 1014, 1253, 1340, 1859; A. B. 1952 to 2003, inclusive; A. B. 2619; A. B. 2620.

S. B. 38, S. B. 372.

Prophylactics

(One Bill)

A. B. 1721, by Boyle (referred to Committee on Medical and Dental Laws).

Radio Advertising

(Two Bills)

A. B. 288, by Gilbert (referred to Committee on Judiciary—Codes).

S. B. 785, by Olson (referred to Committee on Judiciary).

Schools

(Six Bills)

Health and Development Certificates to Osteopaths

A. B. 684, by Daley (referred to Committee on Public Health and Quarantine).

A. B. 1880, by Clark (referred to Committee on Education).

Hearing and Sight Tests (Audiometers)

A. B. 812 and A. B. 1676, by Miss Miller (referred to Committee on Education).

Physical Examination of Pupils

A. B. 1630, by Laughlin (referred to Committee on Education).

School Nurses

S. B. 314, by Cunningham (referred to Committee on Education).

Silicosis

(One Bill)

A. B. 2029, by Fulcher (referred to Committee on Insurance).

Venereal Diseases

(Two Bills)

A. B. 1089, by Beene, Cottrell, Boyle, Morgan, Turner, Welsh, Patterson, Cronin, Robertson, Dawson, Maloney, Clark, Peek, McMurray, and Hunt (referred to Committee on Public Health and Quarantine). Establishes State Bureau of Venereal Diseases Under Direction Board of Health. Appropriates \$200,000.

A. B. 2569, by Richie (referred to Committee on Medical and Dental Laws).

Veterinary Medicine

(Two Bills)

A. B. 1265 and 1266, by Corwin (referred to Committee on Judiciary—General).

Vital Statistics

(Four Bills)

Death Certificates—A. B. 803, A. B. 1237, and S. B. 507.

Birth Certificates—S. B. 48.

X-Rays

(One Bill)

A. B. 1009, by Boyle (referred to Committee on Medical and Dental Laws). Pacific Roentgen Club Bill. Refer to copy of bill.

Miscellaneous

(Thirteen Bills)

Abortions—A. B. 2264 and 2265, by Hunt.

Blood Grouping Tests—A. B. 2116, by Redwine.

Prevention of Cruelty to Animals—A. B. 2770, by Millington; S. B. 943, by Jespersen.

Eugenics—A. B. 2589, by Johnson and Morgan; A. B. 2590, by Johnson and Hornblower.

Health Inspection of Immigrants—A. B. 2115, by Redwine.

Hospital, Medical, and Nursing Facilities on Vessels—A. B. 418, by Robertson.

Interference with Delivery of Medical Supplies—S. B. 649, by Knowland.

Medical Attention for Prisoners—A. B. 885, by Flint.

Medical Kits on Common Carriers—A. B. 2112, by Hawkins (by request).

Medical Library—A. B. 2599, by Johnson. Kress Bill.

ROSTER OF CALIFORNIA LEGISLATURE

Following the custom of former years, the names of the Legislators who make up the California Senate and California Assembly are given for the information and convenience of component county societies, their committees on public policy and legislation and for members of the California Medical Association. In all matters having to do with proposed laws, members are requested to make it a rule to consult with and act through their local county society officers and committees, who in turn will communicate with their State Committee. In that way the possibilities for confusion or misunderstanding will be greatly minimized. The Legislature will be in session again by the time this issue of CALIFORNIA AND WESTERN MEDICINE is placed in the mails, and as changes take place in the status of proposed public health laws component societies will be kept informed.—Ed.

The maps and lists are taken from the January 4, 1937, Bulletin of the Los Angeles Chamber of Commerce.

STATE OFFICERS

Governor	Frank F. Merriam (R)	State Capitol, Sacramento
Lieutenant Governor	George J. Hatfield (R)	333 Montgomery Street, San Francisco

BILL [WILLIAMS] NOT HEALTH INSURANCE*

By CHESTER H. ROWELL, LL.D.

Officials of a number of credit unions in the San Francisco district are reported to have voted to favor a bill, drafted by Attorney Leo Shapiro and to be introduced in the Legislature by State Senator Dan Williams, which they understood would enable the 40,000 credit-union members in California and all others desiring it, to "obtain voluntary medical and hospital insurance." Since they want this insurance, they naturally looked with approval on a measure which they supposed would provide it.

* * *

If, however, they had examined the draft bill more carefully, they would have discovered that it provides for no "insurance" whatever, "voluntary" or otherwise. The only thing resembling "insurance" in it is that it is under the supervision of the Insurance Commissioner. By that argument, liquor regulation would be tax equalization, since it is administered by the Board of Equalization. Otherwise there is no insurance in the bill, not even in its title, which is the "Voluntary Health Service Act." "Service" is not "insurance," even if it is paid for on the installment plan. What this bill provides for is "contract medicine."

* * *

Even as a "contract medicine" measure the bill has some extraordinary provisions. "A" physician, licensed in California, may go into the business of furnishing medical, hospital and nursing services wholesale, for weekly or monthly fees, and may open branch offices and hire other physicians, surgeons, and nurses, to work under him, as well as making such arrangements as he can with hospitals, by which he (not the hospitals) shall provide hospital service, but there is no provision by which a group or partnership of physicians may do so. It is "a" physician and his hired doctors.

* * *

Even the provision of hospital services is confined to "a" physician, who presumably owns no hospital. The hospitals cannot go into the contract hospital business, on their own, and are dependent on such organization as "a" physician may get up. He will collect the fees from his customers, and will presumably pay the hospital from them. However, the only "reserve" he is required to keep is a half-month's fees, plus the unearned portion of current fees. This would be wholly inadequate if any considerable number of his customers (they are, in this aspect, not "patients") should need serious hospital attention at once.

* * *

What services "the" physician and his hired men shall render the patient is not specified in the law. He is merely authorized to contract for "such medical services of a specified nature" as may be required, and to file with the Insurance Commissioner a copy of his contracts, setting forth "the nature of the medical services to be rendered" and whether, and under what terms and conditions hospitalization and nursing will be furnished. This opens the way to the worst abuses that have grown up under unregulated voluntary health insurance corporations, some of which have almost limited surgical services to fractures of the left tibia, caused by being run over by the right rear wheel of a pink street car, south of Market street, between 8 and 8:30 p. m., in the dark of the moon.

* * *

The duties of the Insurance Commissioner are confined largely to issuing licenses to "a" physician making application in due form; receiving reports showing how many customers the physician has, how much he charges and how much he receives; collecting one per cent of gross fees for the license, and appointing a "medical deputy" who shall be his "adviser," and shall have some sort of vague authority over the standards of services rendered. The licensee shall hire enough doctors to bear a proper

ratio to the number of patients; shall have a half-month's fees on deposit, and shall not draw out the next month's fees except in proportion to the number of days that have expired of the month. There is no other reserve.

* * *

The bill, of course, lacks every feature that would make it a health insurance act, good or bad, and it does nothing for the practice of medicine except to put it on a basis like that of towel service in office buildings, plus the fact that it is paid for on the installment plan. The only part of health service that would be practical on any such plan is hospitalization, and the hospitals are excluded from this, except as they may turn it over to "a" physician, if they can make arrangements with him. Group medicine is also reduced to "a" physician and his hired men. There is no adequate supervision, legal, administrative or medical, and the patient must find out for himself whether there are any jokers in his contract.

* * *

"A" physician engaging in this business on a wholesale scale, with the authorized "branch offices," will, of course, have to employ runners, to drum up business, and to show that he offers more services for less money than his competitor across the street. The Insurance Commissioner cannot prescribe or enforce a standard contract.

If California is going to have health insurance (as nearly all civilized countries have long had it), let it have the real thing.

This bill is not even good "contract medicine."—From the *San Francisco Chronicle*, September 17, 1936.

CALIFORNIA STATE VENEREAL DISEASE BUREAU ESTABLISHED

In August of 1917 the California State Board of Health established a Bureau of Venereal Diseases through the provision of emergency funds by the Governor of California. This bureau operated efficiently until 1920, when its activities were discontinued because of a lack of funds and lack of public interest.

The bureau established by the California State Board of Health in 1917 was the first state bureau of venereal diseases to be established in the country. The war emergency was largely responsible for its organization, which was made possible at that time through the use of federal funds devoted to the purpose.

There is now a civic awakening to the importance of venereal disease control, and through the provisions of the Social Security Act, funds have been made available by the Federal Government which will enable the State Department of Public Health to reestablish its Bureau of Venereal Diseases.

The reestablishment of this bureau, supported by public opinion, will enable the coordination and regulation of activities for the control of syphilis that are now being carried on by the various clinics in medical schools and health departments scattered throughout the State. Under the Social Security Act, funds are disbursed through the State Health Officer, it being necessary for him to submit a budget and plan which meet the approval of the Surgeon-General of the United States Public Health Service.

The main objectives in the present plan for venereal disease control consist of: (a) The provision of adequate facilities for diagnosis and treatment of syphilis; (b) Post-graduate instruction for physicians in the management and control of syphilis; (c) Education of the general public in all matters pertaining to venereal diseases and their control; (d) Stimulation of case reporting and the provision of adequate supervision over active cases of syphilis; (e) Intensive and complete investigations of early and potentially infectious cases of syphilis and their contacts.

In order to facilitate the Department's activities in the control of venereal diseases, new regulations were adopted by the State Board of Public Health on January 2, 1937. These regulations are as follows*:

"It shall be the duty of every person who gives treatment for syphilis or gonorrhea to report in writing immediately to the local health officer within whose juris-

*Article by Chester H. Rowell, Esq., refers to Senate Bill 121 (Williams) and its duplicate Assembly Bill 1283 (Welsh).

* See also news item, on page 200.

diction such patient is, on a card supplied by the State Department of Public Health, the patient's initials, sex and date of birth.

"The local health officer shall forward these reports to the State Department of Public Health at least weekly.

"The physician shall keep a record by name and address of each patient treated.

"The name and address of the patient shall be reported to the local or state health official to whom the attending physician is required to report such case, upon the special request of such official if in his judgment this may be necessary to prevent the spread of the disease to other persons.

"Whenever any person suffering from syphilis or gonorrhea shall discontinue treatment while, in the judgment of the attending physician, he is capable of transmitting the disease to others, such physician shall report immediately such facts, together with the patient's initials and date of birth to the local or state health official to whom the attending physician is required to report such case.

"Records of any local department of health or of any local health officer or of any laboratory, clinic or other institution relating to cases of syphilis or gonorrhea shall be confidential except in so far as may be necessary to carry out the provisions of the law and these regulations."

In order that adequate facilities and efficient methods of treatment may be made available, basic requirements for the conduct of clinics, both as to equipment and methods of procedure, are made. A state-wide survey is now being undertaken for the purpose of developing and adopting uniform standards in the conduct of clinics.

Through the use of National Social Security funds allotted to the California State Department of Public Health, the following services will be made available:

1. Public health nurses to do follow-up field work in order that patients who begin treatment may continue without lapses which are common in patients suffering from these diseases.

2. Distribution of arsenical and bismuth preparations to be used in the treatment of patients who are unable to pay for these supplies and the provision of suitable literature.

3. The provision, in so far as may be possible, for a special short course in social hygiene and venereal disease control for public health nurses at the universities.

In general, the plan for venereal disease control formulated by Surgeon-General Parran while serving as State Health Commissioner of New York will be followed. Each early case of syphilis, which means one in which the infection is of less than one year's duration, will be investigated, locally, and diligent efforts will be made to identify the contacts of each early case, both prior and subsequent to infection. Individuals so identified will be examined and placed under treatment as required.

Each potentially infectious syphilis case, which means all untreated cases in which the infection is of two years or less duration and all treated cases in which the required course has not been completed, will be investigated, locally, and the contacts of such case following infection will be identified, examined and placed under treatment as required. These requirements do not apply to cases under the care of a private physician.

Delinquent cases in the local community will be investigated. Each patient, reported as having discontinued treatment for more than seven days while capable of transmitting the disease, will be sought, and, if found, will be returned to treatment, using such measures as may be necessary.

The National Social Security Act, therefore, makes possible immediate action in the control of venereal diseases, and the California program in the prevention and control of syphilis is already under way.

Dr. Malcolm H. Merrill, in charge of the Syphilis Clinic at the University of California School of Medicine, is the Chief of the Bureau of Venereal Diseases of the California State Department of Public Health. Doctor Merrill is a graduate of the St. Louis University School of Medicine and has spent three years in research work at the Rockefeller Institute of Medical Research, New York City. The appointment of Doctor Merrill was announced by Dr. Walter M. Dickie, Director of the California State Department of Public Health.

SMOKE AND FUMES CLEANSSED BY SUPER-SOUND WAVE IN PROCESS DEVELOPED BY BUREAU OF MINES

The United States Department of the Interior, through its Bureau of Mines, sends out the following bulletin:

Dense clouds of fumes threatening the greenery and freshness of a countryside, subdued at the shriek of a whistle! Columns of choking smoke darkening the skies of teaming cities cleansed at the command of a sound wave! Precious particles of gold, silver, lead, copper, and zinc, bound skyward from the smelter stack, knocked out of the fume and collected as valuable byproducts! Fragments of unburned coal and ash, belched from factory chimneys, bent on soiling the housewife's linen or smirching the surface of fresh paint, diverted from its malignant course at the behest of a "supersonic wave" that may be of such high pitch that you cannot even hear it.

Such is the promise of a device invented by H. W. St. Clair, metallurgist, United States Bureau of Mines, which will be demonstrated in the North Interior Building, Washington, D. C., Saturday, February 13, at 10 a. m. The device should be of real aid in solving the smelter-fume problem, which has for years been the source of expensive litigation due to suits brought by property owners charging damage to vegetation, live stock, and water supplies. The device should also be of value in helping to curb the smoke nuisance in large cities, which has been responsible for injury to property and health running into many millions of dollars annually.

It has long been known that, when sound waves are passed through a tube containing a fine powder, the powder will be concentrated at points that are free from vibratory motion. It has also been known that waves of extremely high frequency affected the diffusion of solid or liquid particles in a gas. However, as the Bureau of Mines points out, no practical application has previously been made of this knowledge.

The St. Clair method merely passes the smoke or fume through a tube in which standing sound waves are established. These standing waves are produced by so adjusting the length of the tube that waves reflected from the upper end are in phase with the original sound waves set up at the lower end.

In order that the process may work at its best, the wavelength used must be approximately equal to the diameter of the tube. For a tube of practicable diameter, this means that the frequencies used will vary from 3 to 20 kilocycles per second. A person of acute hearing can detect waves of frequencies up to about 5 kilocycles; those of greater frequency are above the auditory range and hence are sometimes called "supersonic."

To generate sound waves of this frequency, several types of equipment may be used. Mr. St. Clair has used what is technically known as the magneto-strictive method, but for purposes of popular demonstration, an acoustic generator is used. This, in fact, is merely a shrill whistle. The sound waves produced by the whistle are reflected in phase with the original waves from the top of the tube and cause the solid particles to fall out of the gas stream. The action is similar to the effect produced by drawing the bow of a violin over a metal plate on which dust particles are deposited, when the vibrations cause the particles to arrange themselves in groups.

The Bureau of Mines for many years past has been interested in the problem of smelter fumes. As long ago as 1929 it began work on the possibility of settling smoke by means of acoustic waves.

The installation of the process that has now been devised should be comparatively inexpensive, as it utilizes simple sound waves instead of the more elaborate processes employed in other fume-treatment methods, and is, therefore, adaptable to the smaller plants.

Patents covering the new process will be applied for by members of the staff of the Bureau of Mines for the benefit of the public.

The process will be demonstrated at the annual meeting of the American Institute of Mining and Metallurgical Engineers in New York next week, the demonstration in Washington being a preview for officials of the Department of the Interior.

UNITED STATES SOCIAL SECURITY ACT: TITLES VIII AND IX

Obligations of Employers and Employees*

Under the provisions of the Federal Social Security Act, approved August 14, 1935 (49 Stat. 620), the Bureau of Internal Revenue is made responsible for collecting the taxes imposed by that Act. Two taxes are imposed by Title VIII, and one tax by Title IX, of the Act. Liability for the Title VIII taxes is determined under the provisions of Title VIII. Similarly, liability for the Title IX tax is determined under the provisions of Title IX. The provisions of either title are inapplicable to any tax imposed by the other title.

The taxes imposed under Title VIII became effective on January 1, 1937, and will be administered by the Miscellaneous Tax Unit of the Bureau. The tax imposed under Title IX became effective as of January 1, 1936, and is being administered by the Income Tax Unit of the Bureau. It is the purpose of this mimeograph to call to your attention the principal provisions of Titles VIII and IX of the Act, which affect persons subject to the taxes imposed thereby.

TITLE VIII

Section 801, Title VIII, of the Social Security Act, imposes an income tax upon every employee measured by the amount of "wages" received by him on and after January 1, 1937, with respect to "employment" on and after such date. Section 802(a) of the Act requires that this tax shall be collected by the employer of the taxpayer by deducting the amount thereof from the wages as and when paid. The employer is made liable for the payment of this tax whether or not it is collected from the employee.

Section 804, Title VIII, of the Social Security Act, imposes an excise tax upon every employer (irrespective of the number of individuals employed), measured by the amount of "wages" paid by him on and after January 1, 1937, with respect to "employment" on and after such date. Each tax under Title VIII is imposed at the following rates:

1. With respect to employment during the calendar years 1937, 1938, and 1939, the rate shall be 1 per cent.
2. With respect to employment during the calendar years 1940, 1941, and 1942, the rate shall be 1½ per cent.
3. With respect to employment during the calendar years 1943, 1944, and 1945, the rate shall be 2 per cent.
4. With respect to employment during the calendar years 1946, 1947, and 1948, the rate shall be 2½ per cent.
5. With respect to employment after December 31, 1948, the rate shall be 3 per cent.

The terms "wages" and "employment," for the purposes of Title VIII, are defined in Section 811 of the Act as follows:

"(a) The term 'wages' means all remuneration for employment, including the cash value of all remuneration paid in any medium other than cash; except that such term shall not include that part of the remuneration which, after remuneration equal to \$3,000 has been paid to an individual by an employer with respect to employment during any calendar year, is paid to such individual by such employer with respect to employment during such calendar year.

"(b) The term 'employment' means any service of whatever nature, performed within the United States by an employee for his employer, except—

1. Agricultural labor;
2. Domestic service in a private home;
3. Casual labor not in the course of the employer's trade or business;
4. Service performed by an individual who has attained the age of sixty-five;
5. Service performed as an officer or member of the crew of a vessel documented under the laws of the United States or of any foreign country;
6. Service performed in the employ of the United States Government or of an instrumentality of the United States;

* See also news item in this issue, "When Employer Voluntarily Pays Employees' Tax," on page 202. The Editor prints this non-medical information because it may be of interest and importance to many members.

7. Service performed in the employ of a state, a political subdivision thereof, or an instrumentality of one or more states or political subdivisions;

8. Service performed in the employ of a corporation, community chest, fund, or foundation, organized and operated exclusively for religious, charitable, scientific, literary, or educational purposes, or for the prevention of cruelty to children or animals, no part of the net earnings of which inures to the benefit of any private shareholder or individual."

Under the provisions of Section 11 of the Carriers Taxing Act, approved August 29, 1935 (49 Stat. 974), service performed as an employee of a carrier, or as a representative of such employees, within the meaning of that Act, are also excepted from "employment" as that term is used in Title VIII.

Detailed regulations under Title VIII which will contain provisions explaining its application (including provisions with respect to records to be kept, the method of paying the taxes, etc.), for the guidance of internal revenue officers and employees, taxpayers, and other interested persons, are in the course of preparation. It is expected that such regulations will be promulgated well in advance of January 1, 1937, the date the taxes become effective. When promulgated, copies of the regulations will be made available at the offices of collectors of internal revenue.

TITLE IX

Section 901, Title IX, of the Social Security Act imposes an excise tax upon employers with respect to having eight or more individuals in their employ on each of some twenty days during the taxable year, each such day being in a different calendar week equal to the following percentages of the total wages payable by them with respect to employment during the calendar year indicated:

- "1. With respect to employment during the calendar year 1936 the rate shall be 1 per cent;
2. With respect to employment during the calendar year 1937 the rate shall be 2 per cent;
3. With respect to employment after December 31, 1937, the rate shall be 3 per cent."

The tax applies only with respect to services performed by employees within the United States, and the following services are excepted:

- "1. Agricultural labor;
2. Domestic service in a private home;
3. Service performed as an officer or member of the crew of a vessel on the navigable waters of the United States;
4. Service performed by an individual in the employ of his son, daughter, or spouse, and service performed by a child under the age of twenty-one in the employ of his father or mother;
5. Service performed in the employ of the United States Government or of an instrumentality of the United States;
6. Service performed in the employ of a state, a political subdivision thereof, or an instrumentality of one or more states or political subdivisions;
7. Service performed in the employ of a corporation, community chest, fund, or foundation, organized and operated exclusively for religious, charitable, scientific, literary, or educational purposes, or for the prevention of cruelty to children or animals, no part of the net earnings of which inures to the benefit of any private shareholder or individual."

The measure of the tax is the total amount of remuneration paid or payable by employers to their employees with respect to employment during the calendar year.

Under Section 902 of the Act, taxpayers are entitled to credit against the tax imposed by Section 901 of the Act, contributions made by them, with respect to services not excepted by Title IX of the Act, during the taxable year (before the date of filing their returns for the taxable year) into an unemployment fund under the laws of a state which has been certified by the Social Security Board to the Secretary of the Treasury. The total credit may not exceed 90 per cent of the tax imposed by Section 901 of the Act. The credit will not be allowed unless the taxpayer files the proof of credit provided by Article 212 of Regulations 90, promulgated with respect to the taxing provisions of Title IX of the Act.

Every employer subject to the provisions of Title IX of the Act is required to file a return on Form 940 on or before the thirty-first day of January, following the close of the calendar year with the collector of internal revenue for the district in which is located the principal place of business of the employer, and if the employer has no principal place of business in the United States the return must be filed with the collector of internal revenue at Baltimore, Maryland. The Commissioner may extend the time for filing the return for a period not to exceed sixty days from the date prescribed by law for filing the return. By Article 304 of Regulations 90 authority to grant extensions of time for filing returns has been delegated to the various collectors of internal revenue and such extensions will be granted in the same manner and under the same conditions as are applicable in the case of income tax returns. Applications for such extensions should be made to the collector of internal revenue for the district in which the employer files his returns.

The tax computed on the return is due and payable on the thirty-first day of January following the close of the calendar year, but the taxpayer may elect to pay such tax in four equal installments. If the taxpayer elects to pay the tax in four installments, one-fourth of the tax is due and payable on January 31, April 30, July 31, and October 31, respectively, following the close of the calendar year. An extension of time not to exceed six months from the date prescribed for the payment of the tax or any installment thereof may be granted by the Commissioner under such rules and regulations as he may prescribe with the approval of the Secretary of the Treasury.

Inquiries concerning Title VIII of the Act should refer to the number of this mimeograph and the symbols MT:SS, and inquiries concerning the taxing provisions of Title IX of the Act and Regulations 90 should refer to the number of this mimeograph and the symbols IT:RR.

Persons desirous of information in regard to provisions of the Act other than those relating to taxes are referred to the following agencies:

Old-age assistance, aid to dependent children, and aid to the blind; unemployment compensation; old-age benefits; Titles I, II, III, IV, VII, and X and Sections 903, 904, and 910 of Title IX of the Social Security Act: Bureau of Informational Service, Social Security Board, Washington, D. C.

Maternal and child-health services, services for crippled children, and child-welfare services; Title V, Parts 1, 2, 3, and 5, of the Social Security Act: Children's Bureau, Department of Labor, Washington, D. C.

Public-health work; Title VI of the Social Security Act: Bureau of Public Health Service, Department of the Treasury, Washington, D. C.

Vocational rehabilitation; Title V, Part 4, of the Social Security Act: Office of Education, Department of the Interior, Washington, D. C.

GUY T. HELVERING,
Commissioner.

THE CAMPAIGN AGAINST SYPHILIS

Greater progress will be made in 1937 than in any year since the World War in the campaign to stamp out syphilis and reduce the widespread prevalence of gonorrhea in the United States, it was confidently predicted recently by Dr. William F. Snow, General Director of the American Social Hygiene Association.

Important factors, Doctor Snow pointed out, are the funds available for this purpose to the United States Public Health Service and the Children's Bureau through the Social Security Act, and the changed attitude of newspapers and popular magazines which are now making possible the education of the general public through frank scientific and reassuring discussion.

Doctor Snow's comment was made as he left for Washington, D. C., to participate in the three-day Conference on Venereal Disease Control, December 28 to 30, called by Dr. Thomas Parran, Surgeon-General of the United States Public Health Service. He praised Doctor Parran warmly for making syphilis the next great point of attack in public health protection for the nation.

"It is conservatively estimated, said Doctor Snow, "that about six million men, women, and children throughout the nation are infected with syphilis, although not one in ten is under treatment by a licensed physician; and the amount of gonorrhea is more than twice as great. This minimum is maintained from year to year by new cases which thus far offset reductions through cure of patients. It is especially tragic that the age group in which the largest number of infections occur is between sixteen and thirty.

"Aside from the naturally appealing reasons for stamping out syphilis, such as the physical handicaps and suffering, the emotional distress, economic burdens, and the broken homes to which it is related, there is also a staggering tax load that can be traced to this disease. Thousands of its sufferers—their personal funds exhausted, and treatment delayed until their hearts or other organs have been damaged—are in free hospital wards or being cared for by visiting nurse organizations; additional thousands lose their sight and receive state blind relief pensions; many more thousands are admitted to institutions for the insane. If all fatalities actually due to syphilis were reported as such, very probably it would be found the leading cause of death in the United States.

"The persistent activities of such agencies as the American Social Hygiene Association and its affiliated and co-operating societies have supplemented the efforts of health departments and the medical and nursing professions to build a practical program for the control of venereal diseases. This has been accomplished; and it remains only to secure the necessary state and local appropriations, and sustained public interest, to insure steady progress in the conquest of syphilis and the treatment and control of gonorrhea."

Doctor Snow disclosed that plans are being made for the holding of simultaneous regional conferences in about twenty-five large cities, and meetings in smaller cities and rural areas throughout the country, on February 3, 1937, which has been designated as "National Social Hygiene Day." The American Social Hygiene Association, 50 West Fiftieth Street, New York City, is serving as the clearing house for data, ideas, and suggestions for anyone who may be interested.

Federal, state, and local health officials are collaborating with the Association and other voluntary agencies in utilizing these meetings to focus attention on the vital syphilis problem more extensively than ever before. Among the groups participating, in addition to the medical and public health professions, are a great number of welfare, educational, religious and civic organizations, such as the National Society for the Prevention of Blindness, National Organization for Public Health Nursing, National Tuberculosis Association, National Committee for Mental Hygiene, National Probation Association, National Council of Women, General Federation of Women's Clubs, Federal Council of Churches of Christ in America, and so on.

"The progress of these regional conferences, and the meetings in smaller communities," said Doctor Snow, "will be centered largely about the findings of the Surgeon-General's Conference on Venereal Disease Control. The scientific methods of accurate diagnosis and treatment for syphilis are known; but we must see that this knowledge is used for the benefit of the millions who need it, and for the protection of the rest of the population who are not yet infected."

Regulations for Public and Private Sanatoriums.—According to a law passed by the French senate and chamber of deputies recently, every sanatorium for the treatment of pulmonary tuberculosis will be obliged to possess grounds which will suffice to permit the patients to take walks without leaving the premises under control of the institution. Such an area will be in proportion to the number of beds in the sanatorium. A private sanatorium cannot be opened without special permission of the government. This applies also to any changes in construction and increase in the number of beds. Tuberculous patients whose sanatorium costs are paid by the social insurance authorities can be treated only in institutions that are regularly licensed and not indiscriminately in any villa, hotel, boarding house or private resort.

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. X, No. 3, March, 1912

From Some Editorial Notes:

Do Men Think?—Do such prominent men as William J. Mayo, George W. Crile, A. J. Ochsner, J. H. Carstens, E. Fletcher Ingalls, and others, who contributed articles to the January number of the *American Journal of Surgery*, give the slightest thought to what they are doing by so contributing? It would seem to be impossible that men of that character, men who have worked as hard as a number of these gentlemen have worked for the up-building of the American Medical Association can really understand what it means when they give their support to a publication that represents the very extreme of "published for profit" medical (?) journalism. The advertising pages of the publication in question are full of the very worst fake and fraudulent nostrum advertisements that ever were. And yet men of distinction in the medical world will help that nefarious business along by contributing articles to such a sheet! The *Journal of the American Medical Association*, in December last [December, 1911], called attention to the nostrums advertised in the publication under discussion and deplored the fact that reputable men would contribute articles to such a publication or subscribe to it. And that is the gist of the whole matter. . . .

The Press and Patent Medicine.—We howl a lot about the outrageousness of the newspapers in printing advertisements of quacks, cancer cures and patent medicines of all sorts, but are we very much better than they? Look through the advertising pages of the *New York Medical Journal*, the *Medical Record*, the *Annals of Surgery*, for example, and see what you think is the difference between our own publication and the daily press! There is mighty little, when you come to study it. . . .

Quality of Papers.—At various times, during the past ten years, there has been some discussion as to the quality of the scientific papers published in the *State Journal*. The comment of the editor has always been that the papers published in the official *Journal* reflect the productivity of the physicians in the State and their attitude toward their fellows in the State and toward the *State Journal*. . . . It all comes back to the original contention—the *State Journal* is just what the members of the Society make it. If they write and contribute good papers, then the scientific tone of the *Journal* is good; if they do not do this, then it is lower than it should be. Let us always have criticism, for it is good for anyone; but let us also be sure that we understand what we are criticizing and why. It is up to the members of the Society.

Publicity Campaign.—Probably only a few even of those who are deeply interested in the American Medical Association have any very clear idea of the enormous amount of work directly affecting the medical profession and the public that the Association is doing. This particular word of comment relates to only one of the various large and important activities of the Association—its press bureau for the education of the public on public health matters. . . .

Notice Preliminary Program.—Forty-second annual meeting of the Medical Society of the State of California. Del Monte Hotel, Del Monte, April 16, 17, and 18, 1912. Railroad rates the same as usual; one and one-third fare for the round trip. . . .

(Continued in Front Advertising Section, Page 17)

†This column strives to mirror the work and aims of colleagues who bore the brunt of Association work some twenty-five years ago. It is hoped that such presentation will be of interest to both old and new members.

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By CHARLES B. PINKHAM, M.D.
Secretary-Treasurer

Board Proceedings

At a regular meeting of the Board of Medical Examiners held at Independent Foresters' Hall, 1329 South Hope Street, Los Angeles, February 8 to 11, inclusive, the following changes in the status of licentiates were made:

Edward H. Anthony, Los Angeles, placed on probation for three years without narcotic privileges.

Robert V. Baker, Los Angeles, guilty of violation of probation; penalty deferred until the July meeting.

James H. Beggs, Oakland (conviction, Pacific Coast Abortion Ring), license revoked.

Francis James Bold, Montebello, license restored and placed on probation for five years.

Samuel D. Burgeson, Jr., Los Angeles, placed on probation for five years without narcotic privileges.

John E. Cummings, Los Angeles, dismissed without prejudice.

Merton E. Eastman, Oakland, placed on probation for three years.

Thomas Flint, Redding, license revoked.

James Harvey Johnston, San Francisco, placed on probation for five years without narcotic privileges.

John Lenz, Redondo Beach, license restored and placed on probation for five years.

Ramon Lopez, Brawley, license restored and placed on probation for five years without narcotic privileges.

Leroy J. Otis, Norwalk, guilty; placed on probation for five years without narcotic privileges.

Allen H. Peek, Ventura, guilty; placed on probation for five years without narcotic privileges.

Byron H. Pelton, Compton, license restored and placed on probation for five years without narcotic privileges.

Jesse C. Ross, San Francisco (conviction, Pacific Coast Abortion Ring), license revoked.

Alfred Henry Valentine St. John, Los Angeles (conviction, Pacific Coast Abortion Ring), license revoked.

Leo Morton Schulman, Los Angeles, license revoked.

Henry C. Wallace, Fresno, guilty; placed on probation for five years without narcotic privileges.

George E. Watts, Los Angeles (conviction, Pacific Coast Abortion Ring), license revoked.

Glenn Granger White, San Diego, guilty; license revoked.

Carlisle B. Wiley, Los Angeles, license revoked.

News

"X-ray negatives, although paid for by patients, are the property of physicians. Municipal Judge Alfred J. Fritz so ruled yesterday in an unique case brought against Dr. Robert A. Ostroff by two patients, S. M. Wilzen and his wife, Peggy. 'It is a matter of common knowledge that x-ray negatives are practically meaningless to the layman. Their retention by the physician or surgeon constitutes an important part of his clinical record,' held Judge Fritz, denying Mr. and Mrs. Wilzen possession of x-rays taken by Doctor Ostroff." (*San Francisco Examiner*, February 12, 1937.)

"The United States Circuit Court of Appeals in San Francisco refused jurisdiction in the case of three naturopaths of Hawthorne, California, who were seeking to halt enforcement of the California Medical Practice Act. Arthur O., Ray, and Jack Borland brought suit first in the State court against Los Angeles County officials and officers of Inglewood Township, asking that they be enjoined from enforcing the Act and from refusing to permit them

BAXTER'S ARE THE PIONEER SOLUTIONS

IF YOU will but turn that over in your mind, there will come a recognition of the reasons why Baxter's are so famous. Baxter was the pioneer. Baxter's straddled its job and rode it hard. . . . Made its name world famed, because it gave to physicians perfect solutions . . . solutions as correct and as uniform and as fine as they would have made them themselves had they the time and the surety and Baxter's modern laboratories. Baxter's was first and Baxter's have always been first in all things pertaining to intravenous therapy. Baxter's, the pioneer, are perfect solutions in perfect dispensing containers.

Cibalgine Used to Relieve Pope's Pain.—Last January 19, Pope Pius was said to be in a dangerous condition and suffering from excruciating pain. Powerful sedatives were used at first; then fearing the effects of morphin on the Pope's weakened heart, his physician administered Cibalgine, a sedative produced by Ciba Company, Inc., of New York.

Prior to the use of Cibalgine, the pain had increased in frequency and intensity. Newspapers reported that when the new drug (Cibalgine) was administered, it was believed to have relieved the pain.

Hoarseness and Cancer.—The symptom of hoarseness is present whenever the function of the vocal cords is interfered with in any manner. It may denote simply a mild laryngitis or it may be the result of a severe involvement of the larynx by tuberculosis, syphilis, or a malignant growth.

The intensive campaign for the education of the public concerning the importance of the early detection of cancer should not overlook stressing hoarseness, since of all locations within the body, the larynx gives warning of a growth during its earliest stage. Particularly is this true of intrinsic or chordal carcinoma, a type of malignancy which, when removed before it has extended to involve extralaryngeal tissue, is a curable disease.

The profession generally is aware of the significance of hoarseness as an early sign of laryngeal cancer. It is our duty to impress upon our patients the necessity of investigation by a certified laryngologist as soon as this symptom appears. Schwartz rightly states that "if these principles are practiced many preventable deaths will be avoided." Hoarseness. Editorial from *New York State Journal of Medicine*, August 1, 1936.

It has been said that the foundation of health is proper feeding. In its broader aspect the proper feeding of children revolves around the public recognition of the dependence of humans upon the dairy cow. The white race cannot survive without dairy products.—*Health Digest*.

POTENT PRODUCTS

THE NATIONWIDE campaign to control venereal disease is receiving valuable publicity from many sources. The final results of the campaign, however, will depend upon the effectiveness of the products used and the proper supervision of all cases.

It is generally agreed that efficient treatment requires the administration of an arsenical and a heavy metal, alternately and continuously, for a period of from twelve to eighteen months. For this purpose Squibb has available two outstanding preparations—Neoarsphenamine and Iodobismitol with Saligenin.

Neoarsphenamine Squibb is designed to produce maximum therapeutic results. It is noted for its high stability, chemical uniformity, rapid solubility, brilliantly clear solution, low toxicity and high spirocheticidal power. Equally effective

for the conditions in which their use is indicated are Arsphenamine Squibb and Sulpharsphenamine Squibb.

Iodobismitol with Saligenin provides all the systemic effects of bismuth in the treatment of syphilis. It presents bismuth in anionic (electro-negative) form. It is slowly and completely absorbed and slowly excreted, thus providing a relatively prolonged bismuth effect. Repeated injections are well tolerated in both early and late syphilis.

Iodobismitol with Saligenin is a propylene glycol solution containing 6 per cent sodium iodobismuthite, 12 per cent sodium iodide and 4 per cent saligenin (a local anesthetic).

Vitamin Advertising and the Mead Johnson Policy. The present spectacle of vitamin advertising running riot in newspapers and magazines and via radio emphasizes the importance of the physician as a controlling agent in the use of vitamin products.

Mead Johnson & Company feel that vitamin therapy, like infant feeding, should be in the hands of the medical profession, and consequently refrain from exploiting vitamins to the public.

Adding Life to One's Years.*—The average length of life has been consistently rising for centuries and has been rapidly increasing for several decades. How high will it go? How high can it go? The health enthusiast seems to think that there is no limit to attainment in this direction and confidently expects to see it go beyond sixty years, even beyond seventy years. He points out this and that "preventable" cause of death and takes another whack at the shins of the Grim Reaper—who merely grins and bides his time. So long as one can be healthy and happy, interested and interesting, all of this is well enough, and we may look with keen anticipation toward the time when the life of man may be long upon the earth.

Obviously, however, not much more can be done toward lengthening life. As it is now we have hardly, if at all, stretched the span, but have merely brought up the average by saving the lives of babies and children—a most worth while endeavor, to be sure. At present a child who dies after a few weeks cuts down the average as much as half a dozen men or women living to the age of seventy can raise it. Shall we then admit that those who are responsible for the health of the community and the race shall rest upon their laurels and be content to try the far less romantic task of merely holding the ground that has been won at so great an effort? As a matter of fact we have only begun the much more important task

THERE is real significance in this greeting by G-E representatives, on their daily rounds among physicians and institutions in all sections of the country.

What the G-E X-Ray representative really means is this: "Doctor, one of the most important duties assigned me is that of observing how our equipment is performing in your hands. Our engineers watch jealously the record of every type of G-E apparatus in use. They want to know definitely that your G-E apparatus is giving satisfactorily the service for which it was designed, and which you have a right to expect. I am here to see that you get it."

Thus the salesman becomes your representative to the company. And because his criticisms are invited, he doesn't have to "pull his punches" in reporting to headquarters. Several hundred representatives in this way keep G-E engineers posted with up-to-the-minute information. It is the best assurance that any G-E equipment you buy is correctly designed to fulfill present-day needs.

Get acquainted with the G-E man in your locality. You'll find him a reliable source of information and technical service, always interested in your continued satisfaction as a G-E user.

of enriching life. Much has been done, but the task of enriching life—unlike that of lengthening life—is one of infinite possibilities. There must of necessity be a limit to length, but there can be no limit to the fullness and the quality of human existence. And so we propose a new goal. *Not so much that we may add years to our life, but that we may add life to our years.*

In large measure the tenets of orthodox health philosophy are tiresome and forbidding. As a rule the public yawns during the health talk. Children are bored by the cautious spinster—male or female, married or single—who instructs them in the quest for vitamins and red corpuscles. Those portions of the population who pay much attention to such lore are in real danger of becoming cranks, neurotics, and all together acute-pains-in-the-neck.

Valetudinarianism is by no means a rare disease in this country and time, and is rapidly becoming a really serious health problem. Already there are millions of people who in attempting to secure their personal comfort and safety succeed only in remembering how miserable they are. They have been taught to be afraid of overeating, under-eating, overexertion, lack of exercise, and a score of other dangers real and imaginary; they are afraid to bear children; they are afraid to smile for fear it will make wrinkles; afraid to work for fear of "domestic hands"; afraid to get up a sweat for fear of "B. O."; afraid to live for fear they will die. It is time to pay more attention to life and less to the technique of living. It is time to begin putting the "living" back into healthy living. It is time to sit up to the table and eat an honest meal with less fussing about vitamins and calories. Vitamins and calories are of importance, to be sure, but they are being overemphasized.

We greatly need a new philosophy of life and health. Health is not an end in itself—at least it should not be. It is a means to an end! I need health in order that I may take care of my family, do my work, and not irk my fellow men too seriously. Otherwise the state of my health

(Continued on Page 41)

MULFORD POLLEN EXTRACTS

FOR the diagnosis and treatment of hay fever patients, the Mulford Biological Laboratories of Sharp & Dohme offer a complete Hay Fever Service. Mulford Pollens Dried and Pollen Extracts include practically all pollens of first importance in the United States and Canada, and meet practically all seasonal and geographical demands. This extensive assortment of pollens is offered in a variety of packages for both diagnosis and treatment, to meet the physician's requirements in his particular community.

Mulford pollen preparations are botanically true to label, being prepared from mature pollens specifically identified. They are freshly prepared and standardized and will retain their full

strength through the dating period.

For Diagnosis. Mulford Pollens Dried are supplied in tube-vials of 50 mgm. Mulford Pollen Extracts are supplied for the scratch test in concentrated form (50,000 pollen units per cc.) in convenient capillary tube-points sufficient for one test; for the intradermal test, in 2-cc. ampoule-vials (2,000 pollen units per cc.).

For treatment. Mulford Pollen Extracts are supplied in Graduated Dose Treatment Packages in syringes or vials, and in 5-cc. vials of 2,000 and 20,000 pollen units per cc.

Write for the informative booklet, "Hay Fever Therapy," thoroughly discussing principles and methods of diagnosis and treatment.

is of no great consequence to anyone except to myself. We must remind ourselves that it is better to enjoy a short vacation than to endure a long one. My mother once bought at a bargain sale a whole bolt of calico. She was overjoyed, and made herself two or three dresses from it. Then there were nightgowns, curtains, pillowcases, napkins—all from the same bolt of goods. She got so tired of the pattern that she finally gave the remainder of it away. Too much calico! One remembers a piece of cloth for its beautiful pattern, its color, its design, but not for its length, provided, of course, that it is long enough to serve a useful purpose. It is better to have lived well than merely to have lived long.

But what has this to do with the matter of food? It has everything to do with food. As children we were asked by our teachers, "Do we eat to live, or live to eat?" How could a bright boy answer such a question? If he told the truth he would get a low grade, and so he lied—and knew he lied—every time.

Much too long we have permitted the health cranks to tell us that the things we like will cause our teeth to drop out and our digestion to be ruined. Too long we have eaten the things which we have loathed simply because someone has said that they contained vitamins or whatever it takes to nourish the body. We are not saying that these things are not valuable and even essential, but are merely pointing out that they may be found in a variety of foods

For Acidity and Allied Conditions, we suggest ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of these seven known iron and manganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is marked drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

and that there are certain emotional as well as purely physical functions which foods must fill. Let us suppose that an individual has the choice of two boarding houses, in the one of which there is an abundance of nutritious

(Continued on Page 44)

**USE ONLY ON ORDER AND UNDER SUPERVISION OF
A LICENSED PHYSICIAN. HE WILL GIVE YOU INSTRUCTIONS**

*...from the
very beginning*

EVERY PACKAGE OF S. M. A. HAS BORNE THIS INJUNCTION

thus putting S. M. A. irrevocably on the side of ethical medicine

S.M.A. is a food for infants—derived from tuberculin tested cows' milk, the fat of which is replaced by animal and vegetable fats including biologically tested cod liver oil; with the addition of milk sugar and potassium chloride; altogether forming an antirachitic food. When diluted according to directions, it is essentially similar to human milk in percentages of protein, fat, carbohydrates and ash, in chemical constants of the fat and in physical properties.

WHEN S. M. A. was first offered, there were many abuses in the field of infant feeding. Some firms, it is true, refrained from giving formulas and feeding directions to the laity, but the producers of S. M. A. voluntarily went further and put the above injunction right on the label. How big a forward step this was may be judged from the fact that few manufacturers have any comparable injunction, even now.

S. M. A. was developed by physicians, under hospital auspices, was first offered in response to demand by physicians, and has always been a physicians' product. Every one of the many millions of packages of S. M. A. has carried this injunction which directs patients, in their own best interests, to the physician.

S. M. A. is offered on the basis of the results it produces under the guidance and supervision of the physician. If you are one of the relatively few physicians unacquainted with S. M. A. may we suggest that you send for samples of S. M. A. and compare the results with whatever you are now using?

S. M. A. CORPORATION * CLEVELAND, OHIO

How much should a child grow or gain from time to time?

That is more significant than mere weight and height measurements

TO THE PARENT the mark on the wall and the reading on the scale reveal the child's growth. But *to the doctor* deviations from the periodic gains offer a sensitive index of dietary or disease disturbances.

The weight curve in infancy furnishes the most delicate index of progress. The birth weight doubles at five months and trebles at a year. Thereafter gains are slower; six pounds during the second year; five during the third; four during the fourth and fifth years. The trend of the first growth cycle is indicated in the chart.

THIS pattern of growth repeats itself during childhood and adolescence. Once the growth increments have been determined for a child, his assessment becomes individual and accurate.

When the child fails to gain in weight, high caloric feeding is simplified by reinforcing food with Karo Syrup. If the total caloric intake exceeds the output, the child will gain weight, provided the diet is adequate and chronic disturbances corrected.

CYCLES OF GROWTH FROM BIRTH TO MATURITY

The course of growth from birth to maturity is continuous but rhythmic. This span includes three cycles. The rapid growth in infancy is followed by the slow growth during the pre-school period; the rapid growth during the period of second dentition is followed by the slower growth during childhood; finally, the rapid growth during pubescence is followed by the slower growth during adolescence.

From Kugelmass' "Growing Superior Children", 1935.
(Appleton-Century)

Every Article of Diet can be Enriched with Calories

Karo provides 60 calories per tablespoon. It is relished added to milk, fruit and fruit juices, vegetables, vegetable waters, cereals, breads and desserts. Karo consists of dextrans, maltose and dextrose (with a small percentage of sucrose added for flavor).

For further information, write
CORN PRODUCTS SALES COMPANY
Dept. SJ-3, 17 Battery Place, New York, N. Y.

★ Infant feeding practice is primarily the concern of the physician, therefore, Karo for infant feeding is advertised to the Medical Profession exclusively.

food, but it is tasteless and unattractively served. The companionship is crude and vulgar. In the other boarding house the food is scanty and poorly chosen, but it is clean and tasty. The service is good and the company is pleasant. A person of wisdom and discrimination would certainly choose the latter for the good reason that the mood we eat in is more important than the food we eat.

The individual who insists too much upon the physical and chemical composition of food is forgetting that the best sauce in the world is a mixture of appetite, enjoyment, peace of mind, and zest for living. Life is much more than a regimen. It is necessary to feed the spirit as well as the body. It is as necessary to feed the desire to live as it is necessary to take the means of living. Personally, I should hardly regard the game worth the candle if I had to wear rubbers and woolens, and eat spinach. It is true that we live by plain foods—though being plain they need not be distasteful—but we live *for the dessert*. We may be forced to live by routine, but we live for romance. It is not enough merely to live—one must strive at least to live well.

The actual fact is that in this day Opportunity not only knocks at your door but is playing an anvil chorus on every man's door, and then lays for the owner around the corner with a club. The world is in sore need of men who can do things. Indeed, cases can easily be recalled by everyone where Opportunity actually smashed in the door and collared her candidate and dragged him forth to success. These cases are exceptional; usually you have to meet Opportunity halfway. But the only place where you can get away from Opportunity is to lie down and die. Opportunity does not trouble dead men, or dead ones who flatter themselves that they are alive.—Elbert Hubbard.

Personal hygiene is largely a matter of purposeful and intelligent cleanliness.—Walter Frank Cobb, in *Graded Outlines in Hygiene*.

The control of syphilis today is one of the major problems of the medical profession. The necessity for concerted action in bringing syphilitic individuals under treatment is evident from the estimate that from 5 to 10 per cent of the population is infected, and that there are more than 500,000 new infections annually.

The infectiousness of early syphilis may be

controlled by prompt and adequate treatment with neoarsphenamine and bismuth.

The administration of neoarsphenamine and the preparation of solutions require care, but these procedures are readily acquired. Information regarding them may be obtained by returning the attached coupon.

Please send me instructions on the technique of preparing solutions and administering injections of

Colfax School for the Tuberculous

Colfax, California

(Altitude 2400 feet)

This institution is for the treatment of medical tuberculosis and of selected cases of extrapulmonary (so-called surgical) tuberculosis.

The Colfax School for the Tuberculous consists of five Hospital Units with beds for patients who come unattended and a Housekeeping Cottage Colony for patients and their families.

The Colfax School for the Tuberculous offers the following advantages:

1. Patients are given individual care by experienced tuberculosis specialists. The patient is treated according to his individual needs.
2. Patients are taught how to secure an arrest of their disease, how to remain well when once the disease is arrested, and how to prevent the spread of the disease.
3. Patients have the advantage of modern laboratory aids to diagnosis and of all modern therapeutic agencies.
4. The climate of Colfax enables the patient to take the cure without discomfort twelve months in the year. We believe climate is secondary to medical supervision and rest, but the fact remains that it is easier to "cure" under good climatic conditions than where these climatic conditions are absent.
5. Colfax is accessible. It is on the main line of the Ogden Route of the Southern Pacific R. R. and has excellent train service. It can be reached by paved highway, being on the Victory Highway, with paved roads all the way to Colfax.

With a minimum of inconvenience to the patient...

ADEQUATE TREATMENT OF
PERNICIOUS ANEMIA
MAY BE OBTAINED BY THE USE OF

1 cc. CONCENTRATED SOLUTION LIVER EXTRACT
PARENTERAL

Lederle

THE CHOICE OF A LIVER EXTRACT for the treatment of pernicious anemia should depend primarily on the potency of the extract. Since treatment must be continued at definite intervals, it is also important to consider the discomfort caused by the injection of the extract.

The newest of the *Lederle* parenteral preparations "1 cc. CONCENTRATED SOLUTION LIVER EXTRACT" has now had two years of clinical use. With this preparation it is possible to effectively treat pernicious anemia economically and with a minimum of inconvenience to the patient.

Available only in boxes of 3 vials—each containing one cubic centimeter.

LEDERLE LABORATORIES, INC.
30 ROCKEFELLER PLAZA NEW YORK, N. Y.

San Francisco: 450 Sutter St. Los Angeles: 337 Central Ave.
Lederle Laboratories Dept., 1216 S. W. Stark St., Portland, Oregon

"Poison Oak has sure made a mess out of you, fella! But this toxok will clean that up in a hurry."

Toxok *will* clean up Poison Oak in a hurry! You will find that this highly refined extract of Poison Oak will reduce the itching and swelling and clear up the rash in much shorter time than is possible with any known local application. In many of your cases a single injection will suffice; and more than two or three injections of toxok, at twelve to twenty-four hour intervals, are seldom required to clear the most severe and stubborn rhus dermatitis.

Toxok - 2-1c.c. ambots \$1.25 — 3 dose syringe \$2.00
Poisonok (Concentrate) 13 c.c. complete treatment \$1.00

FREE CLINICAL SAMPLE

We will gladly send you, without charge, a clinical sample of toxok, consisting of 2-1c.c. ambots.

VITAMIN REQUIREMENTS OF MAN

II. VITAMIN D

• The quantity of vitamin D required by an individual is influenced by such factors as environment, race, age, mineral content of the diet, and possibly by the source of the vitamin. Deficiency is manifest in children as rickets and decreased calcium retention, and in adults by the less well defined condition known as osteomalacia.

The minimum daily intake which will prevent rickets in infants is probably between 135 and 400 International units of vitamin D as supplied by cod liver oil (1). The optimum prophylactic dose is probably in the neighborhood of 1000 International units (2). It is also interesting to note that the League of Nations Technical Commission has recommended a daily intake of 340 International units of vitamin D for pregnant and lactating women (3).

Irradiated pasteurized milk containing 135 International units per quart and irradiated evaporated milk of the same potency have been found equally effective in preventing rickets in infants. The pediatrician will be interested in the following summary taken from a recent review:

"Such evidence as is available may be interpreted to show that cod liver oil, cod liver oil concentrate milk, and irradiated milk are of equal potency for the human being, unit for unit." (1-b).

Other than the above recommendation for vitamin D intake during pregnancy and lactation (3), little definite information is available upon which to establish minimum vitamin D requirements of the human after infancy (1), yet while sunlight produces the anti-rachitic factor, most common foods are known to be deficient with respect to vitamin D (4). However, certain foods such as eggs, butter, liver and sea foods do supply this vitamin. The importance of sea foods, especially canned salmon, as carriers of vitamin D has been definitely established. A recent report on the vitamin D content of different varieties of canned salmon gave a value of 1.9 International units per gram for the least potent brand and 6 or more units per gram for several other brands (5).

From a consideration of the vitamin D values of salmon oil, the oil content of canned salmon and the quantity of canned salmon consumed annually in this country, it has been concluded that there is more vitamin D in the canned salmon sold in this country than in the cod liver oil used for both human and animal feeding (6).

Although neither the minimal nor optimal requirements of individuals of different ages are definitely known, the values of evaporated milk fortified with vitamin D and of canned sea foods as sources of this important vitamin, are well established.

This is the twenty-third in a series of monthly articles, which will summarize, for your convenience, the conclusions about canned foods which authorities in nutritional research have reached. We want to make this series valuable to you, and so we ask your help. Will you tell us on a post card addressed to the American Can Company, New York, N. Y., what phases of canned foods knowledge are of greatest interest to you? Your suggestions will determine the subject matter of future articles

The Seal of Acceptance denotes that the statements in this advertisement are acceptable to the Council on Foods of the American Medical Association.

Officers of the California Medical Association

General Officers

President—Edward M. Pallette, 502 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.	Chairman of Council—Morton R. Gibbons, 350 Post Street, San Francisco.	Secretary-Treasurer—Frederick C. Warnshuis, Four Fifty Sutter Street, Room 2004, San Francisco.
President-Elect—Howard Morrow, 384 Post Street, San Francisco.	Vice-Chairman—Junius B. Harris, Medico-Dental Building, 1127 Eleventh Street, Sacramento.	Editor—George H. Kress, 945 Roosevelt Building, 727 West Seventh Street, Los Angeles.
Speaker of House of Delegates—William W. Roblee, 202 Mission Inn Rotunda, Riverside.	Chairman of Executive Committee—Karl L. Schaupp, 530 Medico-Dental Building, 490 Post Street, San Francisco.	General Counsel—Hartley F. Peart, Room 1800, 111 Sutter Street, San Francisco.
Vice-Speaker of House of Delegates—John H. Graves, 977 Valencia Street, San Francisco.	Chairman of the Committee on Public Relations—Charles A. Dukes, 601 Wakefield Building, 426 Seventeenth Street, Oakland.	Associate General Counsel—Hubert T. Morrow, Van Nuys Building, 210 West Seventh Street, Los Angeles.

EMMENIN

The orally active, oestrogenic placental
extract elaborated by Dr. J. B. Collip, De-
partment of Biochemistry, McGill University.

*(Canadian Medical Association Journal,
February, 1930.)*

IMPORTANT ANNOUNCEMENT . . .

By an improved technique developed in our
laboratories, we have been able to render
Emmenin entirely free from disagreeable
taste and odor. This has been accomplished
without loss of therapeutic activity, and the
potency is ensured by carefully controlled
biological assay.

DETAILS ON REQUEST

Emmenin is biologically assayed and stand-
ardized under direct control of the Depart-
ment of Biochemistry, McGill University.

SAILING

SELLING

... to reach your destination
you must chart your course

7 POINT program for DIRECT MAIL SUCCESS

1. *Intelligent plan*
2. *Sound copy*
3. *Attractive design*
4. *Significant illustration*
5. *Good printing*
6. *Correct circulation*
7. *Barry's coöperation*

Special attention given to "Point 7" will insure proper consideration of the other six points. Call our Creative Department when planning your next printing. There's no obligation, of course.

Intelligent direction is what keeps a ship on its course and assures safe arrival at its destination. Never would the captain set sail without a dependable compass and reliable charts.

The creation of a direct mail campaign should never be impulsive and ill-considered. It is futile to proceed until a substantial basic plan has been developed. Decide upon the load that must be carried, then build the vehicle to carry it.

The initial cost of intelligently planned direct mail advertising is no more than "hit or miss" production—and the results explain why so many representative advertisers consistently return to this firm for Planned Printing.

CO-OPERATE WITH YOUR ADVERTISERS

CALIFORNIA AND WESTERN MEDICINE, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention CALIFORNIA AND WESTERN MEDICINE.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this JOURNAL to members and readers.

A SERVICE AGENCY—FOR READERS

THE JOURNAL of the California State Medical Association and the Cooperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely free to every member of the California and Nevada Associations. The Cooperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in CALIFORNIA AND WESTERN MEDICINE, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Cooperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. CALIFORNIA AND WESTERN MEDICINE and the A. M. A. Service Bureau desire to serve you.

COOK COUNTY GRADUATE SCHOOL OF MEDICINE

(In affiliation with COOK COUNTY HOSPITAL)

Announces Continuous Courses

MEDICINE—Informal Course first of every week; Intensive Personal Courses.

SURGERY—General Course One, Two, Three and Six Months; Two Weeks Intensive Practical Course Surgical Technique (Operative Surgery with Practice); Clinical Course.

GYNECOLOGY AND OBSTETRICS—Four Weeks Intensive Course starting May 3.

FRACTURES AND TRAUMATIC SURGERY—Informal Practical Course; Ten Day Intensive Course starting April 12, 1937.

PEDIATRICS—Two Weeks Intensive Course starting May 3.

OPHTHALMOLOGY—Intensive Two Weeks Course starting April 19, 1937.

UROLOGY—General Course; Two Months; Intensive Course Two Weeks; Special Courses.

CYSTOSCOPY—Intensive Course every two weeks (attendance limited).

General, Intensive, and Special Courses in all branches of Medicine and Surgery starting every week.

TEACHING FACULTY — ATTENDING STAFF OF COOK COUNTY HOSPITAL

Address: Registrar, 427 South Honore Street, Chicago, Ill.

ABDOMINAL SURGERY

The Continuous Course Is Now in Session

STUDENTS MAY ENTER AT ANY TIME

The following subjects will receive special attention:

Stomach and duodenum, colon and rectum, gall-bladder and bile ducts, small intestines.

The work will be given every Tuesday from 11 a.m. to 3 p.m. Those desiring to divide the work into two sessions may report on Tuesdays and Thursdays from 11 a.m. to 1 p.m. The fee is \$15 per month.

Applicants must be graduates of schools approved by the State Board of Medical Examiners

For descriptive circular and further information inquire of

CALOMEL DIASPORAL

Intravenous. Each 5 c.c. 10 mg. Fournier considered that of all the mercurials used in the treatment of syphilis, Calomel was the most effective.

Hazen, in his book, "Diseases of the Skin," states: "Calomel is considered the most powerful anti-syphilitic drug at our disposal, with the exception of arsphenamine and neoarsphenamine."

Haut und Geschlechtskrankheiten, J. Jadassohn.
The germicidal efficiency of mercury bichloride ($Hg Cl_2$), while containing less mercury than other mercurial compounds, is nevertheless more efficient as a germicide. The reason for this is obvious when we consider it from the standpoint of ionization. In $Hg Cl_2$ there is a rapid dissociation of the ions, which accounts for its superior destructive action upon bacteria.

However, in treating syphilis with mercury, we desire the opposite effect, that is, a mercurial compound in which the dissociation of the ions is slow in order to obtain continuous stimulation of the cells. Calomel, due to the slow dissociation of Hg ions, is therefore superior therapeutically and less toxic than other mercurials in the treatment of syphilis. 10s, \$4.00; 50s, \$16.00.

Should Cod-Liver Oil Be Flavored?—It is a well-known fact that young infants shy at aromatics. Older patients often tire of flavored medications to the point where the flavoring itself becomes repellant. This is particularly true if the flavoring is of a volatile nature or "repeats" hours after being ingested. Physicians have frequently used the terms "fresh," "natural," "sweet," and "nutlike," in commenting upon the fine flavor of Mead's Cod-Liver Oil. They find that most patients prefer an unflavored oil when it is as pure as Mead's.

Physicians who look with disfavor upon self-medication by laymen are interested to know that Mead's is one Cod-Liver Oil that is not advertised to the public and that carries no dosage directions on carton, bottle, or circular. Mead Johnson & Company, Evansville, Indiana, will be glad to send samples and literature to physicians only.

How to Eat.—Though ordinarily we eat three meals a day, this is not the rule of many of us who either work too hard, play too hard, or who are simply careless. The school child or college student may arise too late to partake of an ample breakfast, and may bolt down a mere semblance of a meal or take nothing at all in an effort to arrive in the classroom on time. Lunch is frequently disposed of in the limited time allowed and in not ample enough a quantity or wholesome a quality. Such abuse of the appetite and the digestive organs, combined with the fatigue of the day's activities, renders the third meal rather a task than a pleasure. This daily eating habit is

acquired by many business and professional men and women. Equally susceptible to ill health through irregular eating is the society "butterfly," living the unwholesome existence of arising too late for breakfast and going to bed late enough to say good morning to the milkman.

Eating three meals a day should be the rule for those whose weight is not excessive. The meals should be not only properly balanced qualitatively, but also quantitatively, and taken *regularly*. The same hour should be devoted to breakfast each day, the same to lunch, and the same to dinner, each to be separated from the preceding by five or six hours' interval. This permits of the maintenance of a healthy appetite wherewith one can enjoy eating; it permits of proper function of the digestive organs and encourages proper elimination, thus overcoming the need of laxatives. The regular eater is least likely to be perturbed by digestive disorders.

The mental condition of the individual while eating plays an important rôle in the success of the meal. Anxiety, anger, fear, and general nervousness dull appetite, retard digestion and lead to gastro-intestinal disorders. The same is true of frequent disturbances during meal time by telephone, door bell, or unruly children. During meal time the mind must be calm and the period spent in eating must be uninterrupted and of sufficient duration—a half-hour or more. Pleasant company, funny stories, music, and a general air of care-freedom and levity are assets that favor a healthy digestion and the maximum benefit from food consumed.

Sulfanilamide.—A new chemotherapeutic agent for treatment of streptococcal infections is para-amino-benzene-sulfonamide. It is an effective and specific agent in controlling infections caused by hemolytic streptococci and has been the subject of several medical journal papers which have appeared in this country and abroad. It has been proclaimed as the greatest contribution to chemotherapy since Ehrlich's discovery of arsphenamine.

The Squibb Laboratories have made available five-grain tablets of para-amino-benzene-sulfonamide under the name "Sulfanilamide,"—a name suggested by the Council on Pharmacy and Chemistry of the American Medical Association.

Sulfanilamide is given orally. It is indicated in treatment of puerperal fever; postabortion septicemia; erysipelas; complications of scarlet fever; influenza; nasal, postnasal and throat involvements of hemolytic streptococcal origin, including septic sore throat, otitis media, cellulitis, and perhaps also in pneumonia and cerebrospinal meningitis. Initial dosage is three tablets every four hours, for one day or longer, depending upon the patient's condition. The dose may then be reduced to one tablet every four hours until recovery.

Director of the Children's Hospital Research Foundation; Director of Pediatric and Contagious Services in the Cincinnati General Hospital. Second Edition, Revised and Reset. Cloth. Pp. 1,153, with 293 illustrations. Price, \$10 net. Philadelphia: W. B. Saunders Company, 1937.

BOOK REVIEWS

Endocrinology. August A. Werner, M. D., St. Louis University. Cloth. Pp., 672; 265 engravings. Price \$8.50. Lea & Febiger, Philadelphia.

The author has made a worth while endeavor to give to the profession the accepted knowledge that we possess on the normal and abnormal physiology of the ductless glands, the physical disorders caused by disordered function and interpretation of endocrine syndromes.

Essential fundamentals are discussed. Functions are outlined. Extended references are cited. Illustrative clinical cases are well selected.

When it comes to treatment the author commendably stresses the careful determination of the etiology of the syndrome as being of primal importance before any thought can be given to treatment measures. Again he points out the need for potent preparations and warns against the use of promiscuous products.

The text as a whole will be of great value in aiding practitioners to obtain sound information that will be valuable to him in his private practice.

Operative Surgery. J. Shelton Horsley, M. D., Richmond, Virginia. Two volumes. Fourth edition. Price, \$15. C. V. Mosby Co., St. Louis.

The first three editions of this standard surgical text have been reviewed and warmly commended. The fourth edition is now available. It is under the sponsorship of the original author, who has called to his assistance Isaac A. Bigger, M. D., and obtained contributions from Doctors C. C. Coleman, Neurological Surgeon; J. S. Horsley,

Jr., Plastic Surgery; A. I. Dodson, Urology; D. M. Faulkner, Orthopedist.

Doctor Horsley well states that no one man can remain authoritatively informed or experienced in all of the special fields of surgery. He has done well to enlist the cooperative assistance of competent co-editors.

As to the text and its well-selected illustrations, there can be no hesitancy in appraising it as an up-to-date, authoritative surgical text. The obsolete has been discarded. New, accredited principles and technique have been included and enable the reader to obtain advice that is up-to-date.

This text warrants a more extended review. However, that is impossible and would consist largely in commenting upon the special features of each chapter. Suffice it to state that these two volumes exhibit surgical standards and progress of this year.

Autopsy Diagnosis and Technique. Otto Saphir, M. D., Pathologist, Michael Reese Hospital, Chicago. Pp. 342. Price \$5. Paul B. Hoeber, Inc., New York.

This is a manual for medical students, practitioners, pathologists and coroners' physicians. It has a foreword

*Invisible
Color Free
Corrected Curves*

for the LADIES

The ORTHOGON-D Bifocal, recognized for its properties of freedom from color aberration and long working range, has a particular appeal for women.

It is without question the least visible of all bifocals. We recommend its use in cases where invisibility is of particular importance to the discriminating patient.

RIGGS OPTICAL COMPANY

Established in Seventy Western Cities

Distributors of BAUSCH & LOMB PRODUCTS

by Dr. Ludvig Hektoen. Sixty-five well selected illustrations enrich the text.

The manual is a modification of the Rokitsansky's method and is an excellent guide for performing autopsies that can be intelligently summarized. Saphir has made available a guide that will be of helpful value to every autopsy surgeon.

The Diseases of Infants and Children. By J. P. Crozar Griffith, M. D., Ph. D., Emeritus Professor of Pediatrics in the University of Pennsylvania; Consulting Physician to the Children's Hospital, Philadelphia; Consulting Physician to St. Christopher's Hospital for Children; Consulting Pediatricist to the Woman's, the Jewish, and the Misericordia Hospitals, etc.; Corresponding Member of the Société de Pédiatrie de Paris; and A. Graeme Mitchell, M. D., B. K. Rachford Professor of Pediatrics, College of Medicine, University of Cincinnati; Medical Director and Chief of Staff of the Children's Hospital of Cincinnati; Director of the Children's Hospital Research Foundation; Director of Pediatric and Contagious Services in the Cincinnati General Hospital. Second edition, revised and reset. Pp. 1,153, with 293 illustrations. Philadelphia and London: W. B. Saunders Company, 1937. Cloth, \$10 net.

Excellent, clear in meaning, dependable in specific details, voluminous references, and extremely practical. Such is the appraisal of this text. Specialists will do well to consult it and general practitioners will find it to be tremendously helpful in their care of infants and children. We like the chapters on pneumonias and on diseases of the heart because of their modern, up-to-date, thorough and sound presentation and discussion. The same opinion is formed on the diseases of the brain and meninges, which chapters merit repeated reading.

Preventive measures are emphasized. Feeding is on a simplified basis. Tuberculosis is fully discussed. Infectious diseases are carefully covered. Acid-base balance and diabetes, in fact every subject is well done. In consequence there is but one conclusion: this text will serve most satisfactorily as a modern, dependable treatise of diseases of infants and children.

Cancer and Diet. Frederick L. Hoffmann, LL. D., Research Foundation. Pp. 767. Williams & Wilkins Co., Baltimore. Price, \$5.

A presentation of the author's observations and opinions on this subject gained through many years of study. Interesting to read even though everyone cannot accept all the conclusions recorded. There are many excellent dietetic suggestions regardless of any relations to cancer.

Preoperative and Postoperative Treatment. By Robert L. Mason, A. B., M. D., F. A. C. S., Assistant in Surgery at the Massachusetts General Hospital. Pp. 495, with 123 illustrations. Philadelphia and London: W. B. Saunders Company, 1937. Cloth, \$6 net.

With the assistance of twelve contributors, Mason has presented a rather complete summary of recognized forms of pre and postoperative treatment. Standards and methods have a limited value, for after all it is the particular condition and the individual patient that requires careful, individualistic pre and postoperative care. Standards in Boston may not be applicable in St. Paul. It is the principles that are so important upon which methods are developed. These the surgeon develops from his studies and experiences.

As a single illustration, Mason expresses preference for Dakin's solution for irrigation in empyema. Because of this reviewer's experience and the untoward after results of the use of Dakin's in the pneumonia epidemic during the war and subsequently, our strong opposition is based to the use of this solution. Hence there are bound to be differences of opinion with resulting different methods.

On the whole, this is a good review of methods to be observed in rendering pre and postoperative care. It should enable the young resident and assistant to establish a plan of care based upon his enlarging experience.

Do not spend your days waiting for an angel to deliver realized hopes at your door. Go out and toil for them. There are few forms of hard work more wearying than waiting.

WHAT NAME COULD YOU TRUST MORE IN BABY FOOD?

Doctors in ever-increasing numbers are coming to rely exclusively upon Heinz Strained Foods for babies and other soft-diet cases.

That is only natural. All over the world today, the famed Heinz "57" Seal is accepted as a guarantee of uniform purity, quality and flavor.

And as further assurance for the exacting medical profession, each tin of Heinz Strained Foods is stamped with the important Seal of Acceptance of

the American Medical Association's Council on Foods.

No baby food offers more convincing proof of wholesome goodness and high nutrient content than Heinz.

No name in the food industry inspires greater trust.

Recommend Heinz Strained Foods for infant feeding. Your patients should have the *double* protection of the two famous Seals these products bear.

HEINZ STRAINED FOODS

11 KINDS—1. Strained Vegetable Soup. 2. Mixed Greens. 3. Spinach. 4. Carrots. 5. Beets. 6. Peas. 7. Prunes. 8. Cereal. 9. Apricots and Apple Sauce. 10. Tomatoes. 11. Green Beans.

Louis Pasteur

One of a Series of Nineteenth Century Types. During the last century a London periodical, now out of print, caricatured world-famous men of medicine, science, law, and politics.

Petrolagar has selected for reproduction, a number of these studies, interesting to modern men of medicine. Copies suitable for framing, together with a brief description of the subjects, will be sent to doctors on request. Petrolagar Laboratories, Inc., Chicago, Ill.

5 TYPES of Petrolagar

All of which are Council-Accepted

To enable the physician to fit the treatment to the particular need of the patient, these five types afford a range of laxative potency which will meet practically every requirement of successful bowel management.

Petrolagar Plain and Unsweetened act by mechanically softening and lubricating the bowel contents to produce comfortable bowel movement. The other three types are the plain emulsion to which laxative ingredients have been added as designated. The indications for each are obvious to every physician.

Petrolagar is 65 per cent (by volume) liquid petrolatum, emulsified with "Number One, Silver White, Kobe Agar-agar".

TWENTY-FIVE YEARS AGO

(Continued from
Text Page 288)

fixation test to syphilitic serum, and Ehrlich's production of salvarsan, are now medical history. It is history of the sort that does not lighten the physician's labor, but does make it more interesting. All these factors are the result of laboratory work, and lead more and more to depending upon laboratory methods in the diagnosis and prognosis of syphilis. Technically speaking, a record may be considered incomplete without finding the *Spirocheta pallida* in the early lesions or without a positive Wassermann finding in either early or late lesions. But practically speaking, the majority of cases that the dermatologist sees do not require either of these for a positive diagnosis. . . .

Dr. Elias S. Cooper, Surgeon.—In a recent "Bulletin of the Society of Medical History of Chicago," it is recorded among other incidents in the early history of medicine in Illinois, that "Dr. Elias S. Cooper was the first man to use chloroform as an anesthetic west of Pennsylvania." . . .

"He studied anatomy and surgery in Paris. He built the first hospital in Peoria, Illinois, and later he removed to San Francisco, where he became the most renowned surgeon on the Pacific Slope and in whose honor Cooper Medical College was named." . . .

A few years later the nephew of Doctor Cooper, Dr. Levi Cooper Lane, came into the new college, also from Illinois, well equipped with scholastic attainments and sharing alike with Doctor Brainard and Doctor Cooper their love for surgery and exalted beneficence, a worthy follower to supplement and to perpetuate the great work of his uncle, Doctor Cooper. . . .

BOARD OF MEDICAL EXAMINERS

(Continued from Text Page 288)

Following receipt of many complaints, Acting Special Agent John R. Ronan arrested Theodore T. Jacobsen in Los Angeles on a charge of violation of the Medical Practice Act. This individual maintained an office at 607 South Hill Street, on the door of which was the following sign: "725—T. T. Jacobsen, M. D., LL. D., Medico-Legal Jurisprudence Consultant—California laws interpreted for the layman." He was released on \$500 bond, pending trial on March 17. At the time of his arrest he

Unequalled Purity

So far as we know, there is only one Nitrous Oxide of 99% plus purity manufactured in the United States. This is Stuart Hi-Pure, used by many of the leading hospitals of the Pacific Coast and approved as a definite aid in effecting more even anesthesia.

STUART OXYGEN CO.

Seattle, Portland and Tacoma

is said to have stated he was licensed in Ohio, but retired in 1915. A letter from H. M. Platter, Secretary of the Ohio Board, dated Columbus, March 4, 1937, states their records show Theodore Tobias Jacobsen was graduated from the Cleveland College of Physicians and Surgeons, May 4, 1898, and was licensed in Ohio the same year. "Dr. Theodore Tobias Jacobson's certificate was revoked by this department on October 3, 1916, upon the grounds of grossly unprofessional conduct. . . . In 1919 he was arrested by an inspector from this department and charged with illegal practice of medicine in Covington, Miami County, and again in 1919 he was prosecuted for the illegal practice of medicine, that is practice after his certificate had been revoked, in the Municipal Court of Cleveland before Judge McMahon, and was found guilty on January 13, 1920. His activities in the case mentioned from Miami County, as I recall it, were in connection with a fake radium outfit; however, this case was never

brought to trial. I suggest also you make inquiry of his activities in North and South Dakota. . . ."

Investigation reports relate that Samuel Roos Lustberg, M. D., on February 17 was charged by an inspector of the Optometry Board with violation of Section 1 of the Optometry Act, pleaded not guilty, and his trial set for March 15. (Previous entry May and August, 1935.)

A news item printed in the Havana (Cuba) *Post*, February 10, 1937, reports that the Havana Secret Police were holding Dr. George Ozawa, also known as Yukihi George Ozawa, "while they investigated the possibility that he has been engaged in smuggling narcotics and espionage here. . . . Ozawa was dressed in the uniform of a Japanes naval lieutenant-commander and told police he was a naval attaché of the legation of his country in Havana, but, according to police, this was denied by the Nipponese officials. . . ." The records of the Board of Medical Examiners show that this individual has been the subject of correspondence over a period of several years because of his false claim to be a graduate of the University of California Medical School. In 1930 Ozawa signed an acceptance blank for internship in the Cene-maugh Valley Memorial Hospital, Johnstown, Pennsylvania, and in 1934 applied for a position on the staff of Mount Alto (Pennsylvania) State Hospital. In each instance he falsely claimed to be a graduate of the University of California Medical School. In May, 1930, he was an intern at the Hospital and Home for Crippled Children, Newark, New Jersey.

Attorney-General Webb on February 27, 1937, rendered Opinion No. NS-172 to the effect that Section 1 of the

State Narcotic Act made it unlawful "for any person except a physician and surgeon, dentist, or veterinary surgeon, to sell, furnish, or give away any narcotic drugs. This would prohibit the dispensing of same by a chiroprapist. You are, therefore, advised that chiropradists may not prescribe, dispense, or administer any narcotic drugs."

A report indicates that James Henry Beggs, M. D., and Alfred Henry Valentine St. John, M. D., both convicted in connection with the Pacific Coast abortion ring, were on February 15, 1937, released by Superior Judge Aggeler from the Los Angeles County Jail on \$3,000 bond.

Romano N. Trotsky, featured in the *Journal of the American Medical Association*, December 22, 1934, and mentioned as a "deportable alien, with many aliases and a criminal record, who has persistently violated the Medical Practice Act of various states, has served time in the Minnesota State Prison for abortion, went to the federal penitentiary at Leavenworth for a year and a day for violation of the Dyer Act and has been charged with forgery and other forms of swindling," has recently been investigated by the Board of Medical Examiners, both in San Francisco and Los Angeles. He is said to use the aliases Bob Anthony, Ray Armstrong, Bok Lukan, and Romano Trotsky. Our San Francisco investigation department recently acquired a document in the Russian language, said to have been displayed on all occasions by Trotsky, who claimed that it was a license to practice medicine in Russia. According to the English translation of said document, it is neither a medical diploma nor a license, but merely, as noted thereon, "A notation from the Medical Act (Russia) Chapter 225, published 1905." No authentic information is obtainable to show that Trotsky has had any medical training; however, he is reported as having visited various hospitals in San Francisco, claiming to be a nose and throat specialist.

IN SINUSITIS

With congestion of the nasal mucosa as here represented in section, it is obviously difficult to reach all affected areas with a liquid vasoconstrictor.

In sinusitis 'Benzedrine Inhaler' is especially useful. The structure of the rhinological tract is so complicated that, when congestion is present, the whole of the affected area cannot easily be reached by a liquid vasoconstrictor.

The vapor from 'Benzedrine Inhaler,' diffusing through the nasal cavity, reaches and relieves congestion. Thus it not only affords improved respiratory ventilation, but also helps to re-establish drainage of the accessory sinuses—an important factor in preventing acute attacks from becoming chronic.

Prompt and effective relief . . . ease and convenience of application . . . these go far toward insuring the comfort and co-operation of your patients between office treatments.

Each tube is packed with benzyl methyl carbinamine, .325 gm.; oil of lavender, .097 gm.; menthol, .032 gm.

'Benzedrine' is the trade mark for S. K. F.'s nasal inhaler and for their brand of the substance whose descriptive name is benzyl methyl carbinamine.

Leprosy	Typhus fever
Meningitis (epidemic)	Yellow fever ³
Plague ³	
Acute anterior poliomyelitis	

¹ Patients should be kept in mosquito-free room.

² Non-immune contacts isolated also.

³ Cases to be reported to State Department of Public Health by telephone or telegraph, and special instructions will be issued.

Trichinosis Leaflet Issued in Handy Size.—To supplement its recent poster advising the thorough cooking of pork, the Bureau of Animal Industry, has prepared a handy 4 by 8-inch four-page leaflet, convenient for enclosure in letters and packages. It supplies additional information regarding trichinosis, a disease which sometimes follows the eating of raw or imperfectly cooked pork.

The leaflet may be obtained on application to the Bureau at Washington, D. C. It is entitled "Cook Pork and Its Products Thoroughly," and is numbered A. I. 39.

The leaflet points out that hygienic precautions are necessary in preparing many foods. "Most fruits and vegetables," the text states, "are thoroughly washed or peeled. Milk is commonly pasteurized to destroy harmful bacteria that may be present, and water supplies are treated, if necessary, for purification and safety to health."

The text shows also that thorough cooking of pork is advisable not only for hygienic reasons but also for the development of rich flavor. Besides dealing with reasons for thorough cooking, the leaflet states the main sources of trichinosis, emphasizes that large cuts of pork require more cooking than smaller pieces, describes the processing of certain kinds of pork products prepared under federal meat inspection, and includes a small facsimile of the cook-pork poster.

Courts Fine and Reprimand Patent Medicine Manufacturers.—Federal courts in Los Angeles, Baltimore, Pittsburgh, and other large cities sentenced and reprimanded shippers of patent medicines found guilty of violating the Food and Drugs Act, says the Federal Food and Drug Administration in summarizing its recent activities.

A significant case, in the view of the enforcing officials, was that against Mrs. Adah Alberty, proprietress of the Alberty Food Laboratories, and also operating as "U. S. Okey," Los Angeles California. A fine of \$1,000 and costs of \$1,478.30 were imposed by the court. Mrs. Alberty had

(Continued on Page 23)

One of a series of advertisements prepared and published by PARKE, DAVIS & CO. in behalf of the medical profession. This "See Your Doctor" campaign is running in the *Saturday Evening Post* and other leading magazines.

"I never want to go to another party!"

"BUT, dear, tell Mother—what *is* the matter?"

"They wouldn't let me play with them. They let me be by myself all the time. They—they *laughed* at me."

What should Mother do? Denounce the other children as ill-raised little barbarians? Prevent further contact with the youngsters who should be the child's playmates, and the neighborhood that should be her happy little world?

Those would be natural and understandable reactions for any mother. But unfortunately, they would tend only to make matters worse.

When a child is "different" or "difficult," the most sensible thing to do is to get the help of your doctor. And the reason is that the underlying cause, while occasionally psychological, is usually *physical*.

For instance, a child can be slow and awkward at childhood games, because anemia is robbing her of energy. A child can appear backward because a glandular disorder is causing sluggishness, because faulty hearing prevents her from catching questions, or because faulty eyesight prevents her from reading correctly. A child can be sulky or ill-tempered, not because it is her nature to be so, but because some physical derangement is *making* her act that way.

The tragedies these disorders heap upon little heads are very real tragedies. But even more serious is their possible influence on the child's future. The "laughed-at" child so often becomes the crushed and morose adolescent. And the morose adolescent frequently becomes an embittered man or woman in an unfriendly world.

If your child's present and future happiness is being threatened, see your doctor. You will find him a helpful and understanding friend.

Don't fail me, Doctor

Visit the **MENNEN EXHIBIT** *at the Convention*

"Doctor, it means a lot to all us little fellers to have you see the *Mennen exhibit* at your convention. I'm counting on you, doctor—'cause I want you to hear, at first hand, the latest news about the remarkable job Mennen Antiseptic Oil is doing to protect us babies."

The success story of Mennen Antiseptic Oil is an amazing one. Already in five short years, doctors in more than 2,400 hospitals have made Mennen Antiseptic Oil a part of the standard routine of delivery and post-delivery practice.

Mennen Antiseptic Oil is invaluable for removing the vernix antiseptically and for providing dependable non-irritant antiseptics in the baby's initial cleansing and in his daily oil baths. It is recommended for daily use until the baby out-grows the diaper age.

In antiseptic potency, Mennen Oil is superior to the commonly-used ammoniated mercury ointments, yet it is absolutely non-toxic and non-irritant. It leaves no greasy residue, is pleasant to handle and can be used day-in-and-day-out without danger of dermatitis.

See us at Booth No. 36-A, at the California Medical Association Convention.

(Continued from Page 20)

shipped four medicines—"Calcatine," "Liver Cell Salts," "Lebara Pellets," and "Anti-Diabetic Vegetable Compound Capsules"—found by government analysts to contain no ingredients warranting the representation that the products were adequate treatments for malaria, diseases of the liver, constitutional defects, tubercular tendencies, acidosis, diabetes, and other conditions set forth in the labeling and circulars.

Medical experts testified at the trial, which lasted nearly a week, that neither the homeopathic nor the allopathic school of medicine recognized Mrs. Alberty's preparations as treatments for the diseases named. It was shown, further, that the company had ignored the Administration's advice not to place the products on the market, as their interstate shipment would constitute a violation of the law if the proprietress insisted on retaining the false representations.

The composition of the different preparations was as follows: "Calcatine," "Liver Cell Salts," and "Lebara Pellets"—one-grain tablets, consisting of sugar of milk with one-tenth of one per cent calcium phosphate, iron, magnesium, sodium, and potassium salts, and chlorids; "Anti-Diabetic Vegetable Compound Capsules"—capsules containing slightly more than one-half gram of mixed dried asparagus, beet leaves, cauliflower, celery, lettuce, spinach, tomatoes, and watercress.

Richard Diener, operating as the Curarina Agency, Oxnard, California, was called into the same court two weeks later, the report continues. His product, also alleged to violate the federal law, was "Curarina," a water and alcohol solution of plant extracts, containing no curare alkaloid, offered for the treatment of all diseases of the blood, heart trouble, sciatica, sinus trouble, rheumatism, snake and insect bites, mumps, malaria, diabetes, pneumonia, smallpox, tonsillitis, influenza, grippe, lockjaw, cholera, hemorrhages, appendicitis, distemper in animals, ptomaine poisoning, arthritis, not to mention some nameless tropical disturbances described with all possible gory details in the circulars. Diener, who pleaded not guilty

when the case was called, reversed his stand when about half of the government's expert testimony was in, and pleaded guilty. A fine of \$520 was imposed.

In federal court at Baltimore, Judge Chestnut reprimanded a shipper of another patent medicine fraud. The case was that against Thomas F. Maher, trading as Gowan Chemical Company, Baltimore, Maryland, shippers of "Gowan's Preparation," falsely represented as a treatment for pleurisy, spasmodic croup, coughs, congestion, and pneumonia. The article was a salve, consisting of lard, turpentine, carbolic acid, and volatile oils. In his remarks to the defendant on the witness stand, the Court said, "The point of the case is this, that you have been selling a patent medicine with representations to the public that it is an effective remedy for a valuable aid in cases of disease, when it could not have any possible real value in such disease, and anybody of real intelligence, and particularly in your line of business, must have known that. Something more is required of a man who undertakes to make a profit in selling drugs to the public than merely a willingness to change when he is caught or found out by the Department of Agriculture. It is the affirmative duty of the citizen to comply with the law. Of course, there are a great many provisions of the law that the average citizen does not know about; but a man who is in a gainful pursuit with regard to the selling of drugs certainly ought to know whether the thing that he is selling to the public is sold under fair representations or false representations." In view of the fact that the company has revised its labeling, the Court imposed a nominal fine of \$25.

Other medicine cases terminated with penalties imposed by the courts were:

Vasco Products, Inc., Brentwood, Maryland, "Colac Pile Pills," containing iron and magnesium oxides, calcium carbonate, plant drugs and a tar-like material, falsely offered for the cure of piles, fine \$200; Sweet Manufacturing Company, Pittsburgh, Pennsylvania, "Sweet's Cough Balsam," consisting of extracts of plant drugs, in-

cluding wild cherry, pine tar, chloroform, and alcohol, in syrup, for coughs and pulmonary disorders, and "Sweet's Rheumatic Remedy," tablets containing acetphenetidin, potassium iodid, sodium salicylate, caffeine, and plant extracts, for rheumatism, fine \$100 and costs; Paul B. Elder Company, Bryan, Ohio, phenobarbital tablets, containing less than the claimed amount of phenobarbital, and "Pro-targol Suppositories" not of the claimed composition, and represented as a treatment for venereal disease, fine \$50 and costs; Fallis, Inc. (William S. Spero and Herman Arkus), New York, N. Y., witch-hazel extract, offered for the treatment of rheumatism and piles, and "Alcohol-Rub," consisting of a mixture of isopropyl alcohol and water, fine of \$200 against the corporation, and suspended sentences against the individuals; Lederle Laboratories, Inc., New York, N. Y., Hoosier Pharmacal Company, Indianapolis, Indiana, Intra Products Company, Denver, Colorado, Reliance Dental Manufacturing Company, Chicago, Illinois, and Dios Chemical Company, St. Louis, Missouri, substandard pharmaceuticals and other drug products misbranded as to composition, fines of \$100, \$25, \$50, \$25, and \$500 and costs, respectively.

Drug products seized included 475 packages of gauze bandage and 140 boxes of gauze pads, represented as sterile when in fact unsterile; and the following patent medicines:

"Astyptodyne Cough Syrup," a sugar syrup with $1\frac{1}{4}$ per cent pine oil, offered for the treatment of coughs, bronchitis, croup, sore throat, whooping cough and other diseases of the throat and chest; "Astyptodyne Ointment," petrolatum with 12 per cent pine oil, for piles.

"Bol Lecznik Liniment," containing alcohol 61 per cent (the label stated 41 per cent), chloroform 4.6 minims per fluidounce (72 minims declared), ether ammonia, capsicum, water, peppermint, and mustard oil, for muscular rheumatism, stiff neck, pains in the sides, chest and back, nasal catarrh, grippe, neuralgia, sore throat, and coughs; "Cereal Lactic" powder and capsules, represented as a source of bacillus acidophilus when in fact deficient in

living organisms of that type, and contaminated with extraneous organisms: "Gay" tablets, each containing two grains acetylsalicylic acid, 1.7 grains acetphenetidin, and one-quarter grain caffeine, with plant material, bearing on the label no declaration of the presence of an acetanilid derivative, and falsely represented as non-habit-forming and as containing no harmful drugs, for the relief of pain.

"Henry's Deep Rock Oil," petroleum with cade, turpentine and cajeput oils and wintergreen, for pains in the chest, side, back and kidneys, bladder troubles, cough, sore throat, weak lungs, asthma, swellings, sore feet, and rheumatism; "Masc Zywokostowa Ucco Salve," made of menthol, camphor, eucalyptol, wintergreen oil and salicylic acid in a petrolatum base, for sore throat, tonsillitis, stiff neck, neuralgia, rheumatism, congestion, sore muscles, bronchitis, croup, lumbago, pains and aches of the back and joints, colds in the chest, and to prevent pneumonia; "Musterdone," another petrolatum-base salve, containing camphor, menthol, salicylic acid, wintergreen, and mustard oil, for sore throat, tonsillitis, stiff neck, neuralgia, rheumatism, congestion, sore muscles, bronchitis, croup, lumbago, pains and aches of the back and joints, colds in the chest, and to prevent pneumonia.

"N. A. No. 7," a water solution of iron and manganese sulfates, small amounts of calcium, manganese, aluminum, and phosphates, falsely represented as antiseptic, for rheumatism, indigestion, dysentery, diarrhea, sore throat, fresh cuts and itch, and for kidneys and tonsils; and "N. A. No. 7½," water solution of iron and magnesium sulfates, small amounts of quinin, aluminum, phosphate, and chlorid, for stomach, liver and kidneys, stomach trouble, sour stomach, sick headache, chills, fever, ague, tired and run-down feeling, heartburn, sallow complexion, nervousness, malaria, loss of appetite, and for ills arising from impurities of the blood.

"Rx 333 for Females," water, alcohol 34 per cent, and small amounts of phosphates, magnesium compounds, protein and perfume. "Rx 444 for Males," same composition except for 40 per cent alcohol (the label declared 25 per

(Continued on Page 26)

A Poor Scholar . . . because of a Poor Breakfast

MANY a child is scolded for dullness when he should be treated for undernourishment. In hundreds of homes a "continental" breakfast of a roll and coffee is the rule. If, day after day, a child breaks the night's fast of twelve hours on this scant fare, small wonder that he is listless, nervous, or stupid at school.

Pablum offers a happy solution to the problem of the school-child's breakfast. Mothers who learn about Pablum from their physicians are delighted to serve it for it needs no cooking and can be prepared in a minute at the table—more quickly than many less nourishing foods. Pablum not only ends the bane of long cooking of cereals but in addition furnishes a variety of minerals (calcium, phosphorus, iron, and copper) and vitamins (B and G) not found so abundantly in any other cereal.

PABLUM is rich in calcium and iron, minerals likely to be deficient in the school-child's diet yet needed in more than average amounts during childhood. Pablum is 6 times richer than fluid milk in calcium and contains 10 times more iron than does spinach. It also furnishes generous amounts of vitamins B and G, essential for normal appetite. Unlike other cereals, Pablum is base-forming, important because the growing child needs to store alkali. The nutritional value of Pablum is attested in studies by Crimin *et al*

"TOMMY, that's the third time this week you haven't learned your lesson. Why don't you listen to me when I tell you how to work the problems?"

who found that tuberculous children receiving supplements of Pablum showed greater weight-gain, greater increase in hemoglobin, and higher serum-calcium values than a control group fed farina. Reprint sent on request of physicians. Mead Johnson & Company, Evansville, Ind., U.S.A. Pablum (Mead's Cereal thoroughly cooked) is a palatable cereal enriched with vitamin- and mineral-containing foods, consisting of wheatmeal, oatmeal, cornmeal, wheat embryo, alfalfa leaf, beef bone, brewers yeast, iron salt, and sodium chloride.

Please enclose professional card when requesting samples of Mead Johnson products to cooperate in preventing their reaching unauthorized persons

TO THE DOCTOR'S WIFE

It is our conviction that cosmetics should be selected to suit the individual's requirements. We cater exclusively to you, the individual. Our representatives are trained to help you select suitable beauty preparations and to show you how to apply them.

It is only sensible to realize that a truly beautiful skin is first of all a healthy skin and secondly a well-cared-for skin.

Cosmetics serve to enhance your appearance, to present you at your best. In this regard it is well to bear in mind that a natural appearance is by far the most charming.

Carefully selected, and artistically applied, make-up preparations lose their identity as cosmetics and become an indistinguishable part of your personality.

We want it clearly understood that we in no way undertake to treat skin disorders. If you are thus afflicted we had rather that you not use our preparations without the consent of a skin specialist. Our formulary is available to the medical profession.

A card addressed to us will be referred to the manager of the territory in which you reside. It is our pleasure to be at your service.—LUZIER'S, Inc.

tissue-paper handkerchiefs with menthol, for head colds, sinus, and hay fever; "Vicine," a water solution of iron and magnesium sulfates with small amounts of calcium, manganese, aluminum and phosphate, for cholera, roup, limberneck, diarrhea and sleepy disease in poultry, acute colic and dysentery in animals, for worms, for increasing egg production, for fresh cuts, wounds, old sores, skin eruptions, and to stop bleeding; and 245 bottles of witch-hazel extract labeled as a treatment for burns, scalds, wounds, painful swellings, lame back, piles, sore throat, neuralgia, and rheumatism.

Hygienic Clothes for Children.—Selection of proper clothing for children is necessary in the promotion of health. The child's clothes should allow freedom to permit the natural growth of bones, muscles, and tissues of the young body as well as to permit the free action of the organs of circulation and digestion. No tight bands, stiff collars nor hard inflexible materials should be used in clothing children. Both ready-made and home-made clothes may provide the necessary health-promoting attributes. The mother is a busy individual, and if she can purchase proper clothing ready-made she will have more time available for the care of her children and will save the exertion of strength and skill in making such garments at home.

Underwear is specially important. It comes next to the skin and plays a vital part in keeping the body at even temperature at all times. Cotton fiber underwear is generally accepted as best for active children, both summer and winter. It should be of soft and open weave, admitting a layer of air within its meshes, thus retaining warmth when the layer of outer garments is added. The open weave absorbs perspiration and oily moisture thrown off by the skin and allows the moisture to evaporate quickly so that the body does not become chilled. It is cheap and is more easily laundered. Linen or flax fiber is smooth and is the

(Continued on Next Page)

NOW YOU CAN PRESCRIBE HEARING AIDS, DOCTOR, WITH THE NEW AUROGAUGE!

Experience has shown that the only answer to the question—"which hearing aid" is the result obtained with a specific aid by a particular individual.

With this fact in mind, engineers in the Acousticon Laboratories have spent eight years in research to evolve a practical device that would permit a deafened or hard-of-hearing person to try quickly and comfortably all of the 960 different ACOUSTICON combinations available.

The procedure is simple—convenient and absolutely accurate. You merely sit before the AUROGAUGE and, by trial and elimination, select the precise combination that gives your patient hearing results. The fitting takes but a few minutes. You are the one who prescribes.

We shall be glad to show you the new AUROGAUGE without obligation on your part. This is not an audiometer.

PROOF EVEN FOR SKEPTICS!

SO MANY exaggerated claims are made for cigarettes that it would be surprising indeed not to find skeptics in the medical profession. But even the most skeptical will yield to facts.

Philip Morris Cigarettes alone have been proved less irritating by actual tests—less irritating because diethylene glycol instead of glycerine is used as the hygroscopic agent.

Read for yourself the reports* on investigations of irritant properties of cigarette smoke as influenced by hygroscopic agents. Then make your own tests. Smoke Philip Morris. Try them on your patients. Verify for yourself Philip Morris superiority.

coolest in warm weather. Wool, wool and silk mixtures, and silk may be used, but they have some disadvantages.

It is as bad to dress a child too warmly in winter as it is to expose him to the discomfort of cold due to insufficient clothing. If too warmly clad, intense perspiration occurs and may help to produce a common cold. Strong, healthy children do not need to be dressed as warmly as do delicate children or those who may be recovering from illness. Babies, however, must be kept much warmer than older and active children. Mixtures of silk and wool or of cotton and wool are generally used. Thick hems and buttons should be avoided in the baby's underwear because the lumps and ridges make imprints in the tender flesh.

Nightgowns should be designed for comfort rather than for beauty. Soft, warm cotton-fleeced material or flannel is desirable. Collars should be avoided because they wrinkle easily and may cause discomfort. For out-of-door sleeping a sleeping-bag is convenient. The hands and feet are protected and a hood sewed to the neck of the garment prevents cold drafts reaching the back of the neck.

Washable materials are ideal for children's rompers, aprons, dresses, and suits. Materials made of cotton dyed in the yarn and color-set before weaving are desirable. Printed materials do not launder as well. Heavy material, like denim, is useful for coveralls because it stands hard usage. It is tightly woven, however, and does not permit circulation of air and is warm in hot weather.

By selecting proper shoes in childhood much of the foot discomfort found in adults could be prevented. The human foot is a delicately adjusted piece of machinery. In childhood the twenty-six small bones which form its structure, the muscles, nerves, ligaments, and blood vessels, which promote its actions, are soft, pliable, and are easily thrown out of place if cramped in badly shaped shoes.

Flatfoot or fallen arches, corns, bunions, enlarged joints, and calloused places many times have their beginnings in wearing childhood shoes that failed to balance the weight

APPROVED CLINICAL PATHOLOGISTS

American Medical Association Essentials for An Approved Clinical Pathologist

An approved clinical pathologist should be a licensed graduate of medicine. He shall have specialized in clinical pathology, bacteriology, pathology, chemistry, and other allied subjects for at least three years, and he should be reasonably familiar with the manifestations of disease in the body. The director of a clinical laboratory shall be on full time or have definite hours of attendance, devoting the major part of his time to this specialty. A clinical laboratory is an institution organized for the practical application of the fundamental sciences by the use of specialized apparatus, equipment and methods, for the purpose of ascertaining the presence, nature, source, and progress of disease in the human body.

The following Clinical Pathologists directing private laboratories in California are approved by the Council on Medical Education and Hospitals of the American Medical Association:

**Clinical Laboratory of Drs. W. V. Brem, A. H. Zeiler, Roy W. Hammack
and G. D. Maner, 657 So. Westlake Avenue, Los Angeles, California.**

Zera E. Bolin, M.D., 490 Post Street, San Francisco, California. ✓ ✓ ✓

These laboratories use standard methods and are fully equipped to make all clinical examinations of recognized value in: Tissue Pathology, Bacteriology, Hematology, Serology, Bio-Chemistry, Kolmer Wassermanns, Kahn test, Medico-legal, Basal metabolism, Blood chemistry, Hormone Test for Pregnancy, Parasitology, Cardiology, Autogenous vaccines, etc.

Mailing containers sent on request. Special delivery postage insures prompt, accurate service.

FOR ETHER ANESTHESIA —

IN HOME - OFFICE - HOSPITAL

Small, compact! Fits right into any doctor's kit—weighs only one and a half pounds. Its utter simplicity and portability makes it possible to use almost anywhere. Exceptionally practical for administering anesthesia in the setting of painful fractures, lancing, obstetrics and in minor surgery where otherwise an anesthesia might be impractical.

of the body, as nature intended, upon the strong, bony, springy arch of the foot. It pays to select children's shoes with great care. As the child's foot develops and grows, the height of the heel should be gradually increased so as to make use of the arch of the foot in supporting the weight of the body. The toes should never be crowded. There should be plenty of room for each toe, but not too much room. The heel should fit snugly so as to prevent twisted and run-down heels. Careful attention to these details may prevent much discomfort as well as acute physical suffering in later years.

Intracranial Hemorrhages in the New-Born.—Hollósi maintains that the etiology of intracranial hemorrhages is not uniform. It is probable that in some of the cases a constitutional abnormality is a predisposing factor to hemorrhage. The symptoms of the intracranial hemor-

rhages vary greatly; only in exceptional cases is it possible to localize the hemorrhage exactly. The treatment of intracranial hemorrhages should be symptomatic. It has not been definitely demonstrated whether the intracranial hemorrhages play a part in the development of diseases of the nervous system during later childhood.

Our chief enemies at present are heart disease, cancer, pneumonia, tuberculosis, and syphilis. If the full facts were known, as Doctor Osler said, syphilis would probably come first. Syphilis is the biggest killing disease in the community. It and tuberculosis are undoubtedly the greatest present contributors to the total mortality prior to the approach of old age. By the removal of tuberculosis and syphilis most of the preventable deaths from the age of 15 to 65 would be avoided.—Sir Arthur Newsholme, M.D.

THEY LOOK ALIKE...

but there's a Big Difference

One bulb has high quality. It will give long and economical service. The other, foreign-made for bargain counters, will waste current and probably fizzle out after a few hours of use. Yet, because these bulbs look so much alike, the average purchaser can't tell which is which.

The difference between a fully-potent vitamin product and a deficient one can't be told by appearance, either . . . nor by taste, weight or smell. And because deficient vitamin products are known to be sold, the careful physician writes his prescriptions and specifies the product of a responsible manufacturer—one having both the technical skill and the elaborate equipment that is so necessary in establishing quality and potency.

Abbott's Haliver Oil with Viosterol is such a product. Abbott maintains complete control from the time the halibut are caught until the finished product is placed in your patient's hands. Rigid bio-assays assure a vitamin A and D content up to label claims and samples of lots awaiting your prescription on the druggist's shelf are bio-assayed at intervals to guarantee stability.

Abbott Laboratories • North Chicago, Illinois

ABBOTT'S HALIVER OIL

WITH VIOSTEROL

Abbott's Haliver Oil with Viosterol is available in soft, tasteless capsules in boxes of 25, 50, 100 and 250, and in 10-cc. and 50-cc. vials with special droppers.

PROTAMINE, ZINC & ILETIN (INSULIN, LILLY)

PROTAMINE ZINC INSULIN LILLY

● Protamine Zinc Insulin represents a step forward in the management of diabetes and in many cases offers definite advantages over unmodified Insulin in treating the diabetic.

Protamine, Zinc & Iletin (Insulin, Lilly) has been developed as a result of co-operation with Dr. H. C. Hagedorn and his associates of Copenhagen, Den-

mark, and the University of Toronto.

Eli Lilly and Company markets this product in packages containing one 10-cc. vial. After careful shaking, each cubic centimeter contains 40 units of Iletin (Insulin, Lilly) together with protamine and approximately 0.08 mg. of zinc.

Literature will be forwarded to physicians upon request.

EDWARD M. PALLETTE, M. D.
President, California Medical Association

1937

CALIFORNIA AND WESTERN MEDICINE

OFFICIAL JOURNAL OF THE CALIFORNIA MEDICAL ASSOCIATION

VOL. 46

APRIL, 1937

NO. 4

SALUTATION FROM PRESIDENT PALLETTE

To the Members of the California Medical Association and their friends, your Officers and Committee Members extend a cordial greeting.

We are most fortunate this year that the Association is holding its sixty-sixth annual meeting in one of the most delightful places in all America. Monterey, this first capital city of California, with its surroundings, constitutes a spot unsurpassed in all the world for scenic beauty, historic interest and facilities for hospitality.

Monterey is the very cradle of Californian history. Viscaino landed here in 1602 and took possession in the name of the King of Spain. In 1821, Monterey became the capital of the Mexican Province of California. The first Constitution of the American State of California was framed here in the first capitol, Colton Hall, still standing, in September, 1849. Other historic buildings still to be seen here are the house of Governor Alvarado, the Presidio chapel, General Sherman's headquarters, the Larkin House, Robert Louis Stevenson's home, the first United States Customs House, and the first theater in California, where many noted actors appeared before and during the days of the gold-rush. Then there are the famous Seventeen-Mile Drive, Pebble Beach, Carmel, and Carmel Mission where Junipero Serra is buried. The numerous unexcelled golf courses in the neighborhood will appeal to many of our members. Hotel Del Monte, the meeting headquarters, has been well referred to as "the world's best-loved resort."

Several objectives are to be aimed at in a meeting of this kind. The opportunity of meeting colleagues and renewing old friendships is most valuable. Doctors who are acquainted are usually good friends. The solidarity of organized medicine is thus increased. Our health, both physical and mental, must be benefited by even a short period of relaxation from the responsibilities of practice. The consideration of the problems of medical economics and public relations is important.

After all, however, the presentation and discussion of the problems of the strictly scientific side of our profession is probably the most important. Much credit is due the Committee on Scientific Program, and to the writers of papers and their discussants for the preparation of the following program. The Section Officers have done their work well.

Those in charge have done their utmost with the hope that you will spend a most comfortable and enjoyable few days at Del Monte. The attendance should be large.

May all Association members, including those of the Auxiliary and their friends in attendance, have a most profitable and a most enjoyable time!

Cordially yours,

EDWARD M. PALLETTE.

ANNUAL SESSION, CALIFORNIA MEDICAL ASSOCIATION: HOTEL DEL MONTE, MONTEREY COUNTY, MAY 2-6, 1937

The Sixty-sixth Annual Session of the California Medical Association.—Again a work-year, the sixty-sixth of the California Medical Association, is approaching to its close, to be marked by the 1937 annual session in Monterey County, with central headquarters at the world-famed Hotel Del Monte. As in previous years, attention is called to a splendidly arranged program of interesting events of importance to physicians who practice in California; and all who can arrange their professional responsibilities should make an effort to be in attendance.

It is not necessary to recapitulate the many advantages—professional and fraternal—which members of the Association who join with their fellows in making up the scientific and other assemblies may derive from social contacts and exchange of thought. Physicians who have acquired the annual session habit do not need to be reminded of the benefits and pleasures already and always experienced; but members who never, or only rarely, go to such gatherings may well consider the good to be obtained.

* * *

Scientific Program and Pre-Convention Bulletin Printed in the Supplement.—This year, the scientific program and Pre-Convention Bulletin will be found in a Supplement to the OFFICIAL JOURNAL. The Council approved the plan* for such a supplement in the hope that the new arrangement would not only make for more convenient reference, but bring more prominently to the attention of members the annual session's near approach, thereby promoting a greater and healthier interest, and a larger attendance.

The list of papers announced by the twelve scientific sessions, and the important subjects to be considered, are well worthy of inspection. For those who, in addition to participating in the extensive programs, would have social relaxation, the Monterey Peninsula, with its historical background, its literary associations and scenic lure, offers unusual facilities for recreation.

* * *

Hotel Reservations and Railroad Information.—Hotel reservations have been placed in charge of a central agency—the Hotel Del Monte—acting not only for itself, but for other caravansary establishments in the Monterey district. A list of these hotels is given in the Supplement under the caption, "Hotel Information." Members, therefore, who have not yet secured reser-

† Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

* See Council minutes, March, 1937, page 189, item 2.

vations, and who plan to go to Del Monte by auto, should look over the names in advance. Under the heading, "Railroad Information," are given the schedules in operation at this writing; but since new time tables are anticipated about April 1, check should be made on the announcements at the time when tickets are purchased. A reduced rate will be available, but only for those who, through their respective county society secretaries, secure in advance the proper transportation slips.

The group of distinguished guest speakers who will come from other states to address the general and special meetings, the scientific programs of broad scope, and also the entertainment features, should make the Del Monte annual session of May 2-6, 1937, measure up to the highest standards of conventions ever held there. The officers of the Association sincerely hope that the session will be marked by both banner attendance and a record of much good work accomplished.

STATUS OF BILLS BEFORE THE LEGISLATURE

Two Hundred and Fifty Public Health Measures.—In previous issues it was stated that, among the 4,000 bills submitted to the Fifty-second California Legislature, now in session, more than 250 deal with public health matters. These bills were introduced in the month of January; and at this time, in the third week of the second period of the legislative session, are under consideration in some twenty-four committees. It is not possible, therefore, to prognosticate their ultimate fate; and until the Legislature adjourns it will be as important as ever for all County Committees on Public Policy and Legislation to be alive to their responsibilities when called upon for aid by the State Committee. For the information of members we append some notations compiled from reports received from the Committee on Public Policy, showing the status of some of the measures at the time of this writing:

County Hospitals.—Assembly Bill 51, by Assemblyman Heisinger of Fresno, which would open up county hospitals, was tabled by the Assembly Committee on County Government, following a hearing on March 16. Through the Association of California Hospitals, powerful opposition was registered with the committee and the bill was tabled. There are two remaining county hospital bills to be considered at a later date. A Senate Constitutional Amendment, No. 5, which would submit the subject of wide-open county or city hospitals to the people for a vote, will be considered by the Senate Committee on March 25.

Code Bills.—The bills prepared by the California Code Commission, to codify the existing laws relating to Medical Practice, Dental Practice, Nursing, Trained Attendants, Ophthalmia Neonatorum, and Medical Library, have been favorably reported by the Senate Committee, and are now before the Senate for passage.

Optometry Bills.—On March 15, there was a lively fight in the Assembly Committee on medical and dental laws, concerning Assembly Bills 1137 and 1143, inclusive, introduced by the State Board of Optometry and the Optometry Association. Through strenuous opposition, it was possible to amend out provisions which invaded the practice of medicine and gave extended rights to optometrists. Along this same line, Assembly Bill 1676, providing for a division in the State Department of Education to set up audiometer tests in all school districts, was satisfactorily amended.

Osteopathic Bills.—The osteopaths have been especially active during this session of the Legislature, and their committees called upon practically every member of the Legislature during the February recess. There are a number of bills which relate to this subject, and Assembly Bill 1880, giving osteopaths the right to serve as physical inspectors in schools, is set for a hearing before the Assembly Committee on Education on March 23.

Chiropractic Bills.—The chiropractors, also, have been active, this time in behalf of a constitutional amendment to extend their powers. This comes up for final hearing in committee on March 22. The Naturopathic Bill is still resting in committee.

Health and Hospital Insurance.—No action has been taken in committee on the Williams Bill (Senate Bill 121) or the McGovern bill (Senate Bill 605). The Williams bill has been set for hearing before the Senate Committee on Insurance on March 29. Assembly Bill 1132, sponsored by the Association of California Hospitals and designed to provide hospitalization insurance, has been extensively amended by its sponsors and will come up for hearing during the coming week. (Later: on March 29, the Hospital Service Bill passed the Assembly, with a vote of 64 to 0, and without any additional amendments.)

Venereal Disease Bills.—There is much interest in the venereal disease control bills. Assembly Bill 1089, introduced by fifteen Assemblymen, has been substantially amended. Assembly Bill 2790 is sponsored by the State Board of Public Health. Assembly Bill 2569 (the G-S bill) is sponsored by Assemblyman Richie of San Diego. All of these bills will be heard before the Assembly Committee on Public Health and Quarantine on March 24.

Nursing.—Assembly Bill 2125, of interest to nurses, has been withdrawn from the calendar of the committee, with the report that interested parties are getting together outside of the Legislature.

Compensation Act Amendments.—There are a number of bills amending provisions of the Workmen's Compensation Act, and some of these would give the injured employee free choice of any licensed healer (not confined to M. D.'s). But determined opposition has brought about postponed consideration of these until April 2.

At the Del Monte annual session, on May 3, Dr. Junius B. Harris of Sacramento, Chairman of the California Medical Association's Committee on Public Policy and Legislation, will present a progress report.

NEW FEATURES IN COUNTY MEDICAL SOCIETY MEETINGS

County Society Programs Should Be of Broad Scope.—The order of business at meetings of many County Medical Societies has varied but little with the passing years; the generally accepted plan being the reading and discussion of one or two didactic papers on medical topics with which, at times, are given some reports of cases and a brief consideration of business items. The tradition of constancy to this type of program has been so firmly instilled that, when attempts are made to introduce the consideration of important, modern-day problems having to do with medical economics, not infrequently the suggestions are received with silent or outspoken opposition.

Such conservatism and allegiance to former procedures, however, are not everywhere prevalent, and less so, perhaps, in the Far West than in the East. As throughout the Union some of the pressing economic and social welfare problems begin to make themselves felt in medical practice, there are indications of an increasing willingness to permit discussion of matters closely related to medicine's progress, even when these encroach only indirectly on scientific medicine. It is fortunate that an alteration of attitude has come about, because, in this changing, present-day world, with the emphasis that is being placed on regimentation, and on mass and stereotyped production, it is apparent that institutions, organizations and individuals who do not recognize these newer forces may find cause, later on, to regret their indifference or opposition. It is becoming increasingly evident that State and County Medical Societies, through perhaps their official publications, must call the attention of members, not once, but repeatedly, to problems directly or indirectly affecting medical practice, and concerning which it is important to have unity of opinion and collective action. Only through frank discussion and subsequent agreement on courses of action to be pursued, may we hope for successful outcomes in some of these matters which so threaten medical practice and the interests of physicians. In this connection, it is gratifying to note that medical schools also are awakening to their responsibilities to young men and women, by them in the past so often launched into professional practice, saturated presumably with medical knowledge and idealism, but with little or no comprehension as to just what they may be apt to meet in a practical world, or along what lines it would be wise for them to guide their courses if mistakes or blunders, that might prove handicaps for years, were to be avoided.

Fraternal Contacts and Understandings Should Be Encouraged.—Somewhat of the lack of acceptance of these nonscientific portions of medical practice has its basis in the inadequate attention which societies have given in the past to fraternal affiliations between members; it being forgotten or minimized that, through such social fellowship, come better, broader and kindlier understandings, ends much needed in a profession where individualism plays so vital a part in daily living and practice. For instance, that is why dinner meetings, preceding or following scientific and business sessions of County Medical Societies, can be made to have great value. It is encouraging to note the increasing number of medical organizations beginning to appreciate this. In the larger societies, especially, additional features may be brought forward to promote good fellowship, as well as the concord of purpose that comes from better personal understanding and friendship with colleagues whom one might otherwise know only by name, or in the most casual manner.

* * *

Two Recent Novel Features Sponsored by the Los Angeles County Medical Association. Reference may be made, in this connection, to two recent activities which have created much interest in the Los Angeles County Medical Association. One was the Hobby Exhibit, described on page 134 of the February issue of CALIFORNIA AND WESTERN MEDICINE, in which more than forty members presented exhibits of their activities in nonmedical art and work, by displaying things they, themselves, had made or collected. It was the opinion of the many visitors to the "hobby show" that it rendered a most useful service, not only to the County Association and its members, but, through publicity given in the daily press, also to the community.

On page 286 of the current issue appears a story of an "Amateur Night" which was marked by the largest attendance yet recorded since the new headquarters of the Association have been used, the audience consisting of almost six hundred physicians, each of whom enjoyed the talent displayed by fellow members, and voted the evening's entertainment a great success. Mention may also be made of the Bridge Tournament, which was carried on during the noon hours throughout the year. An account of this, with a description of the President's Perpetual Bridge Trophy, is given on page 282 of this month's issue.

The officers of the Los Angeles County Medical Association, therefore, are of the opinion that these new forms of Society activity have been of aid in strengthening the Association, and they propose to continue efforts along such lines.

* * *

Medical Societies Should Promote Scientific, Organization and Fraternal Activities.—There is as much need today as ever for support of all plans that make for the advancement of medical science, but it is an error to think that component county units in the United States—upon whom,

through collective action, falls much of the burden of maintaining, in their own territories and at large, the standards of scientific medicine—can be true to progress in medical science only by remaining aloof from relationships essentially human and fraternal.

As a matter of fact, in every County and State Medical Society, scientific, and also organization and fraternal, activities should be given proper places. There is a real demand for each, and a study of societies will reveal that those associations which give each of these elements their due recognition are accomplishing the best work for medicine, the public health, and for themselves.

“THROW AWAY” PUBLICATIONS

Minnesota Medicine Calls Attention to a Growing Evil.—A letter from the editor of *Minnesota Medicine*, on page 202 of the March, 1937, issue of *CALIFORNIA AND WESTERN MEDICINE*, called attention to the manner in which so-called “throw away” publications—sent out by the thousands for distribution to physicians throughout the Union—were abstracting, without permission, article after article which had previously appeared in State Society and technical journals. The Minnesota Committee on Publications stressed the importance of recognized medical magazines copyrighting their articles, in order to prevent these bold and unwarranted forays upon their contents. Several of these publications (with a no-subscription price, but distributed-free background) that have come into existence during the last several years, state in prominent type that more than 100,000 copies of their current issues had thus been placed in the mails.

The character of the advertising carried in most of these magazines is much like that which appeared, some twenty-five years or more ago, in a group of proprietary medical journals, the majority of which later went out of existence. As a consequence, for about two decades, the advertising pages in medical publications have been of comparatively decent standard, because of the nonexistence of periodicals which would accept advertising copy from the promoters of remedies whose formulae were not known or accepted by responsible investigators, such as the Council on Pharmacy of the American Medical Association.

* * *

Character of Advertising in These Newer Publications.—Come now, and rather of a sudden, not one, but almost a dozen of this new type of journal, in which all kinds of advertising seem acceptable, and as a consequence of which the announcements of all kinds of nonapproved remedies are freely interspersed with the abstracts of articles, written by physicians of established reputation, whose original papers appeared in well-recognized medical journals. It is possible that the increasing number of such magazines may

ultimately make for their disappearance, on the natural supposition that firms which would present for consideration only drugs and remedies proven and acceptable to scientific and ethical medicine would no longer wish to be associated, page to page, with promoters of remedies not endorsed by the American Medical Association's Council on Pharmacy.

* * *

“California and Western Medicine” Is Protected by Copyright.—The California Medical Association, through its Council in the year 1934, took out a copyright, and on a number of occasions the attention of several of these more recent periodicals has been called to their violation of that legal protection. Members, therefore, will confer a favor upon the central office of the California Medical Association if they will notify the Association Secretary whenever and wherever they detect such abstracting by irresponsible journals of articles previously and originally published by *CALIFORNIA AND WESTERN MEDICINE*. The California Medical Association gladly extends to state medical publications and others recognized in the specialties and of acceptable standard, the right to quote from and to make extracts of the contents of the *OFFICIAL JOURNAL*. Through its copyright protection, however, it again gives notice to all other periodicals, particularly to those of the “throw away” type, that the right to print any part of its contents, in abstracts and excerpts, is strictly forbidden.

EXCESSIVE FEES: THE HARM THEY DO TO SCIENTIFIC MEDICINE

What Newspaper Publicity Has Done.—Publicity in newspapers concerning suits over excessive fees has been a big factor in creating, among many estimable citizens, a prejudice against the medical profession; and one of the regrettable effects of such discussion by laymen can be noted in the support which is so militantly given by some civic organizations to various proposed legislation. Among such propositions are those which would open to nonindigent persons, on a part-pay basis, the doors of public institutions maintained for the indigent sick; the sponsoring of compulsory health insurance laws; and the support of voluntary health insurance measures, these last sometimes so loosely drawn that the medical protective feature (presumably of ample amount and types, as well as mandatory) is more a matter of assurance on paper than real security, and little less than a trespass upon the credulity of the unfortunate holders of policies.

In the late nineties and years immediately following, before the Carnegie-Flexner survey of medical colleges of the United States and prior to the surprising legal recognition of cultist groups by some of the States (of which California was one), comparatively little was seen in the daily press on the subject of excessive fees for medical and surgical services.

The Graduates of Smaller Colleges of Former Days.—Looking backward, however, it is to be noted that those were days when the graduate of a smaller or proprietary medical school was apt to be looked upon somewhat askance, or as one of a group of practitioners whose authority of licensure went far to lower the tone of medical standards; and this opinion held with many, in spite of the fact that many eminent in medicine had been, and were, graduates of just such small institutions—their mental capacity and love of the art ultimately giving this group a place, side by side, with leaders in the profession whose undergraduate years had been spent in more favored university schools. It is true that during the last twenty-five years the standards of medical education have been greatly advanced, so that the graduates of today go forth with far more science at their command than their predecessors of two or more decades ago. Yet, in the practice of medicine, mere knowledge of facts is not the end, an equally important element being the capacity to think clearly and to apply the knowledge possessed in logical, scientific manner, and with true art.

* * *

More Than Professional Training Alone Is Needed to Produce the True Physician.—It must be remembered that every medical student and physician is himself, before he is a doctor of medicine, and that no matter what knowledge he may acquire, his basic character will temper his professional work and tone. When then, occasionally, a licensed practitioner, who has had excellent professional training, places commercialism before service (as is manifested, for instance, in fees so high that they are out of all proportion to those asked by colleagues of equal ability, and for services of a similar nature), a real hurt is done to the medical profession of the community in which the offending individual practices; and for an older practitioner to commit such an act only makes the offense the greater. In view of the damage done to medicine by individuals having these supercommercialistic tendencies, it may be asked whether it would not have been better had they never taken up the practice of medicine, but used all their talents in the business world, where search for profits is not associated with a profession inspired by altruistic obligations; and, also, whether such physicians have not done more to lower the esteem in which the medical profession was held in former years than did, in earlier days, the graduates of small proprietary medical schools (whose places in both rural and urban centers have been taken by cultist practitioners).

* * *

A Case in Point.—These reflections are engendered by a recent newspaper item concerning a licensed physician in California who sent a well-known actor a statement for medical services, and demanded in excess of ten thousand dollars; and when the patient refused to pay, the physician entered suit, with the result that the newspapers promptly played up the item for the edification of

their readers. Immediately, and on all sides, were heard words of condemnation for the physician who had rendered the bill. And what made the case, from the standpoint of organized and scientific medicine, the more deplorable, was the fact that the medical man who rendered the twelve-thousand-dollar statement was cited several years ago to appear before the State Board of Medical Examiners (subsequent to a court trial on a narcotic charge that then received much publicity in the newspapers), when the Board, after its hearing, revoked his license. As might be expected, the physician thereupon appealed to the Superior Court, only to have the Court sustain the Board of Examiners, although later the Board, in 1934, restored the practitioner's license while placing him on probation with certain stipulations; which restrictions, at the time this is written, stand. And now comes this later exploitation of a fee of some twelve thousand dollars, which this same physician construed as a proper return for the care of a patient through an illness of not over-great duration. Here, surely, is an instance where it is impossible to estimate the damage done by the wrong kind of publicity!

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 267.

EDITORIAL COMMENT†

THE TREATMENT OF HEMORRHAGIC DISORDERS*

The diagnosis of hemorrhagic disorders involves a careful study of the capillaries, the plasma, and the platelets. Abnormal bleeding is due to disturbances in capillary permeability with or without alterations in the plasma or platelets. Rational treatment depends upon the proper assessment of the part played by each factor in abnormal bleeding.

Clinically, hemorrhagic disorders may be divided into two main classes, hemophilia and purpura.

In hemophilia the primary fault is in the plasma. The platelets fail to lyse readily. Extravasation of blood occurs when the capillary permeability is increased. This usually follows upon trauma.

Purpura is divided into hemorrhagic purpura, characterized by the escape of whole blood from blood vessels and mucous membranes, and anaphylactoid purpura, characterized by diffuse bleed-

† This department of CALIFORNIA AND WESTERN MEDICINE presents editorial comment by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California Medical Association to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

* From the Division of Medicine, University of California Medical School, San Francisco.

TABLE 1.—*Findings in Certain Hemorrhagic Diseases*

	Capillary Resistance	Bleeding Time	Coagulation Time	Clot Retractivity	Platelets Numbers	Platelets Lysis
Thrombopenic purpura	Diminished	Prolonged	Normal	Poor	Diminished	Normal
Non-thrombopenic purpura..	Diminished	Prolonged	Normal	Poor	Normal	Normal
Thrombasthenic purpura	Diminished	Prolonged	Normal	Poor	Normal	Increased
Pseudothrombophilia	Normal	Intermittently prolonged	Normal	Occasionally poor	Normal	Normal
Hemophilia	Normal	Normal	Prolonged	Normal	Normal	Diminished

ing from mucous surfaces, ecchymoses, and swellings containing plasma. Purpura of any type may or may not be associated with a diminution of platelets.

Findings in Certain Hemorrhagic Diseases.—These are outlined in Table 1.

The Capillaries.—Capillary permeability is increased in certain allergic conditions: vitamin B and C deficiency; infections, especially those due to streptococci; chemical poisoning due to drugs having a vasculotoxic effect, *i. e.*, arsenic, benzol, gold, benzamides; after large doses of venom; and in hereditary defects of the vascular endothelium.

Capillary permeability may be altered by immunization with moccasin snake venom; administration of calcium and parathormone; induced hypersensitivity to hen or sheep sera; intravenous administration of cevitic acid; and by the intramuscular administration of antivenin.

The Plasma: Bleeding is favored when the plasma is deficient in prothrombin, fibrinogen, or calcium. When blood is shed, the thrombokinase liberated by disintegrating platelets assists in the formation of the thrombin clot. Only a few platelets are necessary for the coagulation of blood, but many are needed in order to have proper clot retraction.

Prothrombin and fibrinogen may be altered by diets high in protein and fat. Transfusions, intramuscular whole blood, styptysate, and the parenteral inoculation of various blood sera alter the plasma in such a way as to inhibit bleeding. Exposure to x-ray acts similarly.

For local bleeding, the usual hemostatics, adrenalin on cotton, fresh blood on cotton, the application of fresh muscle tissue, styptysate, fibrinogen, thromboplastin, and cobra venom, are at times effective.

The Platelets: The problem of the genesis and function of the platelets is not yet settled. In normal blood their numbers vary from 150 to 900 thousand per cubic millimeters, depending upon the method used in counting them. It has been stated that they represent the remains of intravascular debris derived from the breakdown of blood cells and vascular endothelium. They are a source of thrombokinase, and act as a cement substance to barrier the flow of blood through pathologically permeable capillaries.

The platelets may be increased after transfusion, intramuscular inoculation of whole blood, autohemotherapy, inoculation of foreign protein,

ultra-violet irradiation, exposure to x-ray, and splenectomy.

In emergencies, transfusions or the intramuscular inoculation of whole blood offer the best means for controlling hemorrhage.

University of California Medical School.

S. P. LUCIA,
San Francisco.

Individuals, sometimes getting out of patience with our complex modern life, would return to a simple order of things. Rousseau advocated going back to nature, urging people to lay aside artificiality and compose themselves in a kind of primitive state. His plan was admired, widely discussed, but not put into practice; for society, like time, never moves backward. We can no more return to an earlier condition than the old can become young. Reform, as well as development, goes forward. The car of civilization ascends or descends, but has no reverse gear.

Treatment of Obesity in Children.—Mallam is convinced that dieting is the keystone to treatment in almost all cases of obesity in children, but before prescribing a system of diet a careful family history and knowledge of conditions under which the child is being reared must be obtained. Obesity beginning in childhood often gives rise to endocrine trouble later on, and when one finds a strong dominant obesity factor in the family, one should always be prepared to face a more difficult task than in a purely fortuitous case arising from normal stock. Even then, however, a cure, permanent and complete, can be obtained in the majority of cases by simple measures. The treatment must be explained carefully to the child and need not be elaborate. A simple practice is to weigh and measure the child and give it a diet based on the calculated basal requirements for this particular height and size. This is merely a beginning figure, and it may be necessary either to add to or subtract from the initial starting point. The question of the fluid intake is of considerable importance. If these children are counseled to drink early in the morning and then to try not to drink at all through the day, this is often a great help in reducing weight. Appetite is largely a question of satiation, and these children must be schooled to eat slowly. Salt and sugar should be cut down to a minimum. Many children appear even fatter than they are because of postural defects. Exercises devoted to training the recti abdominis and correcting any possible lordosis and to making them stretch their overloaded limbs are all valuable. Such exercises are always more effective under trained supervision and are usually better done in a class of several children. Some sort of abdominal support employed temporarily often gives considerable help. At the same time strengthening exercises are absolutely essential, for without them one must either rely on artificial means or face a serious chance of visceroptosis. If a child loses weight consistently under treatment, the treatment is being overdone. If one treats an overweight child of ten years and at twelve the child weighs the same, one should realize that a great deal has been achieved.—*Clinical Journal* (London).

LYMPHOMATOID DISEASE: HODGKINS AND LEUKEMIC TYPES—THEIR TREATMENT*

By H. J. ULLMANN, M.D.
Santa Barbara

DISCUSSION by Irving S. Ingber, M.D., San Francisco; William E. Costolow, M.D., Los Angeles; Raymond G. Taylor, M.D., Los Angeles; John C. Ruddock, M.D., Los Angeles.

A GREAT deal has been written on the treatment of the leukemias and lymphoblastomas by radiation. It is only in the last few years, however, that radiologists, to whom these sufferers must look for relief, have begun to consider the patient as an individual instead of a case for such or such dose or course of radiation. This paper is written as a plea to consider each case as a separate problem, and that no radiologist who is not also a clinician is qualified to treat them. This is essential, because if the best results are desired from radiation therapy, the radiation therapist must be in charge of the patient. The plea of the internist, that the radiologist is not qualified to decide anything but the size of the dose of radiation, if true, disqualifies that radiologist from treating the patient, and the referring physician is responsible for sending his patient to an incompetent therapist for treatment of a disease requiring the highest type of clinical judgment if life is to be prolonged.

PRINCIPLES OF TREATMENT

The scope of this paper and the time allotted for its presentation are too short for even an attempt to cover the subject. Nothing will be said regarding details of radiation technique such as regions to be treated in the various types of cases, for they are well known to competent radiologists. It is desired to present what the author believes are the proper principles of treatment, and what may be summarized as follows: The patient must be considered as an individual with a disease, and one differing in major or minor degree from every other individual with the same disease. The radiation, because these diseases are not curable, must be the smallest in amount that will produce beneficial results. Single doses, as small as 50 r, measured on the skin will often produce the effect desired when larger ones would shorten life. Size of dose and intervals between radiations must be determined by the patient's condition and response to previous treatments. As many of these patients live for years under proper management, copper filtered radiation or its equivalent should be used where possible to prevent eventual skin injury. Repetition of treatment should be determined by laboratory findings rather than clinical symptoms. An increase in the mediastinal shadow calls for treatment long before there are clinical symp-

toms. A change in the blood count, quantitative or qualitative, should be a warning even if the patient feels well or no enlargement of spleen or lymph nodes can be felt. While radiation is the primary method of treatment, others must not be forgotten. Diet must be regulated, occasional drugs prescribed and, of prime importance, the morale of the patient maintained.

REPORT OF CASES

Two cases will be discussed to illustrate the application of these principles—a Hodgkin's disease and a lymphoid leukemia.

CASE 1.—The patient with Hodgkin's disease was a boy of twelve years when first seen at the Mayo Clinic. For a year previously he had been treated for tuberculous adenitis, without improvement. He was referred to Doctor Desjardins for radiation therapy in February, 1925, with the diagnosis of Hodgkin's disease. The regions treated were the right and left cervical, infraclavicular, axillary and inguinal. Also the mediastinum and prevertebral lymph tracts, all at 135 K V P through 4 millimeters of aluminum. A second course was given in March, and in April a third to the cervical and axillary regions only. In July only a few very small nodes could be found in the supraclavicular spaces, and these received a fourth treatment. His family moved to Santa Barbara and he came under my care in August, 1925. No radiation was needed until March, 1928, when nodes were palpated in the cervical, axillary and inguinal regions. These were treated at 130 K V P through 0.25 millimeters of copper plus one of aluminum between March 28 and April 9, 1928, inclusive. A check of the mediastinum showed a broadening of the shadow, and this was treated at 200 K V P through Cu 0.5 plus Al 2.0 millimeters. In December, 1929, the inguinal and axillary regions were irradiated, and again in June and December, 1931, and May and December, 1932. These last consisted of single irradiations of small nodes. In March, April, and May, 1933, occasional irradiations to the mediastinum were given, and again in June and July, 1934. The mediastinal nodes became more resistant (or perhaps more apt to enlarge) and required treatment again in February, April, and May, 1935. Continuous though intermittent mediastinal radiation has been required to the present time to control a tendency of the mediastinal shadow, not only to broaden, but to infiltrate, and lately it has been impossible to obtain a complete clearing.

In spite of this, the young man feels entirely well and has been so throughout the time he has been under observation. At no time were nodes allowed to develop to the point of producing symptoms or even of attracting the patient's attention. He attended school regularly, and was graduated from Stanford and is now working. He reports regularly for examination, and accepts treatment whenever he is told that it is needed.

CASE 2.—The second case is that of a man with lymphoid leukemia. He was sixty-three years old when first seen in June, 1931. He had had enlarged cervical glands since 1922. He said that they had enlarged and regressed several times, and that he did not feel so well during the enlargements as during the regressions. A diagnosis of mononucleosis had been made at the Rockefeller Institute in December, 1930. The spleen was not palpable. There was a generalized absorption of the alveolar processes, with multiple alveolar abscesses and slight but constant bleeding from the gums. Hemoglobin was 78 per cent; red, 4,050,000; white, 34,100; small lymphocytes, 92 per cent; large lymphocytes, 4 per cent; polymorphonuclears, 3 per cent; eosinophils, 1 per cent.

The chart shows the progress of this case under treatment. Toward the later stages more attention was paid to the total polymorphonuclear count than to the total white count in deciding on both the time of the irradiations and their amount. Because of the oral sepsis and his procrastination in having the teeth removed, it was

Read before the Radiology Section of the California Medical Association at the sixty-fifth annual session, Coronado, May 25 to 28, 1936.

Fig. 1.—Lymphoid Leukemia.
X=radiation

felt that a reasonable polymorphonuclear count was of more importance than the height of the total count. He was repeatedly urged to have his mouth cleaned up and always promised to do so in the future, but never did. It was felt that the oral sepsis was the immediate danger point. This month (May, 1935) he had an upper incisor extracted with immediate extension of the sepsis into the roof of the mouth. There was considerable necrosis. The total white count was moderate, but the polymorphonuclear count alarmingly low. The beneficial effect of blood transfusions on the polymorphonuclear count may be seen on the chart. As the polymorphonuclears increased, the oral neurosis became demarcated and finally began to heal. With the remaining teeth set in extensive abscesses and the count as shown, I leave it to your imagination what the outcome will be. This chart is shown to illustrate how the blood picture can be controlled by small repeated irradiations over a long period, and how it is also necessary to use other methods as indicated; in this case oral hygiene (a failure from lack of cooperation) and blood transfusions.

IN CONCLUSION

I believe that if these principles, requiring both clinical judgment and knowledge of the effect of radiation, are followed, the average life of patients with these diseases may be considerably lengthened.

1520 Chapala Street.

DISCUSSION

IRVING S. INGBER, M.D. (490 Post Street, San Francisco).—Lymphomatoid disease being chronic, progressive and incurable, one must, in treating these conditions, utilize all of his talents in the prolongation of life with the greatest degree of comfort to the patient.

To attain this objective, we should bear in mind that lesions may occur wherever lymphoid tissue exists; and having this in mind, one will not be confused when con-

fronted with rather unusual complications which happen not infrequently.

Doctor Ullmann has rightfully stressed the importance of utilizing the smallest possible dose of x-rays consistent with beneficial results. The reasons will appear quite obvious to the experienced radiologist.

The lesson to be learned from Doctor Ullmann's second case is the importance of a complete survey of the patient in the beginning, especially in reference to locating all possible sources of focal infection, and eradication of the foci as quickly as is consistent with the patient's condition; and, finally, periodic examinations of the blood in order to maintain a clear conception of the progress of the case.

✽

WILLIAM E. COSTLOW, M.D. (1407 South Hope Street, Los Angeles).—Doctor Ullmann has brought up some very valuable points in connection with the treatment of leukemias and lymphoblastomas by radiation. The idea that the radiation therapist should be qualified to control the clinical aspects of the case is a good one, as the treatment of these conditions is almost entirely radiologic. The day is rapidly passing for the diagnostic roentgenologist to give treatment under the direction of the internist, who is unfamiliar with the action and effects of radiation. The radiation therapist is a new type of medical specialist who is rapidly establishing himself in the field of cancer and diseases treated by radiation because he must know the clinical phases of these diseases, as well as be familiar with the action and effects of radiation agents.

In the lymphomatoid diseases the aim of therapy is almost entirely a palliative one. In order to produce the longest possible palliation, it is important that not only the general condition of the patient be maintained, but also that skin reaction be avoided so that the radiation treatment can be repeated at intervals for a long period of time. The small doses of copper-filtered radiation advised by the author are very essential.

In general, in the leukemias, the chief indication for additional radiation therapy is the increase in the percentage of the immature forms of blood cells. These findings must be correlated with the total white count and

another most important factor—the general clinical condition of the patient. Although in the early stages of the disease prompt remissions are obtained, the life of some of these patients may actually be shortened by overzealous radiation treatment improperly prescribed.

The lymphoblastomas so simulate highly malignant diseases in their clinical course and response to treatment that one familiar with the palliative radiation treatment of cancer may greatly alleviate the suffering of these patients, and actually prolong their lives many years.

✽

RAYMOND G. TAYLOR, M.D. (1212 Shatto Street, Los Angeles).—Doctor Ullmann's plea for individualization in treatment of these conditions is certainly well taken. However, I feel that one should not get the impression, possible from his paper, that individualization means necessarily small doses. In our own experience, we have had a number of patients who did fairly well, over a long period of time, with fairly large doses—not very often repeated.

Doctor Ullmann reports he had remarkable coöperation in Case 1; and it would seem as though this was an ideal case for the small-dose method that he advocates, and he is to be congratulated on the result. However, the best of coöperation is not often obtained, as he notes in his Case 2.

We have had one patient, as I recall, who absolutely would not return for treatment until she got into a very distressing condition. This was a Hodgkin's, and the lesions were chiefly in the neck and mediastinum. Fairly large doses were necessary to accomplish anything with her at any time. However, we were able to keep her alive and useful (she even went through a pregnancy successfully) for over nine years, but finally died after going East.

I should be interested if Doctor Ullmann would tell us if his patient in Case 1, which had so many treatments and over such a long period of time, has had skin reactions or changes that are still evident.

So far as our experience is concerned, the time comes with all these patients when the lesions become radio-resistant, and then I think larger doses can be used with some benefit. However, the progress of the disease, after evidence of increased radio-resistance in the lesions, is almost invariably down hill and usually rapid.

✽

JOHN C. RUDDOCK, M.D. (1930 Wilshire Boulevard, Los Angeles).—Doctor Ullmann's paper on the treatment of lymphomatoid disease is a timely one, and it is refreshing to note that he stresses the point that radiologists are considering the patient as an individual rather than a case for such a dose or course of radiation. Lymphomatoid disease is incurable at this time, although it is agreed that it is possible to prolong life by means of radiation. These cases, however, fall within selected groups. We must not lose sight of the fact that although the pathologist has given us a biopsy report of lymphoma, the end-result may be Hodgkin's disease, leukemia, or lymphosarcoma. The prognosis in each of these three types is somewhat different. Leukemia may be either acute or chronic, prognosis in Hodgkin's disease would depend upon the structural involvement, while the prognosis of lymphosarcoma is a very grave problem. Doctor Ullmann reports presence of profound mouth infection in one of the cases. This is merely one instance of things that may happen in cases of this character.

Patients are naturally desirous of living as long as possible, and so demand comfort. In the treatment of cases of this character much can be done toward increasing the longevity and the comfort of life of the unfortunate patient affected by a complete understanding between the radiologist and the patient's physician. Judgment is paramount, and coöperation and coördination of treatment among all those concerned are necessary if the welfare of the patient is to be considered.

✽

DOCTOR ULLMANN (Closing).—I agree with Doctor Taylor that individualization does not necessarily mean small doses. There are instances where the dose should be increased, but as a rule these are the exceptions. I can only emphasize my statement that clinical judgment in treating these patients is essential.

There are never any skin reactions when the small-dose method is used with heavy filtration. In fact, reactions would preclude such continuous treatment. In the patient with Hodgkin's disease the skin over the mediastinum is now showing some dryness and tan, but this has always disappeared whenever there is a long interval between treatments. Of course, he was warned not to take sun baths and to keep the chest covered when on the beach.

I am in accord with Doctor Ruddock that the best interests of the patient are served when there is complete coöperation between the internist and the radiologist. Unfortunately, in practice this does not always occur, as each physician assumes the other is watching the patient and the internist too frequently exercises his own judgment, regarding further treatments, without consulting the radiologist. This often results in postponement of treatment beyond the point where the greatest benefit would accrue.

TOXEMIAS OF LATE PREGNANCY*

By JAMES V. CAMPBELL, M.D.

Oakland

DISCUSSION by H. A. Stephenson, M.D., San Francisco; L. Grant Baldwin, M.D., Pasadena; John W. Sherrick, M.D., Oakland.

IN reading the literature on the toxemias of pregnancy, one is always rather alarmed by the high incidence of mortality, both maternal and fetal. Maternal deaths in eclamptics vary in different reports, but in this country they average about 20 per cent and fetal mortality ranges from 3.62 to 42 per cent.^{1,2,3} While much has been done to better the general welfare of pregnant women, "no substantial decrease has been made in the death rate due to toxemias and chronic nephritis."⁴

The next factor which stands out is the great variety of etiologic factors that have been suggested and the strictly empiric or symptomatic treatment resorted to.

A third observation which seems significant is the apparently definite relationship of the early toxemias to the late toxemias. This will be discussed later in the paper.

The present report represents 168 women, who developed signs and symptoms of toxemia, in a series of 4,979 consecutive deliveries in the private practice of several physicians—an incidence of 3.35 per cent. Other reports give a higher percentage of toxic patients, but their definition of beginning toxemia varies somewhat from this one especially as to what constitutes elevated blood pressure.

PATIENTS INCLUDED IN THIS STUDY

Any patient who developed a blood pressure of 150 systolic or over, or showed other definite signs or symptoms of toxemia such as albuminuria, edema, persistent headaches, etc., was included in the study. If she had edema of the lower extremities only, with no other evidences of toxemia, she was not included because it is felt that edema of this nature is due to pressure with a resultant poor return circulation. No cases of acute yellow atrophy were encountered. Five patients who had primary arterial hypertension or "essential hyper-

* Read before the Obstetrics and Gynecology Section of the California Medical Association at the sixty-fifth annual session, Coronado, May 25 to 28, 1936.

tension" were included. These individuals had their hypertension when first seen, but no other indications of toxemia developed while under observation.

The term "eclampsia," as used in this paper, indicates the presence of true convulsions or coma. Preëclampsia means the nonconvulsive toxic patient.

AGE INCIDENCE

The age incidence varied from 18 to 45 years, with an average age of 30.2 years. In most articles on toxemia it is noted that there is a marked preponderance of primiparae, and this report is no exception. Primiparae accounted for 114, or 68 per cent, of the toxic patients. Of the fifty-four multiparae, twenty-seven (50 per cent) had had toxemia during their first gestation, and five of these patients were toxic for a third consecutive pregnancy. Other writers³ also report that 50 per cent of toxic patients develop toxemia in subsequent pregnancies.

Adequate prenatal care in the majority of cases is indicated by the fact that these patients were under observation on an average of five months, and their average weight gain was only twenty-two pounds, which is within normal limits.

TREATMENT PROCEDURE

A fairly uniform type of conservative treatment was tried as soon as the first signs of impending toxemia appeared. Depending upon the severity of the disease, the following routine was followed: (1) rest (restricted activity, bed rest, or hospitalization); (2) diet (salt-free, low protein, forced fluids, fruit juices, milk); (3) elimination (citrate of magnesia, colonic irrigations, or magnesium sulphate either by mouth or intravenously; (4) alkalization; (5) quite frequent use of nephritin; (6) sedatives. Venesection was never done. It is interesting to note the relative frequency of the first warning signals of toxemia: albuminuria, 94; elevated blood pressure, 69; edema, 9; convulsion 1; epigastric pain, 1.

SOME SIGNS AND SYMPTOMS

Further observations on the frequency of signs and symptoms that developed during the disease and were sufficiently severe to be noted showed the following ratio: albuminuria (with or without casts), 158; elevated blood pressure (150 or over), 136; edema, 91; headache, 58; nausea (with or without vomiting), 29; eye symptoms, 16; epigastric pain, 11.

This group of patients were observed on an average of 30.5 days from the time of the initial appearance of toxicosis until delivery. While conservative treatment was always tried, when possible, immediate delivery was done whenever the patient did not respond to her treatment. It was felt that conservatism ceased to be advisable if the patient was allowed to develop true eclampsia, or was becoming markedly worse. Dieckman⁵ expressed the opinion, generally held in this series of cases, when he stated that if there was no improvement in the toxemia, or that the condition

became worse after seven to ten days of treatment, the pregnancy should be terminated.

TYPE OF DELIVERY

The method of delivery was also based upon the theory that to follow conservative methods to their logical end would result in the loss of more mothers and more babies. The following table bears out this contention:

TABLE 1.—Types of Delivery			
Type of Delivery		Maternal Death	Fetal Death
Normal	57	2	8
Forceps	41		
Low, 16			2
Mid, 20			
High, 5			2
Breech	10		2
Version and extraction	5		2
Cesarean (35.12 per cent)	59	0	
Classical	52		2
Tubal ligation, 1			1
Hysterectomy, 4			1
Vaginal	3		3
Total deliveries	168	2	23
Twins	6	1.2%	13.2% corrected
Total number of babies	174		6.32%

In 168 deliveries of 174 babies, there were fifty-seven normal deliveries with two maternal deaths (the only maternal mortality in the entire series), and eight fetal deaths. Forceps were applied forty-one times, with four dead babies being born. Two fetal deaths followed the ten breech extractions, one craniotomy, and one of a set of twins. Following five version and extractions, there were two fetal mortalities.

MORTALITY

The first maternal death was that of a forty-year-old patient, who had had seven previous normal pregnancies with normal deliveries. Five days before labor she developed a mild preëclamptic toxemia. Two days following normal labor she was found to have a right pyelonephritis superimposed on a chronic nephritis, verified at autopsy. Death occurred eleven days postpartum. The baby was living and normal.

The second patient to die was thirty-six years of age, and in her second pregnancy. She had had a moderate preëclamptic toxemia for the last two weeks of her first pregnancy. She developed her first evidence of toxemia thirty hours before this confinement. Following hospitalization, labor was induced and she was delivered normally of a healthy, full-term child, though she had one convulsion during labor. A moderate postpartum hemorrhage was noted. Her condition became worse and death occurred only a few minutes after delivery.

Of the entire series there was a maternal mortality rate of 1.2 per cent, while the fetal mortality rate was 13.2 per cent with twenty-three deaths. By eliminating the prematures (before seven months), macerated fetuses, and the two babies,

already dead, on whom craniotomy was done, a corrected rate of 6.32 per cent is obtained.

CESAREAN SECTION

Cesarean section was done in fifty-nine cases—an incidence of 35.12 per cent—with no maternal and seven fetal deaths, all but one being premature. The classical operation accounted for fifty-two of these; four others were followed by hysterectomy, the so-called Porro section; three were delivered by vaginal hysterotomy.

Induction of labor was attempted with sixty-five patients, using one or more of these methods: castor oil and quinin, bagging, rupture of membranes, and some form of pituitrin. Four of these were not successful and eventually the patients were sectioned.

Because of the large percentage of cesarean sections, as compared with other reports, these are more completely analyzed:

Cesarean			Fetal Deaths
Indication: Toxemia (33)			
Fulminating		20	1
Only reason	12		
Disproportion	4		
Relative	3		
Flat pelvis	1		
Soft parts	4		1
Progressive toxemia		9	
Failure of induction	4		
Vaginal hysterectomy	2		2
Only cause given		4	
Indication: Obstetrical (26)			
Disproportion		11	
Funnel pelvis	5		
Relative	3		
Flat pelvis	2		
Justo minor	1		
Previous cesarean		4	
To sterilize		4	
Hysterectomy	3		
Tubal ligation	1		1
Abruptio placenta		3	
Classical	1		
Hysterectomy	1		1
Vaginal	1		
Heart disease		2	
Elderly primipara		2	
Total	59		7
Corrected			11.47%
			1.7%

The patients who had the cesarean operation can be grouped into two classes: (1) the cases in whom toxemia was the primary factor; (2) those who were operated for some other cause, but happened to have a relatively mild toxemia.

Of twenty-three cases of fulminating toxemia, twenty were sectioned. These were subdivided into twelve cases, who were operated because of the toxemia alone—one fetal death (prematurity); four with disproportion; four with long, uneffaced cervixes—one fetal death (prematurity). In the last eight cases it was felt that a prolonged labor would mean almost certain death of the baby, and would greatly add to the danger to the mother.

Four individuals were operated in whom no other cause than toxemia was stated in the records.

Nine patients showed definite signs of a progressing toxemia, which did not yield to conserva-

tive treatment. In four incidences induction of labor failed. Two of the nine had vaginal hysterotomies, with loss of both babies: one premature, and one craniotomy on a dead baby.

Thus, thirty-three cases were operated upon because of a severe toxemia, although about 58 per cent of this group had added indications.

OTHER THERAPEUTIC INDICATIONS

The indications for the remaining twenty-six individuals were primarily obstetrical. Disproportion accounted for eleven, with no deaths. Four patients had had previous section. Sterilization was either requested or urged four times: three of these were done by cesarean with hysterectomy, and one had tubal ligation following classical section at eight months, when the baby died two days postpartum. It is interesting to note that the indication for sterilization was the same in each case—toxemia in all preceding pregnancies. Hemorrhage, due to premature separation of the placenta, occurred three times: one classical section; one vaginal cesarean (loss of baby—prematurity); and one classical section followed by amputation of the fundus. In the last case the patient was forty-one, had had one previous baby, but lost this one due to prematurity. Two patients had heart disease sufficiently severe to be advised against vaginal delivery, and two were elderly primiparae.

No maternal deaths occurred among the fifty-nine patients who were delivered by cesarean section. Of sixty-one babies born, there were seven fetal deaths (11.47 per cent) with a corrected mortality rate of 1.7 per cent.

ECLAMPTIC GROUP

Of course, it is in the eclamptic group that the greatest danger lies. There were twenty patients who developed convulsions of varying severity—an incidence of 12 per cent of the 168 toxemias reported. Two of these were comatose when first seen. Classical cesarean section was resorted to in thirteen incidences; normal delivery in three; forceps in three; and vaginal section in one. One maternal death following normal delivery resulted in this group, a mortality rate of 5 per cent. The number of fetal deaths were four (20 per cent) with a corrected fatal mortality rate of 5 per cent.

TABLE 3.—Summary on Eclamptic Patients

	Babies Living	Born Dead
Total number of toxic patients.....168		
Pre-eclampsics		148
Eclampsics (12 per cent)..... 20		
Convulsions:		
Antepartum	6	3
Postpartum	5	0
Both	5	1

Normal	3	
Forceps	3	
Low	1	
Mid	2	
Vaginal cesarean	1	
Maternal deaths	1—5%	
Fetal deaths	4—20%	
Fetal deaths corrected.....	5%	

EVALUATION OF TREATMENT PROCEDURES

To try to evaluate any given form of treatment or any particular policy that may be followed in the care of the toxemias of pregnancy, is very difficult. We are dealing with a disease entity, the cause of which is obscure and the treatment symptomatic. A policy, such as was followed in this series of cases, would probably give rather disastrous results to the untrained person. Considerable judgment is necessary if one expects to have a relatively high incidence of operative deliveries with this type of patient and still keep the deaths at a minimum.

Conservative treatment and delivery certainly should be the care of choice for the general practitioner. For the specialist, who is adequately trained, a more radical point of view may be taken, to the advantage of both mother and child.

We know that about 50 per cent of women who have a toxicosis in one pregnancy will develop the same condition in subsequent pregnancies, with a resultant permanent damage to the cardio-vascular systems.^{6,3} The longer a woman is subjected to the effects of the toxins the more extensive will be the permanent damage and, consequently, the shorter her life expectancy. Herrick and Tillman⁶ conclusively show this to be true. Hence, the necessity for immediate termination of the fulminating cases and those patients who become worse under conservative treatment.

COMMENT

The following discussion is not based on an extensive scientific study, but represents an opinion founded on clinical observations and deductions made from our present knowledge of the toxemias. No attempt will be made to elaborate upon the many theories suggested to date.

It is generally conceded now that there is a definite association between the nausea and vomiting of early pregnancy and the toxemias of late pregnancy. A number of authorities agree that this disease entity is due to some toxin or toxins of unknown origin,^{8,8,2} which have a predilection for different organs in different individuals leading to classifications of toxemias on a basis of symptoms and pathology.⁹ McIlroy⁴ states that "different symptoms may preponderate at various stages of pregnancy, but the ultimate cause is the same in most cases." This association is shown in the series just reviewed. About 50 per cent of all pregnant women have varying degrees of nausea in the first trimester,³ but we find that 71 per cent of the above group record this complaint. Further analysis of the data shows that nausea occurred early in pregnancy in 76 per cent of the severe toxemias, and this ratio is raised to 81 per cent of the patients who later developed convulsions. Seemingly, the more severe the subsequent toxemia the more frequent will have been early nausea.

We are taught that adequate prenatal care will cut down the frequency and severity of toxemia. No doubt this is true, but how can one account for an incidence of eclampsia of one to two hundred and fifty deliveries in this group, which cer-

tainly have had better prenatal care than in the country as a whole where the incidence is one to six hundred deliveries?

RÔLE OF TOXINS AND ALLERGENS

It is felt by the essayist that the etiology of the toxicoses of pregnancy in many cases may be based upon the increased sensitization of the patient to the presence or formation of toxins or allergens foreign to the host. These in some way may react to or with a certain hormone or hormones (possibly gonadotropic) to form the symptom-complex known as the toxemias of pregnancy.

As examples, the following may be cited. Any infectious process, such as teeth, tonsils, appendix, endometritis, etc., can form a toxin which is developed within the patient. Furthermore, we know that if this focus of infection can be removed, a certain number of toxic pregnant women will become symptom-free of their toxemia.

Allergens also may be the exciting cause. A thirty-year-old primipara, who complained of frequent headaches and skin eruptions before pregnancy, developed a severe nausea and vomiting with upper abdominal pain. Hospitalization on two occasions only gave temporary relief. An acute pyelitis appeared, was helped by kidney lavage, but underwent spontaneous cure when sufficient acidosis occurred. After removal of milk and eggs from her diet, her nausea and vomiting immediately cleared up, with no recurrence unless she "cheated" on her diet.

The relationship of the toxic element with the hormonal is based upon three proved observations. First, is the pregnancy test of Aschheim and Zondek, in which large amounts of anterior pituitary substance are produced shortly after conception. In the hydatidiform mole, a greater quantity of the hormonal substance is given off. Can there be any association between this and the fact that toxemia is more frequent in the presence of a mole? Secondly, Knepper¹¹ and Rössle¹² have reported typical eclamptogenic lesions of liver and kidney in experimental animals by the injection of posterior pituitary extract and horse serum. Lastly, Evans⁷ has shown that "gonadotropic hormone is abundant in the urine by the first missed period and reaches a maximum by the fourth to fifth month of pregnancy. In the toxemias of pregnancy, extremely high amounts have been encountered in the last third of gestation. The hormone disappears very rapidly following termination of pregnancy." When one interrupts pregnancy, one accomplishes two things: almost immediate cessation of toxemia and marked reduction in the concentration of pregnancy hormones.

OTHER THEORIES CONCERNING THE TOXICOSIS

It does not seem tenable that the products of conception, as such, could in any way form a toxic substance which would be detrimental to the host. This theory has been suggested several times and more recently by some German writers. Egorov¹³ maintains that the ovum is normal, and there is no specific toxin in the toxicoses of pregnancy, but that it is an allergic reaction because the

normal immunity of the mother toward the growing ovum is underdeveloped or absent. This especially is true in patients prone to metabolic disturbances. May not the "neurotic" patient, who more frequently develops toxemias, also be prone to more severe metabolic disturbances?

On the other hand, Jegerov¹⁴ states that the toxicosis is due to a sensitization to the waste products of fetal metabolism. If there is a reaction to the products of conception or their waste products, why is the human being the only animal that manifests any evidence of toxemias? Why did Bergsma,³ during nine years of practice in Java, never see a case of eclampsia? Why was there 50 per cent less eclampsia in Germany during the war than in peace times?

It may be possible that primiparae are more liable to toxemia than multiparae because they are experiencing their first major hormonal-allergic test. If so, may they not develop a desensitization to these allergens which is more or less permanent and so prevent toxemia from appearing later in the pregnancy or during subsequent pregnancies? The multiparous patient, with an allergic diathesis, would then be the one who has repeated toxicoses.

Irving¹⁵ has recently published an article giving the pathology to be found in the preëclamptic and the eclamptic patient. The conclusion reached was that the essential lesion is an arteriolar spasm affecting especially the peripheral arteries of the brain, kidneys, and liver, although all arterioles were similarly constricted. He suggests that this spasm may be due either to stimulation of the vasomotor center or direct action on the vessels. The train of signs and symptoms found in the toxemic patient can be accounted for on this basis. Other authorities¹⁰⁻¹⁵ have suggested that the liver and kidney lesions were of vascular origin due to the effects of toxins.

Bartholomew and Krake¹⁷ reported that "hypercholesteremia due to hyperpituitary or hypothyroid activity was the fundamental basis for the toxemias of pregnancy," and that this is "further increased by a diet high in cholesterol-containing foods." What of the hypothyroid Eskimo, who lives on fish, meat, and blubber?

COMMENT

Treatment offers another source of conjecture because of diametrically opposed ideas. One reads of good results obtained from forcing fluids and limiting them, of satisfactory reports when proteins are given or restricted. The controversy of conservative and radical treatment continues to rage. In the end one is left to abide by his own judgment and experience.

Unlike syphilis or tuberculosis, which can give a multiplicity of pathologic and clinical changes due to one agent, we will probably find that in the toxemias of pregnancy we are not dealing with one specific factor, but an increased activation of toxins and allergens in association with hormonal influences.

Perhaps it is a pessimistic point of view, but as long as civilization makes its demands upon us to live a strained abnormal life and requires that we indulge in perverted diets, etc., pregnant women are going to continue to have toxicoses and eclampsia. At best, we can only reduce the incidence of each and prevent some deaths by prophylactic measures and quick action if our treatment proves ineffectual.

IN CONCLUSION

1. In 4,979 consecutive deliveries, 168 women (3.35 per cent) developed toxemia of late pregnancy. Twenty (12 per cent) of the toxic patients developed eclampsia.

2. There were two maternal deaths (1.2 per cent) and twenty-three fetal deaths (13.2 per cent, corrected mortality rate of 6.32 per cent).

3. Cesarean section was resorted to in fifty-nine cases, with no maternal deaths and seven fetal deaths (11.47 per cent, corrected mortality rate of 1.7 per cent).

4. Maternal and fetal mortality can be cut to a minimum if the pregnancy is terminated as soon as it is found the patient is becoming worse or not improving under conservative treatment.

5. In the case of fulminating and eclamptic toxemia, cesarean section is the delivery of choice, provided that rapid vaginal delivery cannot be done.

6. To prolong conservative treatment without definite improvement means increased damage to the cardio-vasculo-renal systems, with a resultant shorter life expectancy.

7. There is apparently a definite relationship between the early and late toxemias of pregnancy.

8. This relationship may be based upon an increased sensitization of the pregnant patient to toxins or allergens which in some way react to the greater concentration of pregnancy hormones.*

DISCUSSION

H. A. STEPHENSON, M. D. (490 Post Street, San Francisco).—This analysis of late pregnancy toxemias is a most interesting one. It shows the incidence, diagnosis, and treatment of toxemias as interpreted by a well-trained obstetrician having a large practice and employing the facilities of modern hospitals in the care of his patients.

Much stress has been laid on the importance and value of prenatal care. It should result in discovering the presence of toxemia in its incipency. The institution of prompt treatment at this stage will frequently avoid the more serious complications which come from the condition if allowed to continue too long. In this particular series the prenatal care averaged about five months per patient, which is considered adequate. The author brings out an interesting and rather surprising fact when he shows that about one-half of the multiparae had suffered from toxemia in previous pregnancies. This high figure makes necessary more careful observation and supervision of such patients. Personally, I have found that increased blood pressure is the earliest and most constant finding in toxemia. Doctor Campbell finds that albuminuria comes first.

There can be little criticism as to his procedure regarding treatment. Conservative or medical treatment which he outlines in some detail should be tried first. Should such treatment not result in satisfactory improvement, some procedure to bring about delivery is then indicated. The fact that there were twenty cases with convulsions leads me to believe that medical treatment may have been too long employed, and more prompt delivery might have forestalled some of these convulsions. In my own experience convulsions do not occur nearly as often as here reported (12 per cent). Cesarean section was employed in 35 per cent of these cases as the method of choice in terminating the pregnancy. Even in the patients with convulsions it was used in thirteen of the twenty cases. This would be severely criticized by many authors, and there are many articles in the literature which show that the mortality rate in patients suffering from toxemia with convulsions is greatly increased when cesarean section is done. The results obtained in this series, however, speak eloquently, as there were no deaths in the fifty-nine cesarean cases. The fetal mortality rate is in keeping with that which has been reported from other clinics.

The author is to be congratulated upon the excellent results obtained in this series. After all, this is the test by which work is judged.

✽

L. GRANT BALDWIN, M. D. (65 North Madison Avenue, Pasadena).—This paper is of interest to all practicing obstetricians, as it discusses a subject we all fear and respect. It differs from most similar reports inasmuch as it deals with a large group of private patients cared for under more or less ideal conditions rather than, as usually is the case, with a group of cases from some large hospital service. It quotes figures we can compare with our own experiences, and does not leave the usual implication that we are reading something somewhat foreign and of chief interest to the larger or teaching institutions. One's first reaction, on reading that 3.35 per cent of a series of 4,979 pregnancies developed sign and symptoms of toxemia, is one of astonishment that adequate prenatal care had not produced a lower incidence; however, more mature thought impresses one with the fact that, inasmuch as toxemias are still of such an unknown and disputed eti-

ology, this incidence is in reality quite low. However, it again proves our inadequacy to prevent these much-feared conditions, failure to prevent them even in the hands of most competent individuals. All of which leads to the conclusion that our methods of prevention are not improving materially, but that our hopes, for the present at least, must be placed in an early apprehension of toxicity, together with prompt and adequate treatment.

Both the believers in the strict conservative method of treatment, and also those who have advocated radicalism, have given ground until today; the majority favor a program essentially similar to that outlined by Doctor Campbell. His statement regarding the opposed theories of treatment, such as increased versus decreased fluid intake, exemplifies the fact that a strictly routine treatment is not advisable, and that each case must be treated on its merits. This rather supports his interesting discussion regarding the possible etiologic values of toxins, allergens, or hormones. This conception is new to most of us, and one difficult of proof; however, certainly not improbable. The massive amount of study now in progress, we hope, will lead to a more advanced understanding of the specific etiology of these conditions; then, and only then, can one hope to decrease the frequency of toxemias. Until then adequate prenatal care, plus prompt and systematic treatment of threatened toxemias with operative interference when conservatism fails, seem our only possible course.

✽

JOHN W. SHERRICK, M. D. (350 Twenty-Ninth Street, Oakland).—It is difficult to add much of importance to this paper, as Doctor Campbell has covered the subject well and carefully. This report reflects my own and Doctor Loomis' reaction to the whole subject of toxemia of pregnancy. We feel justly proud of these results, namely, a 1.2 per cent maternal mortality and a 6.3 per cent (corrected) fetal mortality, especially when one compares them with the high mortality rate (20 per cent maternal and 36 to 42 per cent fetal), as reported in the literature.

There are several points of special interest in this paper, such as, first, the high incidence of association between early toxemia of pregnancy with late toxemias; second, the tendency for recurrence of toxemia in subsequent pregnancies (50 per cent), thus indicating or favoring permanent kidney and liver damage; third, the persistent failure to arrive at an etiologic explanation of this picture.

Attempts at explanation of an etiologic factor still do not seem to have proof for the various theories. Doctor Campbell's suggestion of a sensitization reaction is ingenious and perhaps much more plausible than most of the others; but it is not proved, and I am afraid we must search further and delve more deeply for the answer. Certainly, it would seem to be a most complex phenomenon whatever is the explanation.

We have always felt that if toxemia patients do not definitely improve under intensive intelligent conservative treatment, their condition is progressing with increasing danger to the mother and her baby and all that this imposes in immediate and remote effects. In such circumstances we have favored relieving the burden by emptying the uterus by whatever method seems safest for both members. Our incidence of 35 per cent of cesarean section may seem high, but the excellent results of no maternal mortality and of only one fetal death—a percentage of 1.7 per cent after elimination of those babies who were too premature to have a chance of survival—more than justify the procedure. We have always felt that this method, instituted relatively early, inflicts the minimum of trauma and stress upon the mother and her babe, and offers the quickest and safest means of relieving the toxic burden imposed upon both, thus preventing avoidable, inexcusable, and dangerous trauma to the baby and to the mother's cardiorenal-vascular system. I think the results reported here will stand comparison with any series treated by the so-called conservative measures. The secret of such success depends on having had these patients under constant prenatal supervision and control; in having available every facility for carrying out adequate care, and in knowing when to interfere. Under such circumstances and with trained obstetricians, so-called radicalism becomes intelligent conservatism.

SILICOSIS*

By HAROLD H. F. BEHNEMAN, M.D.
San Francisco

DISCUSSION by Howard E. Ruggles, San Francisco;
Sidney J. Shipman, M. D., San Francisco.

THE most ancient of working men's maladies becomes, rather suddenly, an industrial octopus—firm, far-reaching, and formidable. The ancient "disease of stone cutters," recognized by Hippocrates, recorded by Agricola ("De Re Metallica," 1556), Paracelsus (1567), and De Ramezzini (1671 and 1705), now appears as the most important industrial disease problem in America today.

INCIDENCE

Over a half-million persons are exposed to silicosis in this country. While tuberculosis has decreased over half, silicosis has increased over thirteen times. The activity of the legal profession, plus the shameful "expert" testimony of certain of our colleagues, is in a large way responsible for the recent claims and litigation now being considered, particularly in California, Ohio, New York, and Illinois.

In the latter state, in three years (1933 to 1936), suits have been pending, the paper value of which is \$100,000,000. One company alone is defending claims of \$10,000,000, all filed in this three-year period. In our own State the claims against just one company (California State Compensation Insurance Fund) have been so numerous that special legal counsel has been necessary for their exclusive handling.

This is a paper on an industrial medicine topic; therefore a clinical exposition of this disease entity is not forthcoming in any detail, but may be obtained in a late publication.¹ Suffice it to say here that the etiology is inhaled free silica (SiO_2), usually microscopic. As the tools and technique of industry have become more accurate, powerful and advanced, so have the dust particles become finer and more pure. The important etiologic factor is that the lung injury is not traumatic or mechanical, but a chemical assault.

SILICOSIS DIVIDED INTO THREE STAGES

Clinically, the disease is usually divided into three stages, variously named, but universally accepted in this country as well as in England, Canada, and South Africa. The cardinal symptom of silicosis is dyspnea; the cardinal sign is decreased chest expansion. The first stage presents a pretty healthy picture with usually only two findings to create suspicion—a dry cough and a limited chest expansion. The second stage reveals exacerbation of the first stage plus chest pain, expectoration and hemoptysis, dyspnea, and impaired working ability. In the final stage the dyspnea is marked and distressing; cough is harsher and more constant; there is usually copious expecto-

ration, weight loss, and all the signs of decreased pulmonary function.

Nationality plays no part, as no race is exempt.

Age in itself, also, seems to play no part. The majority of the patients are in the latter half of their third decade—probably because they have worked about long enough to produce symptoms.

Any constitutional defect speeds up the progress of the disease, particularly lues, tuberculosis, and other respiratory-tract infections.

The average period of development of silicosis in those exposed is ten years; yet it may be two or twenty-five.

The severity depends on three factors:

1. The number of dust particles per cubic foot.
2. The amount of silica in the dust.
3. The frequency and duration of exposure.

TREATMENT

So much for the clinical picture. The treatment is the treatment of tuberculosis—rest and constitutional measures, to increase the general health and resistance to other disease. Of course, withdrawal from contact with dust is necessary. The latter, however, has often taken place before the diagnosis becomes apparent—from days to years. The prognosis is good in the first stage, fair in the second, and poor in the third.

RELATIONSHIP OF TUBERCULOSIS TO SILICOSIS

Now a very controversial question enters the picture. What is the relationship of tuberculosis to silicosis? The answer is the opinion of the one who replies. First, let us acquaint ourselves with a few known facts:

1. Seventy-five per cent of silicosis sufferers die of tuberculosis.
2. The tuberculosis factor may appear in any stage of the disease.
3. A quiescent tuberculosis may be reactivated by exposure to silica.
4. The more extensive the silicosis when tuberculosis first appears, the more rapid the progress of the tuberculosis and the death of the afflicted.

Those are facts. Now, answering the initial question, it is my personal opinion that every silicosis victim is or was an active, quiescent or potential tubercular, or silicosis would not gain the headway it does; nor would tuberculosis kill 75 per cent of silicosis victims, as it does.

IMPORTANT FACTORS IN DIAGNOSIS

So far, two very important factors in diagnosis have not been discussed here. The first is of tremendous importance, being the necessity of a long, accurate, detailed industrial history of the patient. Unfortunately, we often have to employ private investigators over a long period of time to get such a history, as many of the claimants seem to have a memory strangely at fault when it comes to answering questions. That history should go back to the first working days of the individual. The last, and yet often the first all-important factor in diagnosis, is the x-ray examination.

* Read before the Industrial Medicine and Surgery Section of the California Medical Association at the sixty-fifth annual session, Coronado, May 25-28, 1936.

¹ Silicosis Pneumoconiosis: Clinical and Industrial Aspects, Northwestern Medicine, Vol. 35, No. 5, May, 1936.

I believe that most experienced roentgenologists feel that the roentgen picture of a man's chest reveals a fair index of a man's "respiratory past." Therefore, only the trained, experienced eye should formulate an opinion regarding silicosis from a roentgenogram. There is evidence of many respiratory tract experiences in a chest picture. Yet I realize very often our only positive evidence of silicosis is in a film. I am merely pleading for interpretation by a qualified roentgenologist.

The silicotic lung, uncomplicated with tuberculosis, for instance, in the first and second stages shows a distinct, individual x-ray appearance. The pathology is one of increased fibrosis, is always bilateral and never limits itself to a particular isolated area in the lung. It appears as a beady or reticulated fibrosis and is found in the hilar areas, extending peripherally like the branches of a tree. The apices and bases are the last to be affected, if at all.

INDUSTRIAL AND LEGAL ASPECTS OF SILICOSIS

Now a few words about the industrial aspects. Suits on file in this country now aggregate, on paper, about \$500,000,000. Reputable and disreputable members of the legal and medical professions are largely responsible for this deplorable situation. A review of most of their hearings and trials leave an honest practitioner of medicine or an honest lawyer sorely disgusted and distressed about so-called "expert testimony." The vast majority of these claims are presented in courts; juries are often ignorant, biased, generous, and bewildered. They often do not know whom to believe, and give the benefit of the doubt to the ailing (?) claimant.

Also the statute of limitations for filing claims or suits in this State now has an indefinite time limit. As a result of the Marsh case *et al.*, the Supreme Court considered that a man is not suffering from an occupational disease until he has definite belief or information that his symptoms are related to the work he was doing—even if it were years before.

SOLUTION OF THE PROBLEM

What is the solution to two problems—the prevention of the disease, and the honest disposition of half a billion dollars' worth of claims? The solution in prevention holds many immediately feasible possibilities. I mention the following measures which appear to me to be practical:

1. Compensation laws that will allow and recognize the physical and radiologic examination of men applying for employment in dusty trades.

2. Periodic physical and roentgen examination of those at work in these trades. This would allow rejection of the unfit and a warning to those with early evidence of silicosis.

3. Preventive measures at the site of the employment, such as:

- (a) Analysis of dust particles per cubic foot of air.
- (b) Increased ventilation, *i. e.*, air velocity.
- (c) Wet drilling, grinding, etc.

- (d) Control of dust at its point of generation.
- (e) Determination of what is a harmful dust.
- (f) Tuberculous workers prohibited from dusty or underground employment.

(g) Standardization of records, examinations, and inspections.

(h) The ascertainment of dust hazard for each trace, and the threshold limits of safety.

(i) The use of an efficient respirator.

4. The creation of a medical board of appeal who would determine the justice and propriety of a claim leading to the law courts.

5. Compensation award should be made only on the *occupational* disability of the claimant.

6. First-aid safety measures by the employer:

(a) Filtering plants for water.

(b) Bath houses.

(c) First-aid stations.

(d) Easily obtained and low-cost medical care.

DISPOSITION OF SILICOSIS CASES NOW PENDING

Finally, we come to the problem of the present—the disposition of the hundreds of cases now pending, a few legitimate, but the vast majority undeserving and unwarranted.

1. The answer is immediate and close coöperation between the legal profession, the doctor and the employer. The courts should only allow an expert witness of the highest caliber to testify regarding x-ray interpretation. The local or national Roentgen Ray Society should either approve of the expert, review the testimony of so-called experts, or both.

2. Employers *must* spend money to analyze dust hazards, both to eliminate them for the future, and to ascertain whether any hazard has really existed heretofore.

3. Modern legislation by states covering all industrial diseases, with special reference to those peculiar to the various trades and occupations.

4. Eliminate the quack and charlatan in medicine and in law. That job is the duty of the ethical medical and legal societies. A "visiting court committee" from the county or state medical society should sit in on cases where expert medical testimony is given. The Bar Association should investigate and properly chastise the ambulance-chasing lawyers, some of whom have handled dozens of cases, employed the same doctor in as many as seventeen suits, combed the wards of county and other hospitals for patients who worked in industries, etc.

IN CONCLUSION

To me, however, the most important move for everyone's benefit is the creation of a medical board of review, that board to decide whether or not a case is compensable at all; then a lay commission to decide to what degree, "occupationally speaking," that claimant is disabled. Those two procedures should result in justice to the claimant, the employer, and the insurer. They would also stop suits in our courts with their evils of cost, unexpert testimony, jury verdicts, delays, and grossly unfair awards.

California was a leader in compensation laws to protect the worker. The State, therefore, may well be one of the first to protect industry and the employer!

384 Post Street.

DISCUSSION

HOWARD E. RUGGLES, M.D. (384 Post Street, San Francisco).—From the x-ray standpoint, an ideal arrangement would be to secure at least one film of every individual before his employment in a dusty occupation. A man with evidence of an old or latent tuberculosis should, of course, be excluded from any such occupation. Practically, this ideal is unattainable, at least at the present time, but employers and insurance companies would find that a roentgenological survey of employees subject to dust hazard, once in three to five years, would more than repay the expense incurred.

As in so many other conditions, the earliest stages of silicosis give no characteristic roentgen picture. The first recognizable evidence of the disease is an enlargement of the hilar shadows and a thickening of the bronchial markings, particularly those toward the bases of the lungs and posteriorly. There next appears a variable amount of pleural thickening, followed by the development of the characteristic silicotic nodules in both lung fields. These are rounded areas of increased density, 3 to 5 millimeters in diameter, with hazy margins, usually scattered fairly symmetrically in the lung fields, particularly in the posterior halves. With continued exposure, these nodules enlarge and coalesce, as the result of a progressive fibrosis. The process ends in a terminal tuberculosis or, less commonly, cardiac failure, due to interference with the lung circulation. In many cases where films of the individual are not available until the later stages of the disease, it is difficult to decide how much of the fibrosis present is due to the underlying silicosis, and how much to the secondary tuberculosis. Earlier films in such cases would be invaluable.

✻

SIDNEY J. SHIPMAN, M.D. (490 Post Street, San Francisco).—Doctor Behneman has written a timely and comprehensive analysis of the silicosis problem. Fortunately, the importance of this disease is now generally recognized. The means of prevention are fairly well understood, and the outlook, therefore, much brighter than it has been at any time in the past. The fact that silicosis is *per se* one of the purely industrial diseases and, therefore, involves a pecuniary factor of great importance, has no doubt greatly accelerated its study and prevention.

There are one or two minor points in Doctor Behneman's paper which, while not highly important, might be open to argument; whether, for example, the etiology of the pulmonary injury is not traumatic or mechanical, but a chemical assault, might be questioned. There are still those who believe that the mechanical factor is not unimportant.

In discussing the importance of tuberculosis as a complicating factor of silicosis, Doctor Behneman does well to point out that most silicosis victims sooner or later develop tuberculosis. The importance of this observation emphasizes the necessity for adequate antituberculosis measures in communities where the silicosis hazard is high, as in the Mother Lode district of California. The California Tuberculosis Association has recognized this field as a new arena for concentrated endeavor, and it is to be hoped that the measures now in use for the prevention of tuberculous infection and disease will be applied more intensively in the future in these communities.

The other methods of prevention, in the occupational sense, have been adequately described by Doctor Behneman. The various measures for eliminating dangerous concentrations of dust particles are, of course, highly important, although in this connection it is somewhat questionable whether respirators really furnish much protection, or whether they merely give a false sense of security and thus lead to abuses. As far as periodic examinations are concerned, there seems to be a perfectly understandable but, from the medical standpoint, unjustifiable opposition on the part of labor unions. These unions must be won over to the medical viewpoint by proper

education, when I feel sure their enthusiastic coöperation can be enlisted.

As Pierson has repeatedly pointed out, what we need in California is an impartial silicosis commission or silicosis institute, probably connected with one of the large universities, for the purpose of studying the problem as it affects California, and furnishing impartial advice and testimony wherever needed.

THE SO-CALLED "STRADDLE" INJURY: ITS MANAGEMENT*†

By EDWARD W. BEACH, M.D.
Sacramento

DISCUSSION by Thomas E. Gibson, M.D., San Francisco; Jay J. Crane, M.D., Los Angeles.

IT was Plato who said, "All science is but remembrance," and we seek herein remembrance and recapitulation of certain basic facts with regard to this type of injury rather than the promulgation of any novelty or innovation.

REASONS FOR THIS ARTICLE

The reasons for this article are several, all of which seem important to us.

1. These straddle injuries are fairly common in industrial practice. They should, therefore, interest the surgeon to whom the unfortunate man first applies; the urologist who may be called because the urethra is frequently involved; and last, but not least, the insurance carriers, because they pay the bills.

2. There is little to be found in standard textbooks concerning these straddle injuries, and this little is handled in rather a perfunctory and empirical manner. Usually no attempt is made to rationalize their treatment. Elaborate embroidery patterns for urethral anastomosis are artistically demonstrated and often advised under these circumstances, which makes one with experience conclude that many of these cases were purely hypothetical, and treated in the "mind's eye" rather than at the bedside.

3. It has been our observation that many otherwise most excellent surgeons view this type of injury askance and with a commingling of awe and horror somewhat akin to Magellan's feelings when he first beheld the Southern Cross in navigation of the equatorial zone. This may be a tribute to enthusiastic urologic propaganda, but at any rate the male urethral perineum is still hallowed ground for most general surgeons in point of fact, and occupies with them about the same status today as in the era of the Collots. Taken all in all, perhaps no injury is viewed by them with more consternation, foreboding, perplexity and uncertainty than one which occurs in the urethral perineum in the male.

* Read before the Urology Section of the California Medical Association at the sixty-fifth annual session, Coronado, May 25-28, 1936.

† An apology is due the strict grammarian for our legerdemain with the word "straddle." To assume this license in a scientific article is, doubtless, reprehensible. However, for the surgical mind the erstwhile adjective "straddle" has a deeper and different connotation. It represents a concise, graphic and descriptive, if somewhat loose and ungrammatical, method of grouping a common industrial accident. Moreover, frequent technical application in this connection has liberalized and almost standardized this grammatical error in this way among the profession.

Fig. 1

Fig. 2

Fig. 1.—Fasciae of importance in urinary extravasation (after Wesson). Colles's fascia is concerned in nearly all extravasations and its abdominal continuation. Scarpa's fascia is less frequently involved. Intrapelvic extravasations are least commonly observed.

Fig. 2.—When extravasation originates on the pelvic side of the triangular ligament, retroprostatic, perirectal and ischio-rectal infiltrations are most commonly observed, although perivesical involvement may occur.

4. We, therefore, seek to review and clarify this subject in a practical way, hoping to dispel some of this mysticism anent the perineum and injuries therein.

5. Finally, it has been our good fortune to have treated a number of these straddle cases. We have adduced, from their care at the bedside, certain principles which have helped us. We will attempt to set forth these principles, with a hope that they may help others also.

ANATOMIC FACTORS

Site of Injuries.

From the standpoint of mechanics, when an individual falls astride a flat, unyielding surface such as a timber, the soft tissues and urethra of the perineum are commonly pinched between the timber below and the undersurface of the pubic arch, or the transverse ligament above.

In such an accident, with the force applied more or less at right angles to the perineal surface, the bulbar urethra is seldom injured, although it is nearest the surface, most exposed in position and relatively extensive in spread. From an anatomical standpoint (Drawing A), it is seen that the urethral lumen traverses the bulbar expansion in such a way that approximately two-thirds of the surrounding erectile tissue is beneath the urethra itself, or between the latter and the perineum. This tissue acts as a cushion, therefore, to the urethra. Moreover, the bulbocavernosus muscle likewise furnishes additional protection to the bulb itself.

Thus, when the perineum receives a sharp blow or is subjected to a crushing force (as in a fall astride a broad, immobile surface), these anatomical bulwarks usually render the bulbar urethra immune. Instead, by virtue of that dense fascial sheath, the superficial layer of the triangular ligament, this force is transmitted to and brought to bear upon the weaker and unfortified abutting membranous structure, *i. e.*, the terminal or distal

membranous urethra. Furthermore, this terminal membranous urethra invites injury because of its unusually thin-walled structure and its relatively fixed position in close proximity to the pubis and ischium. A point of great practical importance in this connection is that since most strictures are located in or near the bulb, this natural thinness of the membranous structure is enormously enhanced by the dilatation behind such an impediment and its vulnerability to trauma proportionately increased. For these reasons, therefore, partial rupture often accrues in the distal membranous urethra in the ordinary type of straddle accident, and in our experience the floor is most often involved, leaving the roof intact.

There is now a second and distinctly different type of injury which primarily implicates the bulb. Force of a tangential nature is brought to bear upon this structure either from the side or more often from the rear. Because of this violence the bulb is dislocated or torn from its attachments to the triangular ligament and thrust forward often over the anterior surface of the pubis, which ordinarily assumes an angle of about 30 degrees with the horizontal. In this mechanism avulsion or complete rupture of the urethra transpires again in this distal membranous structure or in the immediate vicinity.

Extravasation Possibilities.

The practical surgeon, with regard to extravasation, considers the urethral perineum like Caesar's Gaul—to be divided into three parts, to wit: (1) territory within the superficial perineal interspace; (2) territory between the inferior and superior layers of the triangular ligament or urogenital diaphragm; and (3) territory above or proximal to the superior layer of the triangular ligament. For completeness, it is also necessary to take cognizance of a fourth territory concerned more often with rupture of the pendulous urethra, namely, extravasation between the layers of Buck's fascia. In certain instances when urethral rupture

Fig. 3

Fig. 3.—If extravasation originates within the triangular ligament, extension occurs in either direction, most often externally.

Fig. 4

Fig. 4.—Spread of extravasation when primary focal lesion is anterior to the triangular ligament. A course bounded by Colles's and Scarpa's fasciae is pursued.

occurs at the root of the penis within the sheath of the corpus cavernosum, the advancing extravasation is confined to very narrow limits by a special fascia. This fascia, as described by Buck, is a membranous sheath completely encompassing the corpus cavernosum, and taking its origin above and behind from the suspensory ligament and below from the perineal fascia. It invests the corpus cavernosum closely and is bound to the corpus spongiosum above by two reflections, one of which passes above the latter and the other beneath.

The superficial perineal interspace holds the most interest for the straddle surgeon. It will be recalled that the vulnerable portion of the membranous urethra (the distal portion) lies in this interspace. Extravasation here cannot go upward because of the dense inferior diaphragmatic fascia, nor can it go backward into the ischiorectal region because of the deep layer of the superficial fascia (Colles's), which fuses with the former at the base. Moreover, the extravasation cannot spread into the thighs, because both the inferior ligament and Colles's fascia attach laterally to the pubo-ischiatic rami. Hence, the tumefaction confined beneath Colles's fascia tends to advance forward over the perineoscrotal angle into the scrotum, and later up over the pubes.

That portion of the membranous urethra between the inferior and superior layers of the triangular ligament is sometimes involved in these straddle injuries, and particularly by puncture wounds. Should accumulation take place here it remains confined for a time, and then may slough through either ligament, *i. e.*, down into the superficial perineal interspace or up into the territory above the deep layer of the triangular ligament. However, any extravasation proximal to the superficial layer of the triangular ligament may seep backward into the ischiorectal region and buttocks or into the thighs.

The territory above the superior layer of the triangular ligament is seldom concerned in these accidents save by puncture wounds. In these cases the extravasation is held forward by Denonvillier's fascia and often, by pushing up the peritoneum from the bladder, passes into the cave of Retzius. In two puncture cases involving the deep urethra (these may have involved the proximal membranous structure with rupture of the deep triangular ligament), in this series we found perhaps a quart of blood and urine in this area while performing cystotomy. On the other hand, the extravasation may at times extend retroperitoneally up to the diaphragm.

CLINICAL MATERIAL

This article is based on sixteen of these straddle injuries seen by the author in the last twelve years of practice. Many were seen in consultation at small hospitals in northern California. Several were seen at the Jones Memorial Hospital in Grass Valley, among gold miners, through the courtesy of Doctors Carl Power Jones and Walker Reed. For others the author is beholden to his surgical brethren in the peripheral area and to the insurance carriers. It is well to remember in this connection that the urologist is consulted only in the complicated and more difficult cases.

The oldest man in this series was fifty-six and the youngest, fourteen. Most were husky workers in the prime of life. Nearly every sort of object was straddled, *viz.*, a bench support, a stepladder, a fence, a curb, a stump, a rock, a steel rail, but most often a piece of timber used as a brace in the mines. The mechanics of the accident remained virtually the same throughout. Variants involved (*a*) the distance fallen, and (*b*) the contacting surface. (*a*) The distance fallen was difficult to estimate in many cases. The shortest distance was approximately two feet, and the longest

almost twenty feet. The distance dropped offered no index as to the urethral lesion except in the broadest possible sense. In two stricture cases the fall was trivial, while in the longest drop little urethral damage accrued. (b) Contact was most often with broad or blunt surfaces—therefore, the twelve closed cases in this series as opposed to the four puncture or open cases. None of the latter involved the rectum.

ANALYSIS OF THE CLINICAL MATERIAL

Under this caption subheadings have been arranged for convenience and simplicity, and whenever possible appropriate deductions made.

1. Urethral Injury.

These injuries comprised three general groups: (a) partial rupture on the floor of the distal membranous structure of which there were eight cases; (b) complete urethral rupture often by tearing loose the bulb from its fixed position of which there were four cases; and (c) four puncture wounds, of which one involved the membranous urethra, one the bulb directly, and two either the proximal membranous urethra or the distal pros-

tatic urethra. The exact nature of the urethral lesion was difficult to estimate; but when catheterization was possible it was assumed that the rupture was incomplete.

2. Preëxisting Urethral Strictures.

Incidentally, two men in this series had a penile hypospadias. Seven of these sixteen cases presented evidence of stricture. The high incidence of the latter finds explanation both in the great prevalence of this fibrous legacy, and as to its pertinent application from an anatomical standpoint. Moreover, most strictures are ineffectually and inadequately treated because of the sufferer's attitude, which may be crystallized thus: "The devil was sick, the devil a monk would be; the devil was well, the devil a monk was he." Most of these individuals quickly acquire this disposition to avoid treatment, from which nothing can dislodge them except another attack of acute urinary retention.

3. Urinary Retention.

Only five of these patients were able to void spontaneously after the accident. Three refused subsequent treatment after catheterization, and two returned a few days later with urinary extravasation. Moreover, the author has seen three other patients who presented the clinical picture of urethral rupture, but refused examination because they were able to void without difficulty, and one later developed extravasation. It is, therefore, our conviction that when the urethra is injured and there is broken continuity, the act of voiding by reason of the vis a tergo forces the urine out into the tissues and favors extravasation.

4. Perineal Appearance.

This ranged from slight ecchymosis to a large hematoma, but offered no exact criterion as to the urethral lesion. Only slight ecchymosis (particularly in stricture cases) may accompany a badly ruptured urethra. Many times the swelling in the perineum is extraordinary. In these cases the region about the vascular bulb is traumatized so that blood is poured out beneath Colles's fascia. This

TABLE 1.—*A Résumé of the Clinical Material*

Initials	Nature of Accident	Catheterization	Type of Injury	PreExisting Stricture	Urinary Retention	Treatment
M. B.	Caught in steam shovel, dropped astride sharp rock.	Impossible	Puncture wound involving proximal membranous urethra.	No	Yes	Cystotomy — later indwelling catheter.
C. B.	Slid down telephone pole, astride iron rung.	Impossible	Puncture wound proximal membranous urethra.	No	Yes	Cystotomy — indwelling catheter.
G. D.	Tumbled off cultivator, astride spiked wheel.	Impossible	Puncture wound membranous.	Penile hypospadias tight orifice	Yes	Cystotomy — retrograde indwelling later.
C. O.	In garage pit, astride bench support.	Impossible	Complete.	No	Yes	External urethrotomy.
P. P.	Astride timber brace in mine.	Impossible	Puncture wound involving bulb. Complete.	No	Yes	Cystotomy — retrograde indwelling later.
A. S.	Astride timber brace in mine.	Possible	Incomplete.	Yes	Yes	Indwelling catheter.
W. R.	Astride timber brace in mine.	Possible	Incomplete.	Yes	Yes	Indwelling catheter.
S. H.	Astride fence rail.	Possible	Incomplete.	No	No	Refused — subsequent extravasation.
G. V.	Astride stump from ladder.	Impossible	Complete.	Yes	Yes	External urethrotomy.
M. O.	Astride seat arm, in theater.	Impossible	Complete.	No Penile hypospadias	Yes	External urethrotomy.
C. L.	Astride limb in tree-pruning.	Possible	Incomplete.	No	No	Indwelling catheter.
P. H.	Astride saddle horn, horse stumbled.	Possible	Incomplete.	Yes	Yes	Indwelling catheter.
S. G.	Astride steel rail	Impossible	Complete.	Yes	Yes	External urethrotomy.
W. W.	Astride curb.	Possible	Incomplete.	Yes	No	Refused; extravasation.
S. L.	Astride step ladder.	Possible	Incomplete.	Yes	No	Refused; no extravasation.
E. B.	Tumbled off garage astride fence.	Possible	Incomplete.	No	No	Indwelling catheter.

hematoma effaces the perineoscrotal angle and swiftly advances into the scrotum. In other cases the scrotal tissues receive direct violence as part of the accident. These two confluent structures (the perineum and scrotum) then comprise a purplish mass extending nearly to the knees.

5. *Bleeding From the Penis.*

This was common, independent of micturition, and often persistent, but of small volume. It offered no index as to the urethral damage.

6. *Pain and Tenderness.*

This was always present in the perineum. Urinary retention provoked the greatest pain in most cases.

7. *Shock.*

This was greatest and most prolonged in the puncture cases. Bleeding from these wounds was also usually profuse, but never serious. The shock is often negligible in the ordinary straddle injury.

8. *Complications.*

Urinary extravasation was fairly common. This occurred in three cases, but only in one treated with an indwelling catheter. This tumefaction was promptly evacuated with a perineal incision, which

sufficed for cure. In the other two cases an external urethrotomy was done and the bladder drained by means of a tube through the proximal urethral segment. Free incisions were made into the advancing mass. In one case the extravasation was very troublesome, advancing into the scrotum despite free incisions, and finally onto the abdomen just above the pubis. It is our belief that the final chapter with regard to extravasation in its various phases has never been written, although its behavior from an anatomical standpoint is quite clear. Four cases in this series also developed an epididymitis.

9. *Sequelae.*

The most common sequela was a post-traumatic stricture at the site of urethral injury. It was roughly proportionate to the original damage, and was least in the cases treated by an indwelling catheter. It was never troublesome, but required occasional dilatations consonant with the contraction speed, generally at brief intervals in the beginning and a matter of months later. Three of our external urethrotomy patients complained of temporary impotence, and in one it persisted for nearly twelve months.

MANAGEMENT

Concerning Treatment.

The fundamental objective is to divert the urine from the site of urethral injury and, incidentally, in many cases to relieve acute urinary retention. We have, therefore, three avenues of approach, used singly or in combination: (1) the catheter, (2) external urethrotomy, (3) cystotomy.

1. An indwelling catheter for seven to ten days is usually adequate for partial urethral rupture. It splints over the lacerated area and favors healing. The traumatic urethritis incident to the catheter does not appear to retard healing. A patient, dextrous and gentle attempt at catheterization should be made in every case before surgery is undertaken. It is often facilitated by anesthesia. If it is not successful, then surgery must be resorted to without delay.

Technique of Catheterization.

Technical difficulties increase with lapsed time after the injury. Only a filiform is used at the outset because (a) many patients have preëxisting strictures in the penile urethra or about the bulb; (b) the bulbar urethra is often compressed, angulated, or displaced either by reason of the violence or contiguous hematoma or both; (c) the filiform hugs the roof better than other instruments; (d) and the filiform does not tend to increase the urethral laceration as a catheter nib or sound point might do. Once the filiform enters the bladder the rest is easy. This procedure is carried out under aseptic conditions, and then the catheter end is kept as sterile as possible. Five of our cases were successfully treated in this manner, with slight urinary extravasation in one.

2. An external urethrotomy is not always successful under these circumstances. With a large perineal hematoma it is best avoided, in our opinion, because of distortion, extravasated blood and altered anatomical landmarks. Moreover, the proximal urethral segment tends to retract particularly in the lithotomy position. The use of a filiform as a searcher and manually bringing the patient nearer a supine posture (lowering the legs and working beneath) after the exposure is made, have both helped us at times to discover the illusive upper segment. Once the proximal segment is located, the usual indwelling catheter is employed in the regular way. No attempt to suture the urethra was made by us, because in the dorsal decubitus the two ends come together anyway and healing appears just as rapid without the sutures. External urethrotomy was done four times in this series for the rupture and twice for extravasation developing later.

3. Cystotomy is the sheet anchor in all of these cases. This is especially true in puncture cases where the exact depth and extent of the wound is unknown. The urine should be drained a few days and then a secondary attempt made to pass the catheter in the regular manner or retrograde with the help of a perineal incision. Cystotomy was necessary in four of these cases. Twice we resorted to retrograde catheterization with the aid

of a perineal incision. In the other two catheterization was easily done seven or eight days subsequently.

CONCLUSIONS

Based upon our experience with these sixteen cases, we venture the following generalizations anent their management:

1. Every case of urethral rupture, whether partial or complete, should be hospitalized. This particularly concerns the gentleman who voids spontaneously after the accident, because he is the most difficult to handle and most often develops complications.

2. The truth with regard to treatment lies somewhere in the middle of the road between ultra-conservatism and meddlesome radicalism.

3. Each case is a law unto itself and must be handled accordingly.

4. Many partial ruptures when catheterization is possible do well with no complications on an indwelling catheter.

5. If catheterization (and it should be attempted) is impossible, surgery must be undertaken without delay.

6. Surgery should be bold and direct, but as simple as possible. Surgery devoid of fancy work, frills, and time-consuming maneuvers gave us the best end-results.

7. Surgery must not be too extensive at one session. Better to drain the urine and get out. After a few days of rest, one is agreeably surprised at the ease of subsequent accomplishments.

8. When sound surgical judgment is used, the results are gratifying and no group of patients more appreciative.

DISCUSSION

THOMAS E. GIBSON, M.D. (450 Sutter Street, San Francisco).—Straddle injuries fall into two clinical groups: (1) immediate and (2) late. Doctor Beach has clearly outlined the salient features of treatment with respect to the immediate group. Emphasis should be placed on strict asepsis in handling these cases. One should have as much respect for the urethra as for the peritoneum. It is not enough to cleanse the external genitalia, but in addition the anterior urethra should be thoroughly irrigated with an antiseptic solution before catheterization or instrumental manipulation. Measures taken to minimize infection will minimize the occurrence of peri-urethritis at the site of injury with resultant scar tissue proliferation and stricture formation, which is the bane of this type of injury. Great discretion is likewise necessary in the use of the indwelling catheter in these cases, because an indwelling catheter in any case produces urethritis. This may cause peri-urethritis at the site of injury, with an increased tendency to later stricture formation. If an indwelling catheter is used at all for splinting purposes, it should be for as short a time as possible, and a size 18 or 20 F. is recommended, rather than a 24 or 26 F. The more tightly the catheter fits the urethra the greater is the resultant urethritis. Doctor Beach's statement that an "attempt at catheterization should be made in every case before surgery is undertaken" is at variance with the opinion of several authorities. Garlock (1923) states that any case presenting the symptoms of inability to void, perineal hematoma, bladder distention and urethral bleeding should be considered an emergency, and operated upon as soon as possible. Perineal, scrotal or pelvic extravasation of urine, when not relieved with a reasonably short space of time, invariably becomes infected, to be followed in succession by necrosis, sloughing of the soft parts, spread-

ing of infection, grave sepsis, and death. This fact constitutes the strongest argument for early operation where rupture is suspected, or diagnosed with certainty. Under no condition should preliminary catheterization be attempted in the face of this syndrome, which is practically always accompanied by a complete or almost complete rupture of the urethra. Attempts at catheterization increase trauma, create false pockets in the perineum, cause fresh hemorrhage, introduce infection, and in some cases convert an incomplete to a complete tear. Furthermore, even though one succeeds in passing a catheter to the bladder under such conditions, the ultimate result after healing has occurred is generally stricture formation due to the intense peri-urethral infiltration and reaction. Stricture formation is what we desire especially to prevent, because once present it is generally vicious and may require operation later. In other words, Garlock feels that by not using the indwelling catheter the tendency to stricture formation is lessened. The procedure to be followed in these cases, then, is drainage of the perineum and suprapubic cystostomy, letting nature attend to the healing of the urethra. After the initial traumatic reaction has subsided it may then be advisable to use an indwelling catheter, provided the urethra does not close spontaneously.

Even though the original straddle injury has been so slight as to produce no actual rupture or tear in the urethra, the patient may experience stricture formation and even complete retention coming on weeks, months, or even years later. It is imperative, therefore, even in slight injuries which do not interfere with urination at the time, to have these patients report periodically for dilatation with sounds for a long time, thus obviating late stricture formation. Traumatic strictures are notoriously more resistant and difficult to deal with than strictures of gonorrheal origin. It is of interest, as Lowsley has pointed out, that many of these straddle-injury cases suffer the occurrence of sexual impotence.

The late cases, which are often seen as a result of inadequate early treatment (and sometimes in spite of adequate early treatment), offer serious problems which may tax the skill and resourcefulness of the urologist to the utmost. The chief problem of the late case, seen perhaps months or years after the original injury, is the management of stricture, which is generally of a most rigid and refractory type. An attack of complete retention of urine may be the presenting symptom which makes the patient seek urgent relief. Filiforms and followers are called into play, but if they cannot be passed, cystostomy or external urethrotomy is mandatory, depending upon one's judgment in the individual case. Incidentally, if the stricture cannot be traversed with a filiform, it is sometimes possible to achieve success with a well-oiled filiform passed through a panendoscope under direct vision. If the stricture can be traversed, it may then be possible to maintain dilatation of sufficient degree by periodic passage of sounds. If the stricture is too resistant to dilate readily, as is often the case, and is attended by chills and reactions, an internal urethrotomy should be done. Following this procedure it is permissible to insert a large indwelling catheter (26 or 28 F.) for a week to establish patency, and to follow this up at necessary intervals with sounds. In my experience, an internal urethrotomy in late cases is always better than an external urethrotomy, if it can be done. An external urethrotomy, with excision of the scar and reunion of the proximal and distal urethra on an indwelling catheter splint, may be followed by partial incontinence, and reformation of scar tissue requiring further dilatation with sounds. When external urethrotomy is indicated, the method of Pasteau, modified to suit the individual case, should be followed.

It is important to bear in mind the damaging effects of stricture of long standing on the upper urinary tract. Ascending pyelonephritis and hydronephrosis are sequelae which may result in death from uresepsis or uremia.

✽

JAY J. CRANE, M.D. (1921 Wilshire Boulevard, Los Angeles).—We have just listened to a well-written paper on a subject which is of great interest to all urologists, although all of us do not have the opportunity to see such a large series of cases as those just described by Doctor Beach.

The subject has been well handled, and the paper when published will command the attention of all surgeons; for

nowhere in our present-day texts or even in our current literature, is there such a complete description of this subject.

Having cared for only a very small number of such patients in comparison with the large series Doctor Beach has seen, I feel that anything I may say will not lend much weight. However, I should like to emphasize the necessity of recognizing the nature of the injury early, in order that treatment may be carried out before extravasation of urine and blood is too extensive, especially in those patients who void spontaneously after the injury.

I also wish to mention that a cystogram taken at the time of the first catheterization will be of great assistance in ruling out a ruptured bladder. If after a catheter is passed, and no rupture of the bladder is found, then many of these patients can be cared for successfully with only a retention catheter; if catheterization, however, cannot be accomplished, then one should never hesitate to drain suprapubically and explore the abdomen at the same time if necessary.

PELVIC FLOOR AND ADJACENT VISCERA: THEIR PLASTIC SURGERY*

By ALBERT V. PETTIT, M.D.
San Francisco

DISCUSSION by H. A. Stephenson, M.D., San Francisco; H. N. Shaw, M.D., San Francisco; R. Glenn Craig, M.D., San Francisco; L. A. Emge, M.D., San Francisco.

A CONSIDERATION of the recent literature dealing with operations designed to correct damage to the birth canal and its supports, and to correct certain alleged pathological positions of the generative organs, leads one to believe that some of the significant factors in the statics of the female pelvic viscera are being overlooked. Certain it is that the behavior of many surgeons has been little influenced by the notable work of R. H. Paramore,¹ published almost twenty years ago.

OBJECT OF THE PAPER

The object of this paper is to outline briefly what appears to this writer to be the salient features in several useful plastic operations upon the pelvic floor and contiguous viscera. It is not intended in any sense to give a complete description of operative technique in the operations discussed, but rather to point out what should be the common feature in the various procedures designed to produce the desired results. Careful study of the various surgical methods described in textbooks and even more recent publications will show that credit for good results is often given to unimportant detail, while the significant factors go unstressed.

NORMAL ANATOMIC AND PHYSIOLOGIC FACTORS

In order to discuss the mechanics of repair, it is first necessary to consider the normal anatomic and physiologic factors concerned in pelvic visceral support.¹ It is important to understand that, except for its gaseous content, the abdominal and pelvic contents represent one visceral mass which

* From the Department of Obstetrics and Gynecology of Stanford University School of Medicine and the Department of Public Health.

Read before the Obstetrics and Gynecology Section of the California Medical Association at the sixty-fifth annual session, Coronado, May 25-28, 1936.

is incompressible, deformable and, within limits, movable, and that this visceral mass throughout the life of an individual is continually being squeezed by its muscular walls. The pressure in this mass is subject to sudden and wide variation, and is caused by contraction of the thoracic diaphragm, the abdominal wall and pelvic floor muscles. Such pressure, originating in the upper abdomen, courses generally downward and, due to the lumbar spinal lordosis, is directed against the anterior abdominal wall a short distance above the symphysis. From here it is directed backward, and its repeated impactions produce the hollow of the sacrum from which the forces are reflected throughout the pelvic contents.

The diaphragm, which forms the pelvic floor, is composed of striated muscles with their fascial coverings, the levatores ani and the coccygei. Anteriorly, just behind the symphysis pubis, is a defect in the pelvic floor, through which escape three visceral canals to reach the surface of the body: the urethra, the vagina, and the rectum. This defect has been called the pelvic floor aperture.¹ The levatores ani—the only muscles which concern us in supportive operations—are bilateral muscular sheets which arise in front from the symphysis and laterally from the fascia covering the obdurator internus, and from the spine of the ischium. The fibers pass backward and medially surrounding this aperture, to insert into a median osseofibrous raphe and the terminal part of the sacrum. Below this upper sheet of the levators lies another muscular layer, a most important one in surgical repair, the puborectalis, which is inserted into the lower margin of the symphysis pubis, and completely encircles the aperture in the pelvic floor. In all of the operations designed to increase the tone of the pelvic floor, the puborectalis is the most accessible. Contraction of the fibers in the upper levator layer, the pubococcygeus, causes lateral constriction of the pelvic floor aperture, while contraction of the puborectalis layer exerts a sphincter-like squeeze of the aperture from behind the rectum forward toward the pubic bone.

VITAL STRUCTURES IN VISCERAL SUPPORT

There is ever recurring discussion among surgeons concerning the importance of the fascia and condensations of visceral connective tissue in pelvic visceral support; but it seems reasonable to agree with Paramore that the vital structure in preventing visceral protrusion through the pelvic aperture is the living tonic, striated muscle disposed about this aperture, and resisting downward thrusts.

The condensations of the visceral connective tissue stretch when the pelvic floor becomes inefficient, because of the inability of the musculature to withstand the pressures. The muscular floor depends, it is true, upon its connections, that is, the aponeuroses and bones. Without these rigid attachments the muscles would be useless. However, the changes which cause prolapse lie in the muscles and not in the connective tissue, which is greatly thickened in such cases.

THE PELVIC FASCIA

The pelvic fascia, about which there has been so much confusion in the past, is now known to be similar to fascias elsewhere in the body. It simply forms sheaths for muscles and has no direct connections with any pelvic viscera. It is this parietal pelvic fascia, together with the periosteum of the bones, which forms the real limits of the pelvic cavity, just as the transversalis fascia limits the abdominal cavity.

FASCIA ENDOPELVINA

The intricate layers of the so-called fascia endopelvina, which were thought to form ligaments supporting pelvic viscera (such as the true ligaments of the bladder, anterior and lateral, Mackenrodt's ligament running laterally from the upper part of the vagina and the cervix, and the sacrouterine ligaments) are simply condensations in the visceral connective tissue. While it is true that some of these thickenings contain smooth muscle fibers, their only rôle in influencing the position of the pelvic viscera is in virtue of the space they occupy and, because of their incompressibility, they are a part of the pelvic contents. These connective tissue thickenings are not present at birth, but are the later result of tensions set up in the loose, connective tissue which fills in the space between the limits of the pelvic cavity and its contained viscera.¹

MENGERT'S CADAVER STUDIES

Recent experimental work upon cadavers by Mengert,² in which he found the uteri were easily pulled down into the position of prolapse only after section of the dense connective tissue in the base of the broad ligaments and upper paravaginal regions, was thought to prove that the muscular pelvic diaphragm plays no important rôle in pelvic visceral support. There are several factors in these experiments which make it inapplicable to conditions in the living, such as the opened abdomen, the pulling downward on the uterus from below and the loss of contractibility of the muscles. What seems to have been proved is that section of certain connective tissue structures allows the uterus to be pulled down easily when the pelvic diaphragm is unable to contract.

A disturbance in the nerve supply to the levators in infancy results in uterine prolapse soon after the activity of crying raises the intrapelvic pressure.

RÔLE OF THE UNDAMAGED STRIATED MUSCLE

It seems obvious that undamaged striated muscle is the only tissue in the body which can continuously respond successfully in time and in degree so as to maintain a physiologic equilibrium of the pelvic viscera in the face of downward thrusts produced from above by the sudden contraction of striated muscles. With failure of the muscle, pelvic viscera begin to descend through the pelvic aperture in spite of fascia and greatly thickened connective tissue, and this generally occurs at a time of life when the pressure in the visceral mass is reduced. This reduction in abdominopelvic pressures is caused by atrophy of the muscular walls.

THE SMOOTH MUSCLE LIGAMENTS

The various smooth muscle ligaments of the uterus have been by some assigned a rôle in pelvic support, and have been used by surgeons of the past in vain attempts to cure uterine descent by their shortening. Although these are now generally considered useless procedures for prolapse, they are used in suspension operations on the uterus in attempts to cause anteversion of the organ. Studies on the cadaver, observations during surgical operations with the peritoneal cavity open, even bimanual examination of the uterus with the abdomen closed—all have a tendency to lead us into erroneous conclusions regarding the uterus. The rigidity of the uterus is due to the tonic contraction of its muscular walls; but to our tactile sense it suggests weight and immobility and, in contrast to the practically impalpable surrounding viscera, it seems isolated. In retroversion the greater ease of palpation intensifies this impression and strongly suggests abnormality, especially as we recall idealized anatomical illustrations of the proper uterine position.

POSITION PECULIARITIES OF THE UTERUS

It is well to remember that the uterus is completely surrounded by an incompressible medium and that its position is largely determined by changes in the volume of neighboring viscera such as the bladder and rectum, and by the disposition of small intestines as caused by the thrusts of increased pressures coming down from above. In most women the pressures from above tend to press the uterus forward and downward upon the bladder, and the higher the intrapelvic pressure the greater the uterine immobility. Orthopedic factors which change the direction of the downward thrusts may distribute the viscera differently so that small intestinal loops lie anterior to the uterus. No amount of ligamentary shortening will change permanently the position of the uterus if the postoperative position is resisted by pressures initiated by striated muscles. Suspensions of the cervical and vaginal stumps, after partial and complete hysterectomy, are useless gestures for the same reason—that is, that smooth muscle cannot long withstand forces generated by striated muscles.

INDICATIONS FOR OPERATIONS TO CHANGE UTERUS POSITION

Fortunately, indications for operations designed to change positions of the uterus are disappearing, as we better interpret physical findings and symptoms. A high percentage of the backaches in women are orthopedic problems, even when appearing only in association with the menses. Chamberlain, at Temple University, seems to have shown an increased mobility of the pelvic articulations during menstruation, similar (except in degree) to that occurring during pregnancy.

The weight of the uterus is almost, if not completely nullified by the pressure and incompressibility of its surrounding medium, and can be considered as floating in this medium unless it is adherent to immovable structures by inflammatory or malignant change.

The lower the abdominopelvic pressure the more movable becomes the uterus, so that hypermotility and retroversion are found most often in asthenic individuals. This low pressure is probably the explanation of the engorged veins so often described as caused by retroversion. The circulation of the abdomen and pelvis is markedly influenced by the abdominopelvic pressure, and rapid emptying of the veins only occurs when normally high pressures are maintained. The sensation of weight in the pelvis complained of by many patients is not due to a heavy or displaced uterus, but is the patient's interpretation of symptoms arising from distended vein walls.

PLASTIC OPERATIONS UPON THE CERVIX

Plastic operations upon the cervix, whether for repair of lacerations or for the removal of infected glandular structures, have become markedly simplified since Sturmdorf described his tracheloplasty in 1919. This operation supplanted many of the earlier procedures, because it removed pathology with a minimum of disturbance in physiological function. However, the conception that the Sturmdorf flaps of mucous membrane, when inverted into the cervical excavation, reproduce a normal relationship between vaginal vault and cervix, is erroneous. If the flaps stay as originally sutured, the cervix is pushed out of the vagina, thereby flattening the vaginal vault. Bilateral scars result, which are often mistakenly diagnosed as lacerations when only palpated. Conization of the cervix with the endotherm, using the Hyams tip, removes the pathology as effectively as the Sturmdorf enucleation, and gives a much better plastic result. If done quickly there is very little destruction of tissue, as is the case in cauterization and, therefore, little or no slough or secondary stenosis.

Just as the Sturmdorf technique could be applied at a higher level as an amputation of the cervix, so the endotherm can be used with a straight blade in cervical amputation. Control of the bleeding should be by deep suture. Whether the suturing of loosened mucous membrane flaps in the excavation is necessary or even advisable, may be questioned.

Routine inspection of the vaginal vault eight to ten days after the operation will often show the flaps loosened and hanging loosely in the upper vagina. Some of us are of the opinion that healing of the excavation by granulation and epithelization, such as occurs in conization, will give better plastic results and more nearly preserve the normal appearance of the vagino-uterine junction.

PROCIDENTIA

Procidentia can be considered as a hernia of the uterus through the pelvic floor aperture, and represents a pathologic equilibrium established with the descent and dilatation of the aperture as contrasted with the physiologic equilibrium which exists when the pelvic floor is competent. It is always accompanied in its descent by varying amounts of bladder and rectal wall. Surgical cure in procidentia depends upon reduction of the hernia and restoring tone to the damaged levator

fibers. Reduction of the hernia consists, in the case of bladder and rectum, in dissecting these structures free from uterine and vaginal attachments; and, in the case of the uterus in its removal, interposition, reposition or amputation of the swollen cervix. The method of opening the vaginal wall is of little consequence, as long as adequate exposure is obtained; and the shape of the denudation of the vaginal wall, if any, is also unimportant, as long as snug closure can be made.

Interposition of the uterus below the bladder is an effective method of treating prolapse, and except for the fact of retention of a potentially dangerous organ, and a slight outward bowing effect upon the ureters, can be considered a useful operation. Those who advocate interposition for prolapse make as one necessary condition in its use, that the uterus must not be atrophic. Now the uterus will later become atrophic, but recurrences after this operation are very few, so that, except as a temporary feature, the good result must be due to some detail of the operation other than that produced by the position or size of the body of the uterus itself. It must be understood that no treatment of prolapse or cystocele can be considered complete until the levator muscles have been restored in tone.

OPERATIONS FOR THE RESTORATION OF TONE

Operations for the restoration in tone of the damaged muscular mechanism for closure of the pelvic floor aperture are not anatomical restorations in any sense. The operation is called perineorrhaphy, although the surgery in the perineum is only incidental to, and not at all a necessary part of the surgery of the pelvic floor. The perineal body, about which so much has been made in the literature of the past, lies below the pelvic floor and contains the intrinsic closure mechanism for the rectum and vagina. Complete rupture or incision of the perineal body in the absence of damage to the levators contributes nothing to the production of prolapse.

All methods of increasing the efficiency of the levator muscles consist in pulling bundles of their fibers (mainly in the puborectales layer) out of their usual course and suturing them together in the midline between the vagina and the rectum. This converts a damaged and elongated U-shaped muscle into an approximate figure-of-eight, thus in effect shortening the muscle and thereby increasing its tone, and enabling it once more to close effectively the pelvic floor aperture.

OPERATIVE TECHNIQUE OF SOMERS

The writer would like to call attention to an operation for repair of the levator muscles first described by Dr. George B. Somers in 1903.³ The special point in technique as outlined by him concerned the suturing of the muscle bundles. After a high, triangular denudation of the posterior vaginal mucosa, the levator ani bundles are approximated by a layer of continuous silkworm gut sutures. The sutures are inserted through the vaginal mucous membrane above the apex of the denudation and are continued as mattress sutures,

closing the wound longitudinally and emerging through the skin of the perineum. The number of sutures is determined by the depth of the wound, the first being passed along its deepest part. After the mattress suture has transversed the length of the wound to emerge through the skin it is pulled taut, and this brings the tissues in the sides of the wound into contact. Each succeeding suture is placed more superficially until the entire wound is closed. The projecting ends of the silkworm sutures are left long and protected by a lead shot.

This method of perineorrhaphy closure holds the muscle and connective tissue firmly in the midline between the vagina and rectum, with little or no strangulating effect; is not as painful as usual methods of suturing, and produces no palpable transverse ridge in the reconstructed vagina. Healing is uniformly good due to the tolerance of tissues for silkworm gut and the absence of strangulation. Swelling can occur, the tissue sliding along the sutures, none of them being tied; and if infection of the wound occurs, the sutures will be effective drains while still splinting the wound edges. We have used flexible steel sutures for demonstration, and although the postoperative results were very good, the difficulties in insertion and removal are greater than silkworm gut.

ESSENTIAL ELEMENTS IN VISCERAL \ DESCENT OPERATIONS

The essential elements, therefore, in operations designed to correct visceral descent are:

1. Replacement of the herniated structures after dissection has sufficiently mobilized them.
2. Perineorrhaphy to reestablish effective closure of the pelvic floor aperture. This is done by suturing the two arms of the levators ani, with their fascial coverings, together between the rectum and the vagina.
3. The use of condensations of visceral connective tissues about the bladder and cervix uteri, the sacro-uterine, the lateral parametrial and pubocervical thickenings. These structures give immediate, although temporary, postoperative immobilization to the replaced structures and allow a firmer union to occur in the myorrhaphy.
4. When small intestinal loops accompany the bladder or rectum through the relaxed aperture, the condition is called enterocele; and cure of this condition requires, in addition to the extensive mobilization of the herniated viscera, the removal of the peritoneal sac and closure of the gap created, using the connective tissue structures previously referred to.

Recurrences in the large enterocele after operation will occur more frequently than in any other repair, because the muscular defect is the greatest. It may be necessary to use partial or complete colectomy to cure the condition. This obliteration of the vagina can be done very simply after recurrence has occurred, and should be reserved for the treatment of recurrences or in large prolapse with enterocele in patients considered to be poor surgical risks.

COMMENT

The controversy, then, between those who believe the connective tissue or fascia the most important supporting structure, and the adherents to the theory that muscle is the real support, can be reconciled at least as regards the utility of these structures in surgery. It will be noted that the excellent operations designed for prolapse by Fothergill, Neel, Rawls, and many others, always include a posterior colporrhaphy. It seems to this writer that, although he is thoroughly convinced by the researches of Paramore, that the visceral connective tissue (the uterine, vesical and paravaginal ligaments) is of no value in determining the position or contributing to the support of pelvic viscera normally, except as it is a part of the incompressible visceral mass and not a part of the pelvic floor, still it can play an indispensable part in reconstructive operations. He believes also that many plastic operations would fail but for the temporary protection given by use of these thickenings of visceral connective tissue to the healing myorrhaphy.

DISCUSSION

H. A. STEPHENSON, M. D. (490 Post Street, San Francisco).—Doctor Pettit sets forth clearly and fully the value of certain pelvic structures in plastic surgery of the pelvic floor and contiguous viscera.

His theory of the causation of pelvic herniae is interesting and, to me, logical. If generally accepted, it should obviate the unjustifiable employment of certain operations involving the various pelvic ligaments for uterine malpositions. Hospital records already show that the operation of uterine suspension is now less frequently done than a few years ago.

All obstetricians will agree with the treatment of the cervix as described. Conization is the best method for patients still in the child-bearing age. Much obstetrical grief has resulted after the repairs and amputations formerly done by ambitious surgeons. In most instances this was due to the sacrifice of too much cervical tissue.

The careful reading of this paper by surgeons, obstetricians, and gynecologists should result in better plastic surgery of the pelvic floor and, therefore, better results for the patient requiring such surgery.

✱

H. N. SHAW, M. D. (901 Pacific Mutual Building, San Francisco).—Doctor Pettit has explained simply and clearly the relations and functions of the supporting structures of the pelvis. In many papers on this subject the descriptions of the pelvic fascias are so complicated that the reader is left hopelessly confused.

I know of no operation in which there are more variations of technique than in repair of the perineum, yet, thanks to an excellent blood supply, the end-results are nearly identical. One man stresses the importance of a "butterfly incision," the next uses a wedge shape, another employs silkworm gut with lead shot for approximation, while his associate regards them as relics of barbarism and uses buried catgut.

In the treatment of lacerated cervixes we prefer radial cauterization in general to the various trachelorrhaphies. I have seen end-results of cervical repairs, done by excellent men, that looked like starfish. A cautery takes about

a minute or two, and about twenty-four hours' hospitalization, while a careful cervical repair often takes a half-hour and keeps the patient in the hospital ten days.

One of the main reasons for repairing the cervix is to prevent cancer. A very early cancer would be destroyed by adequate cautery, while a very fine-looking repair might spread the malignancy like wild fire.

✱

R. GLENN CRAIG, M. D. (490 Post Street, San Francisco).—The indications for operations advocated to correct anatomical abnormalities of the uterus are steadily declining. As Doctor Pettit has pointed out, the adjacent uterine structures are the "guy-ropes," but the position of the uterus is maintained by the pressure of the soft, mouldable mass above. This we need not discuss. You might wonder why anyone would wish to talk of the anatomical structures of the pelvic floor, since they have been well known and well recognized for several decades. The present paper is based on anatomical concepts and operative procedures emphasized two or three decades ago. If one is interested enough to watch the various procedures carried out in the operating room, the answer will be obvious: the overabundance of tissue available for suturing deludes the operator into forgetting the importance of the restoration of the anatomical structures to their former normal position. While no operation is easier to do, none in gynecology is so frequently done so badly. For this reason Doctor Pettit is to be commended for so clearly emphasizing the necessity of fundamental anatomical and physiologic knowledge. I agree with the principles outlined by him, and hope we all shall have a better anatomical conception before our next attempt, of what we are trying to accomplish.

✱

L. A. EMGE, M. D. (2000 Van Ness Avenue, San Francisco).—Doctor Pettit's very frank statement of his own ideas about the mechanism of pelvic support deserves serious attention; so many statements of previous writers, giving undue credit to the pelvic fascia, have gone unchallenged and are automatically repeated in reviews of the subject. It is, therefore, refreshing to find someone who has enough courage to challenge established notions. I fully agree with Doctor Pettit that the pelvic diaphragm as a whole must depend upon functioning muscle fibers. A fascial membrane devoid of these fibers would have to possess a tremendous tensile strength and unusual thickness to withstand the abdominal pressure of an active individual. Wherever the musculature of the diaphragm has been weakened, pressure ultimately will produce a pelvic hernia. It may be argued that in old age this musculature atrophies, and that prolapse is not the usual result. However, with advanced age the pelvic diaphragm contracts and thickens, if not previously weakened, and if one realizes that physical activity is also decreased during that period, one can readily understand nature's way of regulating the supporting mechanism of the pelvis to prevent herniation.

Doctor Pettit did not discuss the work done at Stanford by Doctor Blaisdell in 1917, which includes both experimental and comparative anatomical studies. Blaisdell fully realized the importance of living muscles, and demonstrated their presence and response to functional changes in various animals and the different ages in man. Blaisdell pointed out that the basal ligaments were not individual components in the true sense of ligaments, but that they represent interchangeable groups of musculo-elastic structures to which he gave the name "suspensorium fibro-elasticum." Paramore's splendid contribution is considerably broader in its deductions than Blaisdell's, but it in no way detracts from Blaisdell's conclusions.

As far as the application of this knowledge to pelvic repairs is concerned, it perhaps is not out of place to say that any extensive repair would include muscle tissue either purposely or accidentally. Unfortunately, the very best of dissection and the strictest adherence to principles of plastic surgery will not always yield the desired end-result. The patient is relieved for some months, but herniation recurs because the supporting diaphragm has lost its contractility. In such instances there remains nothing to do except to resort to one of the operations which obliterates the vagina.

IMMUNOTRANSFUSION: ITS USE IN THE TREATMENT OF COMMUNICABLE DISEASES*

By PAUL M. HAMILTON, M.D.
Alhambra

DISCUSSION by Albert G. Bower, M.D., Hollywood;
C. M. Hyland, M.D., Los Angeles; Hyman I. Vener,
M.D., Los Angeles.

IMMUNOTRANSFUSION may be considered to be the combining of two well-proved therapeutic procedures, namely, transfusion and serum therapy. Theoretically, it would seem to be based upon sound logic, and practically it has fulfilled expectations in some diseases, while in others it has been less successful or has failed entirely, in some instances in the very diseases in which one might most confidently expect success. It is the purpose of this paper to outline the clinical impressions gained at the bedside in a hospital for communicable diseases, with only scant reference to purely scientific aspects or to the tremendous literature on the subject.

APPRAISAL OF RESULTS

An exact appraisal of the results of immunotransfusion is particularly difficult because of many variables, some of which are the natural variants of disease, the possible effect of transfusion, whether immune or not, the difficulty in grading the immunity of the donor, and the effects of other concurrent therapy. Parallel cases are usually a practical impossibility, with the result that adequate scientific standards for control are seldom, if ever, achieved. Results, therefore, are hard to couch in statistical terms, even those accepted by the consensus of all observers.

From the theoretical standpoint, one should expect the results to come both from the nonspecific actions of transfusions in general, such as the general supportive effect, the stimulus to hematopoiesis, the increase in oxygen carrying capacity, and the increase in volume of the circulating medium; and from the specific actions of added antibodies. In general, its advantages over animal sera lie in its multiplicity of actions, its negligible reactions, and, in some instances, in its greater specificity; its disadvantages are lesser potency, inadequate standards of potency, and the fact that it is often not available. Usually a highly potent serum is best used as a serum, whereas a serum of low potency gives better results in the form of whole blood. Convalescent serum and convalescent whole blood are so obviously closely parallel that both will be considered together.

Inasmuch as the antitoxic and bactericidal powers of a given blood are difficult to determine, we plan dosage as it would be planned for any transfusion, upon the size and general condition of the patient and his hemoglobin and red count. The quantity of blood used averages about 100 to

150 cubic centimeters in children, and ordinarily does not exceed 300 cubic centimeters in adults. The direct method is used unless technical difficulties prevent. The indirect or citrate method has seemed to give comparable results when it has been used.

TYPHOID FEVER

Transfusion has a definite and at times an apparently life-saving value in this disease, but a study of hospital records is not convincing that the degree of immunity of the donor is a decisive factor. These records show no critical drop in temperature, and no greater general improvement than might be expected on the basis of nonspecific results of transfusion. Reports from other communities, notably European, indicate a much greater effectiveness than has been our experience, due possibly to our lack of donors whose time interval since having the disease is not excessively long. Efforts to prepare a donor through the giving of vaccine have also been disappointing.

MEASLES

Our experience with measles is very largely with its complications, which are not amenable to this mode of treatment. We have, however, treated occasional toxic cases by immunotransfusion with encouraging results, and serum therapy in uncomplicated cases treated in the home has many advocates. Serum used as a prophylactic, in doses of 5 to 10 cubic centimeters, has given the same excellent assistance in cutting down cross infections in the hospital that has so often been reported among private patients. Both for therapy and for prophylaxis, donors free from fever for about two weeks are most desirable, though their immunity remains high for at least six months and may be expected to maintain a level of appreciable value for a much longer time.

MUMPS

This condition is one which we seldom have to treat. Reports indicate a definite value in preventing and treating orchitis, but our own experience is too small to be significant.

ERYSIPELAS

Some workers have assigned immune serum or blood a definite rôle in the management of this disease, but our cases have shown no benefit other than the purely nonspecific. This failure is rather to be expected in view of the poor immunity developed by erysipelas patients, and their tendency to recurrence.

SCARLET FEVER

This disease offers possibly the most striking opportunity for immunotransfusion in our entire experience. In the septic type, characterized by lymphangitis, adenitis, "picket fence" temperature, chills, and severe inflammation of the throat, results are always good and are often most dramatic. Commonly the temperature is normal by the following day, the rash faint or absent, the glandular swelling much reduced, and the patient subjectively improved in like proportion. Complications in these cases are extremely rare, the usual course being entirely uneventful.

* Successes and failures of whole blood and of serum from immune donors in specific treatment of communicable diseases, as seen at the Los Angeles County Hospital.

Read before the Pediatric Section of the California Medical Association at the sixty-fifth annual session, Coronado, May 25-28, 1936.

If treatment has been delayed until a complication has developed, such as otitis media or empyema of a sinus, results are much less gratifying, though a decided improvement may still be expected, especially in the disease process itself and sometimes in the complication as well.

Toxic scarlet fever, the type lacking evidence of extensive bacterial invasion but presenting marked prostration, sustained high temperature, heavy purplish rash, often hemorrhagic, and rapid pulse, has in our experience responded less dramatically to immunotransfusion, though these patients also are unquestionably improved by the treatment.

Simple scarlet fever, the type including the vast majority of our cases, will almost always reach a satisfactory conclusion with nothing more than symptomatic treatment; and due to press of work and lack of donors they are ordinarily not transfused. They respond very well, however, and many figures have accumulated to show a lessened incidence of complications. Other streptococcal infections, particularly of the throat and cervical glands, will also frequently respond in a manner almost specific.

In selecting donors the type and severity of their infection seems to be of relatively little importance, compared with the duration of convalescence. Those most frequently used are individuals who have had a mild attack, and who are at or near the end of the quarantine period. It would seem that the immunologic value of their blood begins to decrease quite appreciably by the end of the fourth week after defervescence. Dosage need not be large, 100 to 200 cubic centimeters being adequate for adolescents. Serum is as effective as whole blood, and is likely to be more potent than blood from a casually chosen convalescent donor, inasmuch as it is ordinarily pooled; and it is also more desirable because of its ease of administration. When using serum the dose is about a third the quantity that would have been used with whole blood. Results with either are the same, whether given by vein or intramuscularly, except for the delay in absorption using the latter route.

MENINGOCOCCIC MENINGITIS

This disease ordinarily does not enter into a discussion of convalescent serum therapy. However, it may be of interest to note that during the past year we have seen four patients whose organism could not be agglutinated by any commercial serum, and whose course was steadily downward under treatment with these sera. Inasmuch as they showed no evidence of septicemia it was assumed that their own blood must contain antibodies; this was verified in the laboratory, and all recovered under treatment with their own serum.

POLIOMYELITIS

Possibly no other disease at the present time offers such a focal point of controversy as does this one. Needless to say, final answers to the questions raised by it have not yet been forthcoming, despite vast amounts of laboratory and clinical research. Immune blood or serum for prophylaxis and treatment of this disease has received more attention than for any other condition, quite

possibly from sheer lack of any other visible approach to the problem; but results have been so conflicting and concrete evidence so scarce and difficult of appraisal that the advocates of immunotherapy have lacked conclusive support. It is difficult, nevertheless, to ignore completely the bedside impressions of able clinicians who have recorded improvement in many patients following this treatment, in instances giving every evidence of progressing unfavorably. In some of these cases improvement has been spectacular, including a critical drop in temperature and a return of reflexes to normal; this, of course, may have been due to natural vagaries of the disease, and the fact that such results do not consistently follow treatment rightly casts doubt upon its specificity. In the midst of such confusion, then, one can only offer the impressions of the men who did the work for whatever they may be worth.

Thus, Vener collected the subjective reactions of fifty consecutive patients from hospital personnel, almost all doctors or nurses, with the idea that their impressions should, presumably, be of more value than those of lay patients. Of this group, one felt worse after transfusion, three noticed no change, three felt only slightly better or were doubtful, and all the remaining forty-three considered that their transfusions had helped them decidedly. The most frequent improvement noted was in diminution or disappearance of pain, next in general sense of well-being, and next in diminution or cessation of nausea and vomiting. Objective improvement was noted in the disappearance of fever in almost all cases, and in the stopping of catheterization in seven. These patients had been ill an average of 6.6 days, with extremes of one to twenty days, and the changes noted occurred within twenty-four to thirty-six hours, regardless of previous duration of illness. Simple bed rest was not thought to be a large factor, as many of the patients had already been in bed some time without improvement; and in only four cases was any other therapy instituted at the time. These had spinal punctures, and one other patient had had a spinal puncture previously without relief.

Studying another group of patients at the same time, Meals found the same subjective improvement following the use of serum and glucose, but without transfusion; and further, that this group presented a shorter total duration of illness than did the group receiving transfusions. Thus, both observers felt that at least a subjective improvement is directly attributable to the immune bodies present in convalescent blood, but Meals holds that, except possibly in severe cases, it should be given as serum rather than whole blood. He argues that a patient having little involvement of the central nervous system may be made worse by transfusion, through an increase in the permeability of the choroid and consequent greater invasion of nerve tissue; whereas serum, lacking such effect on the choroid, permits neutralization of virus without opening new portals for its dissemination.

Such studies as these are not completely convincing, even to the enthusiast, and immunotherapy

in poliomyelitis has not been able to produce consistent statistical or scientific data in its own defense. The whole question, however, is thrown wide open again by the work of Claus Jensen during the 1934 epidemic in Denmark, in which he demonstrated what may prove to have been the unknown variable of many contradictory reports.

Jensen classified his donors on the basis of the severity of their symptoms, and tested the neutralizing power of sera from the different classes. He found the permanent paralytic, whose blood has made up the bulk of all serum used, to have the poorest neutralizing power; the patient with transient weakness, who only rarely becomes a donor, to have much higher antibody titer; and the abortive patient, who has been most carefully avoided as a donor, to have still greater neutralizing power. The potency ratios of the three groups were: paralytic, 1-1000 to 1-2000; nonparalytic, 1-80,000; abortive, 1-150,000. Thus, if Jensen's observations are correct we may have been carefully choosing the poorest available donor and creating confusion through variable potency of serum.

Jensen's work reached us too late for use during the epidemic, and we have had too few cases since then to be significant; but the present routine of the hospital, until a better one can be evolved, is to give every poliomyelitis patient immune blood or serum, preferably from an abortive donor.

IN CONCLUSION

Immune blood (or serum) is of great value in treatment of scarlet fever, particularly the septic type; it has some, but much less, value in treatment of measles; it is of great value in preventing and modifying measles; it is of little if any specific use in typhoid fever, erysipelas, and mumps; it may, under special circumstances, be of great value in meningococcic meningitis; its precise worth in poliomyelitis is still undetermined, but it offers the nearest approach to specific therapy now available, and is worthy of further use and investigation, particularly along the lines suggested by Jensen.

248 East Main Street.

DISCUSSION

ALBERT G. BOWER, M.D. (1724 North Highland, Hollywood).—Immunotransfusion is a term coined to set this procedure apart from ordinary or routine transfusions. By it we mean that, in theory, actively immunizing substances to a specific disease contained in the donor's blood are to be transmitted to the blood of the recipient for the purpose of passive immunization through the medium of transfusion. The donor is presumed to possess this active immunity by virtue of having successfully passed through an attack of the specific disease, preferably quite recently.

From the standpoint of therapy, in most diseases results are very disappointing; in some they are frequently startling. In the latter class fall simple and septic types of scarlet fever, poliomyelitis and, occasionally, severe measles and typhoid fever; though in typhoid the newer intravenous bacteriophage treatment (after Van Cleve) will, in most instances, undoubtedly supplant immunotransfusion. In the former class fall toxic scarlet fever, erysipelas, streptococcus septicemia, etc.

In those diseases in which immunotransfusion works, similar effects are not noted when merely carefully selected non-immune donors are used.

With the ultimate establishment of serum depots for pooled, specific, convalescent human sera, immunotrans-

fusion will be discarded in most instances in favor of intravenous serum therapy, because of more general availability of the latter, greater simplicity, and the establishment of standards of potency. It is to be hoped that in the future some better preservative than tricresol may be used for these sera.

Doctor Hamilton is to be congratulated for securing a serum depot for the Children's Hospital in Los Angeles.

From the standpoint of passive immunization of non-immune contacts, specific-pooled, convalescent human serum, given in adequate dosage very soon after exposure, will generally prevent the appearance of scarlet fever, measles, and mumps. In this connection its efficacy in poliomyelitis, as well as most other diseases, remains unproved.

✽

C. M. HYLAND, M.D. (4614 Sunset Boulevard, Los Angeles).—Of the conditions mentioned by Doctor Hamilton in which immunotransfusions have been used, I am especially interested in measles and scarlet fever.

His experience and observation in a large group of such cases gives much weight to his conclusions regarding the value of such therapeutics.

It is my feeling that his results following immunotransfusions may be duplicated with convalescent serum, provided the variables mentioned are properly evaluated in our appraisal of results, as these variables apply to convalescent serum as definitely as they do to whole blood. One of the variables, and an important one, namely, the immunity of the donor, applies less to convalescent serum than to whole blood due to the custom of pooling sera from many individuals; whereas, in an immunotransfusion, blood from only one individual is used. My experience with immune measles serum has pertained entirely to the prevention and modification of the disease. It can be conservatively stated that serum given early will prevent, and if given later will modify measles in a very high percentage of cases.

Scarlet fever convalescent serum also has two very definite uses. If given in adequate doses to contacts it will prevent the disease in a very high percentage of cases.

In a recent report from a study made in Chicago, each case of scarlet fever was responsible for 1.4 other cases. In the past season in Los Angeles multiple cases in a family were very frequent where seroprophylaxis was not used. On the other hand, in families where contacts were immunized with convalescent serum, the incidence of contact scarlet was negligible. When the disease did occur, it was definitely of a very mild sero-attenuated type.

We have observed instances where adult members of a family not immunized developed scarlet fever and immunized children of the same family escaped, although equally exposed. It would seem, therefore, that convalescent serum has a decided place in the prophylaxis of scarlet fever. Cases treated with adequate dosage show uniform improvement. In most instances this improvement is striking and dramatic.

I would like to make a brief reference to what might be considered an acceptable donor for immune whole blood or convalescent serum, and in so doing feel that the instructions given by the National Institute of Health for the production of convalescent serum are acceptable. From cases of measles the blood should be obtained not before the seventh day nor after the sixth month following the onset of the disease, whereas in scarlet fever, not before the twenty-first day nor after the sixth month following onset. In the serum prepared the past season, we did not use measles donors more than two months after the onset of the disease, and scarlet fever donors were not used more than three months from date of onset. Blood obtained in the above periods should contain a maximum of immune substances.

In concluding this discussion, I feel that both immunotransfusion and convalescent serum are of extreme value. In the contagious-disease hospital where immune donors are available, severe cases of scarlet fever may be given immunotransfusions. It will save lives and greatly reduce complications. In the home, or where transfusions for one reason or another would be difficult, convalescent serum if available may be used with equal results.

Transfusion or convalescent serum should be given early and in adequate dosage.

Doctor Hamilton's suggestion that the dose of serum should be about one-third that of whole blood is the generally accepted quantity. There is a tendency on the part of physicians to use too large a quantity of blood and too small a dose of convalescent serum. This latter tendency is probably accounted for by the fear some people have regarding the administration of serum in general.

This should not apply to a properly prepared homologous serum, which may be administered in adequate dosage, intramuscular or intravenous, and without fear, if the basic principles of such technique are observed.

HYMAN I. VENER, M.D. (1531 Purdue Avenue, Los Angeles).—Doctor Hamilton rightly emphasizes the clinical indications and observations of immunotransfusions in communicable diseases. He has presented the subject from a practical bedside aspect as encountered in our daily hospital routine.

For years I have urged transfusions in the acute infections, often to the point of obsession. When transfusions were first instituted, normal healthy donors with high hemoglobin sufficed, but as our knowledge increased we supplemented this method with immunized donors, either from a recent convalescent or by the use of a vaccine, preferably of the autogenous type. Such a procedure is not only of definite value, but is also a worthy addition to our armamentarium of medical therapeutics. Transfusions, when administered properly, not only aid in overcoming severe toxemias and combating the resultant anemias, but very frequently are a life-saving measure.

If convalescent serum is not available, whole blood by direct method without typing, in small amounts of 15 to 20 cubic centimeters, may be given intramuscularly into one or both buttocks. Care must be taken to have a Wassermann-negative donor, unless one is certain, as may be the case when a parent is often used. This injection can be repeated at intervals as needed.

In cases of typhoid fever when we know the course of the disease will be protracted, active immunization of one or more normal, healthy donors can be started at a very early date. A vaccine of the autogenous type isolated from the patient—either from the blood stream, feces, or urine—would be preferable; but stock vaccine could be used. The dosage of vaccine can be calculated and given at four to five-day intervals for approximately two to three weeks, with a last dose being given about six to eight hours before the contemplated transfusion. Better yet would be the immunization of old, recovered cases, or those previously immunized with the triple typhoid vaccine. Such cases are expected to have a much higher antigen titer, and the results of the transfusion would be more satisfactory. Similar methods of treatment could be instituted for cases of long-drawn-out sepsis, such as streptococci and especially undulant fever.

Foshay, in a personal communication, believed that immunotransfusions might be effective in Brucella's infection. However, he felt that the donor should be a recovered patient and subjected to active vaccination rather than the use of a normal immunized donor. He calls the former type a hyperimmune status. Undoubtedly the serum or blood thus obtained has a tremendous potency and is of great therapeutic value. He firmly believes however, that it is necessary to vaccinate such a donor for at least a period of sixty days with daily injections in order to obtain good results. Foshay attributes the disappointing results obtained from normal immunized donors to the fact that they have not been immunized enough.

Some of the disappointing results of immunotransfusions can be traced to a rather hurried, active immunization with little consideration given to strains and specificities of the organism involved. Three weeks of active immunization is usually the maximum limit; often the period is much shorter. Consequently, the donor has not had sufficient time or antigen to call forth his greatest effort for high titer production.

As Foshay aptly states, "we send a new-born infant to do a man's work."

Halberg of Stockholm found that immunotransfusions gave surprisingly good results where simple whole blood had previously failed. He advocated the use of autogenous vaccine—one billion bacteria to a cubic centimeter—given at four to five-day intervals for three to four doses, and a final dose about six hours prior to the transfusion. Other

workers advocate dosages of vaccine from 50 to 250 million per cubic centimeter at weekly intervals.

On a practical basis, it has been found that the bactericidal capacity of immunized donors gradually increases during the first six hours after the vaccine injection, and remains unaltered during the following forty-eight hours.

I believe that a donor, wherever possible, should be of the same blood-grouping and is preferable if choice is available. The reason is that the agglutinin content of the recipient is increased.

Transfusions cannot be relegated to a minor surgical technique. I am convinced that it is a major procedure, and infinite care and judgment must be used in the preparation of the patient, donor, and instruments. Attention to details and good teamwork in the procedure will save time and avoid the frequent delays. Moderately small doses of 150 to 200 cubic centimeters at frequent intervals in acute communicable or infectious diseases are of more decided value than one large transfusion of 500 cubic centimeters.

Transfusions cannot be supplanted by the various drugs, serums or vaccines advocated by different biological firms, despite their extravagant claims. Much of the reluctance in the use of transfusions by the profession may be ascribed to the fact that they do not have a product all wrapped up in a fancy package, and have not been deluged with reams of literature on the subject. Instead of making use of a transfusion *early* in the course of the disease, proprietary drugs are given, and when they fail to perform the miracles claimed, then transfusion is instituted. Under such circumstances the patient is either semioribund or in extremely poor condition. It is no wonder, therefore, that many physicians do not believe transfusions have any value. It only serves to cast disrepute on such therapy. Certainly, it would be best not even to attempt transfusions and thereby save time, effort, and expense.

Finally, if immune transfusions are to be of value and have a fair degree of success, we must enlist the cooperation and teamwork of the clinician at the bedside and the bacteriologist in the laboratory. The latter must know the clinical history of the case and thereby be in a position to evaluate the causative organism and its special characteristics for isolation. A thorough understanding of the problem and a willingness to work together may be the deciding factor between success and failure. With this aim achieved, proper active immunization of the donor can be instituted with the consequent possible saving of a life realized in what otherwise may be a hopeless struggle.

PREMEDICATION FOR SURGERY*

By JAMES C. DOYLE, M.D.
Los Angeles

DISCUSSION by Lawrence Chaffin, M.D., Los Angeles;
H. N. Shaw, M.D., Los Angeles; Mary E. Botsford,
M.D., San Francisco; Elmer Belt, M.D., Los Angeles.

WHILE inhalation anesthetics are less than one hundred years old, as you all know, the use of drugs to produce sleep or stupor and facilitate surgery dates back many centuries. Soporific potions known to and used by ancient and primitive peoples included henbane, hashish, hemp, opium, and mandragora. In our own country, according to Stevenson,¹ certain Indian tribes used infusion of jimson weed (*Datura stramonium*). Drinking this they slept through crude operative procedures without a move or grimace.

REVIVAL OF AN ANCIENT ART

Today we are emulating these practices by the use of "potions" in the form of a barbiturate and a hypodermic. Although great strides have been recorded in anesthesia and surgery, I believe that the adequate preoperative preparation of the pa-

* Read before the Anesthesiology Section of the California Medical Association at the sixty-fifth annual session, Coronado, May 25-28, 1936.

tient has been in many cases grossly neglected. However, there is a more general appreciation of premedication just now than a few years ago. The day is passing when the patient is sent to surgery with only a hypodermic of morphin and atropin, and in many instances the patients themselves are asking for adequate premedication.

AUTHOR'S PERSONAL EXPERIENCE

Twelve years ago I had a major abdominal operation. I mention this only because I shall never forget the dread and fear that the inadequate preparation then in vogue did not alleviate. The night before I was given no sedative. A strange room, a different bed, thoughts of the morrow, and, in addition, a fire-alarm near by with the usual accompaniment of noise and confusion, were factors not conducive to slumber. Finally, at a late hour, after pacing the floor, reading, and counting sheep, I dozed off. The surgical preparation consisted of no breakfast and a hypodermic of morphin with atropin one-half hour before surgery. For some reason unknown to me the operation was postponed an hour; meanwhile the hypodermic had been given. The morphin, so far as I was concerned, served no purpose; the atropin, on the other hand, made me very dry and thirsty, for which there was no relief. As the minutes crept by, I was wide awake, anxious and apprehensive. Fear became predominant. There are countless thousands, I am sure, who feel as I do, and I bring this personal aspect to you because until very recently little or no thought has been given "adequate premedication" of the patient. Is it not surprising that even today some surgeons follow the course I have outlined?

PRESENT-DAY METHODS

At present there are available various preparations (drugs) that will entirely eliminate fear, worry, and even apprehension. Why are they not more generally advocated and used? Surely, it is not a question of safety. For the past six years, without any untoward reactions, I have given a barbiturate the night before, repeated it an hour before surgery, and fifteen minutes later administered a hypodermic of pantopan and scopolamin. No, it is not safety that deters premedication; it is probably no more than an old-established "habit."

MENTAL REACTION OF THE PATIENT

We have heard very little of the mental reactions of a patient about to have surgery; yet this factor, in fairness, cannot be overlooked. Some of us know of patients who died during induction. Recently I saw a patient wheeled into surgery for a traumatic lesion of the leg; the anesthetic was begun without even the preoperative "hypo"; the patient died after not more than half a dozen breaths of gas. What killed him? Many opinions were expressed. *I believe he died of fright.* The adrenals pour out their secretion excessively during fright—a powerful heart stimulant which may cause death.

Without adequate premedication patients are prone to shock and they require more anesthetic—

25 to 50 per cent more in some cases. The majority spend a restless preoperative night. Upon arriving in the operating room they are apprehensive, worried, or excited, all of which contribute to poor anesthesia and a miserable convalescence.

A WORKING PROCEDURE

"Ideal" preparation, on the other hand, should include a barbiturate, preferably nembutol, the night before. For the average patient three grains is usually sufficient. One hour before surgery, nembutol, grains four and one-half, are given, and fifteen minutes later pantopon, grain one-third, or morphin sulphate, grain one-fourth, with scopolamin (ampoule), grain 1/150, by hypodermic. Thus, the patient secures a night of rest, free from apprehension and worry; in most instances will have no recollection of the trip to surgery or, if so, only a hazy one. Frequently he has no recollection of the first few days following operation. To illustrate how complete is the amnesia, patients often ask twelve to twenty-four hours following operation when they were going to surgery.

USE IN SUBARACHNOID BLOCK

The premedication routine just described is urgently recommended for subarachnoid block, and in all other cases where cocain or its derivatives are used. Barbiturates detoxify cocain and its derivatives: this is shown by the work of Tatum, Knoefel, and Guttman (quoted by Downs and Eddy),² and Swanson,³ and many others. (The author stressed their use in 1932.)⁴ Several years ago a prominent urologist told me of the behavior of many of his patients during sacral and spinal analgesia: immediately following the injection of novocain they would become pale, the blood pressure would drop, the pulse become rapid and thready, the body surface would be clammy and wet; the whole picture was that of cardiovascular collapse, in other words shock. I suggested that he use a barbiturate preliminarily, and he has done so, with the result that to date the above-mentioned sequelae have been eliminated. Many patients, sensitive to cocain or its derivatives, must be fortified against these undesirable sequelae. It is my belief that many of the sudden deaths reported due to "spinal" are, as a matter of fact, novocain poisoning or sensitivity. Other sequelae and complications reported, such as extra-ocular palsies, neuritis, headaches, spinal-cord degeneration, etc., may be obviated by the use of barbiturates.

In addition to the preliminary medication already mentioned for subarachnoid block, ephedrin grain three-quarter, is given when the patient leaves the room for surgery. When given ten to fifteen minutes preceding the block, this drug, by its action on the smooth muscle, causes a moderate rise in blood pressure of 10 to 30 millimeters. Ferguson and North⁵ experimentally established that there was no drop in blood pressure following its usage. Personally, from a clinical aspect, there is a moderate and gradual drop, depending on the level of analgesia desired and the condition of the vascular tree. In other words, on a patient

with a marked generalized arteriosclerosis, ephedrin would have much less effect than on one with little or no sclerosis.

COMPOUNDS OF BARBITURIC ACID

The barbiturates first came into use in 1903 after Fischer and Mehring⁶ synthesized "veronal." Since then many new compounds of barbituric acid have been produced and used as basal narcotics, also at times as anesthetics. Included in this group are luminal, somnifain, dial, neonal, allonal, amytal, pernocton, sodium amytal, and nembutol. Much has been written about these last two preparations, nembutol and sodium amytal; their popularity has reached the point where their use in some clinics and hospitals is almost routine. They are derivatives of barbituric acid, depressing the sensory and intellectual processes, and act by diminishing the proprioceptive faculties, thereby favoring sleep. They are sedative, antispasmodic, and hypnotic. The effect is prompt, and dreamless sleep is secured within twenty to thirty minutes following oral administration. When combined with morphin sulphate and scopolamin, body functions are altered but slightly. The blood pressure drops 10 to 30 millimeters, the pulse rate decreases and respiration is slowed. The barbiturates are broken up by the liver, and thought to be excreted through the lungs. In the instance of nembutol and sodium amytal they are not recovered in the urine.

ADVANTAGES OF THE BARBITURATES

I have mentioned some of the benefits afforded by this group (of which nembutol and sodium amytal are by far the most popular), benefits providing the patient with a restful night and amnesia on the day of surgery. Furthermore, they lessen the amount of anesthetic needed. Other favorable factors are the elimination of the excitement stage of the anesthetic; a favorable impression on the part of patients having had previous surgical experiences; a decrease in postoperative pulmonary complications (Hooper and Gwathmey).⁷ Gwathmey⁸ also stated that their preoperative use reduced by 28 per cent the use of morphin sulphate postoperatively, and by 15 per cent the incidence of vomiting as compared with the usual preliminary of morphin sulphate, which requires 82 per cent postoperative morphin and results in 60 per cent vomiting. The combination of nembutol with morphin sulphate and scopolamin has proved efficacious: the one fortifies the other and the tranquillization produced is greater than when one is given without the other. Respiratory depression is greater, but is slight as compared with the increased efficiency obtained. Clinical and experimental evidence, substantiated by personal experience, has led the author to use nembutol almost exclusively.

PHARMACOLOGY OF PREMEDICATION DRUGS

The pharmacology of the premedication drugs, I am sure, is well known to you all. A few points may, however, be mentioned. *Morphin and pantopon* are similar in action. They differ in that the latter consists of the isolated alkaloids of opium

in their natural proportions, the gums and resins being absent, thus assuring prompter absorption. Both act on the central nervous system, depressing its higher functions. The cardiovascular and respiratory systems are slightly depressed. The latter (pantopon) is less likely to cause nausea and vomiting, and tends to be less constipating. Both are broken up in the liver and partially destroyed there, while a smaller part is eliminated in the urine and feces. When combined with scopolamin and the barbiturates they are synergistic, and aid each other in producing more satisfactory tranquillization.

Scopolamin and atropin are similar in that both are alkaloids. The former occurs in various plants containing atropin and is now prepared mainly from scopol. The latter is derived from a number of plants, such as belladonna, scopol, etc. It is a respiratory stimulant. Both dilate the pupil; both suppress secretions of the salivary, sweat and mucous glands, the former being the more powerful in this respect. Because of its stability the ampoule form of scopolamin is recommended. In this form the dextro-rotatory, or stimulating alkaloids, have been removed, leaving only the levo-rotatory, or sedative alkaloids.⁹ I have never seen a deleterious reaction from the ampoule, while unfavorable sequelae are not infrequent when the tablets are used. There is an antipathy in the minds of some men regarding the use of scopolamin, and rightly so. An elder colleague informed me of a death due to 1/75 grain (tablet) many years ago. It is needless to say he never used it again, but this was before the time of the ampoule; besides, the need for so large a dose rarely, if ever, arises.

I have previously stated my usual recommendations for preoperative drugs. I may go so far as to say they are almost routine. There are, of course, reservations as to age, weight, general condition, and to some extent the type of anesthetic, but for subarachnoid block, nitrous oxid, oxygen and ether I follow the outline above. Exceptions relate to avertin and evipal and children.

Because *avertin* (tribrom ethanol) is a powerful respiratory depressant, the preliminary medication should be somewhat less. The evening before the usual nembutol, grains three, is recommended (except in the aged and cachectic when one and one-half grains are sufficient. One hour before surgery nembutol, grains three, is given, and it is followed fifteen minutes later by a hypodermic of morphin sulphate, grain one-quarter or one-sixth, and atropin sulphate, grain 1/150. The avertin is then instilled rectally about twenty to thirty minutes before surgery. No ill effects have been noted with the above method, nor has respiratory embarrassment been encountered.

In cases where evipal is to be used, the question of premedication depends upon whether or not the patient is hospitalized and also upon the operative procedure employed. *For out-patients premedication is not recommended.* For in-patients morphin sulphate or pantopon with scopolamin will suffice, and to some extent lengthen the anesthesia; post-

operative comfort, too, will be assured. From evipal alone patients generally recover rapidly with no untoward reaction. It is only when large doses of a barbiturate are used that the reaction is delayed. In itself the drug is a cardiovascular, respiratory depressant; and the addition of nembutol or amytal increases this action unduly. It is a splendid anesthetic for operations of short duration.

SURGICAL PREMEDICATION FOR CHILDREN AND INFANTS

Of late some progress has been made in preparing the adolescent and adult for surgery. Children and infants have been woefully neglected. I wonder how many of us would be willing to undergo surgery with no premedication whatsoever? I feel quite sure of the answer! We know that infants and children tolerate medication. Jarman¹⁰ has advocated and used nembutol in children successfully and without a failure in over two hundred cases by rectal administration. Leech,¹¹ in a still larger series of cases, recommends morphin, sulphate and scopolamin from two years on, and has used hyoscin, grain 1/1200 or 1/900, in infants with pyloric stenosis. His schedule begins at one year, with morphin sulphate grain 1/40, hyoscin grain 1/600, forty-five minutes before surgery, and proceeds up to twelve years, with morphin sulphate grain 1/12, hyoscin grain 1/300.

As with adults, we pay no heed to the psychic effects of surgery on these children, yet we know that the child is afraid of a hospital and of an operating room. Should they not be permitted to face the ordeal of a surgical experience with the same tranquillity as their elders? The induction is usually associated with crying and exhibitions of physical prowess, and undoubtedly a sequel to this terrifying experience is manifested by their fear during future contacts with the medical and nursing professions. This fact is substantiated by reports from numerous children's clinics, nurses, and social workers.

How, then, shall we aid these children? The answer is quite simple: nembutol plus atropin for the infants, with the addition of morphin in older children. How much shall we give them? No routine will apply here because of the prevalent variations in age, weight, and general condition. However, for a child of roundly four years, grain one of nembutol the night before and grains one and one-half one hour before surgery. If not asleep in thirty minutes, another grain may be instilled in the rectum. Subsequently a hypodermic of atropin, grain 1/450, forty-five minutes before surgery. In older or younger children, the doses will vary correspondingly.

I have seen no untoward reactions from this treatment, and the children were sleepy or asleep when they arrived in surgery. The induction was smooth and quiet; the anesthetic dosage was appreciably lessened. The children, I feel sure, have had no visions of terror or fright, no memory of the mask or ether, and their future medical care will be simplified with better and happier coöperation.

COMPLICATIONS

Complications, sequelae, or untoward reactions are infrequent, but do occur. This fact necessitates careful watching on the part of the anesthetist and nursing staff. As an example, occasionally a patient having had a preliminary barbiturate may get out of bed on the first or second day postoperatively. Although the incidence of this somnambulism is low, and more of a rarity with nembutol than sodium amytal, it should be guarded against by side boards routinely. It is noteworthy that none of these patients had to be reoperated for hernias or eviscerations. Some few patients do not react favorably to the barbiturates and are hyperactive postoperatively. These need closer observation on the part of the nursing staff. Morphin sulphate or pantopon usually controls them. Cyanosis of lips, associated with a cardiorespiratory depression, is usually of brief duration. Carbon dioxid or carbogen inhalations twice daily or three times a day may serve to prevent lung complications, and should be used routinely when ether has been given for a long operation. Rarely postoperative narcosis lasts several days, but causes no untoward result.

IN CONCLUSION

In an experience of six years there have been no fatalities or unfavorable sequelae from "adequate premedication." Nembutol grains three the night before with nembutol grains four and one-half one hour before surgery and pantopon grain one-third, or morphin sulphate grain one-quarter, with scopolamin (ampoule) grain 1/150 forty-five minutes before surgery (with variations for age, weight, and general condition of the patient), have proved satisfactory for all concerned—patient, anesthetist, and surgeon.

This combination was productive of amnesia, tranquillization, and a notable absence of fear and apprehension for the patient. The anesthetist found the induction easier and the anesthetic dosage was reduced by 25 to 50 per cent. When subarachnoid block was used, the patients slept throughout and no untoward reactions or sequelae occurred. Premedication for children is humane; it is desirable from the standpoint of the family, the anesthetist and the surgeon. Last of all, adequate premedication aids convalescence by decreasing the postoperative use of morphin and materially lessening lung complications.

DISCUSSION

LAWRENCE CHAFFIN, M.D. (1136 West Sixth Street, Los Angeles).—The value of adequate preoperative medication cannot be overestimated. The demand for more satisfactory preoperative medication in all types of surgery has been answered during the past five years by the general use of the barbiturates. Experience has clearly proved that preoperative barbiturates, in addition to the usual morphin and scopolamin, are of definite practical value, and for the following reasons:

1. Fear is so completely eliminated that many patients do not remember having had their operation.
2. The safety of spinal anesthesia is materially increased.
3. The amount of general anesthesia required is definitely lessened.
4. All types of anesthesia are taken smoothly and without effort.

I have found the procedure outlined by Doctor Doyle to be efficient and satisfactory in all respects. I would, however, suggest caution in the dosage of barbiturates for those past sixty, and for those patients who have had a prolonged illness. It has been my experience, likewise, that not infrequently children under three years of age are rather sensitive to nembutal, and require careful dosage.

✽

H. N. SHAW, M.D. (901 Pacific Mutual Building, Los Angeles).—This paper emphasizes a very important point: the necessity for close coöperation between the anesthetist and the surgeon.

A careful study of the patient by the anesthetist, with suggestions as to the type of anesthetic, takes quite a load from the surgeon's mind.

Among our surgical patients, a good number had previous operations before proper attention was paid to the preoperative medication. These individuals never fail to express their appreciation of its value. As the author points out, the strain which the patient undergoes before the ordeal of surgery may be a considerable factor in a delayed convalescence.

In 1908 I was operated for an empyema. As far as I was concerned, that rib resection was the most important operation that had been performed anywhere for several years. I can never forget the trip to the operating room, through walls redolent of iodoform. A crowning humiliation was to hear one of three or four white-clad figures say, "Here's the next case, who's going to put him on the table?"

A surgeon, who has recently returned from a tour of the large eastern clinics, told me that in many of them they pay very little attention to surgical premedication. It is, however, an extremely important part of the surgical procedure, and I wish to compliment the author on his very clear presentation of the subject.

✽

MARY E. BOTSFORD, M.D. (807 Francisco Street, San Francisco).—This timely paper is on a subject that, for some years past, needed to be brought to the attention of the medical profession. The routine administration of morphin and atropin militates against the best results, preoperatively and postoperatively, with a large percentage of patients.

The psychologic factor is of the utmost importance in the adult patient and, as Doctor Doyle points out, doubly so in children, as the sights and sounds of transportation to, and a possible long period of waiting in, the surgery

may produce a psychic response which has been known to lead to a complex lasting for years. The addition of the barbiturates and tribromethanol to the previously known narcotics, such as the opium derivatives and scopolamin, have helped immeasurably in providing an escape from the depressing effect of fear, and in bringing the patient to the operating table in the best possible physiologic and psychologic condition.

The selection and combination of hypnotics and anesthetics must vary with the individual condition.

The use of atropin in combination with morphin was based on the tradition which still maintains, that being the physiologic antagonist of morphin, it provides a safety factor. It stimulates respiration, accelerates the heart, and increases the metabolic rate. This respiratory action is a disadvantage in modern gas anesthesia, and now that carbon dioxide is available in all well-equipped operating rooms, respiratory depression can be immediately overcome.

All of the arguments of the psychic and physiologic values of the methods advocated in this paper for inhalation anesthesia have double force as to their use with subarachnoid. Finally, the barbiturates have been proved to decrease the toxicity of the cocaine derivatives.

✽

ELMER BELT, M.D. (1893 Wilshire Boulevard, Los Angeles).—Dr. James Doyle is to be commended for his vigorous and pleasing style of writing, as well as the presentation of a very usable plan of surgical premedication. With the magic of the phenobarbital group of drugs at hand, there remains little excuse for permitting the occurrence of preoperative terrors and fatiguing worry. I vividly recall an old gentleman driven to seek surgical help because of severe urinary hemorrhage. Fear of his hemorrhage outweighed his fear of surgery. Entering the hospital late at night, he refused all medication and suddenly fled when an orderly came in to shave his pubes. The next day another hemorrhage occurred. He reentered the hospital, still vowing that he would not be drugged. He permitted the nurse to give him an enema and thus received nembutal by rectum. When he awakened, the papilloma, which had caused his trouble, had been removed. He is now friendly to hospitals and laughs at his former fears.

Doctor Doyle fails to mention a powerful factor in his success as an anesthetist. This is his custom of visiting and examining the patient on the day before surgery. This contact is comforting and reassuring to the patient. It gives him an opportunity to express his fears and have fear replaced by a rational understanding of the manner in which a scientific man is prepared to meet for him the problem of anesthesia.

URETERAL CALCULI*

By DOZIER H. GIBBS, M.D.
Los Angeles

DISCUSSION by Burnett Wright, M.D., Los Angeles;
A. A. Kutzmann, M.D., Los Angeles; Lionel P. Player,
M.D., San Francisco.

AS this paper deals with the practical management of ureteral calculi, the question of etiology of urinary lithiasis will be only briefly mentioned.

ETIOLOGY

The primary cause is unknown, and it remains for the physical chemists to solve the problem. When they discover the cause of the disturbed colloid crystalloid balance, the question will be nearer a solution. Urinary stasis; infections, local and focal; disturbances of metabolism, especially calcium; vitamin A deficiency; trauma of the kid-

* Read before the Urology Section of the California Medical Association at the sixty-fifth annual session, Coronado, May 25 to 28, 1936.

Fig. 1.—Case No. 1. Impacted stone lower ureter. Passed after enlarging ureteral meatus, and one dilatation of ureter below stone.

ney or spinal cord, and highly concentrated acid or alkaline urine are contributing causes, and should be corrected, in so far as possible, as a prophylaxis against the formation of other stones.

Primary ureteral calculi are formed in the kidney and pass into the ureter, where they may become lodged at any point, usually above a narrowing, or they may pass directly into the bladder. After being arrested in the ureter they usually increase in size, causing complete, partial, or intermittent obstruction. If a groove forms they may increase to considerable size without producing any symptoms or damage to the kidney. Unless there is free drainage of urine past the calculus, there will be some damage to the kidney, varying from slight dilatation of the renal pelvis to complete destruction from hydronephrosis or by invasion of the parenchyma by infection.

A very conservative attitude should be maintained while dealing with these apparently hopelessly destroyed kidneys, as they have remarkable regenerative powers after free urinary drainage has been established.

There have been some very large stones reported by Kretschmer, Goldman, and Bugbee. The largest in my small series was 12 by 4 centimeters in diameter.

DIAGNOSIS

The diagnosis can usually be made, although it is not always easy; and even when it appears obvious from the history and symptoms, a complete urologic study may be necessary and should always be done.

Pain of some variety is usually present and is typical when it radiates into the external genitalia. Microscopic blood is practically always found, with the exception of the anuria cases. There are

many conditions external to the urinary tract that may cause either hematuria or suppression. The x-ray is our greatest aid in establishing a positive diagnosis. If the ureter is entirely filled with the proper contrast media, even the non-opaque stones will usually be outlined. Intravenous urography has been a great aid, not only in establishing a diagnosis, but in determining the condition of the urinary tract above the stone. No great significance should be given to the entire absence of secreted opaque media if there has been a sudden complete block. As soon as the obstruction is removed they rapidly regain their normal function. Present-day writers, reviewing large series of cases, state that from 10 to 22 per cent cannot be demonstrated by the x-ray. A wax-tipped catheter is a great aid, and should always be used in doubtful cases.

There is a definite number of cases with typical symptoms, and a few red blood cells in the urine in which no calculus can be demonstrated. These are due to a mass of adherent crystals, which may be passed spontaneously or following the passage of a catheter. Phleboliths, calcified glands and various other opacities are readily identified and do not cause much confusion if opaque catheters are used and stereo films then made.

Air bubbles in the ureterogram are occasionally confused with non-opaque stones.

TREATMENT

The management of ureteral calculi should be highly individualized, and they should all be removed as speedily as all the factors warrant.

Fig. 2.—Case No. 2. Calcium oxylate stone upper right ureter. Impacted eight days. White blood cells 36,000. Constant vomiting. Five unsuccessful attempts at cystoscopic removal elsewhere. Ureterolithotomy through a lumbar incision liberated 60 cc. of purulent urine under pressure from the kidney pelvis. No sutures were placed in the ureter. No urinary drainage. Healed eight days.

Since Lewis introduced his stone dislodger there has been a continued parade of dilators, screws, bulbs, slings, crushing forceps, etc., to assist in the removal of ureteral stones. The better procedure is the use of the ordinary catheters and bougies, dilating the ureter, changing the position of the stone and, if possible, providing temporary drainage past the stone. The catheter or catheters should not be left in place too long. The enlargement of the ureteral orifices with surgical diathermy is often indicated and surprisingly large stones that have become lodged here will pass. The cystoscopic removal of calculi is ideal, and every effort should be made to relieve the patient this way when the size of the stone, the condition of the kidney, and the condition of the patient justify it. A note of warning, however, should be sounded as to the dangers of too prolonged attempts with this procedure. Conservatism must have, as its object, the welfare of the patient. From 50 to 90 per cent of ureteral stones have been reported as passing spontaneously or after some cystoscopic maneuver.

INDICATIONS FOR OPEN OPERATIONS

The indications for open operations are:

1. Stones obviously too large to pass.

Fig. 3.—Case No. 3. A laminated calculus in the lower ureter and a similar calculus in the hydronephrotic kidney. The ureter was large enough to permit the easy passage of the ureteral stone to the kidney pelvis.

Fig. 4.—Case No. 4. A calculus twelve centimeters by four centimeters in diameter blocking the lower ureter. Young man of twenty-one with a history of severe abdominal cramps with nausea, vomiting and diarrhea, associated with limping at irregular intervals for twelve years. Ureteral calculus had not been suspected.

2. Failure to pass, after repeated cystoscopic procedures.
3. Anuria.
4. Severe infections of the kidney.
5. Impacted stones that cannot be moved or passed.

Peacock states that often the shape, rather than the size, is the determining factor.

TECHNIQUE

The operative removal of an impacted stone is fairly easy, as it will usually remain stationary while the patient is being anesthetized. Any movement will practically always be toward the kidney. For stones in the upper two-thirds of the ureter a lumbar approach is used. If in the lower third the mid-line incision is preferable, although some operators prefer the Gibson incision. Adequate drainage must be provided, preferably by soft tubing, and if necessary through a stab wound in the flank. This dependant drainage is especially indicated after any type of muscle splitting approach through the lateral abdominal wall. The incision in the ureter should be large enough to permit the easy removal of the calculus in one piece, and should always be done under direct vision. Profuse hemorrhage will result if one inadvertently removes a phlebolith.

No attempt is now made to close the ureter. If the ureter is entirely free from obstruction, it will rapidly heal. In my very limited experience wounds in the lower ureter have urinary drainage more often and longer than those of the upper ureter.

Ureteral calculi discovered during early pregnancy should be promptly removed. Those found during late pregnancy should be treated more conservatively.

During the past five years I have treated fifty-one private cases of ureteral calculi that were demonstrated by x-ray. There are twelve other cases of ureteral colic relieved by one dilatation in which no calculus could be demonstrated. These, I am sure, were caused by masses of adherent crystals, as the urine in each case was loaded with crystals or amorphous phosphates. In thirty-three cases the stones were passed following conservative treatment, nine being removed by various stone removers. Following the use of a metal corkscrew, one case developed a severe hemorrhage, filling the bladder with clots which were removed by way of the urethra, when the stone was found embedded in one of the clots. Twenty-four patients passed stones after being dilated from one to nine times, four requiring the enlargement of the ureteral orifice by surgical diathermy. There were eighteen open operations. Twelve ureterotomies, with two deaths from pulmonary emboli, both occurring on the twelfth postoperative day. Six nephrectomies, with no deaths: three because of hydronephrosis of long standing, and three because of multiple abscesses resulting from prolonged retention of infected urine in the kidney pelvis. One of these was removed at the time of operation, one three weeks postoperative, and the other one two months after the stone had been removed from the ureter. I would like to cite a few illustrations and unusual cases.

REPORT OF CASES

CASE 1.—Cystine calculus in the lower right ureter.

Indian boy. Age, eighteen months. Loss of weight and attacks of vomiting and crying for past six months. Many red blood cells; no white blood cells; and no infection in the urine.

CASE 2.—Calcium oxylate stone in the upper right ureter.

First attack of twenty-four hours' duration. Complete anuria. Gibson incision. Postoperative pulmonary emboli (three), with recovery. Insufficient drainage resulted in huge collections of pus in the flank, which were drained on the tenth and eighteenth postoperative days. Should have been drained by a stab wound in the flank.

CASE 3.—Calcium oxylate stone in the upper right ureter. Impacted eight days. White blood count, 36,000. Constant vomiting. Five unsuccessful attempts at cystoscopic removal elsewhere. Ureterolithotomy through a lumbar incision liberated 60 cubic centimeters of purulent urine under pressure from the kidney pelvis. No sutures were placed in the ureter. No urinary drainage. Healed in eight days.

CASE 4.—Impacted stone in the lower ureter. Passed after enlarging ureteral meatus, and one dilatation of ureter below the stone.

CASE 5.—Bilateral calculi in the intramural ureter. Many attempts at removal, after enlarging the ureteral openings unsuccessfully. Both stones removed through a suprapubic cystotomy wound. Healed in ten days. Died on twelfth postoperative day. Pulmonary emboli.

CASE 6.—Bilateral multiple calculi. Right nephrolithotomy five years previously. Has passed over fifty calculi

from both sides. N. P. H., 76. Total phthalein, only trace in two hours. Both ureteral orifices were enlarged. He now passes stones with little pain. The urinary infection has not yielded to treatment.

CASE 7.—Calculi in the lower ureter. Kidney removed elsewhere eighteen months previously. Continued to have colic, with blood and pus in his urine.

CASE 8.—The two x-rays were taken six months apart, and show the rapid growth of the phosphatic ureteral stone that was pushed back into the kidney pelvis during an attempt at cystoscopic removal.

CASE 9.—(a) Shows a small stone in the pelvis that remained the same size for three years. (b) Shows the same stone enlarged, and engaged in the ureter after the patient was on a very rigid stone-dissolving diet for one month.

CASE 10.—(a) Sinus tract injected with lipiodol solution. From this a diagnosis of a tuberculous lesion of the spine was made. (b) Injected with iopax, shows its connection with the kidney pelvis, and a large stone obstructing the lower ureter. The other kidney appears normal.

CASE 11.—A laminated calculus in the lower ureter, and a similar calculus in the hydronephrotic kidney. The ureter was large enough to permit the easy passage of the ureteral stone to the kidney pelvis.

CASE 12.—A calculus, 12 by 4 centimeters in diameter, blocking the lower ureter. Young man of twenty-one, with a history of severe abdominal cramps with nausea, vomiting and diarrhea, associated with limping at irregular intervals for twelve years. Ureteral calculus had not been suspected.

SUMMARY

1. Ureteral calculi are formed in the kidney. The actual cause is still unknown.

2. The prophylaxis to prevent a recurrence consists in (a) removing all urinary stasis and infection; (b) keeping the urine well diluted and changing its reaction; (c) a diet rich in vitamin A; (d) in cases of calcium oxylate stone, eliminating from the diet food containing oxylates.

3. Urography and the waxed-tipped catheter are diagnostic necessities.

4. Ureteral colic may be caused by masses of adherent crystals that cannot be demonstrated.

5. Conservatism must have as its object the welfare of the patient.

6. Repeated use of the ordinary catheters and bougies is preferable to the various stone removers, and is the treatment of choice in about 70 per cent of the cases.

7. The size of the stone, the size of the ureter, the condition of the kidney and the condition of the patient must be considered in determining how long we are justified in using conservative methods.

8. Free drainage must be provided. A stab wound to provide dependant drainage is occasionally indicated.

9. It is not necessary or advisable to close the incision in the ureter.

10. A small series of sixty-three cases are analyzed.

1061 Roosevelt Building.

DISCUSSION

BURNETT WRIGHT, M. D. (727 West Seventh Street, Los Angeles).—There is so much that is good and so little to disagree with in Doctor Gibbs' paper that it can be considered and referred to as a safe, sensible guide to the management of ureteral calculi. In this locality, where urinary stones are so common, and open operations, especially ureterotomy, are relatively frequent, it may be well to emphasize the fact that dangerous and occasionally fatal complications sometimes follow the surgical removal of impacted ureteral calculi. The author's two deaths from pulmonary emboli, in a series of eighteen ureterotomies with a mortality of 11 per cent, while uncommonly high, illustrate the point. In more than fifty ureterotomies for stone in the past fifteen years, I have, luckily, had but one pulmonary embolus, which Doctor Gibbs and I both remember all too well, since he was the unfortunate patient, and I was the terrified surgeon! That emboli may follow inadequate drainage and retroperitoneal suppuration after ureterotomy, is a conviction now firmly implanted in my mind, and is an additional argument in favor of suturing the ureter, especially in its lower third, where drains do not function as well as through a lumbar approach to the upper ureter. A certain percentage of sutured ureterotomies will heal per primum, while there is practically always some urinary leakage in those left open; often it is profuse and prolonged, and results in peri-ureteral scarring, and predisposes to coccal infection in the kidney, with subsequent stone formation, as pointed out by Kidd a number of years ago. We recently cut down on a ureter to remove a stone impacted at the site of a previous ureterotomy, and found two inches of the ureter imbedded in a dense mass of scar tissue that bound it firmly to the surrounding structures. This must have resulted from urinary leakage, after the first operation. We feel that it is especially important to suture dilated ureters that have to be opened. It is our opinion that postoperative stricture of the ureter will occur less frequently if the ureter is carefully and properly sutured after ureterotomy. For a number of years we have opened the ureter with a cataract knife and sutured it with needles and instruments used in eye surgery in an effort to avoid trauma to the edges of the incision, and to attain better approximation and healing. We recommend periodic examinations with intravenous urography and ureteral dilations, when indicated, for all patients who have had a ureterotomy for stone, to ascertain and correct any tendency to postoperative stricture formation.

✽

A. A. KUTZMANN, M. D. (1930 Wilshire Boulevard, Los Angeles).—I would like to commend the author on his timely and common sense, conservative discourse on ureteral calculi, especially in the treatment outlined. In the present era of advancing urology and the bringing out of so many new mechanical ureteral-stone removers, we very often forget many good and time-tried procedures with simpler instruments. It is true that some of the new stone removers can be used to better advantage in the extreme lower ureter, but for general use through the entire course of the ureter the ureteral catheter is still the best. It is fraught with less danger in causing trauma, ureteral perforations, etc. We must exercise special care where there is suspected a pathologic ureter, resulting in obstruction, edema, brittleness, etc. The writer has enjoyed much success with calculi in the ureter, situated higher than 4 to 5 centimeters, by employing the use of several catheters, and leaving them indwelling for several days. As these catheters are being removed, the injection of either sterile olive oil or glycerin, or an equal combination of both, will tend to help a stone on its downward progress. Often the stone becomes enmeshed with the catheters and will come out with them.

I believe the figure of non-visualization, 10 to 20 per cent, is too high—5 to 10 per cent being more near the

usual run. Excellent modern x-ray equipment, and technique to bring out good tissue detail are responsible for this. The use of intravenous urography will enhance such studies still further. Occasionally with the patient in the throes of colic, or shortly thereafter, no opaque media will be excreted on the stricken side, but the kidney outline will stand out more than usual due to the apparent holding of the media in the renal parenchyma. The affected kidney is not functioning, even though there be no ureteral obstruction, as evidenced by cases with very tiny ureteral calculi, but having excruciating colic. The affected side apparently is in a type of "shock," leading to a suppression which may take from several hours to one or two days to cease; meanwhile the opposite kidney will function normally, as evidenced by a visible ureteropyelogram. This phenomenon has helped in diagnosing some cases with tiny calculi or urate stones not casting shadows in the plain x-ray plate. Further aid may occasionally be obtained from the x-ray by stereo pictures, lateral views and serial pictures.

Whenever possible a catheter should be passed up the ureter prior to operation and an x-ray exposure made. This will give the operator definite information as to the location of the calculus, and, furthermore, will keep it anchored in that location until removed.

In conclusion, I would like to stress conservatism in the management of ureteral calculi, since most of them will pass spontaneously or with aid of conservative instrumental manipulation. Doctor Gibbs has outlined very well the definite indication for the surgical removal of ureteral calculi.

✽

LIONEL P. PLAYER, M. D. (384 Post Street, San Francisco).—The essayist in his brief discussion of the etiology of urinary lithiasis aptly concludes with the usual phrase: "etiology not definitely known." It is generally conceded that urinary calculi are primarily renal in origin. Calculi may gravitate from the renal substance to the calyx, pelvis, the ureter and the bladder, or they may become arrested at any point along the urogenital tract, and cause symptoms in proportion to the degree of obstruction and irritation they produce.

This paper is concerned with ureteral lithiasis, its diagnosis, and treatment. On an average, 90 per cent of stones are demonstrable by x-ray and this average is somewhat increased by the intravenous or retrograde injection of a selected opaque media, which shows the comparative density between the calculus and media.

The author mentions the frequent necessity for full cystoscopic study in order intelligently to determine whether surgical or manipulative procedures are indicated. He stresses the danger of delaying surgery in favor of manipulative measures, and presents in concise form the indications for open operation. He might add to these, however, two more indications, namely, increasing hydro-nephrosis and diminishing renal function.

The various metal instruments for removing ureteral stones are dangerous, even in the hands of the most skilled urologists, and should be used only in selected cases. The simplest and best instrument for removing ureteral calculi is the ordinary ureteral catheter with its varied tip modifications. It may be left in the ureter either above or below the stone for the purpose of dilatation, and the various oils, diluted acids, etc., can be injected to facilitate the stone's expulsion.

The site of the incision in open surgery should be governed by the position of the ureteral stone, and x-ray should immediately precede the operation for obvious reasons.

In many instances I have refrained from suturing the incision in the ureter, and so far have had no reason for regret. Dependant drainage, I certainly agree, is highly important, but the drain should be close to and not in contact with the incision in the ureter.

In the after-treatment of the patient, dietary precautions and clearing up of urinary infection are important; but further investigation of the urinary tract for strictures and other abnormalities is of paramount importance.

ACUTE METASTATIC SPINAL EPIDURAL ABSCESS

By WILLIAM J. VAN DEN BERG, M.D.
Sacramento

DISCUSSION by Howard W. Fleming, M.D., San Francisco; Carl W. Rand, M.D., Los Angeles; F. L. Reichert, M.D., San Francisco.

ACUTE spinal epidural abscess, metastatic in origin, is undoubtedly more common than a review of the literature seems to indicate. There have been two cases in this vicinity within the past two months. The few papers published, describing this definite clinical entity, have endeavored to focus the attention of physicians in general on the signs and symptoms which point so clearly to an abscess in the spinal epidural space.

ETIOLOGY

The etiology is similar to that of perinephric abscess. One can usually obtain a history of a previous infection elsewhere, usually a furuncle or subcutaneous abscess, occurring a short time before the onset of the epidural abscess. In studying the previously reported cases, it is interesting to note the high percentage with a trifling back injury in addition to a previous infection. In a few cases there is a history of a back injury without an infection history. The age incidence has been from two to fifty-five years.

DIAGNOSIS

The patient is acutely ill, and has a moderate or high fever and hyperleukocytosis. One of the distinctive symptoms of this condition is that the patient will complain of severe root or girdle pains radiating from the back to the front of the chest, or to the front of the abdomen, or around the pelvis and down the thighs, depending upon the segmental location of the abscess. Upon examination, one finds extreme tenderness of the spinous processes over the affected area, accompanied by spasm of the adjacent back muscles. Stiffness of the neck and bilateral Kernigs are present—when the abscess is in the lumbar region the Kernigs are extreme, the neck stiffness slight.

These are early signs, and if the condition is untreated they are soon complicated by signs of cord involvement—paraplegia, sphincter disturbances, sensory loss, and, as the abscess advances up the space, an advance of the sensory loss, and paralysis will be noted.

A spinal tap is essential to confirm the diagnosis, though this admittedly increases the hazards to the patient. When the abscess is in the lumbar space, there is grave danger that the spinal needle may carry the infection from the epidural space into the subarachnoid space, and thus initiate a meningitis. However, the lumbar space is over one centimeter in depth, and is distended with pus, and one can successfully pierce this space by a careful tap without entering the subarachnoid space. In fact a routine spinal tap is apt to enter this space only and evacuate pus, and if the operator does not have an epidural space abscess in mind he is likely to make a diagnosis of purulent meningitis. Any doubt in the matter can be dispelled by a

recheck through the cistern which will show a practically normal spinal fluid.

When the abscess is in the dorsal epidural space, a block is produced early; a positive Queckenstedt is present; and the Froin syndrome will be noted—the spinal pressure will be low or quickly fall because of the block; the fluid will be yellow and will clot spontaneously owing to its greatly increased protein content.

ANATOMY

The epidural space, according to Dandy's¹ study of its anatomy, is formed by the division of the dura into two halves at the foramen magnum: the inner half, running down the canal, acts as the dura proper while the outer half serves as the periosteum of the vertebrae; and in between these two layers is the epidural space. This space contains fat, connective tissue, and venous and arterial plexus. Above the seventh cervical vertebra the space is merely potential, the two layers being in contact. But from the seventh cervical vertebra downward this space has a depth varying between .5 to .75 centimeters in the upper dorsal region, narrowing slightly in the lower dorsal and upper lumbar regions, and deepening to over one centimeter in the lower lumbar and upper sacral regions. The space is present only dorsal to the nerve attachments.

TREATMENT

There is only one successful treatment—a laminectomy—which should be done as soon as a positive diagnosis is made. And the incision should be packed wide open. In several cases reported in the literature, a second operation was necessary because of pus pocketed in the spaces just above and below the limits of the original laminectomy. Operation offers a cure even in the presence of cord involvement (paraplegia), if the latter has not been present too long. Otherwise there is some residual paralysis after recovery from the infection.

I am convinced that the use of staphylococcus antitoxin in my case, following the laminectomy, was of distinct value.

REPORTS IN THE LITERATURE

Slaughter, Fremont-Smith, and Monroe² reported one patient who recovered following a laminectomy, and in reviewing the literature found twenty-nine cases reported with six recoveries—two of the six with residual paralysis of the lower extremities.

Cathey³ reported one patient who was operated on and died; but as he states there was also osteomyelitis of the spinous processes, we must conclude the abscess was by direct extension and cannot, therefore, include it in our metastatic cases.

Stanley⁴ reported two cases with recovery. In neither was there any history of subcutaneous abscess or questionable focus preceding the epidural abscesses. In both cases, however, there was a history of a trifling back injury.

Gasul and Jaffe⁵ reported three cases in children, with two recoveries, and in an exhaustive bibliography reviewed the entire literature, begin-

ning with the first reported case by Morgagni (1682-1771). Up to July 1, 1936, and including the two cases reported herein, there have been seventy-one cases reported in the entire literature. Twenty of these patients recovered, five of whom had some residual paralysis.

In reviewing the literature one is impressed by what seems to be two distinct era in the diagnosis, treatment, and prognosis of these patients. The first era, from the time of Morgagni to the end of 1928, was despairing: out of thirty-six cases reported only one recovered (Pulvirenti⁶)—a mortality of over 97 per cent. In the second era, beginning in 1929, there is a distinct change for the better. Out of thirty-five cases reported in this second period, nineteen of the patients recovered—a mortality of 46 per cent. And this brighter new era is due chiefly to the work of such pioneers as Dandy,¹ Mixter,⁷ Smith,⁸ MacDonald,⁹ Ely,¹⁰ and others.

REPORT OF CASES

CASE 1.—The first case of epidural spinal abscess reported herein is one in which the patient had a subcutaneous abscess two weeks before his entry into the hospital. A laminectomy was done and the patient made a complete recovery. Howard W., a well-developed and nourished high school athlete, age seventeen years, was admitted to the Sacramento Hospital June 11, 1936, with an admitting diagnosis of back sprain. He stated that six days previously he fell and hurt his back slightly, but thought nothing of it at the time. The following morning he had pain in his lumbar region, which gradually increased. For the past three days the lumbar pain had been severe, with sharp, shooting pains referred down both thighs anteriorly. He had had occasional headaches, but no nausea or vomiting. His mother stated he had been very irritable, and had had a high fever for the past four days. On further questioning, he recalled having had a subcutaneous abscess of his right arm two weeks before his present illness.

The abnormal physical findings were a moderately stiff neck, extreme bilateral Kernigs, marked spasm of the lumbar muscles, and extreme tenderness to pressure over the lumbar spinous processes. At entry his temperature was 102.6; pulse, 110; respirations, 24. Urine had one plus albumen. Blood hemoglobin was 75 per cent; white blood cell count, 15,400. An x-ray of the spine was negative.

A lumbar puncture in the third interspace evacuated about two drams of thick pus. Laboratory smear of the pus showed an abundance of Staphylococci which, on culture, proved to be *Staphylococcus aureus*. A provisional diagnosis of acute *Staphylococcus meningitis* was made, and the case was referred to me. However, a reexamination and study of the patient made me question this diagnosis. Mentally, the patient was too alert for any meningitis of a degree revealed by the spinal needle. Furthermore, the girdle pains radiating around the pelvis and down the legs, indicating a nerve-root irritation which was definitely localized in the lumbar region strongly suggested a lumbar epidural abscess. To confirm my diagnosis, I did a cisternal tap by which I obtained a perfectly clear, normal, cerebrospinal fluid.

Operation was performed about twelve hours after entry into the hospital, and about six and one-half days after the onset of symptoms. A laminectomy of the second, third, fourth, and fifth lumbar vertebrae was done, the initial incision being just to the left of the spinous processes, freeing and retracting the periosteum and muscles outwardly to the left; then severing the spinous processes at their bases and retracting them with their attached ligaments, muscles, and outer periosteal layer of the right laminae to the right. As soon as the epidural space was opened, about a dram of thick pus was released. Culture of the pus showed *Staphylococcus aureus*. The laminae of the second, third fourth, and fifth lumbar vertebrae were removed, releasing about two drams more of thick pus, and, as there was a small collection of pus epidurally in

the upper end of the sacral canal, the first sacral spinous process and laminae were also removed. There was no osteomyelitis of the vertebral processes, nor was there any granulation tissue in the epidural space. The wound was packed wide open. On each day for five days succeeding the operation, the patient was given intramuscular injections of 10,000 units of *Staphylococcus antitoxin*. His temperature went up to 104 following the operation, gradually dropped to normal on the fourth day, and stayed about normal thereafter. On the thirty-sixth postoperative day a secondary closure was made under local anesthesia. The patient was discharged August 6, 1936, completely recovered.

♦ ♦ ♦

CASE 2.—While I was preparing to report the above case, a pathologist called my attention to another case of epidural spinal abscess which he had on the autopsy table. And while I did not see this case before autopsy, I have reviewed the case history notes and present a résumé herein. D. M., white, female, age sixteen, was injured in an automobile accident August 1, 1936, and sustained a fracture of the right ankle. Physical examination was otherwise negative, except for notched upper incisor teeth (Hutchinson). Her urine was negative; white blood cell count, 16,500; blood, Kahn and Wassermann four plus. The patient had an upper respiratory infection, and spinal anesthesia was used on August 4 in setting the fractured ankle. On the second postoperative day she began to run a daily septic temperature, with its maximum between 101.6 and 102.6 degrees. On the fifth postoperative day she began to complain of severe girdle pains, radiating to the front of the lower chest and upper abdomen, and repeated examinations of the chest and abdomen failed to account for these pains. On the eighth postoperative day she insisted on sitting up in a wheel chair, and a few minutes later complained of numbness and weakness of her legs, which later in the day developed into a complete paralysis and sensory loss below the costal margin. White blood cell count was 57,400. This sensory loss and paralysis gradually ascended. The patient died within twenty-four hours of the onset of the paralysis. Autopsy showed an abscess of the entire epidural space from the foramen magnum downward into the sacrum, accompanied by cord-softening. Culture of the pus showed an abundance of *Staphylococcus aureus*.

DISCUSSION

HOWARD W. FLEMING, M.D. (384 Post Street, San Francisco).—Doctor Van Den Berg has emphasized the similarity of acute epidural abscess syndrome to that of perinephritic abscess. As regards the etiology the comparison is most apt, and properly stresses the relationship of local trauma and staphylococcus infection. Only too frequently the chief attention is focused on the site of primary infection or to the region of the referred pain,

until far-advanced cord symptoms make the diagnosis. In a recent case, paraplegia was considered an hysterical manifestation before proper surgical treatment was instituted.

The necessity of a thorough back examination in cases of adults complaining of thoracic and abdominal pain, is fully as real as in the child suspected of Pott's disease. Local tenderness to pressure or pounding over a spinous process is often a helpful diagnostic sign, and may be found several hours before the onset of cord symptoms. The following record of an unusual case illustrates this point.

A middle-aged man, with a moderately severe diabetes, had been operated on for a right mastoiditis. The post-operative course was difficult and interrupted by several minor complications. Several weeks after the operation the patient began to complain of pain, weakness and numbness of the left arm and hand. Early examination suggested the possibility of a stereognostic impairment, and the diagnosis of a right cerebral brain abscess suggested. The absence of stupor and signs of increased intracranial pressure made this diagnosis seem unlikely. The very definite tenderness of the cervical spine focused one's attention to that site. In a few hours it was possible to demonstrate a definite Brown-Séquard syndrome with a total block of the spinal canal. Operation revealed a very large epidural abscess in the cervical region.

The necessity for immediate operation in these cases should be emphasized. The cord signs are due to interference with circulation and a toxic softening of the cord as well as the direct pressure. If satisfactory drainage is not accomplished in the first few hours, the patient may have a permanent paraplegia. I feel a negative exploration is justified in an attempt to diagnose and treat this condition early in its course. Close observation and very frequent examination are fully as important in cases of suspected epidural abscess as in cases with a suspected surgical belly.

Doctor Van Den Berg's paper brings to our attention a syndrome that is probably far more frequent than we suspect, and one that is often diagnosed too late to allow effective treatment.

✽

CARL W. RAND, M.D. (523 West Sixth Street, Los Angeles).—There is now no doubt but that acute epidural abscess is a distinct clinical entity which can be diagnosed with unusual accuracy. The patients almost invariably have an infection elsewhere in the body. We have seen epidural abscesses secondary to a carbuncle of the neck, a boil of the leg, a furunculosis and osteomyelitis of the humerus.

In my experience the initial symptom has been a terrific pain in the back. This is of great intensity and is localized over the site of the abscess. The motor symptoms usually appear before the sensory. The latter, however, may become complete within a few hours after the onset. Slaughter, Fremont-Smith, and Munro have pointed out that a complete spinal block may be present before the motor and sensory symptoms have become advanced. Basing the location of the abscess on the tenderness in the back and the presence of a positive Queckenstedt's test, they have been able to drain such abscesses before severe damage to the spinal cord has occurred. This is important, for in advanced cases where damage to the cord is extensive one may expect little, if any, recovery from the symptoms. Allen and Kahn have outlined in considerable detail the structural changes which may occur in the spinal cord in such cases. Their illustrations show not only edema, but cystic areas of degeneration and necrosis. In some of their sections the cord near the posterior columns shows a honeycombed appearance. Again degeneration of the anterior horn cells is shown. These changes appear relatively early, and make it imperative that surgery should be instituted before paraplegia has appeared. Unless operation is employed early, damage to the cord will be more irreparable.

As Doctor Van Den Berg states, these cases are now being more favorably treated than heretofore. Epidural abscesses are more common than have been supposed, and in the future many more cases should be accurately diagnosed. In the past many of them presumably have been hidden under the name of "transverse myelitis."

F. L. REICHERT, M.D. (Stanford University School of Medicine, San Francisco).—The importance of recognizing and treating properly the acute spinal epidural abscesses is emphasized in Doctor Van Den Berg's paper. He has clearly and briefly summarized our knowledge of this condition and pointed out the essential diagnostic findings, indicating the important and distinctive symptom of severe root or girdle pains as an early complaint.

The findings at autopsy, in the second case, of epidural pus extending the entire length of the spinal canal, would make the pathologic condition more extensive than an abscess.

✽

DOCTOR VAN DEN BERG (Closing).—Early diagnosis and treatment are essential to save life and cord function. To save life after we get some degree of the permanent cord damage described in Doctor Rand's discussion is, at best, an unhappy victory. Doctor Fleming adds an interesting successful case to the growing list. Epidural abscess, as Doctor Reichert points out, is not an accurate pathologic description—empyema of the epidural space is perhaps a more exact pathologic diagnosis—but the former has been accepted by the profession and will undoubtedly remain.

THE LURE OF MEDICAL HISTORY†

PRACTICE AMONG THE ESKIMOS

By BRUCE H. BROWN, M.D.

San Ysidro

IN preparing this paper, I have drawn mostly from memory. Having been in government employ,* all my case records and reports became the property of the Government.

Practice among the Eskimos is the subject of my paper, but I shall also speak of the customs, especially those akin to disease, which will tend to give some insight into the Eskimo character.

ON FEEDING OF CHILDREN

To render young children strong and healthy, these savages feed them the flesh of young pups or dog's excrements mixed with their food, which sometimes causes their death. I have in mind a case of epithelioma of the lip (one of two cases of cancer seen in five years), which I had treated, of course, unsuccessfully. The native becoming discouraged, drank, either on the advice of the medicine man or some ignorant white, a mixture of dog urine and gunpowder. It killed him.

Parents who have lost several children give the surviving ones to some childless couple who, by adopting them, save them from the death to which they are doomed in their own family. This plan may work well in cases in which the parents are negligent, or too stupid to take proper care of the children, or are tuberculous; provided, the adoptive ones are not the same. But experience shows that the mortality of adopted children is not noticeably less than that of others.

BOILS

To cure permanently a crop of successive boils, to which these natives are not infrequently sub-

†A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of CALIFORNIA AND WESTERN MEDICINE. The column is one of the regular features of the Miscellaneous department, and its page number will be found on the front cover.

*Editor's Note.—Dr. Bruce H. Brown was formerly a passed assistant surgeon in the United States Public Health Service.

ject, they have two methods, of singular efficacy. The core, being carefully extracted, is placed in the barrel of a gun and fired off with the load, or else it is swallowed by the patient. The second method might be considered an homeopathic treatment, while the first is decidedly allopathic.

Both, however, in this Eskimo point of view, proceed from the same idea of utterly destroying the offensive germ. In the second case the native theory is that organic matter is thoroughly destroyed by the process of digestion. Another habit, fortunately obsolete, is that of wives carefully gathering, in cups or other receptacles, the expectorations of their consumptive husbands, blood as well as pus, and swallowing it. To burn anything excreted from the body would, to them, be running the risk of terrible disaster.

PUBERTY

The puberty customs exclusively concern the woman. They appear to have no notion of age in puberty in males; and though they sometimes impose a new name to a male child about his twelfth year, it seems to have no reference to any organic development. In the case of a girl, the renaming generally takes place when she reaches the age of puberty. They have the idea that women at this time are particularly receptive toward all external influences; hence the principle of assimilation by contact is brought to bear, and all available objects that are possessed of qualities desirable for her are sought for and put in close proximity to her. They also believe that the discharge contains the very essence of femininity, hence the woman must avoid all contact with men; especially young men, as this would render these young men womanish and unmanly.

Of course, no young man who has a spark of ambition would willingly expose himself to blight thus the rest of an earthly career, nor would a young woman bring this misfortune upon him, and so the puberty rules are rather scrupulously observed.

I have never heard of a case of legal impurity contracted by a woman in this condition.

MENSTRUATION AND CHILDBIRTH

Making due allowance for honorable exceptions, it must be said that it is a notion among these people, and one that does no credit to their morality, that menstruation is a consequence of previous sexual intercourse. Thus, in certain localities, girls generally, with the full consent of parents or guardians, have intercourse, preferably with a married man, to have the first catamenia.

In other places, notably on the Yukon, it goes otherwise; and when the phenomenon first occurs to one, she receives a severe scolding as though guilty of misbehavior.

If it is in winter a small space is curtained off from the remaining space by a piece of canvas or blanket; if in summer a tent is erected for her outside. This is the retreat chamber in which the young woman eats, sleeps, works, and muses. She is conducted to it by the oldest woman in the

camp, who also administers to her a mixture of water and oil extracted by boiling some salmon heads, which have undergone partial decomposition under water, and some dried slices of white fish. The grease is put in so she will always have grease in her mouth, which is equivalent to saying that she may always have food in abundance. Solemnly presented, the beverage is swallowed with equal solemnity. Then follows a sort of lecture in which the old woman presents herself as a pattern of all womanly virtues and inquires from the girl if she will conduct herself in the same praiseworthy manner. She, naturally, answers that she will. During the month of confinement, she cannot speak to any man; not even see his face, much less touch his clothes or any object belonging to him. No evil would ensue for her, but the misfortune would be all for him. When she has to leave the place for the necessities of nature, she must do so unseen. She generally goes out late at night after the others are in bed or early in the morning before they are awake. She wears a long parkie with a long hood. This hood is called the flabby cap, which is pulled over the eyes before leaving and kept down as long as she remains out. She is not allowed to undress, but sleeps with all her clothes on, even her mittens. In these, as well as in her stockings, she has some decayed birch wood, ground to a fine powder, that her hands and feet may remain dry throughout her lifetime.

The Eskimo values this circumstance because of the frequent occasions on which they are exposed, and which, in extremely cold weather, sometimes means freezing them. In her stocking she also wears next to the skin the horny soles cut off from the porcupine's feet that, during after life, her footwear may never wear out.

Around her waist she wears a cord, tying the drawers, on which are strung the heads of femurs of the porcupine. These are sawed off from the bone and perforated for the purpose, and a supply of them are always on hand. Besides this, she wears another porcupine cord of a peculiar nature. When a porcupine is killed and its bowels are taken out, they contain the feces in small round balls distributed along the intestine, and about three or four inches apart. The guts and contents are put to dry in this condition; and when a girl "goes apart" one of these strings is given to her. She sews it inside of a belt which she wears around her waist during the period of sequestration.

These cords are to enable her to bring forth children without difficulty. The porcupine of all animals known to the natives is the one that has the easiest parturition. It lays the young without effort, just momentarily interrupting its walk to deliver itself of them, and then resuming its motions as if nothing had happened.

The porcupine cords are intended to make the women porcupine-like in this important function. The Eskimos are convinced that they possess in this a great secret, and that the women of the white race suffer so much in labor because they do not know this.

To the same end, if during a woman's sequestration someone kills a female porcupine with young, the feti are given to the woman, who slips them within her shirt and makes them slide through down to her feet to obtain the porcupine facility of delivery. She is allowed no fresh meat during the whole month, except the flesh of porcupine.

Dried meat, fish, and marrow constitute her diet.

She cannot drink from the common cup, but has her own tableware and uses no other. She sucks water through a swan's bone, which is afterward tied around her neck. It serves, together with the parkie, to acquaint others of her condition.

A menstruating woman cannot sleep with her husband, more especially if he is young. She makes her bed apart from his, and both husband and wife sleep with their blankets over their heads that the effluvia of femininity may not pass from her to him and blast his manly abilities. After the flow is over she has to wash herself from what may remain. If, however, she should happen to be very busy, as during the salmon run, it is sufficient for her to wash her head very carefully.

The menses represent to the native mind the life-giving principle; hence, it is much used as a medicine.

The substance is at times obtained by washing in a basin of water rags soiled with it. The liquid is then used as a lotion to bathe young children or even administered to them as an internal remedy. Mothers believe that by so treating their children they preserve them from disease, although the reverse frequently happens.

I remember such a case at Mouse Point, a village on the Yukon; where a healthy child was made to drink some of this medicine and the following morning it was seized with an eruptive fever which, within twenty-four hours, had covered the whole body with red patches. Soon, however, the fever subsided and the patches turned into running sores, which did not heal for nearly a year.

In these would-be medical practices the mother always obtains the soiled rags from some other woman, never using her own, the idea appearing to be that the child has already received her entire stock of vital power; so she draws on others.

Now these people are quite faithful in their observance of these superstitions and others. Of course, individuals may disregard them at times, but they will never do so openly, and take care to persuade themselves and others as well that they are observing the customs even while acting against them. One may safely say that they tend to maintain a certain standard of morality.

When the savage is brought into contact with whites and begins to disregard these superstitions, unless something can be substituted the contact with our civilization invariably proves fatal to the race. I hope at some future time to take up other customs, especially those concerning pregnancy and childbirth.

CLINICAL NOTES AND CASE REPORTS

MULTIPLE NEUROFIBROMATOSIS*

By HARRY J. MAYER, M.D.
Los Angeles

AS contributions to the literature on von Recklinghausen's have multiplied, no longer is multiple neurofibromatosis, a fibroblastic diathesis with early optic nerve involvement, considered a rare disease. However, the case to be described is regarded as the earliest optic nerve involvement in neurofibromatosis to be recorded.

REPORT OF CASE

Mrs. Z. R., an American, aged 43, whose chief complaint, on admission to the out-patient department of Cedars of Lebanon Hospital in Los Angeles on January, 1935, was failing vision.

Past history showed treatment from 1925 to 1927 for pulmonary tuberculosis, and the surgical removal of, in 1918, the appendix; in 1926, one cystic ovary; in 1928, a small breast growth and tonsils; and in 1930, fibroid uterus and the other ovary. In May, 1931, radium was applied to a keloidal growth in the abdominal surgical scar. On August, 1931, a diagnosis of Dupuytren's contracture was considered in connection with a flexion of the right ring finger, to the flexor tendon of which adhered a firm nodule.

Important findings in the family history are: Father had a progressive loss of vision, beginning in his youth, becoming totally blind at the age of fifty-six. The paternal grandfather, who died at the age of eighty, had a growth with contraction of hand, his vision also being gradually lost.

On physical examination the patient showed a slightly generalized pigmentation of the skin. The pupil of the left eye was larger than that of the right eye, reacting more sluggishly to light. The visual acuity of the left eye was reduced to 20/200, that of the right eye to 20/50. The visual fields were found to be concentrically and markedly contracted, no fundus lesions being demonstrable. The deep reflexes were markedly exaggerated throughout. A soft subcutaneous nodule, two centimeters in diameter, was concealed at the scalp line behind the right ear; a smaller and much firmer nodule adhering to the flexor tendon of the right ring finger. Evidence of keloidal growth in abdominal surgical scar persisted.

The histopathologic diagnosis on biopsied nodule was neurofibromatosis.

Since 1930, laboratory findings, including blood Wassermann tests, studies on the cytology and chemistry of the blood, and three spinal fluid examinations, have been essentially negative.

Repeated roentgenologic examinations of the skull, cervical, dorsal, lumbosacral spine, thorax, shoulder, hand, gastro-intestinal and genito-urinary tracts, failed to disclose any pertinent anatomical change.

Treatment, which consisted of deep x-ray irradiation, resulted in temporary symptomatic and objective visual improvement.

COMMENT

Penfield's concept of von Recklinghausen's as a diffuse disease, with connective tissue proliferation in the nerve sheaths and the secondary formation of tumors, is illuminating.

Neoplastic connective or cicatricial tissue has the physical property of contracting upon ageing. The result in multiple neurofibromatosis is a pres-

* Read at staff meeting, Cedars of Lebanon Hospital, January 20, 1936.

sure atrophy of nerve fibers, with early loss of function.

A fibroblastic diathesis is apparent in this patient's family history, dermatologic manifestations, with confirmation in the histopathology of surgical specimens. Collectively, the findings described may be regarded in the light of a constitutional predisposition in which multiple neurofibromatosis is a disease entity.

1930 Wilshire Boulevard.

ANAPHYLAXIS FOLLOWING THE USE OF PITUITARY EXTRACT

By R. A. KOCHER, M.D.

Carmel

THE phenomena of protein sensitization, and of anaphylaxis resulting from a subsequent parenteral administration of the specific protein, have long been recognized. No case of anaphylactic reaction following the use of pituitary extract, so far as I am aware, has appeared in the literature. Since, therefore, I recently witnessed a severe reaction of this kind in a patient treated by hypodermic injections of United States Pharmacopeia solutions of pituitary, it seems worth while to report the experience.

REPORT OF CASE

B. K., a woman, aged 40, had had measles, chickenpox, and scarlet fever as a child. Infestation with *Entameba histolytica*, for a period of ten years, finally was completely cured six years ago with no demonstrable sequelae. Occasional mild attacks of influenza. Tonsillectomy in 1920. Otherwise, in good health. Physical examination revealed no pathology. Leads an active domestic life, has two children, ages four years, and five months, respectively. Both cesarean deliveries. The patient had never experienced an attack of urticaria, hay fever, asthma, or any other allergic condition. On May 18, 1936, she suffered an attack of herpes zoster, with four patches of cutaneous vesicles involving some of the endings of the lower branches of the right cervical plexus. There were no symptoms of any primary condition to account for the herpes, with the exception of fatigue as the result of a period of overactivity occasioned by the care of her two children. Encouraged by the favorable results reported in recent years in the use of pituitary extract for the treatment of herpes zoster by Sedlick in 1930,¹ Niles in 1932,² Somers and Pouppirt in 1935,³ and by personal previous experience in two cases, I decided on its use in the present case. Following the method described by Somers and Pouppirt, this patient was given an initial injection of 0.2 cubic centimeter of posterior pituitary extract (U. S. P. ampoule, Squibb). There was no unfavorable reaction; this was followed in one hour with 0.5 cubic centimeter. There was a fleeting pallor and tremor following the injection, and considerable relief of pain. This dose was repeated in three hours, and during the following two days, injections of 0.5 cubic centimeter as pain reappeared; the intervals varied from two to four hours. By the end of the third day a total of 5 cubic centimeters of surgical pituitrin had been given, the pain had greatly subsided and the vesicles had begun to dry up.

On the sixth day, following the last injection of pituitary, and at about 4 p. m. the patient noted the appearance of four or five urticarial wheals about one-half centimeter in diameter, with intense itching, on the flexor surface of both forearms. By 8 p. m. similar scattered wheals appeared on all parts of the trunk and extremities. At five o'clock the following morning I was called and found the patient in shock, covered from head to foot with scattered

giant urticarial wheals; the largest, on the buttocks at the site of the original injections, measured 5 to 10 centimeters in diameter. There were nausea and vomiting; pulse 140, thready; blood pressure, 80/50; temperature, 97 degrees Fahrenheit. There was slight chill; patient complained of pain in the joints, intense itching, and a feeling she was going to faint. She was immediately given a hypodermic injection of epinephrin, one cubic centimeter, to which she responded within a few minutes by relief of the nausea and vomiting; improvement in pulse, rate 100, fair volume; blood pressure, 110/70. The intense itching and burning of the urticaria were not much relieved by the epinephrin. Along with soothing lotions and starch baths, injections of epinephrin, 0.5 cubic centimeter, were given at intervals of three to four hours. Giant urticarial wheals appeared in fresh crops about every six to ten hours, preceded by nausea and vomiting, ultimately involving every square inch of the body surface, not missing the vulva, rectum, scalp, palms of hands, and soles of the feet. By the end of four days the urticaria began to abate, and within twelve more hours had entirely disappeared, leaving a slight edema of the face for an additional twenty-four hours.

COMMENT

At the time of delivery of her last baby five months previously, this patient had received repeated injections of posterior pituitary extract for the control of uterine contraction as well as gas pains. There is no doubt that these were the sensitizing doses of pituitary. Pituitary extract contains the water-soluble principles from the fresh posterior lobes of the pituitary body of cattle. Whether any precautions are taken in the preparation of this extract to exclude water-soluble proteins or their derivatives, I do not know. In any event, it seems most probable that accompanying proteins rather than the active pituitary principle are responsible for the sensitization and subsequent anaphylactic reaction described. It has been mentioned that this patient had never before experienced an allergic reaction of any kind. Furthermore, there is nothing in her recent history, habits or behavior to lead one to suspect any other substance than pituitary extract as the offending agent.

SUMMARY

A woman, age forty, otherwise in good health, was treated for herpes zoster by injections of posterior pituitary extract. Six days following the last injection of pituitary, she suffered an attack of anaphylactic shock, characterized by nausea, vomiting, fall in blood pressure, rapid, thready pulse, painful joints, and generalized giant urticaria. She was treated by injections of epinephrin and after four days of intense suffering made a complete recovery. Sensitization to pituitary (probably contaminating proteins) at time of childbirth, five months previously.

PREPARATION OF CATHETERIZATION

I. PATHOLOGY AND DIAGNOSIS

EDWARD W. BEACH, M.D. (Medico-Dental Building, Sacramento).—*Historical Notes.*—Few surgical instruments boast the hoary antiquity of the lowly urethral catheter, and perhaps no single instrument has proved a greater boon generally nor afforded suffering mankind more relief. If we could but conjure a sort of retrospective television, or borrow Eric Bell's "Televisor" and thereby slip chronologically backward into possibly the fourth dynasty, we might behold our noble predecessor, old Imhotep himself, armed with a hollow metal instrument (not historically authenticated), bending over some unfortunate Egyptian in the throes of acute urinary retention. Somewhat later we could applaud the dexterity of the Hindu medico with his metal sonde (as related by Hessler) and follow the catheter's modification and development into the era of Hippocrates. Soon we might witness the advent of the non-metallic or flexible tube among the Arabs. Successively, as the centuries rolled swiftly by, we might study with amazement the bizarre types of catheters which made their appearance notably with the development of the lithotomy operation after the time of Ambroise Paré, and marvel at the unique materials, other than base metals, which were used to fabricate these early-day catheters. Then, if the modern aseptic conscience could withstand the shock, particularly anent catheter accessories and various embellishments, we might later watch with interest the importation of rubber into Europe, and see how quickly this new substance was adapted to the old principle of catheterization.

Taken all in all, it appears logical to assume that the procedure of catheterization must have antedated the Vedāngas, and yet it begins authentically, notwithstanding, in this period. Slowly at first, progress concerned itself with refinement of these pristine instruments as to form, size, shape, and contour, as well as intrinsic composition. With the dawn of aseptic comprehension, thanks to Pasteur and Lord Lister, the improvement in technique now came quickly to the fore. As a net result, today the physician possesses a wide assortment of catheters ranging in size, shape, composition, and structural design, which is sufficient to master almost any deviatory quotient, and the operation is performed aseptically. Indeed, the urethral catheter has now become as common and almost as indispensable to the profession as the carbon radical to the benzene series.

The invention of the first urethral catheter undoubtedly hinged upon the urgent necessity for relief. Even today the catheter still renders its

greatest service, and is most useful to the general profession as an emergency agent for relief of acute urinary retention. For the urologist, however, aside from this retention phase, the urethral catheter becomes a veritable factotum in the urologic domain, so wide and diversified is its application both as to treatment and diagnosis. Considered purely from the diagnostic standpoint, the catheter comprises a sort of ridgepole which offers support for the entire ensemble and about which much of the other urologic structure is draped. In fine, the catheter constitutes a virtual "runner-up" to the cystoscope, and offers the urologist an "open sesame" to the diagnostic realm, through which medium certain priceless information is educed which would be difficult or impossible to obtain in any other way. This diagnostic information may be gleaned directly from behavior of the catheter itself (*e. g.*, with urethral strictures), or indirectly with the catheter merely an intermediary agent for consummation of a definite objective (*e. g.*, the cystogram). Some of this diagnostic information possible of acquisition by means of the urethral catheter might be tabulated as follows:

(1) *Concerning the Urethra and Adnexa*

(a) Anent the penile, bulbous, and membranous portions of the urethra: The catheter may, at the outset, detect some urethral anomaly, *e. g.*, a diverticulum, etc. Again, strictures are common about the bulb (especially the venereal type), but these accrue, likewise, in the penile portion. The position, number, type, caliber of luminal diminution, and some idea as to the extent may all be roughly ascertained with the catheter. The catheter is particularly valuable in the "straddle" injury to determine the position, extent, and degree of urethral damage. This injury most often involves the membranous portion, and is usually incomplete, *i. e.*, catheterization is possible.

(b) Anent the pars prostatica: A stricture here, which is rare, usually means tuberculosis or lues. A general decrease in caliber may mean cancer. With prostatic hypertrophy, the prostatic urethra is usually lengthened and its anatomical conformation distorted, contingent upon the portion or portions of the prostate most implicated in the growth. In the precystoscopic era, for diagnostic purposes it was customary to measure accurately the length of the posterior urethra (the distance from the external sphincter to "water," which is normally about 4 centimeters) by calibrations upon the catheter. Any increase in length of this portion of the urethra was indicative of hypertrophy, and the degree of the latter commensurate with the former. An excellent idea of the prostatic lobe or lobes most involved in the

hypertrophy may be adduced from the urethral encroachment, or hence from the type of catheter (Nélaton, Wishard and stylet, Coudé, bicoudé, overcurve, etc.) which is necessary to treat of this architectural deviation and override the given impediment. With use of the catheter and radiopaque media, prostatic urethrography and a study of bladder-neck topography are easily managed. This procedure is particularly informative before and after transurethral resection, for comparison as to tissue removed, anatomical reconstruction, end-results, etc.

(2) Concerning the Bladder and Bladder Neck

(a) By means of the bladder urine: A catheterized specimen is often essential for diagnosis notably with regard to identification of the offending organism and for cultural study, not to mention determinations of the pus and erythrocytic content. The presence of residual urine is easily established with the catheter. Residual urine usually means vesical neck obstruction, but may connote nerve dysfunction or be indicative of diverticulum. Foul, ammoniacal residual urine suggests stone. A metal catheter may elicit the pathognomonic "click."

(b) By means of the bladder capacity: A bladder capacity under 150 cubic centimeters denotes contracture, while an increase above 600 cubic centimeter means bladder atony. Some idea of the bladder tone can also be acquired in this procedure by the force of the return flow from the urethral catheter. Prior to the development of the roentgen ray this capacity determination had great diagnostic value in suspected bladder rupture.

(c) By means of cystography: The catheter is essential to this procedure. Valuable diagnostic aid is furnished by this maneuver, especially in obstructive lesions about the vesical orifice, *e. g.*, posterior valves in children, contracted vesical neck in the middle-aged, and true prostatism in the aged, etc. Cystography is also of value in the diagnosis of vesical tumors and diverticuli, and especially by contrast pictures in the latter. Cystography is of the greatest importance in suspected vesical injuries, to confirm the presence of bladder rupture and to indicate the location.

(d) By means of the cystometer: The catheter is necessary in this procedure, which comprises a technical method for accurately measuring the intravesical pressure, with a specially constructed manometer (usually the Rose device). Several readings are taken at specific intervals and a graph constructed to be contrasted with the normal. This is the best method, to date, for differentiation of the usual myogenic atony of the bladder contingent upon pure obstructive phenomena from that type of bladder atony dependent solely upon nerve changes. Sometimes, however, these two conditions coexist with confusion of the picture. When defective enervation is present, the cystometer may also help to distinguish which of the three nerve groups, viz., pelvic, hypogastric and pudendal, is at fault. Much knowledge remains undiscovered in this field and most specifically as

to evaluation of sphincter tonus (both internal and external) in its relation to that of the detrusor.

From this brief outline, one immediately appreciates the exalted position which the ancient and lowly urethral catheter has come to assume in the sphere of modern urologic diagnosis.

* * *

II. TREATMENT

HENRY A. R. KREUTZMANN, M. D. (2000 Van Ness Avenue, San Francisco).—The various conditions in which catheter treatments are important are:

1. Retention due to (a) prostate abscess; (b) urethral stricture; (c) hypertrophied prostate.
2. Rupture of posterior urethra.
3. Cord injury.

There are many types and shapes of catheters. For general purposes, a No. 18F. or 20F. Robinson catheter is excellent. It is a soft rubber catheter with two eyes. The tip has a depression into which a stylet can be inserted without danger of it slipping out and perforating the urethra.

The most common catheter used in women is made of glass. There is always danger of its becoming cracked on boiling and breaking off after insertion. Another disadvantage is the fact that it will promptly fall out if not constantly held in place. The ideal catheter for women is the Furniss metal catheter. It is shaped to fit the female urethra and is self-retaining.

There are two types of retention catheters. They are the mushroom or Pezzar, and the winged or Malecot catheters. The latter are either two- or four-winged. The four-winged is the better, as there is less chance of its slipping out of the bladder. The retention catheters are used following cystostomy. They are not to be inserted through the male urethra.

In women the Malecot catheter is excellent for urethral drainage, as it produces less irritation *in situ* and its removal causes little discomfort.

Prostatic Abscess

Acute retention following prostatic abscess is nearly always a complication of an acute gonorrheal urethritis. Although instrumentation during a gonorrheal infection is contraindicated, these cases are an exception. A small coude woven catheter has the proper stiffness, and its tip has the proper angle to ride over the bulging prostate with a minimum of trauma and pain. It should be used in preference to either a soft rubber or metal catheter.

Urethral Stricture

Acute retention usually results from the complete closure of a strictured area following either an alcoholic or sexual debauch, or both. One may be assured that strictures in these men are severe, of long duration, and that treatment has been greatly neglected. It is inadvisable to attempt to open up the stricture with either sounds or metal catheters. There is great danger of producing false passages or of perforating the urethra.

Attempts to empty the bladder should be made with the smallest size (10F.) woven catheter with a coudé tip, or the smallest sizes (4-6F.) straight olive-tipped, woven catheters. Too much instrumentation with these catheters will do real damage, therefore one should not persist too long in attempting to pass them. It is better to insert threaded filiforms to which a woven Phillips urethral catheter, size 8-10F., is attached, after successfully passing one filiform through the strictured area.

Hypertrophied Prostate

The purpose of catheters in these cases is twofold:

1. To relieve acute retention.
2. To institute drainage preparatory to operation.

The first attempts to relieve acute retention in prostatics should be made with a small size (10 to 12F.) soft rubber catheter. If unsuccessful, either a woven coudé or bicoudé catheter should be tried. Metal catheters are contraindicated on these patients. When all other catheters have failed, a No. 6 olive-tipped ureteral catheter will often slip by the obstruction. A ureteral catheter is also very helpful in long-standing cases of obstruction where the bladder is greatly dilated, and sudden complete emptying may result in renal hemorrhage, shock, and even death. The small lumen of a ureteral catheter assures very slow emptying of the bladder, thereby preventing any of the complications just mentioned.

Preliminary drainage of the bladder with an indwelling catheter is an essential procedure in preparing patients for prostatectomy. Some urologists use a No. 18 or 20F. soft-rubber catheter tied in the urethra. In patients with a sensitive urethra this cannot be tolerated. There is also the possibility of epididymitis developing if the vasa are not first ligated. Therefore, many surgeons perform a two-stage prostatectomy, preferring to drain the bladder suprapubically with a Pezzar catheter.

If the bladder is greatly distended, one can pass a No. 20 Malecot catheter, stretched on a straight stylet, through a trocar which has been inserted into the bladder through the space of Retzius. A silkworm gut suture through the adjacent skin is tied about the catheter, thereby preventing its accidental removal. By this method there is no leakage of urine around the catheter, and the patient need not be hospitalized. This does away with a preliminary cystostomy, but should not be attempted where the bladder capacity is less than 500 cubic centimeters, as the trocar may perforate the bowel.

Rupture of Posterior Urethra

This condition usually results from an accident. Attempts should be made to pass a No. 22 to 24F. soft-rubber catheter. If the avulsion is not severe, the catheter will pass readily. If the catheter will not pass easily, stop all manipulations, as continued efforts will only increase the tear in the urethra.

It is better to open the bladder suprapubically and pass a catheter retrograde from the internal sphincter through the meatus. A soft-rubber catheter of the same size is tied to the tip of the one in the urethra. The catheters are then pulled out of the suprapubic wound until the openings of the second one are in the bladder. The two catheters are then cut apart and the bladder is closed around a Pezzar catheter. The urethral catheter is left *in situ* for two weeks or more, depending on the amount of urethra torn.

Cord Injury

Complete bladder retention resulting from injury to the cord is usually treated by intermittent catheterization. Sooner or later cystitis will develop, followed by pyelitis or pyelonephritis.

If the physician has the courage, he will refrain from any catheterization. For some time the bladder will be greatly distended with overflow incontinence. In time, however, automatic emptying of the bladder will result and urinary infection will not complicate the primary condition.

General Consideration

Physicians should at all times regard catheterization as an important surgical procedure. It should be performed only under proper aseptic conditions such as thorough cleansing of the meatus and the use of sterile towels, gloves, instruments, and lubricant.

In prostatitis and patients with urethral stricture, some urinary antiseptic should be given for several days beforehand.

Urethral chill is a frequent complication of catheterization. It can often be aborted by the oral administration of urinary antiseptics; by giving quinin every four hours for a short time before and after treatment, and by irrigating the urethra with an antiseptic solution before passing a catheter.

* * *

III. CATHETERIZATION OF THE FEMALE

ADOLPH A. KUTZMANN, M. D. (1930 Wilshire Boulevard, Los Angeles).—Catheterization of the female should be a simple procedure, but so complex has it been made with awkward and unnecessary preparations that it has become almost akin to a major operation in some institutions. This complex procedure is the result of two facts, the complicated standard technique as taught in training schools for nurses and the unnecessary preparation, almost bordering on fanaticism, demanded by many physicians to avoid supposed contamination, a presumed cause of cystitis.

Catheterization of the female is and should be kept a simple procedure. The extensive use of sterile towels covering the thighs, abdomen and bed, and excessive washing of the external genitalia pubes and vestibule are not necessary. The catheter, if it is of the proper type and skillfully handled, will never come in contact with these surfaces. The use of much cleansing fluid, such as green soap, 1-1000 mercury bichlorid solution, will leave the patient in a pool of contaminated

water, as well as a collection of unclean fluid in the posterior fourchette; exception to this may be in the case after vaginal surgery or during the puerperium. The use of the male soft-rubber catheter leads to awkward and painful catheterization. Consider the fact that the female urethra is about $1\frac{1}{2}$ inches long, semi-crescent in shape. If the long catheter is used it must be gathered in a sterile gloved hand or permitted to drag along. It should be passed about $1\frac{1}{2}$ to 2 inches, but it will not remain in place, slipping out because of the weight of the very long portion left outside. The natural reaction, therefore, is to keep pushing in such a catheter until about 4 to 6 inches are in the bladder. This will cause a loop to be formed against the bladder wall, resulting in pain. If an irrigation or instillation is to be given by the syringe method, such a kinked or looped catheter will tend to straighten out under the pressure, thereby enhancing the pain to the point of distress, and even trauma. Should the funnel gravity method be used, the fluid would probably not enter the bladder because of the kink in the catheter. To avoid this with the long, soft-rubber catheter, it must be constantly held in the proper place with one hand, thereby handicapping the skillful carrying out of the procedure when an instillation or an irrigation is to be given. The use of female catheters, 18 to 20 French in size, either glass, metal, or woven silk, with the proper shape and contour, will easily eliminate such troubles. The use of the short, stiff female catheter is always under complete control during the act of catheterization. The end of the catheter need never be touched by instrument nor hand, but directly passed into the bladder to the proper distance and without any difficulty. Because of their shape they will usually remain in the proper position of their own accord. The use of pyrex-glass catheters, and their careful examination prior to insertion, will avoid the chance of breaking. Should it be wished to eliminate this element of the danger of breaking, the metal or silk-woven catheter may be used. I believe that the danger of glass catheters breaking has been exaggerated. But one such case has been observed by the writer, and this was due to the permitting of an inexperienced student nurse to catheterize a pregnant woman, an obvious mistake.

The simple catheterization of a female may be carried out as follows: The patient is placed flat on her back, in the lithotomy position, either on a table or the bed. If the latter, the legs are pulled up and bent outward, thereby obtaining a position similar to the lithotomy. The attendant's hands should be thoroughly washed. If right-handed, stand to the right of the patient, if in bed. With the fingers of the left hand, the labia are spread apart so as to obtain a good view of the external urinary meatus. A good light should always be available. With the right hand, and using a good soft piece of cotton, dipped in a mild mercurial solution (1-1000 solution mercuric cyanid, merthiolate, oxycyanid of mercury or any other good mercurial solution), the vestibule is cleansed, washing from above downward, each time dis-

carding the used cotton. If it is necessary to let the labia fall back in place, a piece of cotton dipped in the cleansing solution is first placed in the vestibule. Then using a stiff female catheter (glass, metal, or woven silk), the cotton is removed and, again holding the labia apart, the catheter is inserted about two inches, utilizing gentle pressure and carefully following the urethral curve. Since the female catheters are shaped, they will usually remain in place without holding, permitting the use of both hands to carry out an irrigation or instillation. Keeping the procedure of catheterizing the female simple will, therefore, be less likely to result in a bladder infection. It is the traumatizing of the urethra and bladder, with the permitting of prolonged bladder distention or the overlooking of a urinary residual that really result in cystitis. Too often the nurse or house physician is unnecessarily blamed by the attending physician because of the lack of understanding this simple procedure of catheterization. Nothing predisposes to bladder infection as much as trauma, obstruction, residual, and distention. It is well-nigh impossible to infect a normal bladder, except possibly with the gonococcus.

Shortage of Radium.—The National Radium Trust was established in 1929 with a capital of \$1,250,000, contributed by the public to provide radium for the treatment of disease. The trust appointed a National Radium Commission to distribute the radium to hospitals and clinics. In the report for the year ended July 1936, just published, the Commission states that, in order to secure efficient radium service for the country it will be necessary for the present radium centers to extend their work, new centers will have to be formed, and further supplies of radium are required. At most of the centers there has been a tendency to replace the interstitial and intracavitary use of small quantities of radium by the application at a distance of large quantities of radium. This method has led to many of the centers pressing the Commission for more radium. The report records much progress at almost all the centers and high level of initiative and zeal, which will go far toward solving the grave problem of the Commission. The trend of present-day experience indicates the advantages in certain cases of cancer of combining radium and x-ray treatment. It is calculated that in this country about forty thousand persons are suffering from cancer in those accessible organs in which radium may be of value, but that only eight thousand obtain the treatment.—*A. M. A. London Correspondent.*

Elaborate Preparations Against Attacks with Poison Gas.—Britain will soon be the first country in the world to have gas masks available for the whole of the civil population of the capital. Scientific and technical experts have worked out a difficult and new problem: how to produce a simplified and improved gas mask, which can be made by the million by mass production methods. At a factory established by the government, the output will soon be half a million masks a week, and it is proposed to make thirty million, sufficient for the whole civilian population. The components of a gas mask are a light metal container filled with activated charcoal, several pieces of wire gauze, a thick wad of absorbent cotton, some layers of muslin fabric, metal springs, and a rubber mask or face piece into which the container is fixed. The mask fits securely under the chin, over the mouth, cheeks, and eyes. A cellulose acetate window permits vision. The mask is fixed to the head by easily fitting elastic straps.—*A. M. A. London Correspondent.*

Yet all experience is an arch where through
Gleams that untraveled world whose margin fades
Forever and forever when I move.

—Alfred Tennyson

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

CALIFORNIA MEDICAL ASSOCIATION

ASSOCIATION ACTIVITIES

DUES! DUES! PAYABLE BEFORE APRIL FIRST

Unless your 1937 dues to your County and State Association are paid to your county secretary, this will be the last issue of this publication that you will receive while being in arrears.

The by-laws provide that members whose dues are not paid on April 1 shall be placed on the roll of delinquent members, the JOURNAL shall be discontinued, and all membership privileges and rights suspended.

Hence the query: Have you paid your 1937 dues? If not, *remit them today* to your county secretary and thereby remain in good membership standing.

These are serious days and times. Grave questions confront the profession as a whole and members individually. There are some three hundred bills before the present session of the Legislature that affect every individual practicing physician. United action and support is necessary to prevent undesirable, unwise, and harmful enactments. Your committee and officers are intensely active in guarding your personal and professional interests.

The least you can do is to remit your dues so as to benefit from this representation. Write that check today and see that it reaches your county secretary within twenty-four hours.

SPECIALTY EXAMINING BOARDS

The latest advice from the Council on Medical Education and Hospitals is that the following examining boards in the medical specialties have been fully approved by the Council: American Board of Dermatology and Syphilology; American Board of Obstetrics and Gynecology; American Board of Orthopedic Surgery; American Board of Pediatrics; American Board of Psychiatry and Neurology; American Board of Radiology; American Board of Urology; American Board of Internal Medicine.

* All articles listed under the caption, "This Month's Topics," have been written and sent to the Editor by the Association Secretary, Dr. Frederick C. Warnshuis.

This action was authorized by the House of Delegates of the American Medical Association, which invested control of special examining boards and the formulation of standards to be met in this Council.

ETHICS OR ETIQUETTE

It is interesting to think of the relations between ethics and etiquette. The most satisfactory definition is: "The science of human duty." Etiquette is defined as usages of professional intercourse. Science of duty conveys the thought of authority and permanence. Usages of professional intercourse may vary at different times and places. Ethics is compelling, while etiquette is persuasive. They are so closely related that neither can be ignored in the practice of medicine without serious loss. The disregard of them is the occasion of many complaints, much bitter feeling, disrupted friendship, lifelong enmities, and even personal violence.

If the public fails to give the medical profession the degree of respect and confidence to which it is entitled, if the attitude of many intelligent and worthy people to us is one of criticism and distrust, if we fail to inspire sentiments of grateful appreciation, may it not be that we are responsible and that the cause lies in our disregard of professional ethics and etiquette?

The duty that a medical man owes to his profession has greater claims upon him than any other duty. None of us is above criticism, and we cannot expect to receive more courteous treatment than we accord to others.

It behooves us all to give considerable thought to the ethics and etiquette of our conduct as we pursue our vocation and come in contact with fellow men.

DEL MONTE SESSION, MAY 2-6

This issue has a supplement which contains the official program and Pre-Convention Bulletin for the Association's annual session in Del Monte, May 2-6.

Members are invited to carefully read the program and annual reports. The program is very creditable, and contains many interesting subjects that will be presented by capable guests and California clinicians. It is an educational, postgraduate series of papers, discussions, and scientific demonstrations. No member can lightly conclude that he cannot afford to attend or carelessly pass up this annual session. Members should embrace this opportunity for their personal and professional good.

Hotels.—Ample hotel accommodations, all within a few minutes from Hotel Del Monte, are and will be available. Write to Mr. Carl Stanley, Manager, Hotel Del Monte, Del Monte, California; tell him the accommodations you desire. Mr. Stanley is in charge of all hotel reservations in Monterey Peninsula, and will provide you with acceptable, comfortable hotel service. Better write today.

Determine to attend the Del Monte session. Reread the program supplement of this issue. Surely, you will feel the urge to attend.

OUR INVITED GUESTS

Our annual sessions have always been characterized by the presence of distinguished national clinicians who take prominent part in the scientific program. The array of distinguished guests for this year's annual session is indeed notable: William C. Woodward, Jesse G. M. Bullowa, Cyrus Cressey Sturgis, and Norman F. Miller.

Our Association is extremely favored this year in having outstanding guest speakers from without the State participate in our scientific program for the Del Monte

annual session. They are known well and favorably in our medical world. An extended biography or write-up of each guest is not indicated nor is it necessary. Consequently, only a brief statement is being made in regard to the professional background of each one of our invited guests.

W. C. Woodward, M.D. Doctor Woodward requires no introduction. Holding the degree of Doctor of Medicine and Bachelor of Law, he has most efficiently served the profession as director of the Bureau of Legal Medicine and Legislation of the American Medical Association. Sufficient credit cannot be given him for his conscientious and efficient services. Doctor Woodward will bring us the last word upon Social Security legislation and enactments both Federal and State. His address before the third general meeting will be of vital interest to every member.

Jesse G. M. Bullova, M.D., New York City. The following are personal data regarding this guest speaker. Born October 19, 1879, in New York City. A.B. at the College of the City of New York. M.D. at Columbia University, College of Physicians and Surgeons, 1903. Internship: Montefiore Hospital, Mount Sinai Hospital, Willard Parker Hospital, and Sloane Hospital for Women, all of New York. Teaching appointment: Clinical Professor of Medicine, New York University College of Medicine. Hospital appointments: Visiting physician, Harlem Hospital; visiting physician, Willard Parker Hospital; consulting physician, New York Infirmary for Women and Children; and consulting serologist, Long Beach Hospital.

Cyrus Cressey Sturgis, M.D. Born in Pendleton, Oregon, April 2, 1891. B.S., University of Washington in 1913; M.D., Johns Hopkins University in 1917. Medical house officer of Peter Bent Brigham Hospital, 1917-1918; First Lieutenant, Medical Corps, United States Army, 1918-1919; assistant resident physician, Peter Bent Brigham Hospital, 1919-1920; resident physician, Peter Bent Brigham Hospital, 1920-1922; teaching fellow in medicine, Harvard Medical School, 1920-1922; faculty instructor in medicine, Harvard Medical School, 1922-1925; associate physician, Collis P. Huntington Memorial Hospital, 1925-1926; assistant professor of medicine, Harvard Medical School, 1925-1927; physician, Peter Bent Brigham Hospital, 1925-1927.

Present positions: Professor of medicine, University of Michigan Medical School, director, Thomas Henry Simpson Memorial Institute for Medical Research; director, Department of Internal Medicine, University Hospital.

Society memberships: Association of American Physicians; American College of Physicians; American Society for Clinical Investigation; Central Society for Clinical Research; American Association for the Advancement of Science; American Clinical and Climatological Association; Washtenaw County, Michigan State, and American Medical Associations.

Doctor Sturgis will conduct the Clinical-Pathological conferences at the second general meeting, and will present a paper before the Section on General Medicine.

Norman F. Miller, M.D. Was graduated from the University of Michigan Medical School in 1920. From then until 1926 served as instructor and assistant professor in the Department of Obstetrics and Gynecology at the University of Michigan.

In 1926 became affiliated with the University of Iowa, where he served as associate and later as professor of obstetrics and gynecology. In 1931 returned to the University of Michigan as professor and head of the Department of Obstetrics and Gynecology.

Doctor Miller will present a paper at the first general meeting and before the Section on Obstetrics and Gynecology.

DEL MONTE MEETING: PAST PRESIDENTS ADVANCE REASONS FOR ATTENDANCE

Why attend annual sessions of the Association? Past presidents advance reasons why members should attend. If these are not sufficiently inducive, please refer to the supplement of this issue, note the speakers on the programs for scientific sections and general meetings and then ask yourself if you can afford to miss this opportunity of hearing the latest and practical in the medical world.

Ample hotel accommodations for all in first-class hotels in the Monterey area, five to fifteen minutes from the meeting places. Write today to Mr. Carl Stanley, Hotel Del Monte, Del Monte, California, who is in charge of all reservations, and ask him to assign you the accommodations you desire. But now read what our past presidents say. (Their replies are responses to a letter from the Association Secretary.)

FROM DR. JOHN C. KING: PRESIDENT IN 1909

I enclose copy as requested. Take my own medicine? Well, I am too deaf to hear the proceedings; too deaf to participate in conversation, even with the aid of my acousticon; too courteous to burden my friends with the annoyance of trying to make me hear. No complaint! At eighty-four one is entitled to some disability. Then, too, one gets lonely when old friends have departed. Of course, I have many among the younger set; young fellows like George Kress, Will Roblee, Joe King, Paul Ferrier, lots of others. But why bore them with my deafness? Hope you will have a rousing meeting and that will not be due to numbers alone.

* * *

We are selfish. Attendance pays. Professional success, financial and other, depends much on the support, respect and friendship of colleagues. State meetings afford opportunity to acquire one or more of these. "It is more blessed to give than to receive." Give a paper, discussion, appreciation, the friendliness of one's presence.

* * *

FROM GEORGE H. KRESS: PRESIDENT IN 1916

Annual sessions of our State Medical Association provide the environment in which, while renewing our allegiance to the guild of the healing art, we at the same time move forward, individually and collectively, in greater attainment of the scientific, fraternal, and organization objectives to which we have pledged our best efforts.

* * *

FROM JOHN H. GRAVES: PRESIDENT IN 1921

Reasons why members should attend the annual meeting:

1. More knowledge of recent progress in medicine and surgery can be gained in less time, with less effort than in any other way.

2. To preserve established friendships and create new ones.

3. To cooperate with colleagues in supporting measures that will protect the ideals of the profession and improve our service to the sick.

* * *

FROM EDWARD N. EWER: PRESIDENT IN 1925

The California Medical Association's annual meeting affords excellent opportunity to keep in touch with medical science progress. It is in constant movement.

Medical ethics, however, rest upon a foundation of right conduct among ourselves and in our public relations. There is little change in right and wrong. So go to the meeting and see if the officers and delegates you have elected are protecting this foundation against destructive termites from within and without.

* * *

FROM WILLIAM H. KIGER: PRESIDENT IN 1928

Would like to urge all members who possibly can to attend the annual meeting in Del Monte, for it is the best way to keep in touch with the activities of the Association. It is very vital during these troublesome times that the membership know what the State Association is trying to do for its members to help them solve many of their problems (professional and economic) that are confronting the profession.

* * *

FROM MORTON R. GIBBONS: PRESIDENT IN 1929

It seems to this writer that the advantages of attending California Medical Association conventions must be obvious. We must put first the opportunity to acquire new knowledge, hear men tell of their own work, and to discuss unsettled points.

A vacation, a few days relief from responsibility, especially with the consciousness that the patients at home

will grant such leave more readily than one for pleasure alone.

Renewal of friendships and improving of acquaintance-ship is pleasant and inspiring.

And not the least, the wives of the members have a very good time in a very agreeable environment.

* * *

FROM LYELL CARY KINNEY: PRESIDENT IN 1930

There are two reasons why we should go to Del Monte.

First: This is the yearly opportunity offered by the State Medical Society for reeducation, to keep abreast with medical progress and to find inspiration for doing better medicine.

Second: Violent changes in medical practice threaten us in California. We should be with our delegates while they are considering these problems so that they may know and follow the wishes of the entire membership in their decision.

* * *

FROM JOSEPH M. KING: PRESIDENT IN 1932

I regret that I have been so busy since receiving your letter of February 20 that I have not had the time to formulate a worth while fifty-word statement as you request, but there are many of the other past presidents so much more gifted in this sort of thing than am I that you doubtless will have all the copy you will need.

I shall be at the past presidents' breakfast Tuesday morning if I arise early enough; rather doubtful, in view of the fact that there are no single accommodations available in the convention hotel. I am, it seems, to put it mildly, a rather vigorous snorer, and so I do not inflict my infirmity on others.

* * *

FROM C. G. TOLAND: PRESIDENT IN 1934

It is very necessary that all members of the California Medical Association make a real effort to attend the meeting at Del Monte in May, 1937.

The officers, councilors, and chairmen of the standing committees feel that this is an opportunity for you to hear of the activities of the Society and to express, through your delegates or personally, your opinion on important matters that will be discussed. A great deal of hard work has been done, especially by our Legislative Committee, the results of which you should hear first-hand.

FROM ROBERT A. PEERS: PRESIDENT IN 1935

I am just in receipt of your letter of February 20, and I am enclosing herewith a short statement for the April JOURNAL.

✓ ✓ ✓

"Iron sharpeneth iron; so a man sharpeneth the countenance of his friend."—Proverbs 27:17.

Contact between medical men at our annual meetings sharpens the intelligence, promotes increased enthusiasm, and sends the participants home prepared to practice better medicine. It also makes for better fellowship. Be sure to attend the Del Monte meeting.

REDUCED RAILROAD RATES TO DEL MONTE

Arrangements have been made whereby members traveling by train may secure reduced rates on railroad tickets to Del Monte.

To secure this reduction a certificate must be presented to the agent at the time when the ticket is purchased.

Members can obtain these certificates by sending a *self-addressed stamped* envelope and request to the Association's headquarters, 450 Sutter Street, San Francisco.

MEDICAL SOCIETY OF THE STATE OF CALIFORNIA Notice to Members

The annual meeting of the Medical Society of the State of California will be held in Hotel Del Monte, Del Monte, California, at 4:15 p. m. on Wednesday, May 5. Meeting room will be announced on the bulletin board.

All members are urged to attend. Annual reports will be rendered and important matters considered.

F. C. WARSHUIS, *Secretary*.

WHY INSURANCE PREMIUMS ARE HIGH

Case 1: "Had I seen the eye one day earlier I could have saved it." *Sic*.

Case 2: "It was poor technique and not good practice."

Case 3: "Unlicensed physician was allowed to administer light and heat therapy in a doctor's office during illness of the doctor; result, severe burns."

The remark and opinion in Case 1 caused a \$50,000 damage suit to be filed against a very competent physician. The testimony of one physician in this suit caused a nineteen-day trial, a jury disagreement, attorney fees for the defense over \$3,000, and another trial yet to be defended. Carelessness in Case 3 in entrusting the patient's treatment to an unlicensed *locum tenens* agent has caused a suit for heavy damages. These cases occurred quite recently.

Suits, large verdicts, and expensive court procedures, in many instances due to unwarranted opinions, unsubstantial testimony, failure to employ due care, failure to call consultants, neglect in not obtaining x-rays, poorly kept records, and careless comments and opinions, cause malpractice suits and high premium rates for indemnity insurance.

You may not be a defendant today, but you are liable to be tomorrow. That liability will increase as long as physicians neglect to protect themselves against carelessness; as long as physicians will express unfounded opinions and give unwarranted testimony in favor of a plaintiff who seeks to make capital out of fabricated circumstances, and just so long insurance premiums will be exorbitant. When will medical men learn?

NORTH AND SOUTH GOLF TOURNAMENT IN DEL MONTE

This annual tournament will be revived in Del Monte on Sunday, May 2. Entries should be sent to Doctor Morgan, who issues the following declaration:

Dr. Robert W. Langley,
Los Angeles, Calif.

Dear Doctor:

We hereby issue a challenge to the Southern California Medical Golf Association for a North vs. South golf match to be played at Del Monte beginning at 12 noon on Sunday, May 2, 1937, the first day of the State meeting.

The State tournament is on Tuesday afternoon, but we cannot wait that long for a shot at the South. I trust that you remember that we have in our possession the trophy (the beautiful North-South plaque) which we won at our last meeting at Santa Barbara.

In order to give you some chance of winning and to show our charitable intent, we shall permit you to play any doctor whether he belongs to your association or not. We shall even permit you to play refugees from the flood and drought areas.

Daring you to reply and hoping that all of your scratch players develop dermatitis, I am

Medically yours,

JAMES W. MORGAN,
Secretary, Northern California Medical Golf Association.

FOUR CENTS PER DAY!

Under the initials of "L. D. R." the Westchester, New York, Medical Bulletin publishes these figures.

If you read a morning and evening paper, this costs \$30.10 per year.

If you smoke two ten-cent cigars a day, you spend \$73 per year. Five packs of cigarettes per week cost \$39 per year.

Your automobile insurance ranges from \$90 to \$160 per year.

If you indulge in a snack of Camembert and crackers before going to bed five nights a week, your revelry may reach \$35 per year.

To these we would add:

One cocktail before dinner daily.....	\$ 36.50
One highball (good stock) daily.....	54.75
And add one for wife or guests.....	164.25
Shaving cream (scented) and lotion.....	15.00
Chewing gum, two packs per week.....	5.65
Mints, two rolls per week.....	5.65
Two golf balls per week.....	78.00
One movie per week (self).....	31.20

Why figure further. The point is that we all exceed these expenditures, think nothing of it, and yet we do like to "rant and holler" about medical society dues. Use fifty-cent golf balls and cuss them as you play, but you will save sufficient on this one item to pay your county and state dues, without need for further holler. Your loss or winnings at the noon-hour bridge game will more than pay your annual medical dues.

Oh heck! Why figure or comment further? Incidentally, your dues were payable April 1 to avoid loss of membership. Have you sent your check to your county secretary?

C. M. A. DEPARTMENT OF PUBLIC RELATIONS†

Public Education

In outlining suggestions for activities that will bring about better understanding on the part of all peoples our thoughts are of that wider province of the physician that lies beyond the laboratory, the hospital, and the consultation room—the education of the public at large.

DeWitt Clinton Poole, discussing propaganda, observes: "Scientific propaganda has invaded every strata of society and government. It no longer constitutes a curiosity, but instead has caused a feeling of alarm on the part of those who think with honesty of purpose as to the future welfare of society. These thinkers have noted the influence that is being exerted by minority high-pressure groups, organized and vocal, because of their effectual use of propaganda." To which thought we add propaganda for selfish ends.

Public health education movements cannot be classified as propaganda. The ends sought are not selfish or for personal gains for a minority group. Their purposes are the enhancement and conservation of the health of all peoples and all classes for the good of all society and government.

To educate the public so that it may reap the benefits of better health and physical well-being is not the sole responsibility of the medical profession. It is a joint responsibility to be assumed by the public, its representatives, and the members of the medical profession. By means of joint effort this responsibility can be discharged. It appears, however, that the initiative must be assumed by the medical profession.

For a number of years, medical organizations have sought in a more or less orderly and sometimes disorderly manner to undertake that initiative. Much has been accomplished, but much still remains to be done to enable the public to ascertain the possibilities of life.

"The perfection of communications—press and radio—has stimulated an interest on the part of perceiving, but not necessarily an intelligent and discretionary mankind in social relations and life. They are commencing to look up and beyond their immediate environment." They are beginning to see others and are comparing standards of living. Envy is creating demand, but again, the demands are not intelligent or based upon sound principles and facts. Education as to accepted principles and facts is the need of these days. To accomplish this the physician must assume an active rôle beyond that of his professional work, as stated in the opening paragraph.

What are the desirable educational means. At this time they can only be enumerated; specific details will be forthcoming:

1. Public lectures on health and scientific medicine before lay groups, Farm Bureaus, Parent-Teacher Associations, women's clubs, luncheon clubs, etc.

2. Public health hours in physicians' offices for preventive medicine and diagnostic physical examinations for those who are unable to assume the regular financial costs.

3. Radio broadcasts.

4. Personal education of patients by the attending physician.

5. Literature and texts in public libraries.

6. Public Health Institutes.

7. Sound local and State legislation, through education of local and State officials and legislators by members of county medical societies.

8. Interest in civic affairs.

As Poole also states: "Ever-widening millions are being raised from the politically negative condition into dynamic political units. It is not merely in an engineering sense that we are passing into a higher and higher-powered age. The dynamics of political action are being intensified in at least the ratio of our concomitant technologic advancement. Society is growing volatile and explosive to a degree we may not yet fully appreciate. Rightly directed the new forces can carry us into an empyrean of universal well-being and contentment. Misdirected, perverted by selfish or unenlightened leadership, it can lure us suddenly into the abyss."

The responsibility of education and right direction must be brought about by the initiative of the medical profession acting through the individual doctor. Is this being recognized by you and your county medical society? If not, will you, member, initiate the program of your county society to educate your public as to sound policies relating to medical care?

"They Who Said It Couldn't Happen"

A negro sought a lawyer to obtain a divorce, and the following conversation ensued:

"That woman talks too much—she just talks, talks, talks all the time and I can't stand it no longer."

"Well, what does she talk about?"

"Why, she doan say."

For a score of years there has been talk, talk and writing, writing upon the one subject variably designated as state medicine, health insurance, medical service plans, panel systems, governmental medical care, and social security. During the past few years the subject has been considered under the somewhat vague term of "medico-economics."

By means of resolutions, surveys, formulation of principles, and attitudes, the quest has been to assure ourselves that "it couldn't happen." Talk, talk, sporadic outbursts, and even condemnations of groups and individuals, temporarily afforded a flimsy sense of security. There was generated a sense of certainty that medicine and its disciples would be able to resist outside or governmental invasion into our ranks and insure the continuation of the conditions under which medical care was being provided.

But—"it has happened." As has recently been said: "Whether you like it or not, Social Security plans are here to stay." "Our only course open now is to coöperate and seek to shape and guide as best we can."

The cry is commencing to be heard: "Why didn't someone foresee this?" "Why were we not prepared?" "Where did we lack in foresight?" "Why was this not foretold?" "Little do we remember that the basic and only absolute certainty is the uncertainty of the future. Of one thing only can we be sure—that we cannot foretell the order of events, or whether or not they will occur."

"Foresight is not foreseeing, but the effective adjustment of conduct by matching probabilities against significant possibilities. Usually the possibilities that are significant to us are not those that we know *will* happen, but those that *have* happened; and the probabilities that we hope or fear will be realized are those that have been experienced in the past. Our sense of both the possibilities and the probabilities is largely a derivation of the past. It is not foresight, but projected hindsight." One need but review the yesterdays and their events to confirm this statement and obtain the answer as to why it *did* happen while there were those who said "it couldn't happen."

Now the query arises as to what problems the new program will create. Somebody has got to solve these problems. How?

Surely, we all hope that they will be solved by the application to the new conditions of the old principles of

† The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. Charles A. Dukes of Oakland is the chairman, and Dr. F. C. Warnshuls is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. F. C. Warnshuls, Room 2004, Four Fifty Sutter Street, San Francisco.

justice out of which grew our institutions; but to do that we must understand those principles, their history, their spirit, their capacity for extension and their right application. Upon this principle your Council and committees are earnestly engaged in developing and creating a program and policy for our members. This policy and program is being transmitted to county society officers for presentation to the members of their organizations. The request is made that every member become conversant with their provisions and conform to their application. "Whether you like it or not" is repeated because unless there is manifested a full coöperation attitude, each non-coöperating member is bound to lessen the possibility of acquiring satisfactory adjustments and conditions in the social security program of government.

Remember, "It can happen." By cohesive unity untoward, undesirable happenings may be minimized. Cease talking. Act!

Annual Reports

This issue contains the annual report of the Committee on Public Relations as well as the reports of other standing committees that are concerned with public affairs and relations. Members should read all of these reports. To not trespass too greatly upon your reading time, the articles in this department are being limited. Read the Pre-Convention Bulletin and program contained in the Supplement.

Committee on Public Relations

A meeting of the Committee on Public Relations was held in San Francisco, February 27, 1937.

1. Present: Chairman C. A. Dukes, M. R. Gibbons, F. B. Clarke, J. B. Harris, D. Crosby, Howard Morrow, Hartley Peart, Howard Hassard, F. C. Warnshuis, Louis Packard, and T. Henshaw Kelly.

2. *Resettlement Administration.*—The Director reported upon his interview with the Regional Director of the Federal Resettlement Administration. The Administration is desirous of establishing a policy for medical service for the clients of the Administration. A conference is to be held in Los Angeles on March 2 relative to seven-teen family State projects.

Pending further action by the Council and the House of Delegates, the Director was instructed, on motion of Dan Crosby, seconded by J. B. Harris, to recommend that the Administration set up a budget for medical care for each resettlement region and that there be free choice of physicians. That arrangements be made to pay for medical services on a fee schedule similar to the Los Angeles Water Department employees or the San Fernando plan under the supervision of the County Medical Society, and thus provide for the direct payment of the physician.

3. The annual report of the committee was approved. The Director was instructed to attach Dr. Lyell Kinney's report as an appendix. Upon motion of M. R. Gibbons, seconded by J. B. Harris, the Chairman was directed to present a suitable gift of appreciation to Doctor Kinney during the Del Monte session.

4. The Director reported upon his conference with the Chief of the License Division of the State Highway Traffic Department relative to physical standards to be met by automobile drivers applying for license. The State Division requests appointment of a committee to recommend these standards and to act in a medical advisory capacity.

On motion of M. R. Gibbons, seconded by Dan Crosby, the Chairman and the Director were authorized to appoint this committee.

5. *Speakers' Bureau.*—The Director recommended that a speakers' bureau be created. The Director reported upon weekly requests being received from lay organizations for medical speakers. He cited the Los Angeles Speakers' Bureau. He stated that he had filled some of these requests personally and had after much difficulty been able to secure members to fill these engagements.

On motion of Dan Crosby, seconded by J. B. Harris, the Director was instructed to take steps to address a special letter to county societies requesting them to formulate speakers' bureaus and to create an Association Central Speakers' Bureau.

Doctors Dan Crosby and T. Henshaw Kelly suggested that it was highly important that a corps of fifteen to twenty-five well-informed members be enlisted upon legislation and other important pending questions that are of public concern.

On motion of Dan Crosby, seconded by Fred B. Clarke, the Director was authorized to pay from the Committee's budget fund the expenses of speakers who requested reimbursement where engagements required hotel or extraordinary travel expense.

6. *Venereal Disease Educational Movement.*—The Director indicated the need and desirability of formulating a sustained program of public education on venereal disease and coöperation with the Special Committee of the State Association, of which Doctor Morrow is chairman.

Upon motion of Dan Crosby, seconded by J. B. Harris, the Chairman was authorized to appoint a special subcommittee to confer with Doctor Morrow's committee, to outline a plan, to prepare publicity items, and to report at the next meeting.

The Chairman appointed Dan Crosby, J. H. Graves, and Fred B. Clarke on such committee.

7. *Cancer Campaign.*—The Chairman called attention to the public cancer education campaign to be held in March. On motion of M. R. Gibbons, seconded by F. B. Clarke, the Committee recommended the coöperation of county societies.

Adjourned, to meet in Del Monte.

C. A. DUKES, *Chairman.*

F. C. WARNSHUIS, *Director.*

COMPONENT COUNTY MEDICAL SOCIETIES

HUMBOLDT COUNTY

The Humboldt County Medical Society met on the evening of March 4 at the General Hospital, with President Allan R. Watson presiding. Twenty members were present, and two guests—Doctors Matthew Hosmer and Howard Brown of San Francisco.

The Legislative Committee, headed by Doctor Norman, reported that they were active and ready to carry out any instructions that may come to their attention, of any new legislation.

Doctor Hosmer presented a paper on *Neuralgias and Pains From Ear, Nose, and Throat Conditions*. Doctor Brown discussed *Neuralgias and Pains From a Neurologist's Side of the Question*.

These papers were very much enjoyed, and all present voted it one of our best meetings.

LAWRENCE A. WING, *Secretary.*

✱

SACRAMENTO COUNTY

The regular meeting of the Sacramento Society for Medical Improvement was called to order by the president, Dr. Raymond Wallerius, on February 16 at the Auditorium on Twenty-ninth and L streets. There were seventy-seven members and guests present.

The speaker of the evening, Dr. Eugene S. Kilgore, Professor of Medicine at the University of California, gave a very interesting and informative talk on *Coronary Occlusion: Its Symptoms, Diagnosis, and Treatment*. The differential diagnosis between real anginal pain and false anginal pain was first discussed in some detail by Doctor Kilgore. The subject of coronary occlusion and thrombosis was then presented, with special emphasis being placed upon some of the newer ideas in treatment, *i. e.*, use of the oxygen tent early in the attack; the use of small doses of quinidin, to prevent further attacks; and vasodilator drugs during the acute attack. Discussion by Doctors Gundrum, O. Johnson, Scatena, Reardan, and Pulford.

Dr. J. B. Harris, Chairman of the Legislative Committee of the California Medical Association, gave an interesting *preview* on the present legislature, stating that there are 3,897 bills in at present, 7 per cent of which (260 bills) concern the medical profession. Thirty-three bills pertain to the Medical Practice Act.

The application of Dr. E. R. Cole for transfer from the Fresno County Society was read for the first time.

The minutes of the last Board of Directors meeting were read and approved. Doctor Harris suggested that the two resolutions presented be sent to the Council of the California Medical Association for approval.

Doctor Scatena reported that the Banquet Committee was doing splendidly, and that the banquet would be held at the Sutter Club. A good program was assured by the committee.

GLENN E. MILLAR, *Secretary*.

✽

SAN DIEGO COUNTY

The San Diego County Medical Society begs to report the following news items:

February 9—Dr. S. J. McClendon, Society President, presented Dr. J. B. DeLee, who was guest speaker to perhaps the largest gathering ever attending our monthly medical dinners. Past presidents of the San Diego County Medical Society were special guests of honor. Doctor De Lee's subject, *Fetal Birth Injuries*, was well received. February 9 was also Ladies' Night.

✽ ✽ ✽

February 23—San Diego Galen Club, Dr. Paul E. Wedgewood, President, presented a symposium on *Chest Disturbances*. Doctors M. J. Hogan and R. A. Schneiders read papers. Dr. R. H. Sundberg presided as chairman.

✽ ✽ ✽

March 1—The Society met at a special dinner, honoring Dr. Walter Schiller of Vienna, Austria. Doctor Schiller's discourse dealt with *Endocrinological Aspects as Related to Gynecology*.

✽ ✽ ✽

Dr. W. H. Geistweit was reappointed to the California Board of Medical Examiners.

F. E. TOOMEY.

✽

SANTA BARBARA COUNTY

The regular meeting of the Santa Barbara County Medical Society was held in the Bissell Auditorium, Monday evening, March 8.

The secretary read a communication from the Police and Fire Commission, in which they asked for the names of members who would be willing to conduct sobriety tests at the police station. A panel of three will be selected for a six months' service at \$25 per month each.

Doctor Johnson introduced the speaker of the evening, Dr. John McKenzie Brown of Los Angeles, who gave an extremely interesting, instructive, and timely talk upon *Simusitis in Children*.

The paper was discussed by Dr. Pierre Voile of Los Angeles and Doctors Profant, Johnston, Lamb, Howard Eder, Hunt, Henderson, Means, and Mellinger.

The meeting was well attended and greatly enjoyed by all.

Doctor Jones of the Santa Maria branch asked the secretary to notify the membership that their branch wished to have the regular May meeting at Santa Maria under their auspices, promising their usual enjoyable time.

WILLIAM H. EATON, *Secretary*.

✽

VENTURA COUNTY

The regular monthly meeting of the Ventura County Medical Society was held at the Saticoy Country Club on Tuesday, March 9.

A report of the second annual Secretaries' Conference was given by the secretary. It was moved by Doctor Osborn, seconded by Doctor Shore, that the secretary be commended for the completeness and clarity of the report. Carried.

A plan of ethical advertising as a society was presented by Mr. Dunnigan of the *Ventura Star*. In the discussion following, the members present were favorable to the idea, but felt that it should be carried on in the various newspapers of the county, rather than in just a single newspaper. Doctor Hendricks appointed Doctor Shore to investigate the cost of advertising in the various newspapers throughout the county and suggest a plan for carrying on the campaign.

It was moved by Doctor Strong, seconded by Doctor Osborn, that the secretary be instructed to write a letter to the members who were not present at the meeting, outlining the plan and asking for a definite expression of an opinion from them. Carried.

It was moved by Doctor Neilsen, seconded by Doctor Bardill, and unanimously carried, that Dr. Thomas W. Hagerty be accepted as a member of the Society.

The meeting was then turned over to Doctor Shore, the program chairman, who introduced Doctors Moore, Walker, Wells, and Witten of the County Hospital. They presented a *Symposium on Gynecologic Cases From the County Hospital for the Past Year*.

A. A. MORRISON, *Secretary*.

CHANGES IN MEMBERSHIP

New Members (52)

Alameda County.—John James Hayes, Harold E. Roe.

Butte County.—Myrtle A. Cummings, C. E. Plumb.

Contra Costa County.—James Alison Cary.

Fresno County.—George T. Hoskins, George W. Olson, Madge Peirsol, Eliot Sorsky, K. L. Stout.

Kern County.—J. M. Krevitt.

Kings County.—E. C. Bond, P. K. Edmunds, Charles T. Rosson, Jr.

Los Angeles County.—Charles A. Bailey, Elmer J. Ball, Leon P. Belous, Ralph W. E. Bledsoe, F. Earl Brown, Stanley S. Bruechert, Willard T. Conley, H. C. Crumrine, William G. Durnin, Vincent P. Flynn, J. Edison Goldsmith, Ralph R. Greenspoon, John Hromadka, Abraham Marians, Tesla Nicola, Fenn E. Poole, Samuel Reznick, Lawrence A. Schueler, Samuel Shore, Bernard Silver.

Mendocino-Lake County.—F. J. Morley.

Merced County.—Raffaele Moretti.

San Diego County.—Bert A. Dannenberg.

San Francisco County.—Edward Campion, George C. Esker, Jr., Jean S. Feldheim, Webb Haymaker, Jay Jacobs, Jess P. Jacobson, E. Horace Klabunde, Leon M. Michels, Bernard Strauss, Jesse H. West.

San Mateo County.—Gordon Morrison, Milton F. Novotny, Phillip Seeley.

Tulare County.—F. Lynn Smith.

Ventura County.—Alexander W. Cruden.

Transferred (8)

John H. Childrey, from Santa Barbara County to San Mateo County.

Edwin R. Cole, from Fresno County to Sacramento County.

Fritz Held, from Orange County to San Bernardino County.

Elliott P. Smart, from Los Angeles County to San Joaquin County.

Frank P. Topping, from Sacramento County to Monterey County.

Paul A. Werthmann, from Merced County to San Joaquin County.

F. W. Yocum, from San Luis Obispo County to Stanislaus County.

Resigned (1)

Coleman A. Block, from San Francisco County.

In Memoriam

Busby, James Leslie. Died at Pasadena, February 23 1937, age 46. Graduate of the Ohio State University College of Medicine, Columbus, Ohio, 1913. Licensed in California in 1929. Doctor Busby was a member of the Los Angeles County Medical Association, the California Medical Association, and the American Medical Association.

✦

Tomlinson, Richard Frank. Died at San Francisco, March 13, 1937, age 64. Graduate of Hahnemann Medical College of the Pacific, San Francisco, 1900, and licensed in California the same year. Doctor Tomlinson was a member of the San Francisco County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION†

Del Monte Annual Session

The convention in Del Monte is the thought uppermost in the minds of many of the Auxiliary members, and they will be pleased to learn that our national president, Mrs. Fitzgerald, intends to be present at that time. The convention will be held the first week in May, and much thought has been given all details by Mrs. John Hunt Shepard, who is the convention chairman. Monterey and Santa Clara auxiliaries are assisting her in every way. The convention program is published elsewhere in this JOURNAL.

It is with great regret that Mrs. Weil tendered her resignation as president-elect, but unavoidable circumstances caused her to change her plans. The Auxiliary is very fortunate in having Mrs. Hobart Rogers accept the vacant position. She has been recording secretary, and is familiar with the work of the organization and is most capable to discharge the duties of president. Let us all give her our support and help to make her administration a success.

The April edition of *The Courier* will be mailed to each Auxiliary member during the first week in April or earlier. If anyone does not receive a copy, please notify me or Mrs. Harry O. Hund, 400 Grand Avenue, San Rafael, and a copy will be sent at once.

MRS. ROBERT M. FURLONG,
State Publicity Chairman.

News Letter

Dear Auxiliary Members:

The question is often asked, "How can we interest more doctors' wives in our organization?" And my answer is, "Do not spend too much time trying to sell an idea to an quality of personnel that makes any organization succumb. The majority of people have fixed ideas by the time they are twenty-five or thirty. It is not quantity, but quality of personnel that makes any organization successful."

Never forget that we are auxiliary and our only purpose for organization is to serve the profession to which our husbands belong. Keep in mind also that our National Auxiliary has adopted certain policies and that if we work together as a national unit we can achieve more for the profession in a large sense than by concentrating all of our strength on local activities.

Men cannot rise to their highest and best capabilities unless their wives, too, possess the idealism of their profession. Yes, the wives of doctors need training also—training in character, training in intellectual poise, and training to live this rôle of doctor's wife.

MRS. DAVID S. LONG,
First Vice-President, National Auxiliary.

Component Auxiliaries

Alameda County

The Woman's Auxiliary to the Alameda County Medical Association held a special luncheon on February 12 at the Claremont Country Club, honoring Mrs. Andrew J. Thornton, State President, and Mrs. Willard H. Newman, State Corresponding Secretary.

Before the luncheon a reception was held for the one hundred members and guests assembled. The tables were gay with spring flowers, which had been arranged by the general chairman for the afternoon, Mrs. A. A. Alexander and her committee.

†As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Robert M. Furlong, Chairman of the Publicity and Publications Committee, Linden Lane, San Rafael. Brief reports of county auxiliary meetings will be welcomed by Mrs. Furlong and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the editor to allocate two pages in every issue for Woman's Auxiliary notes.

Following the luncheon, Mrs. Clarence Page introduced the honored guests, as well as the local members of the State Board, Mesdames Hobart Rogers, Charles Hall, and Frank Makinson.

After a brief business meeting Mrs. Thornton gave a splendid talk, giving highlights of other auxiliaries of the State, and complimenting the Alameda County Auxiliary on their Public Health Institute held in 1935. She emphasized the need of increasing Auxiliary membership through the influence of the individual member, and asked that the need of forming auxiliaries among unorganized counties be stressed when the opportunity arose at the coming State convention. Influence could also be used among laymen to correct and guide opinions where public health matters are concerned, and unlimited opportunities to serve are to be found when important legislation is pending.

The afternoon concluded with a delightful musical program—a trio of violin, piano, and cello—played by Mesdames Milton Shutes, Beau Mark Palmer, and Herbert Stoltz, all Auxiliary members. They played a Mendelssohn trio for an opening number, and "Moment Musicales" by Schubert as an encore. MRS. JOHN O'HANNESON,
Publicity Chairman.

Los Angeles County

The Woman's Auxiliary to the Los Angeles County Medical Association met on Tuesday, February 23, at the Pacific Coast Club in Long Beach, with 123 members present. President Mrs. Clifford A. Wright presided.

The luncheon tables were bright with red, white, and blue decorations, arranged by the Long Beach committee.

Honor guests were the wives of Navy doctors. The only speaker was Mr. Ben Read, who discussed pending legislative measures in which the medical profession is interested.

Immediately after lunch the group was conveyed to San Pedro, and from there in waiting water taxis to the U. S. S. *Relief*, hospital ship of the Navy. This was an unusual treat to all the members, and much credit is due the Long Beach committee, headed by Mrs. F. B. Settle, who arranged it. MRS. ROBERT L. CARROLL.

Marin County

Mrs. Andrew J. Thornton of San Diego, State President of the Woman's Auxiliary to the California Medical Association, and Mrs. Willard H. Newman, also of San Diego, who is State Secretary, were honored guests at the luncheon and meeting of the Woman's Auxiliary to the Marin County Medical Society at the Meadow Club on February 11.

Mrs. Harry O. Hund, President of the Marin Auxiliary, entertained the two distinguished visitors at dinner at her home on Grand Avenue.

Mrs. Thornton spoke on the work of the Auxiliary and its plans. A musical program was presented by the Marin Junior College Octet, under the direction of Clinton Lewis.

Santa Clara County

The February 8 meeting was a luncheon, held at the San Jose Country Club, forty-two members being present. Honored guests and speakers were: Mrs. Andrew J. Thornton, State President, and Mrs. Willard H. Newman, State Corresponding Secretary of San Diego. Mrs. Thornton painted a verbal picture of the history and organization of the medical auxiliaries and stressed the importance of a well-functioning social and educational group.

A letter was read from the American Association of University Women, inviting members of the Auxiliary to hear Dr. Leo Eloesser of San Francisco, recently returned from a three months' stay in Russia, speak on *Medical Education, Care and Organization in the Soviet Union*.

Mrs. Charles E. Moore, President, announced March 1 was selected by the Auxiliary committee for an informal dinner dance to be held at the San Jose Country Club for members and their husbands.

Mrs. John Hunt Shephard, Chairman of the State Convention, to be held at Del Monte in May, urged all members to take an active part in the various committees.

MRS. DANIEL BILKER,
Publicity Chairman.

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, Atlantic City, New Jersey, June 7-11. Olin West, M. D., 535 North Dearborn Street, Chicago, Secretary.

California Medical Association, Del Monte, May 3-6. F. C. Warnshuis, M. D., 450 Sutter Street, San Francisco, Secretary.

✓ ✓ ✓

American College of Physicians, St. Louis, April 19-23. Mr. E. R. Loveland, 4200 Pine Street, Philadelphia, Executive Secretary.

Arizona State Medical Association, Yuma, April 1-3. D. F. Harbridge, M. D., 15 East Monroe Street, Phoenix, Secretary.

Association of Western Hospitals, the Association of California Hospitals, and the Western Conferences of Catholic Hospital Association, Los Angeles, Biltmore Hotel, April 12-15. Secretary, Hotel Whitcomb, San Francisco.

Western Branch of American Public Health Association, Phoenix, Arizona, April 13-15. William P. Shepard, 600 Stockton Street, San Francisco, Secretary.

Medical Broadcasts*

American Medical Association

The American Medical Association and the National Broadcasting Company are presenting the second series of dramatized health broadcasts, under the title, "Your Health." The first broadcast in the new series, the thirty-second dramatized cooperative broadcast under the title "Your Health," was given October 13, 1936. The theme for 1936-1937 differs slightly from the topic in the first series, which was "Medical Emergencies and How They Are Met." The new series is built around the central idea that "one hundred thousand American physicians in great cities and tiny villages, who are members of the American Medical Association and of county and state medical societies, stand ready, day and night, to serve the American people in sickness and in health."

The program will be on the Blue network.

The time of the broadcast is Tuesday afternoon, one o'clock, Pacific time.

The topics are announced monthly in advance in *Hygeia*, the health magazine, and three weeks in advance in each issue of the *Journal of the American Medical Association*.

✓ ✓ ✓

San Francisco County Medical Society

A radio broadcast program for the San Francisco County Medical Society for the month of April is as follows:

Tuesday, April 6—KYA, 6 p. m.

Tuesday, April 13—KYA, 6 p. m.

Tuesday, April 20—KYA, 6 p. m.

Tuesday, April 27—KYA, 6 p. m.

✓ ✓ ✓

Los Angeles County Medical Association

The radio broadcast program for the Los Angeles County Medical Association for the month of April is as follows:

Thursday, April 1—KECA, 10:45 a. m. The Road to Health.

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to CALIFORNIA AND WESTERN MEDICINE, 450 Sutter Street, San Francisco, for inclusion in this column.

Saturday, April 3—KFI, 9:15 a. m., The Road to Health.
Saturday, April 3—KFAC, 10:15 a. m., Your Doctor and You.

Thursday, April 8—KECA, 10:45 a. m., The Road to Health.

Saturday, April 10—KFI, 9:15 a. m., The Road to Health.

Saturday, April 10—KFAC, 10:15 a. m., Your Doctor and You.

Thursday, April 15—KECA, 10:45 a. m., The Road to Health.

Saturday, April 17—KFI, 9:15 a. m., The Road to Health.

Saturday, April 17—KFAC, 10:15 a. m., Your Doctor and You.

Thursday, April 22—KECA, 10:45 a. m., The Road to Health.

Saturday, April 24—KFI, 9:15 a. m., The Road to Health.

Saturday, April 24—KFAC, 10:15 a. m., Your Doctor and You.

Thursday, April 29—KECA, 10:45 a. m., The Road to Health.

Corrections.—The stenographic report of the Coronado Clinical-Pathological Conference appeared in the March issue (pages 151-157). Much to our regret a number of errors appeared therein: F. Volhard and Th. Farr were written Bolard and Farre; Clifford Allbut was Clifford Orbutt; v. Basch was Bausch; Gull and Sutton appeared Gullen Sutton; Emanuel Libman for Manuel Lipman; Pel-Ebstein for Pel Epstein; Buerke for Bunting.

University of California Medical History Will Be Reviewed.—The history of medicine in California from the time that the Indians experimented with the old reliable Jimson weed, up to the period of deep radiation, ethylene gas and cesarean section, is to be reviewed in a series of seminars at the University of California Medical School, to which all members of the profession are invited. The seminars are to be held under the direction of the Division of Medical History, of which Dr. Langley Porter, Dean of the Medical School, is the head.

The first of the seminars was held on Wednesday, March 24, when Dr. H. Harris, associate professor of clinical medicine, told how the site for the Medical School was obtained and how the first buildings were constructed. On Wednesday, March 31, Dr. E. L. Gilcreest, instructor in surgery, spoke of Dr. H. H. Toland and his work. The school, established by Doctor Toland at the end of the Civil War, became the nucleus of the present imposing Medical Center, and much of the early history of the school revolves around this famous old-time practitioner. On Wednesday, April 14, Dr. W. I. Terry, clinical professor of surgery, will discuss Dr. T. W. Huntington. On April 21, Dr. Chauncey W. Leake, professor of pharmacology, will speak of Dr. James Black, and in the concluding seminar on April 28, Dr. H. C. Moffitt, clinical professor of medicine, will talk on the life and career of Dr. William Watt Kerr. Doctor Huntington, Doctor Black, and Doctor Kerr were outstanding figures in the history of California medicine, doing their work at a time when the establishment of medicine and medical practices on the last frontier vied in interest with the stamping out of banditry and the establishment of some semblance of law and order.

Each of the lectures will be held at 8 p. m. in Toland Hall, in the University Hospital. This hall was named in honor of Doctor Toland, who is the subject of Doctor Gilcreest's talk.

First Federal Old-Age Benefits Payments Certified by Social Security Board.—The Social Security Board today started another chapter in this nation's social legislation history by placing its approval on the first eight claims filed for lump-sum payments since the inauguration of the Social Security Act's federal old-age benefits program on January 1, 1937. More than 24,500,000 wage earners are now accumulating credits toward the monthly annuities for life, payment of which will begin to qualified persons in 1942. . . .

A lump-sum payment is made to a worker who reaches 65, in the event he is not eligible for monthly retirement benefits, or to his estate if he dies before 65. The settlement is made on the basis of 3½ per cent of the wages received after December 31, 1936. A worker is not required to retire at 65 to receive the lump-sum benefit.

The Board explained that every worker, no matter how young he is when he enters employment covered by the act, will receive in benefits more than he has paid in taxes on his wages under the act. The eight claims certified today are for 3½ per cent of wages received. Those who will receive these sums paid a tax of only 1 per cent of their wages.

The Board's actuaries have calculated that claims may be made by 123,000 persons who reach 65 during 1937. The estimated number of claims filed by workers who became 65 prior to 1942 may increase in 1938 to approximately 136,000 and probably will continue to grow slowly until 1942, when a downward trend is foreseen.

The Board expects payment of death claims will increase slowly for a number of years. Actuarial figures place the number of death claims that may be made during the present year at approximately 191,000. In 1938, it is expected that this number may increase to approximately 194,000 and will continue to grow until 1980, when the figure for 1937 will be about doubled.

The payment of lump-sum benefits, the first of which were authorized today, is preliminary to the Social Security Act's major program of monthly old-age retirement benefits, for which payment begins in 1942. Benefits, ranging from \$10 to \$85 a month for life, will be paid to qualified individuals on retirement from regular employment at 65 or over who have received a total of \$2,000 or more in wages earned in five or more different calendar years after 1936 and before reaching age 65.

The number of claims filed for lump-sum payments is increasing, the Board reported, and procedures for prompt settlement are now being developed. Claims may be filed at any of the 100 field offices of the Board for forwarding to Washington or may be mailed directly to the Board in Washington.

The Board stated that its personnel in these field offices throughout the country is now equipped to give assistance to claimants in the preparation of their claims or in securing the information necessary to expedite payment of their claims. It was indicated that the personnel of the Board will be adequate to handle all such cases, so that no claimant will require for this purpose the services of anyone not employed by the Board.

Lane Lectures: 1937 Series.—The twenty-sixth course of Lane Medical Lectures will be delivered by Eugene F. Du Bois, A. B., M. D., Medical Director of Russell Sage Institute of Pathology, Professor of Medicine of Cornell University Medical College, and Physician-in-Chief of New York Hospital, on the evenings of April 5, 6, 7, 8, and 9, at 8:15 o'clock in Lane Hall, Stanford University School of Medicine, Sacramento Street near Webster, San Francisco.

The medical profession, students, teachers, and research workers in medicine and allied sciences are cordially invited to attend.

The Lane Medical Lectures were founded in 1896 by the late Dr. Levi Cooper Lane and have been given as follows:

1896. Sir William Macewen, M. D., Regius Professor of Surgery, University of Glasgow—Surgery of the Brain.
1897. Christopher Heath, F. R. C. S., England, Professor of Clinical Surgery, University College, London—Congenital Malformations, Aneurism, and Other Surgical Topics.

1898. Sir Thomas Clifford Allbutt, M. D., F. R. S., Regius Professor of Physics, University of Cambridge, England—Diseases of the Heart.
1899. Nicholas Senn, M. D., Ph. D., LL. D., Professor of Surgery, Rush Medical College—Topics in General Surgery.
1900. Sir Michael Foster, K. C. B., D. C. L., Professor of Physiology, University of Cambridge, England—History of Physiology.
1901. Sir Malcolm Morris, F. R. C. S., Edinburgh, M. R. C. S., England, Surgeon, Skin Department, St. Mary's Hospital, London—Social Aspects of Dermatology.
1902. Sir Charles B. Ball, M. Ch., F. R. C. S., Ireland, Regius Professor of Surgery, University of Dublin—Diseases of the Rectum.
1903. Oscar H. Allis, M. D., Philadelphia, Pennsylvania. Dislocations and Fractures Involving Larger Joints.
1904. William H. Welch, M. D., LL. D., Professor of Pathology, Johns Hopkins University, Baltimore—Infection and Immunity.
1905. Sir Patrick Manson, K. C. M. G., F. R. S., School of Tropical Medicine, London—Tropical Diseases.
1906. John C. McVail, M. D., D. P. H., Cambridge, Glasgow—Practical Hygiene, Epidemics, and Preventive Medicine.
1910. Reginald Heber Fitz, M. D., LL. D., Hersey Professor of Theory and Practice of Medicine, Harvard University, Boston, Massachusetts—A Consideration of Some Features of the Lymphatic System.
1911. Ernest Fuchs, Professor of Ophthalmology in the University of Vienna—The Importance of Ophthalmology in Its Relation to Systemic Diseases.
1913. Sir Edward A. Schafer, LL. D., Sc. D., M. D., Professor of Physiology in the University of Edinburgh—Internal Secretion.
1915. Frank Billings, M. S., M. D., Professor of Medicine in the Rush Medical College, Chicago, Illinois—Focal Infection.
1917. Simon Flexner, M. D., LL. D., Director of Laboratories, Rockefeller Institute for Medical Research, New York City—Physical Basis and Present Status of Specific Serum and Drug Therapy.
1919. Alonzo Englebert Taylor, Professor of Physiological Chemistry, University of Pennsylvania, Philadelphia—The Feeding of the Nations at War.
1921. L. Emmett Holt, M. D., Sc. D., LL. D., Emeritus Professor of Pediatrics, College of Physicians and Surgeons, Columbia University, New York City—Growth and Nutrition.
1924. Ludwig Aschoff, M. D., Professor of Pathology, University of Freiburg, Germany—Selected Topics in Pathology.
1925. Vittorio Putti, M. D., Professor of Orthopedic Surgery, University of Bologna, Director Rizzoli Institute of Bologna, Italy—Selected Topics in Orthopedic Surgery.
1928. F. d'Herelle, M. D., Professor of Bacteriology, Yale University, New Haven, Connecticut—Bacteriophagy.
1929. Walther Straub, M. D., Ph. D., Professor of Pharmacology, University of Munich, Munich, Germany—Selected Topics in Pharmacology.
1930. Charles R. Stockard, M. D., Ph. D., Sc. D., Professor of Anatomy, Cornell University Medical School, New York City—Constitution.
1933. J. C. Drummond, Sc. D., Professor of Biochemistry, University College, University of London, London, England—Biochemical Studies of Nutritional Problems.
1935. G. V. Anrep, M. D., Sc. D., F. R. S., Professor of Physiology, Egyptian University, Cairo, Egypt—Regulation of the Cardiovascular System.

Doctor Du Bois will give the following lectures:

- Lecture 1
April 5—Heat Production and Heat Loss.
- Lecture 2
April 6—Radiation, Convection and Vaporization.
- Lecture 3
April 7—The Significance of the Surface Area of the Body.
- Lecture 4
April 8—The Regulation of Body Temperature.
- Lecture 5
April 9—Chills and Fever.

Southern California Medical Association.—The next semi-annual meeting of the Southern California Medical Association will be held in Coronado, at the Hotel Del Coronado, on April 9 and 10.

Guest speakers will include Dr. Eugene F. DuBois, Professor of Medicine, Cornell Medical College and Medical Director of the Russell Sage Institute, New York City, and Dr. Hugh Cabot of the Mayo Clinic, Rochester.

This will be an unusually good meeting and a large attendance is expected. Make your reservations at the hotel now.

For further information, write to Robert W. Langley, M. D., Acting Secretary, Los Angeles.

Dengue in 1934-1935.—In 1934 two cases of this disease were reported in San Francisco. These are the first cases reported to have originated in Northern California. While clinically they were typical of dengue, there is the disturbing factor that, so far as is known, no mosquitoes known to transmit the disease have been found in the vicinity of San Francisco. The cases were reported in detail in the *Archives of Internal Medicine*, 56:1067-1096, December 1935, by Dr. G. Cheney.

Cases previously reported are:

In 1922, three cases were reported in Southern California, and imported from the epidemic area in Texas.

In 1929, three cases; 1932, one case; 1933, one case. All these were reported in Southern California, and the diagnosis may be open to some question.

International Congress on Hepatic Insufficiency.

While the Universal Exhibition is being held in Paris, the International Congress on Hepatic Insufficiency will be in session at Vichy on the 16th, 17th and 18th of September, 1937, under the presidency of a member of the Academy of Medicine, Prof. Maurice Loeper, of Paris. It will be divided into two sections: (1) Medicine and biology; (2) Medical, surgical, and hydrological therapy.

Papers will be submitted in the two sections by gentlemen of different countries.

It may be recalled that this congress will be preceded by the Second International Congress on Gastro-Enterology, to take place in Paris on September 13, 14, and 15, 1937, under the presidency of Prof. Pierre Duval, at which two questions will be discussed:

1. The early diagnosis of cancer of the stomach, under the presidency of Professors P. Duval and Gosset of Paris, and of Professor Konjetzny of Berlin.

2. Acute and chronic occlusion of the small intestine: Authors have been selected in England, Belgium, Spain, the United States, Italy, and Poland for papers dealing with this latter question.

Those desiring to attend these congresses may receive information by applying to Dr. Anthony Bassler, 121 East Seventy-first Street, New York City. A large contingent from this country are arranging to go.

Automobile Mortality Summary.—Report by the Department of Commerce Bureau of the Census, Washington, D. C., of deaths from automobile accidents in eighty-five major cities for four-week period ending February 13, 1937, includes, among other cities, the following:

	Total Deaths for—			
	Four Weeks Ending		Eight Weeks Ending	
	Feb. 13, 1937	Jan. 16, 1937	Feb. 13, 1937	Jan. 15, 1936
Total (85 cities)	715	975	486	1,690
Chicago	50	79	44	129
Long Beach	7	7	3	14
Los Angeles	50	77	53	127
New York	78	98	42	176
Oakland	11	6	6	17
Philadelphia	25	35	16	60
St. Louis	11	12	18	23
Salt Lake City	6	5	5	11
San Diego	8	6	2	14
San Francisco	8	7	3	15
Seattle	6	15	8	21
Spokane	0	10	2	10

Poliomyelitis in California, 1934-1935.—In 1934 California experienced its largest epidemic of poliomyelitis, having 3,399 cases, with 110 deaths reported.

During the past ten years we have had three extensive epidemics:

Year	Cases	Deaths
1926	187	30
1927	1,298	224
1928	303	80
1929	171	46
1930	1,903	157
1931	293	48
1932	191	31
1933	170	14
1934	3,399	110
1935	831	67

The age distribution of the cases reported in 1935 was very interesting:

	Cases	Per Cent
Under 1 year	30	0.80
1 to 4 years	505	14.86
5 to 9 years	888	26.13
10 to 14 years	677	19.92
15 to 19 years	334	9.83
20 to 24 years	309	9.09
25 to 34 years	402	11.83
35 to 44 years	145	4.26
45 to 54 years	42	1.24
55 plus	21	.62
Adult	6	0.17
Unknown	40	1.17
	3,399	100.00

Cases by Months—1934

January	25
February	27
March	18
April	38
May	314
June	1,192
July	767
August	429
September	226
October	186
November	104
December	73
Total	3,399

This epidemic has some interesting features. The fatality rate was unusually low—3.2 per cent compared with 8.3 per cent in 1930, and 17.3 per cent in 1927 over previous epidemic years. There is some indication that the disease is less virulent; however, a large part of this reduction in fatality is due to the inclusion of mild abortive cases which previously were not diagnosed and reported as cases. The percentage of paralytics in this epidemic is for the same reason correspondingly low.

Another interesting feature was in institutional outbreaks experienced in Los Angeles and Orange counties. This is unique in the history of poliomyelitis. In the Los Angeles Isolation Hospital during the epidemic of 1934 over 136 nurses, attendants, and doctors contracted the infection. In 1935 over forty-five came down with the same disease. In Orange County during the epidemic of 1934 over sixty cases developed poliomyelitis. No definite explanation of these institutional outbreaks has been given, although it has been suggested that excessive fatigue may have been a factor. There was no indication that isolation technique as is usually practiced was not adhered to by the personnel.

Deaths Due to Accidents in City for—

	Eight Weeks Ending			
	Four Weeks Ending		Eight Weeks Ending	
	Feb. 13, 1937	Jan. 16, 1937	Feb. 13, 1937	Jan. 15, 1936

American Neisserian Medical Society Meeting.—The third annual meeting of the American Neisserian Medical Society will be held on June 8, 1937, in the Senator, Atlantic City.

The program will consist of papers and discussions on the various phases of the management and control of gonorrhea. All who are interested are cordially invited to be present.

The meeting will begin promptly at 10:00 a. m., and will continue through the day. Additional information may be secured from Oscar F. Cox, Jr., M. D., secretary, 113 Bay State Road, Boston, Mass.

Social Security Taxes Now Being Paid.—The federal tax returns required by Title VIII of the Social Security Act are now being filed at a satisfactory rate in the offices of the sixty-four collectors of internal revenue, Commissioner of Internal Revenue Guy T. Helvering recently announced. The commissioner calls attention to the fact, however, that some misunderstanding evidently exists on the part of many taxpayers as to the place to which the returns should be sent and the payments made.

Each employer should file his return on Form SS-1 with the Collector of Internal Revenue for the district in which is located his principal place of business. If the employer has no principal place of business in the United States he should file his return with the Collector of Internal Revenue, Baltimore, Maryland. The tax must be paid at the time the return is filed. Checks, drafts or money orders in payment of these taxes should be made payable to the Collector of Internal Revenue.

Title VIII of the Social Security Act, approved August 14, 1935, imposes an excise tax upon employers and an income tax upon their employees measured by the amount of wages paid on and after January 1, 1937, with respect to employment on and after that date. The rate of each tax for the years 1937, 1938 and 1939 is 1 per cent of the wages paid. The law provides that the employer shall collect the employee's tax by deducting the amount of such tax from the wages as and when paid. The returns now being filed on Internal Revenue Form SS-1 cover the month of January, 1937. Every employer who, during any calendar month beginning after December 31, 1936, employs one or more individuals in a business not specifically exempt from the tax is required to make a return on Form SS-1. The returns for the month of January, 1937, must be filed not later than the end of February.

The taxes imposed by Title VIII of the Social Security Act have created a new class of federal taxpayers, many thousands of whom have heretofore had no occasion to send tax returns and payments to the various internal revenue collectors. This, no doubt, accounts for the fact that some misunderstanding exists on the part of a portion of these taxpayers in regard to meeting their obligations to the Government under the Social Security Act. Some of the returns and moneys are being sent to the Social Security Board at Washington and some of the taxpayers are making their returns to the various field offices of the Social Security Board, while still others have sent their returns and remittances to the Bureau of Internal Revenue at Washington. The Bureau of Internal Revenue states that every possible effort is being made to refer the returns and moneys promptly to the appropriate collectors of internal revenue, where the moneys will be deposited in the designated depository banks and the returns listed for assessment. It is expected that before the end of the month more than two million returns will have been received in the sixty-four collectors' offices.

Prior to the effective date of the taxes, the sixty-four collectors of internal revenue located throughout the United States compiled lists of the persons and firms apparently subject to the tax and distributed blank returns to them. All possible efforts were made to place a blank in the possession of every potential taxpayer. However, it was explained by the Bureau of Internal Revenue that failure to receive a blank return form did not excuse a taxpayer for failure to file his return and pay the tax on time. Any person liable for the tax who failed to receive a form may secure a blank by making a request upon the Collector of Internal Revenue for his district. The law provides penalties both for delinquency in filing the return and for failure to pay within the required time.

Pacific Coast Society of Obstetrics and Gynecology. The next meeting of the Pacific Coast Society of Obstetrics and Gynecology will be held at San Francisco, November 3 to 6, at the Fairmont Hotel.

Menninger Clinic.—Guest speakers at the third annual postgraduate course on Neuropsychiatry in General Practice, April 19 to 24, inclusive, at the Menninger Clinic, Topeka, Kansas, will be:

Dr. Franklin G. Ebaugh, Denver, Colo., professor of psychiatry, University of Colorado Medical School; director of Colorado Psychopathic Hospital; director, division of psychiatric education, National Committee for Mental Hygiene.

Dr. Winchell McK. Craig, Rochester, Minn., of the Section on Neurology, surgical, the Mayo Clinic; associate professor of neurosurgery, University of Minnesota, graduate School of Medicine.

Dr. J. W. Kernohan, Rochester, Minn., pathologist to the Mayo Clinic; associate professor of pathology, University of Minnesota.

Automobile Accident Experience.—Many odd and surprising facts about America's automobile accident experience in 1936 are revealed in a new booklet entitled, "You Bet Your Life," just issued by the Travelers Insurance Company of Hartford, Connecticut. By comparing the hazards of traffic with some of the common forms of gambling, the editors have put forth a clever argument against reckless driving and walking.

The traffic gambler, the booklet points out, is eleven times as likely to be killed or injured in an automobile accident as the holder of a sweepstakes ticket is to win even a small prize. He is thirty-two times as likely to be killed on the highways as the holder of a sweepstakes ticket is to collect a major prize.

The pedestrian who risks all the remaining minutes of his life to save a single minute by crossing the street in the middle of the block, the record shows, is as foolish as the man who would bet seventeen million dollars against one dollar that he could toss a booklet into the air and catch it as it falls. He probably would win, but the small gain would not be worth the tremendous risk. . . .

After analyzing reports of 36,800 fatalities and 967,840 injuries in traffic accidents last year, the company's statisticians point to these interesting and little-known facts about accidents:

Nearly 94 per cent of drivers involved in fatal accidents are male and only 6 per cent female. It does not necessarily follow that women are safer drivers than men, they carefully point out, because adequate data on the relative exposure are lacking.

More than 97 per cent of drivers involved in fatal accidents have had one or more years' driving experience.

More than 75 per cent of all fatal accidents occur when the road is dry. More than 85 per cent of all fatal accidents occur in clear weather.

Saturday was the most dangerous day for driving in 1936, and Tuesday was the safest. In 1935, the fewest number of accidents occurred on Wednesday. More persons were killed last year between seven and eight o'clock in the evening than at any other hour, but the heaviest injury toll came between five and six o'clock in the afternoon.

About 60 per cent of the fatalities occurred during the hours of darkness, when there was only about 25 per cent of the total traffic on the road.

Nearly 80 per cent of the total vehicles involved in fatal accidents were passenger cars.

More than 93 per cent of all vehicles involved in fatal accidents were in apparently good condition when the accident occurred.

The number of Americans killed in traffic accidents during the last fifteen years exceeds by a wide margin the number of Americans killed in action or died of wounds during all the wars in which the nation has ever engaged.

Single copies or quantities of the booklet for club and school use may be obtained gratis by writing the company or any of its agents.

Financial Statement of State Compensation Insurance Fund.—Commissioner Frank C. MacDonald reported the following financial statement of the State Compensation Insurance Fund, which is conducted under the supervision of the Industrial Accident Commission of California:

During 1936, the premiums written by the State Compensation Insurance Fund amounted to \$8,244,000. This is the largest volume ever written by the Fund, and exceeds the next highest year, which was 1930, by \$500,000. The increase in premiums for 1936 over 1935 was \$1,700,000 or 26 per cent. This is the largest amount that any year has ever increased over any previous year. It is an increase of nearly 100 per cent in volume of business over 1933.

The reserves for compensation payments and expense, which are held for the protection of injured workmen and their dependents, have been increased to over \$8,200,000, an increase over December 31, 1935, of over \$1,200,000. There has been a corresponding increase in investment of funds to take care of these reserves. The total assets of the Fund have increased to \$13,491,000, the largest in its history.

Over \$1,000,000 is maintained in cash and short-term U. S. Treasury notes, and \$11,620,000 are invested in bonds, which are legal for savings banks in California. Of this amount, \$2,265,000 is invested in bonds of the State of California and \$5,921,000 in bonds of municipalities and other public agencies of California. Thus, over \$8,000,000 is invested in the obligations of California governmental units, all of the highest rating.

The underwriting exhibit is one of the best in the Fund's history. The financial statement for 1936 shows a loss ratio of 60.50 per cent, and an expense ratio of 14.17 per cent. This expense ratio is the lowest of any compensation insurance company in California, as most California companies have an expense ratio of approximately 40.6 per cent.

The dividends declared by the Fund on policies issued during 1935 have been increased substantially over those on 1934 and immediately preceding years of issue. It is anticipated that on 1935 year of issue policies the dividends will exceed \$2,000,000, the largest amount ever paid on any one year of issue. The excellent underwriting results during the 1936 calendar year indicate that the Fund will be able to maintain the same substantial return to policyholders on policies issued during 1936.

* See also Report of Special Committee on Qualifying Certificate Act in Supplement of this issue (Pre-Convention Bulletin section), page 54.

Lectures on Medical History of California.—The Division of Medical History of the University of California Medical School has arranged a series of talks on the medical history of California, with particular reference to the physicians who were instrumental in founding the University of California Medical School and those who devoted their efforts to building up the various activities of the School. The schedule is as follows, all of the talks being in Toland Hall, University Hospital, at 8 p.m.

Thursday, March 25—Dr. Henry Harris, "How the site of the University of California Medical School was chosen."

Wednesday, March 31—Dr. E. L. Gilcreest, "Toland."

Wednesday, April 7—Dr. R. T. Legge, "McLean."

Wednesday, April 14—Dr. W. I. Terry, "Huntington."

Wednesday, April 21—Dr. C. D. Leake, "Blake."

Wednesday, April 28—Dr. H. C. Moffitt, "William Watt Kerr."

The medical profession and all others interested are cordially invited to attend these talks.

Botulism in California.—During 1934 there were six cases, with six deaths, while in 1935 there were twenty cases, with only seven deaths. During the first six months of 1936 only one case occurred. Home-prepared products were involved, the products being home-canned mushrooms, home-prepared soy bean paste, home-canned string beans, home-canned corn and home-made cheese; in one instance either home-canned corn or salmon. In one outbreak an imported commercial canned antipasto was incriminated; however, it could not be confirmed bacteriologically.

A few of the outbreaks deserve particular attention. Three members of a family ate home-made cheese, all developing typical symptoms, one ending fatally. The preparation of the cheese was very significant. It was made in a large ten-gallon earthen crock. The top of the crock was covered with a cloth, a hole dug in the ground and the crock buried bottom up, where it remained six to eight months before being dug up and portions of it eaten. The portion in contact with the soil was found to contain large quantities of *Cl. botulinus*, while the bottom of the jar was free from contamination—the cheese having a uniform yellow color.

The largest outbreak involved ten cases, with three deaths. Epidemiologically, a salad containing an imported antipasto seemed to be the most likely food product; however, the laboratory recovered *Cl. botulinus* out of a partially used jar of home-canned mushrooms found on the premises. This jar was not supposed to have been used by any of the victims of the outbreak.

Children's Books Help Out Doctors at University of California Hospital.—There is nothing in any record to show that Little Red Riding Hood, Old King Cole or other Mother Goose characters went around carrying surgeon's scalpels or rolls of bandages. But there is considerable evidence to show that these worthy characters are taken into consultation by the doctors in the children's wards in the University of California Hospital while the little patients are on the road to recovery, and, to say the least, they have been a big help in taking the minds of the children off both their physical and their mental ailments.

A study of the situation made by Clifton E. Brooks, a graduate of the University, reveals that there is nothing more effective in subduing restlessness and peevishness in long periods of convalescence than well-written and entertaining children's books. As there are many children passing through the hospital whose parents are unable to supply this need, Brooks makes the plea that the public at large, and particularly the alumni of the University, send in as many Mother Goose and other books as possible.

"One of the most important departments of the hospital and the School of Medicine is that of pediatrics, the treatment of children's diseases," Brooks says, in a message to the alumni. "In this department are many chronic cases of diabetes and heart ailments. There are also many cases of convalescence from various acute conditions, all of which require quiet rest in bed. All parents know how extremely difficult it is to keep quiet an ailing or convalescent child without some well-selected aid in the shape of an entertaining book to keep his mind occupied."

Typhoid Fever in 1934-1935.—In 1934 there were 626 cases of typhoid fever in California with 80 deaths, and in 1935, 534 cases with 75 deaths. Practically all of these were sporadic cases, no major epidemic being reported. In the spring of 1936 a very interesting outbreak, involving twenty-nine cases, occurred in a small community in the Sacramento delta region. Investigation proved this outbreak to have been water-borne. The water supply was from a deep, drilled well, the casing of which had rusted through about three feet below ground level, permitting water to seep in. This seepage water was heavily polluted. It was found that a twelve-inch sewer line passed within a few feet of the well, and every joint leaked. Heavy rainfall raised the ground water level and allowed sewage-polluted water to pass through the well casing into the well. When a new supply of water was furnished, the outbreak subsided.

Diseases Greatly Affect History of Peoples, Nations.—Nations and races, since the remotest times, have been profoundly affected by epidemics and long-prevailing diseases, according to Dr. Alfred C. Reed, professor of tropical medicine at the University of California.

Doctor Reed's theory that epidemic and endemic diseases have helped greatly to shape the history of certain regions and peoples is expressed in the March issue of the *Scientific Monthly*.

The history of the plague, says Doctor Reed, is particularly interesting. For example, in the fifth century B. C. it swept through Athens, so weakening the Attic manpower that Athens was later beaten in battle at Syracuse and the road paved for the fall of the Golden Age of Greece. Such diseases as typhus, cholera, yellow fever, smallpox, and measles have been particularly deadly. Influenza, in 1918-1919, added its name to the list of great epidemic diseases.

Unlike the plagues, which rage for a certain period of time and then vanish without leaving lasting social scars, the so-called endemic diseases cause the steady deterioration of the populations on which they prey. Malaria, alone, says Doctor Reed, has supplied countless examples of the racial weakening and inefficiency which such diseases bring. Other examples, according to the author, are leprosy, which was a great problem in fourteenth century Europe, and is now increasing in central Africa; sleeping sickness, which has stunted the cultural growth of the African negroes; and syphilis, which has recently become the object of a world-wide medical offensive.

Association of Western Hospitals.—The Association of Western Hospitals announces the preview of the 1937 convention program:

The eleventh annual convention and display of exhibits of the Association of Western Hospitals, the Association of California Hospitals, the western conferences of the Catholic Hospital Association, and allied groups and sections, will be held April 12-15, Biltmore Hotel, Los Angeles.

The theme of the convention this year is: Hospital Service Is a Profession—How Well Do We Carry Out Its Traditions?

To effect this theme, the Program Committee has planned a concentrated study of some of the major hospital problems. This study will be conducted under the leadership of competent, colorful authorities, with opportunity for pertinent questioning and discussion. The responsibilities of hospitals to the public, to the patient, to the employees, will be stressed throughout the convention.

The Program Committee is planning fewer and better speeches, more and better discussions. General assemblies, scheduled without conflict from other sessions, will be held twice daily. In each of these sessions, you will hear an able speaker, one chosen for knowledge of the subject, ability to deliver his message, and for courage to tell the truth, even though it startles.

Periods for discussions will be provided after each major session. They will be led by competent chairmen, assisted by discussants chosen for special knowledge of the subject.

A convention program, filled but not crowded! The committee is confident you will like it. Do not miss it!

Human Voice Put Under Microscope at Medical School.—An actual demonstration of how the human voice may be studied under the microscope as an aid in both the detection and the treatment of certain diseases was recently given by Dr. Paul Moses, lecturer in voice and speech defects in the University of California Medical School, in a series of lectures at the School.

Vacancies on Medical Staffs in State Institutions.—Opportunities for physicians to enter the California State service were given a boost on March 9, 1937, when the State Personnel Board announced examinations for four positions at salaries of \$200 per month plus living costs for each doctor and his family, and another position at \$100 per month plus living costs. The positions were all in institutions operated by the State.

Applications to take the examinations must be filed with the State Personnel Board in Sacramento. Residence requirements for these positions have been set aside by the State Personnel Board, and applications will be received from physicians who are not residents of the State of California.

University of California Medical School Had Medical Program for Charter Week.—The University of California Medical School has prepared a notable program as its part in the Charter Week observance of the University, and has invited all members of the medical profession to participate, whether they are graduates of the University or not. The program was carried out on Wednesday, March 24, and consisted of operative clinics, lectures on late developments in both medicine and surgery and the annual dinner of the University of California Medical School Alumni Association, which was held at the Bohemian Club. This dinner was addressed by Dr. Monroe E. Deutsch, vice-president and provost of the University and Dr. Herbert C. Moffitt, clinical professor of medicine.

Vaccination of Cattle Against Bang's Disease: Still Experimental.—The vaccination of cattle against Bang's disease during calfhood is a promising means of combating this serious cattle malady, says Dr. J. R. Mohler, chief of the Bureau of Animal Industry, United States Department of Agriculture. "Yet," he cautions, "this procedure is still in the experimental stage and livestock owners hesitate to place faith in claims that promise more than scientific findings to date warrant."

To correct erroneous and misleading statements that have come to its attention regarding vaccination for Bang's disease, the Bureau summarizes present scientific knowledge on this subject:

The Bureau's investigators have found a vaccine prepared with a *Brucella abortus* strain of low virulence, and used only on calves between 4 and 8 months old, to be an encouraging means of coping with Bang's disease. Calves have appeared to be more resistant than mature unbred animals to the vaccinal infection, and the agglutination reactions induced by the vaccine injections have given indication of being of shorter duration in calves than in unbred heifers of near breeding age or in unbred cows. . . .

The Bureau of Animal Industry is coöperating with about 250 herd owners in different states in a calfhood-vaccination experiment on farms where 15 per cent or more cattle have reacted to the Bang's disease test. It is proposed to continue this experiment until such time as all cattle in these herds will be those that were vaccinated when calves.

Unification of Medical Curriculum Deemed Desirable. Medical education has become too specialized and standardized, and medical educators are too prone to teach individual divisions of medical science and practice without regard for their relationship to the whole.

This statement of the late Williams McKim Marriott, M.D., dean of the University of California Medical School, has been reprinted from the *Southern Medical Journal*.

Medical schools, said the late dean, depend too much on the ability of the student to organize the material which

is given him in class. The component parts of a good medical education are given him, but little attempt is made by the faculty to make him realize their relation to the whole.

It would be better, said Doctor Marriott, if, from the very start of the course, the student could have before him some picture of the complete medical education. The curriculum of the medical school should be so coordinated that each separate subject would be taught not as an isolated branch, but as part of a central idea.

There should be no break between preclinical and clinical instruction, according to the article. The study of medical sciences should be continued while clinical study is being carried on.

The unification of the curriculum, said Doctor Marriott, would necessarily mean the breaking down of some department lines and a mingling of the members of the departments. Frequent symposiums and comprehensive examination in which many branches of medical science are treated would be represented would be beneficial.

LETTERS

Concerning ownership of x-ray plates.

San Francisco, March 10, 1937.

To the Editor:—Inasmuch as there is now pending before the California Legislature numerous bills for the regulation of the practice of medicine, I believe it timely to call to the attention of my colleagues the following case. Within the last ten or more years the atmosphere has become so charged with court actions against the physician and surgeon that every act of the profession is an excuse for legal procedure.

The action brought against me was by husband and wife, both of whom had been patients for which both medical and surgical services had been rendered. They demanded recovery of x-ray films, laboratory reports, and damages of \$1,250. These reports they asked be turned over to them for possession, refusing the offer made by me that I would allow any physician to whom they wished to go subsequently, the opportunity to see and obtain all information in my hands.

The case was heard in the municipal court of Judge Alfred J. Fritz, San Francisco. In deciding this case in favor of the physician, Judge Fritz's decision was as follows: "There are no decisions in the State of California on the point, and the only case in the United States that counsel for either side have been able to find is that of *McGarry vs. J. A. Mercier Co.*, decided by the Supreme Court of Michigan on September 9, 1935, and appearing in Volume 262, N. W. Reporter, at page 296, which was concurred in by the entire bench."

In that case, Judge Fritz quotes in part from the opinion of the court, as follows:

In the absence of agreement to the contrary, such negatives are the property of the physician or surgeon who made them incident to treating a patient. It is a matter of common knowledge that x-ray negatives are practically meaningless to the ordinary laymen. But their retention by the physician or surgeon constitutes an important part of his clinical record in the particular case, and in the aggregate these negatives may embody and preserve much of value incident to a physician's or surgeon's experience. They are as much a part of the history of the case as any other case record made by a physician or surgeon. In a sense they differ little, if at all, from microscopic slides of tissue made in the course of diagnosis or treating a patient, but it would hardly be claimed that such slides were the property of the patient. Also, in the event of a malpractice suit against a physician or surgeon, the x-ray negatives which he has caused to be taken and preserved incident to treating the patient might often constitute the unimpeachable evidence which would fully justify the treatment of which the patient was complaining. In the absence of an agreement to the contrary, there is every good reason for holding that x-rays are the property of the physician or surgeon rather than of the patient . . . who employed such phy-

sician or surgeon, notwithstanding the cost of taking the x-rays was charged to the patient . . . while not fully to the point, it has been indicated by court decisions that the negatives of an ordinary photograph, in the absence of an agreement otherwise, belongs to the operating photographer, though his use thereof may be restricted.

This case and decision will undoubtedly set a precedent in the State of California. I believe that through closer cooperation between the two great organizations, Law and Medicine, in this State as well as throughout the United States, much could be accomplished to establish a better understanding and in this way there might be a marked decrease in all types of court actions against the physician and surgeon. These have become all too frequent, especially in our own locality. The increase of our protection rates bears witness to this fact.

516 Sutter Street.

ROBERT A. OSTEROFF, M.D.

Concerning recent appointments to State Board of Medical Examiners.

The following letter was sent to Governor Frank Merriam by Dr. William R. Molony, President of the State Board of Medical Examiners:

Los Angeles, California,
March 5, 1937.

Hon. Frank Merriam
Governor of the State of California
Sacramento, California

Dear Governor:

I want to thank you for your very cordial expression of confidence in the Board of Medical Examiners as shown in your recent reappointment of Doctors Charles E. Schoff and William H. Geistweit, Jr. These physicians have served with distinction and have rendered valuable service to the people of California as members of the Board of Medical Examiners.

The medical profession of this State join with me in expressing to you their gratitude and thanks for making it possible to retain these two splendid doctors upon the board.

May I take this opportunity also to tell you of the splendid and worth while service and cooperation shown to the Board of Medical Examiners and the profession of this State by Mr. William G. Bonelli. It is indeed a great pleasure to have associated with us as the Director of Vocational Standards such a fine, understanding and sympathetic person as found in Mr. Bonelli.

I am very cordially yours.

WILLIAM R. MOLONY.

Concerning May Day—Child Health Day, 1937.

The following letters explain themselves:

U. S. DEPARTMENT OF LABOR
CHILDREN'S BUREAU
WASHINGTON

February 20, 1937.

Dr. George Kress, Editor
CALIFORNIA AND WESTERN MEDICINE
304 South Broadway
Los Angeles, California
My dear Doctor Kress:

Dr. W. W. Bauer, Director, Bureau of Health and Public Instruction of the American Medical Association, has suggested that we send to you the enclosed Suggestions for the Observance of May Day—Child Health Day, 1937, with the request that you give same notice of it in your State medical journal.

As you will notice, the State health officer appoints a May Day chairman for each State, who is usually the director of the division of maternal and child health in the State Department of Public Health. If you can give space for an article on child health in your April or May issue, the director of that division will probably be glad to supply you with information on child health in your State to include in the article.

We will appreciate whatever you find it possible to do to emphasize the importance of "Health Protection for Every Child" in connection with May Day—Child Health Day, 1937.

Sincerely yours,

MARTHA M. ELIOT, M. D.
Assistant Chief.

U. S. DEPARTMENT OF LABOR
CHILDREN'S BUREAU
WASHINGTON

May Day—Child Health Day, 1937
Saturday, May 1

Suggestions for Observance

The Children's Bureau sponsors May Day—Child Health Day activities at the request of the State and Provincial Health Authorities of North America and in accordance with the Congressional Resolution of May 18, 1928, authorizing the President to proclaim May Day as Child Health Day.

Slogan: Health protection for every child.

Objective: To promote the extension of year-round child health services in every community, including services for physically handicapped children.

Leadership: State May Day chairmen will be appointed by State health officers to plan the State Child Health Day program and to arrange for the cooperation of organizations concerned with child health.

State departments of education will be asked to cooperate by planning and directing school Child Health Day programs.

Program: For community groups: (1) an evaluation of child health services in the community based on a survey of existing child health conditions and organization to promote child health, (2) the launching of new local child health projects, and (3) exhibits or programs celebrating gains made.

For children: As a climax for the year's health program—festivals, athletic contests, programs, exhibits celebrating children's growth, vigor, and safety from health hazards.

State and local news stories, radio talks, and speeches.

Requests for information on State programs or for further material should be sent to May Day chairmen in State health departments.

KATHARINE F. LENROOT,
Chief.

MEDICAL JURISPRUDENCE†

By HARTLEY F. PEART, Esq.
San Francisco

Malpractice Liability of an Operating Surgeon for the Negligence of a Nurse Assisting at the Operation

Several years ago a physician performed an operation for the purpose of removing the gall-bladder of a patient in a county hospital. Two nurses employed by the hospital assisted the operating surgeon. One was an instructor of nurses at the hospital; the other had about eighteen months' nursing experience, and this operation was the first time she had been in an operating room to attend an operation of any kind.

Neither nurse counted the number of sponges that were brought into the operating room or the number that were used and thrown into the receptacle after use. The operating surgeon later testified that an announcement was made by someone that the sponge count was correct; that he viewed the field of operation, saw no sponges, and closed the incision.

Unfortunately, a sponge remained in the patient's abdomen and she died following a second operation performed to remove the sponge. Within a year a malpractice action was filed against the supervisors of the county and the operating surgeon. Because of the rule of law which grants an immunity to counties for the negligence of officers or employees in county hospitals, the case was dismissed as to the supervisors. (For the law on this point, see CALIFORNIA AND WESTERN MEDICINE, pp. 516-517, December, 1936.)

The case proceeded as against the surgeon alone. Eventually it reached the Supreme Court of this State, where a judgment against the surgeon was upheld on two separate grounds: First, that an operating surgeon is legally responsible for all of the acts or omissions of nurses, no matter by whom employed, assisting in a surgical operation; second, that in a certain type of malpractice case, including sponge cases, the doctrine of *res ipsa*

loquitur applies. The phrase *res ipsa loquitur*, when applicable to a malpractice case, means, generally speaking, that it is only necessary for the plaintiff to prove a bad result in order for the case to go to the jury for its verdict. The jury is then entitled to infer from the bad result that the physician or surgeon was guilty of malpractice. The case to which we refer is *Ales vs. Ryan*, 93 Cal. Dec. 18.

Each of the propositions announced by the Court in *Ales vs. Ryan* is of vital importance to practicing physicians and surgeons. In the present article we will discuss the malpractice responsibility of physicians and surgeons for the negligent conduct of nurses employed by a hospital and assisting in the operating room, since the decision in *Ales vs. Ryan*. In a future article the application of the *res ipsa loquitur* doctrine by the Court will be analyzed.

The full extent of the legal responsibility of surgeons as a consequence of the Supreme Court's opinion in *Ales vs. Ryan* may best be illustrated by repeating the words of the Court itself:

The decisions of this state, when they have spoken on the subject, have endorsed the doctrine that *the surgeon is responsible for the acts of the nurse*. . . . The surgeon had the power, and, therefore, the duty to direct the nurse to count the sponges as part of his work in the opening and closing of plaintiff's abdomen, and putting in and taking out of sponges, and it was his responsibility to see that such work was done. He cannot relieve himself of liability by any custom or rule requiring the nurse to count the sponges used and removed. (Italics supplied.)

It may readily be seen that an operating surgeon in this State is now subject to a malpractice action if any of the nurses in the operating room negligently perform an act or negligently fail to do something which should have been done.

In *Ales vs. Ryan* the surgeon did not own the hospital at which the operation was performed, and the nurses who assisted him were not in his employ. As far as the surgeon knew, a sponge count was made, because a count was reported to him; also, he made an independent search for sponges. It would seem that the surgeon did all that he could in the circumstances. Yet, the Court held him liable for the negligent act of a nurse, the occurrence of which he could not know without neglecting his own duties. As a consequence of the decision in *Ales vs. Ryan*, it may be said that a surgeon is an insurer in so far as the nurses assisting in the operating room are concerned.

A surgeon who is about to undertake a major operation upon a patient in a county hospital might well pause to reflect upon the position in which he is placed by the statutes and decisions in this State, in the event that one of the nurses, employed by the county and delegated to assist him, should, unfortunately, be guilty of a mistake. In the first place, the nurse's employer, the county, cannot even be sued by the patient. In the second place, the operating surgeon is responsible for the nurse's mistake, even if it is of such a nature that he could not have prevented it or remedied it after its occurrence.

In Wyoming the rule is different. The same problem was recently presented to the Supreme Court of that state in the case of *Jackson vs. Hansard*, 17 Pac. (2nd) 659. The Wyoming Court came to the conclusion that an operating surgeon is not entitled to rely exclusively upon the nurse's sponge count, but that he could not be held liable, if he used ordinary care to verify the nurse's count, for example, by an independent investigation.

The principle of law which prevails in Wyoming and in a number of other states is as follows:

While a surgeon performing an operation cannot, ordinarily, be held responsible for the negligence of somebody else, it is his duty, we think, to exercise reasonable care in seeing that no foreign substances which ought to be removed are left in the body, and this duty was in fact, recognized by the defendant in giving his testimony. He should not, we think, ordinarily at least, be able to relieve himself of liability for injury to a patient caused by sponges or pads, by an exclusive reliance on a custom or rule requiring the attendant nurse to count the sponges or pads used and removed, and on his nurse's statement as to the count. On the other hand, he cannot be held responsible for the exercise of more than ordinary care. *He is not an insurer against mishaps*. . . .

† Editor's Note.—This department of CALIFORNIA AND WESTERN MEDICINE, containing copy submitted by Hartley F. Peart, Esq., will contain excerpts from and syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

SPECIAL ARTICLES

COCCIDIOIDAL GRANULOMA IN CALIFORNIA IN 1934-1935

Since the publication of Special Bulletin No. 57 by the California State Department of Public Health in 1931 nothing further has been reported on coccidioidal granuloma. This report will serve to revive and bring the data up to date (July 1, 1936).

The general trend of the epidemiology of this disease remains the same as discussed in the Special Bulletin.

Four hundred and fifty cases with two hundred and twenty-four deaths were recorded to July 1, 1936. Table 1 is a tabulation of the cases and deaths by years:

TABLE 1.—*Distribution of Coccidioidal Granuloma in California Cases and Deaths by Years*

Year	Cases	Deaths
Prior to 1928	151	86
1928	36	10
1929	46	25
1930	22	11
1931	19	8
1932	19	9
1933	54	25
1934	49	29
1935	28	14
1936 to July 1	26	7
Totals	450	224

Geographically these cases are distributed according to Table 2. The concentration of cases still persists in central and southern California. Three hundred and one cases, or 66.8 per cent, of the four hundred and fifty cases recorded are from Fresno, Kern, Kings, Tulare, and Los Angeles counties.

The northern rural counties have never reported cases, and it would appear that the disease has certain geographic limits. Since the first large group of cases were reported (prior to 1928) from San Francisco as a medical diagnostic center, only eight cases have been recorded in nine years. Other cases which have been diagnosed in San Francisco have been transferred to the home address or to the most probable source of infection obtained from the detailed history.

A study of the cases according to age and sex (see Table 3) shows that males are the most often affected with 384, or 85 per cent, of the 450 cases occurring in this sex. Sixty-one cases, or 13.3 per cent, are recorded in females and five were of unknown sex. Three cases have been reported under one year of age, and seventeen cases (3.7 per cent) in the one to four age group. However, the majority fall in the higher age groups with a total of 275 cases, or 61 per cent, occurring between the ages of twenty-five and fifty-five years.

TABLE 2.—*Sex and Age*

Age	Male	Female	Unknown	Total
0-1	1	2	...	3
1-4	13	3	1	17
5-9	10	4	...	14
10-14	5	2	...	7
15-19	17	4	...	21
20-24	45	11	...	56
25-34	129	15	...	144
35-44	80	7	...	87
45-54	40	4	...	44
55+	30	8	...	38
A.	13	1	...	14
Unknown	1	...	4	5
Totals	384	61	5	450

Table 4 is a summary of cases according to occupation and sex. The occupations were grouped under the general headings: soil, vegetation, animals, general labor (when no specific type was noted), laboratory infection, and miscellaneous. The latter group included professionals (students) commercial business, mechanical trades, building trades, and others. Two other groups were listed, *i. e.*, unknown occupations and no occupation. Under the heading vegetation was included housewives—since their work brought them into close contact with fruits and vegetables. Seventy-eight patients were found to have work pertaining to the soil; one hundred and one with fruits, vegetables, cotton and other vegetation; one hun-

dred were general laborers; one hundred and sixteen cases were grouped under the miscellaneous heading; twenty-nine were of unknown occupation; and nine had no occupation.

Sixty-five and five-tenths per cent of the cases were found in the groups involving outside work or work involving soil, vegetations, animals, and general outdoor labor. The epidemiology theory that the disease is soil-borne, as expressed by the high percentage of male outdoor workers, has been proved correct since Stewart and Meyer isolated the fungus (*Coccidioides immitis*) from soil samples collected in Kern County.

TABLE 3.—*Occupation*

Type	Male	Female	Unknown	Total
Soil (oil, mines)	78	0	0	78
Vegetation (housework)	64	37	0	101
Animals	16	0	0	16
General laborer	100	0	0	100
Laboratory	1	0	0	1
Miscellaneous:				
Professions and school	21	6	0	27
Children	25	11	1	37
Commercial business	5	1	0	6
Mechanics	19	0	0	19
Building trades	12	0	0	12
Others	12	3	0	15
Unknown occupation	24	1	4	29
No occupation	7	2	0	9
Totals	384	61	5	450

The cases are tabulated in Table 4 according to nationality, with number and percentage given. Practically all races are affected and the per cents for each have remained quite constant since the first tabulation in 1931. There are, however, variations, *i. e.*, the foreign-born whites have decreased slightly, whereas the percentage of cases among Filipinos has doubled during the past five years. The explanation of this increase is not evident from the epidemiological histories. Occupation probably plays a part, as the majority of Filipinos in California are engaged in agricultural work in localities where the highest percentage of cases occurs.

It has been noted that when the medical profession becomes interested in a particular disease, then the morbidity reports increase. This undoubtedly has had an influence on the increase in the number of cases of coccidioidal granuloma reported.

Early diagnosis of pulmonary cases and differential diagnosis from tuberculosis by sputum examination have been important steps during the last few years.

TABLE 4.—*Nationality*

Nationality	Number	Per Cent
American (white)	135	30.00
Mexican	96	21.33
Filipino	67	14.90
Negro	61	13.60
Foreign born (white)	36	8.00
Japanese	9	2.00
Chinese	8	1.80
Portuguese	8	1.80
Hindu	4	.89
Indian	3	.66

PRESIDENT'S PERPETUAL BRIDGE TROPHY: LOS ANGELES COUNTY MEDICAL ASSOCIATION

By ARTHUR E. SMITH, M.D., D.D.S.
Los Angeles

During July, 1936, Dr. Harlan Shoemaker, then president of the Los Angeles County Medical Association, appointed a committee, consisting of Doctors S. M. Alter, Charles E. Phillips, and E. Eric Larson, to organize a bridge tournament, to be held at intervals at the Association's headquarters during the remainder of the year. At the end of that time, appropriate prizes were to be given to the winning participants.

The sessions were held every two weeks for ten weeks. About sixty members played at the first session, most of whom continued throughout the whole period.

The players were divided into two sections: the recognized good players were placed in the North and South positions, and those who felt they were not the best of players occupied the East and West positions. At the end of each session the points were tabulated, and there was great rivalry between the members of each section as to their position on the tabulated lists.

Within a short time following the organization of the medical bridge tournament, Doctor Shoemaker came to my office with a copy of the November, 1936, issue of the *National Geographic Magazine*, and approached me, saying, "Arthur, I've got an idea that I want to explain to you. It is my desire to present a prize to the winner of the bridge tournament, and I have been racking my brain to evolve something unusual, something different from the time-worn reward of a cup. I have really remained awake night after night, giving the matter much thought, and at last I conceived the idea of making a trophy, utilizing the *Calendario Azteca* as a support for a miniature bridge game table, chairs and players, and you have been chosen to design and sculpture such a trophy." Doctor Shoemaker was advised that I would consider the production of such a trophy and would confer with him later.

The very next afternoon, however, and before I had considered such a tremendous undertaking, he returned to my office, saying: "I have another idea for the trophy." He explained that he would like to have carved reproductions of the emblematic Mayan feathered serpents, which guard the Temple of Warriors, Chichen Itza, incorporated in the trophy. Inasmuch as I had only read about the feathered serpents, I was bewildered in creating models of them. With the above explanation, Doctor Shoemaker departed, leaving me in amazement with his words, "Now you produce the trophy!" I had nothing to guide me or use—all had to be reproduced, designed and sculptured from photographs that, as yet, we did not have.

It was less than five months until the bridge tournament ended, when the trophy would be presented to the winner. This was a very short space of time to complete such a detailed art production, and I quite realized that midnight oil must be burned if this unique creation were to be born. It was not fully completed the evening it was presented, and since that date many additional hours have been spent to complete it. Approximately four hundred hours were taken in its production.

Much time and effort was necessary to secure the necessary data, photographs, etc., to start the designing and

This photograph of the trophy was taken from above, looking downward, and shows a bridge game in progress. Note the carved *Calendario Azteca*, cards, score pad, pencil, cigarettes, and cigar stand.

modeling. A plaque or copy of the *Calendario Azteca* could not be found in Los Angeles. After wiring a friend in Mexico City, a small picture of the *Calendario* was secured. Books on Mexican art were borrowed from Dr. Elmer A. Belt, which gave considerable data on the *Calendario*, but models or copies of the feathered serpents could be located in Los Angeles. Some books were secured from the Public Library which gave data and history of the feathered serpents; and after considerable study it was decided that the trophy should consist of four distinct parts: a base designed from Mayan steps leading to Caracol; six legs of feathered serpent design; a disk to support the tableau designed from the *Calendario Azteca*, and a tableau depicting an actual scene during a game of bridge.

After obtaining the above-mentioned data, the next step was to decide on the size of the trophy. The size of the players in miniature, bridge table, chairs, etc., had to be considered from the standpoint of sculpturing. A one-eighth to one-inch scale was decided upon.

The first step in production was to make the *Calendario*. A photograph was taken from the illustration sent from Mexico City, and then an eighteen-inch enlargement was made, and after that an eighteen-inch copper disk, upon which, with scribing tools, the hieroglyphics from the photograph of the *Calendario* were outlined in minute detail. When this was completed, an impression was taken and a plastic positive model produced; then the detailed outline of the hieroglyphics of the *Calendario* were reproduced upon the positive plastic model. That done, all the characters were carefully carved in relief. When this was completed, another negative impression was made from which a positive model was produced in artificial marble. (All models comprising the trophy were reproduced in copper and bronze before assembling.)

The next step was to create models of the feathered serpents. Having no model as a guide, we photographed the feathered serpent from the November, 1936, issue of the *National Geographic Magazine*. This photograph was enlarged to the desired size and was used as a guide in carving a model in plastic material. At the completion of the original, impressions were taken and six reproductions were cast in artificial marble which were reproduced later in bronze. These six feathered serpent copies were to support the *Calendario* and tableau.

For production of the tableau, I photographed four players seated at a bridge table, in informal pose while a bridge game was in session. The players—Doctors Harlan Shoemaker, Charles E. Phillips, Edward C. Pallette, and E. Eric Larson—were photographed from four

The above photograph shows a close-up view of the trophy. Note the base of Mayan design and the six feathered serpent columns supporting the *Calendario Azteca* upon which rests the tableau.

different angles, and each was modeled to scale in clay in his original position. When the players were sculptured, impressions were taken of each miniature and reproductions made in artificial marble and later in bronze. The players were placed in their respective chairs in the exact position that they occupied during the actual bridge game. The score pad, pencil, cigarettes, and pipe were produced in metal on a one-eighth to one-inch scale.

The next step was to produce the bridge table, chairs, and cigar stands. I now conferred with Mr. Cochems, Executive Secretary of the Association, and secured a bridge table, chair, and cigar stand, which were photographed with the players. This equipment was used for the production of the miniature models. Careful measurements were taken and the miniature models were accurately made on a one-eighth to one-inch ratio, from brass and copper. The playing cards were individually cut from thin spring brass, to scale, by the use of a template.

The table, chairs, cigar stands, cards, cigarettes, and the players were now assembled. The next step was to attach the six supporting feathered serpent columns to the Calendario Azteca. These columns occupy equidistant positions. The base, which supports the feathered serpent columns, the Calendario Azteca, and the tableau, is of Mayan design and was created from a photograph of the stone steps leading to the entrance of the Caracol, Chichen Itza. After complete assemblage of the various parts, which comprise the trophy, it was reproduced in copper and bronze.

It will be noted that Doctor Palette and Doctor Phillips each hold twelve cards; Doctor Shoemaker holds thirteen, and is about to play, while Doctor Larson has spread his cards upon the table.

It will also be observed that Doctor Larson is holding a cigarette between his fingers and is peering very serenely

Calendario Azteca shown in detail. This forms the support for the miniature bridge table and players of the President's Trophy.

This photograph displays the trophy at a distance. Note the open mouths of the feathered serpents, and the carved columns.

through his Harold Lloyd spectacles, with his "britches" pulled up almost to his knees. It will be noted that the expression on Doctor Shoemaker's face is that of deep thought and anxiety to win. Doctor Palette's cigarette is reposing on the edge of the table and, as usual, his right leg is resting against his abdomen. Doctor Phillips appears nonchalant and is sucking on an old strong pipe, which has been in use for at least twenty years.

A banquet was served on December 23, 1936, after the sessions were completed, and prizes were awarded to the top four players in each section. All prizes, except the honor prize, were given by different firms dealing in medical supplies.

The honor prize was presented by the writer with the following understanding: (1) It is to be known as the President's Perpetual Bridge Trophy. (2) It is to be the property of the Los Angeles County Medical Association. (3) It is to remain on display at the Association's headquarters. (4) The trophy is to be awarded each year to the physician who makes the highest bridge points and his name shall be placed thereon.

The winner for 1936 was Dr. Harold P. Hare, whose name is the first to be engraved upon the trophy.

A description of the Aztec zone is given in the encyclopedias and other volumes. . . .

The following inscription on copper is attached to the trophy:

THE PRESIDENT'S PERPETUAL BRIDGE TROPHY
Suggested by Harlan Shoemaker, M.D.

President, Los Angeles County Medical Association, 1936
Reproduced and Sculptured From Photographs

by

Arthur E. Smith, M.D., D.D.S.

The disc of the trophy, upon which tableau rests, is a carved reproduction of the Calendario Azteca. The original is in the museum in Mexico City. It is supported by six carved reproductions of the Mayan feathered serpents, the originals of which guard the Temple of Warriors, in Chichen Itza

SOCIAL HYGIENE—1937 MODEL

Some Last Year's Events Which Have Helped to Build the Framework for the Coming Year

The whole history of social hygiene is living drama, from the days of Moses' law-giving down to the present sweeping drive for syphilis control, but surely no period has seen more dramatic events and rapid developments than the past twelve months. This has been particularly true as regards public knowledge and coöperation in the campaign against the venereal diseases. At the beginning of 1936 the situation in this respect was much the same as at any time since the World War impetus slackened its force. Comparatively few people recognized syphilis and gonorrhea as widespread infectious diseases. The social hygiene societies and other health agencies battered against a wall of secrecy and indifference which successfully hid the real facts. The great multitude remained unaware of this threat to family and community health, nor knew what to do if the threat became a reality. Many, as always, were suffering the results of their lack of knowledge, without hope for future recovery.

Contrast with that shadowed picture the brilliant scene as the year closed, with health officials and social hygiene executives meeting in Washington at the invitation of Surgeon-General Parran and with the benediction of President Roosevelt, to map a nation-wide fight against syphilis, and asking for \$25,000,000 to provide the sinews of war. Newspapers and news magazines hailed this conference as one of the most important ever held in the United States—gave it front-page space—wrote leading editorials of approving comment. Many of them had been crusading all through the year for such objectives. The thousand conferees, returning to the country's four corners, found that the home folks had kept pace with Washington happenings, knew what was going on. People were reading and talking about syphilis and how to avoid it. More sick people were seeking treatment. Town authorities were appropriating funds for clinics for those who could not afford to pay doctors. All were ready to help conquer this ancient enemy, now smoked out of ambush. Truly, a marvelous change in public attitude to come about in one short year.

What brought about this change? What happened in 1936 to lift the fog of public apathy and indifference, and promise continuing recognition to social hygiene as a vital issue in present-day life? Passing the year's events in review, we note a few "peaks of progress":

Surgeon-General Parran's announced determination to make the prevention and control of syphilis a major objective of the United States Public Health survey program, and the practical efforts of himself and his staff to find ways and means to this end, as witness the "Christmas Conference" mentioned above.

The passage of the Social Security Act, with the provision of funds applicable to venereal disease control through the state and city departments of health, and the resultant developing of new and effective programs in important localities.

The great increase in newspaper coöperation in social hygiene education of the public, led off by special series of articles published by the Chicago Sunday Tribune and the New York Daily News, and the Washington Herald, and followed in the course of the year by similar feature articles in other important newspapers across the country. A few are: the Portland Oregonian, San Francisco News, Los Angeles Evening News, Philadelphia News, St. Louis Post Dispatch, Dallas News, Buffalo Times, and Syracuse Post-Standard. Aside from these special features, news items and editorials are frequent and informative. Metropolitan dailies, including the New York Times, New York Herald-Tribune, World-Telegram, Evening Post, Sun, the Brooklyn Eagle, and others, which have been accustomed to speak more or less frankly for some time, have increased their coöperation and are definitely influencing public opinion by thoughtful editorials. Many newspapers in smaller communities, such as the Winston-Salem (N. C.) Observer and Evanston (Ill.) News-Index, are actively crusading for the establishment or improvement of local treatment facilities.

The similar increase in interest and practical educational help shown by the weekly and monthly standard maga-

zines. Doctor Parran's fine article, "Why Don't We Stamp Out Syphilis," appearing in the July Survey Graphic, and condensed in the July Reader's Digest, set a new high for reader interest and continued distribution. Seven months after these articles appeared, the publishers and the Association have constant call for reprints, the Digest reporting to date a total distribution of nearly 400,000 to all parts of the world. Recent articles in the Literary Digest, Time, News-Week, and other weeklies, are familiar to all, as are the frequent mentions in home magazines like Ladies' Home Journal, Woman's Home Companion, Farmer's Wife, and Pictorial Review. Liberty has published a number of editorials. Physical Culture ran a series of four special articles during the year. Magazines with special articles in preparation for early 1937 publication include The New York Woman, The Forum, Parents' Magazine, and others. Semi-professional publications such as the National Parent-Teacher, the Junior League Magazine, and Hygeia, have published several articles. The many articles in medical journals, publications for nurses and for other professional and technical groups, have indirectly been of great value in promoting public knowledge and interest during the year.

The increased coöperation of large membership groups such as the General Federation of Women's Clubs and the National Council of Women, whose public health committees during 1936 developed definite programs for club coöperation in syphilis control will enlist the interest and effort of millions of women.

The renewed educational efforts of the Metropolitan Life Insurance Company, which during 1936 prepared for publication (in February, 1937) for the third time a statement concerning syphilis, as one of its regular monthly series of full-page magazine advertisements and distributed thousands of reprints of this advertisement and of a new edition of the pamphlet "The Great Imitator," already widely circulated.

The production of the new "talking slide film" "For All Our Sakes," dealing with syphilis, under the sponsorship of the United States Public Health Service and the Association, and the purchase and showing of this production by a large number of health officers and agencies, mercantile, industrial and other concerns among employees and the lay public.

Publication of the report of the Committee on Survey of Research on the Gonococcus and Gonococcal Infections by the National Research Council and the Association, and a resultant quickening of interest in the possibilities of doing for this prevalent and serious disease as much as has been done for syphilis.

The holding of the fourth annual New York Regional Conference in January, with 2,500 people attending; similar meetings in Syracuse, Buffalo, Rochester, held by local social hygiene committees last fall; Social Hygiene Week, November 1 to 7, sponsored by the Missouri Social Hygiene Association; the month-long educational campaign conducted by the Erie Social Hygiene Association in November and December. Dozens of other conferences, meetings, and sessions held all over the country, by state and local groups and national agencies such as the American Medical Association, the National Conference of Social Work, the American Public Health Association, and the American Hospital Association.

The establishment of numerous new social hygiene committees or societies during 1936, among them:

California—Southern California Association for the Study and Prevention of Syphilis and Gonorrhea, Los Angeles.

Illinois—Social Hygiene Committee, Robinson; Social Hygiene Committee, Council of Social Agencies, Rock Island.

New Jersey—Institute on Marriage and the Home, East Orange.

New York—Social Hygiene Committee, Chautauqua County Tuberculosis and Health Association, Dunkirk; Club for Prevention of Venereal Disease, Middletown.

Ohio—Social Hygiene Committee, Cleveland Health Council, Cleveland.

Washington—Social Hygiene Committee, Tacoma Public Health Council, Tacoma.

These are but a few glimpses of a swiftly moving procession of events, each of which we believe has had its effect in bringing about the great increase noted in public interest and information, and in creating the present favorable outlook for further progress during 1937. Many other factors were involved. A particularly fortunate set of circumstances combined to open the way for these activities, and behind these were years of hard work by all concerned with family health and welfare to bring about just such circumstances, and direction and purpose and planning which enable the wise use of the fortunate situation when it finally occurred. To the leaders and workers who have for long devoted their thought and labor to attack on the barriers of silence and ignorance which, we may hope, are now definitely beginning to break down, belong the praise and the credit and the gratitude of posterity. And in the exultation of the moment over the possibility of actually conquering syphilis at last, it is not forgotten that other phases of the social hygiene program—among them education for marriage and parenthood, the repression of prostitution, and the prevention of sex delinquency—have played and must continue to play, an important part in the programs and benefits of the future.

As the agency serving as a national clearing house, the Association and its staff as workers in the ranks, take pleasure in presenting this brief review, and in behalf of the social hygiene societies and the communities for which they labor, we thank all who have helped in any way in the year's progress, and bespeak their coöperation in the days to come.*

"AMATEUR" AND BRANCH NIGHT

Los Angeles County Medical Association Institutes Unique Entertainment Feature

Standing room only! Everybody was out to see colleagues "do their stuff."

Amateur and Branch Night at the Los Angeles County Medical Association on Thursday evening, March 4, packed the Lounge.

This unique evening of entertainment, which brought many members of the branches and their families to the Association, began with a dinner in the Association headquarters, at which there were 160 guests.

Following the dinner the president, Dr. John P. Nuttall, introduced the master of ceremonies for the evening, Dr. D. G. Tollefson. Much credit goes to Doctor Tollefson and his physician associates who took part in the program, and who were responsible for making the evening a great success.

Doctor Tollefson, as a preliminary and unannounced skit, called upon the secretaries of the branches to answer certain questions relative to those parts of Los Angeles County in which their respective branches functioned. Some of these were pertinent and humorous questions. The secretaries, however, faced the ordeal without flinching, and some came through victorious. The "talent display" from the various geographical branches was then brought forward.

First was the presentation of the Alhambra branch: Doctor Eugene S. Maxson's rendition of two poems by Kipling—"Gunga Din" and "Boots"—winning much applause.

Dr. Marvel Beem of Santa Monica—Doctor Beem, by the way, has a splendid voice—opened the program for the Santa Monica branch with songs of the type that Lawrence Tibbett likes to sing. Dr. R. J. Morrison's impersonation of Harry Lauder—costume, coughs, cane and all—was fine entertainment. Dr. John Bergmann, the accompanist, completed the Santa Monica act.

The Pasadena branch for years has been hiding the ability of its professional men in ballet technique. Ballet costumes are intriguing on the male form. They created a picture filled with movement and of beauty that certainly never could have been imagined by anyone who was not fortunate enough to see it. So graceful was their interpretation of a difficult Russian dance that they were

presented with a gorgeous vegetable bouquet, which expressed the appreciation of some of their admirers. Doctors Robert K. Gustafson, Lyle G. Craig, Ralph E. Netzley, and Russell M. Decker made up the ballet, the accompanist being Doctor Decker.

Because Amateur Night happened to fall upon the same night as the Speakers' Bureau, the Master of Ceremonies called for remarks from the Speakers' Bureau, pertinent to the work of that Bureau.

Dr. H. O. Barnes, scheduled for a talk at the Speakers' Bureau meeting, must be given credit for arising to a very difficult situation when he was called upon by the Master of Ceremonies to give his talk. Doctor Barnes in doing this set an example for all who aspire to address public gatherings. To be a good speaker, one must be prepared, of course, at all times, to get on one's feet, and even when the spirit that surrounds one is of levity, to be able to command attention—this Doctor Barnes did.

Doctors George B. Kryder, S. H. Welch, F. E. Poole, Fred W. Loring, Orrie Christ, and William M. Gibbs made up the Glendale troupe, announced as the "Choral Society of Glendale," otherwise known as the "Disturb-ers." To describe this act one has to use the term "burlesque." The theme of the show was a sponsored radio broadcast.

Dr. Clinton D. Hubbard of Huntington Park mystified the audience by pulling white rabbits out of hats, and other feats of magic. Much applause greeted this presentation of the southeast branch.

From Pomona came a male quartet: Doctors H. C. Anderson, C. A. Arneson, C. W. White, M. R. Jones, and Elwin Welch, in blackface. Good voices all and fine entertainment.

Long Beach, one of the largest branches, depended upon only two of its members to uphold the honors of that branch. But the Branch had reason for its confidence in these two doctors—Raymond Swinney and R. T. Uhls. The act opened with the singing of "Frankie and Johnny," with guitar accompaniment by Doctor Uhls. The setting was of an older time in a small town in Iowa and a medicine show. Doctor Swinney, as Dr. I. Curem, gave a most realistic portrayal of the old-time Medicine Man exhorting "Bray-zilian Oil" and cure-alls of various types for the cure of man and beasts. Yes, this was an act.

Nearly four hundred members attended the show. It was one of the biggest gatherings at the Association since the opening of the headquarters building several years ago.

EXPERT WITNESSES*

By EDWARD C. KRAUSS

The old controversy about expert witnesses has been revived by the publication, CALIFORNIA AND WESTERN MEDICINE, with a brand-new suggestion—that members of the medical profession refuse to testify as experts unless appointed by the Court.

California law provides for the appointment of experts by the Court for both civil and criminal cases, but also permits the testimony of experts hired by either or both sides. The courts have frequently used the power to appoint experts in criminal cases, but they rarely appear in civil cases; with the result that personal injury suits, in particular, seem to be battles between groups of experts open to the suspicion of being partisans of either plaintiff or defendant.

No self-respecting medical man wants to be put in this position, say Doctors H. D. Barnard and George E. Tucker in the publication referred to, but there is no agreement as to how the situation can be avoided. The suggestion that they decline to appear except when appointed by the Court is made by Dr. Andrew S. Lobingier, who originally suggested the present California statute permitting court appointment.

The law provides all that is needed, in the opinion of Doctor Lobingier; what is at fault is the apathy of judges in exercising their privilege. But if the judges will not act, the medical men can, since there is no compulsion upon experts to give testimony. A witness may be re-

* From the American Social Hygiene Association.

* Editorial, Los Angeles Times, March 3, 1937.

quired to testify as to facts, but expert witnesses give opinions, not facts.

The belief that in many cases expert testimony is a purchasable commodity, is possibly only too well grounded, and the California statute providing for naming of disinterested experts by the trial court, plus Doctor Lobinger's suggestion, seems to offer a practicable way out.

If the medical profession adopts this suggestion, it will lead the way in a general housecleaning of the expert-witness field. It is a place in which reform is unquestionably needed.

SYNOPSIS OF MALPRACTICE

By WILLIAM M. RAINS, LL.B.*
Los Angeles

(With apologies to H. L. Tidy, M. D., and his celebrated "Synopsis of Medicine.")

(*Tic doulouerror*) (*Bury-Bury*) (*Mistake*)

MALPRACTICE

An acute infectious disease transmissible mainly to physicians and surgeons, only by the excreta of former patients, characterized by severe pain and prolonged sequelae. Rarely fatal.

Etiology.—Virus unknown, principally affects busy doctors; ultra-careful and conservative practitioners not immune. Endemic throughout North America, particularly United States of America. Degree of infectivity high when exposed to carriers of bacillus avaritia.

Symptoms.—(a) Incubation period: One year from exposure, sometimes called "Statute of Limitations."

(b) Premonitory period: Usually two to eleven months, crystallized by sudden chill upon contact with patient, ordinarily in connection with latter's simulated bill-uselessness.

(c) Clinical period and eruption: Generally during last days of incubation period coincident with premature, too radical treatment of patient's neglect to pay bill.

Characteristics of Clinical Stage.—(a) Eruptions, asymmetrical and varicoid, but always identifiable by court summons and complaint and invariably accompanied by a pimply rash in the form of a process server.

(b) Excruciating hyperesthesia in the region of the gluteus maximus, and splenius colli. Also frequently red spots before the eyes, and set teeth on edge.

Chronic Stage.—May continue six months to five years. A pyrexia syndrome occurs during this stage if the disease is at all activated, the culmination of the febrile parabola always manifesting itself in direct relation to the time of appearance of the "victim" in a court proceeding.

Course and Prognosis.—If early treatment can be obtained, the uncomplicated disease usually smothers in its own excreta. The prognosis is markedly good if there has been a generally effective starvation of the "bacillus avaritia."

Prophylaxis.—(1) Do not (unless necessary) sue for fees until one year has elapsed from the date of last treatment. Patients ordinarily have only one year within which to sue for malpractice. Doctors have at least two years within which to sue for fees. If patient is a minor, the rule is different; consult counsel.

(2) Pay or no pay, a private physician is equally responsible in law, therefore, insist on coöperation of the patient in all reasonably required respects, such as x-rays and laboratory analyses; otherwise demand acceptance of public facilities and release of responsibility.

(3) Do not criticize the doctor who precedes on a case. The problem may have appeared distinctly or subtly different to him. Remember, if your successor follows this paragraph faithfully, your sincerest though perhaps most futile efforts will be accounted sympathetically.

(4) Do not experiment on a live patient. Risks likely to be dangerous to a patient provoked by experiment are incompatible with the law. Therefore, to avoid legal responsibility for damage, refrain from doing that which the ordinarily prudent practitioner of average skill would not

do under similar circumstances, and be diligent to do at least those things which a reasonably prudent practitioner would consider indicated under similar circumstances.

If this rule is followed, bad results do not support legal responsibility.

(5) Do not be brutal. "Offensiveness" is *not* the best "defense" to impending trouble with a patient. On the contrary, kindness, solicitude, understanding, and, surprisingly often, consultation will ward off lurking trouble.

Treatment.—(a) Aromatic spirits, care, and caution 1 oz. t. i. d., p. c.

(b) Sweet oil of charity q. s. for articulating surfaces with other doctors.

(c) Isolation of case records and x-rays.

(d) Absolute quiet, abstention from further exposure to source of infection or carrier.

(e) When examined in court be frank, modest, sympathetic, professional. Avoid inclinations to rancor or debate. (Let counsel carry latter burdens.)

Morbid Anatomy.—Though this disease is only rarely fatal, there is one outstanding histologic sequela, to wit: Proliferation and desquamation of the cortex of the "glans reputation."

Thus, it is well to follow the prophylactic admonitions wherever possible if this unfortunate result is to be avoided to yourself or your fellow practitioner.

THE PAY-PATIENT PLAN SHOULD NOT BE APPROVED*

An assembly committee has tabled a bill by Assemblyman S. L. Heisinger of Fresno County, seeking to amend the Political Code to open the doors of county hospitals to "pay" patients on permission of the county supervisors.

That was a good move.

Sacramento County once had such a system. But when the new county charter was adopted it was abolished, because experience had shown it to be limited to individual benefits, but *costly to the taxpayers*.

To get rid of the abuses developed thereunder, the county charter specifically provides:

The Sacramento County Hospital shall be maintained for Sacramento County indigents only.

1 1 1

On July 1 of this year this system will have been in operation for a period of four years. Suggestions have been made from time to time that it be modified—most of them brought forward by interested office holders—but they have failed to gain any appreciable support from the public.

The reason is obvious.

The people have found the present *modus operandi* satisfactory and at the same time *they have not been called on to contribute large amounts in taxes to pay for medical attention and hospital care for those well able to provide for themselves otherwise*.

1 1 1

What is the aim and purpose of a county hospital?

It is to see to it that the unfortunate and the needy are not denied medical service; that they shall not die or suffer needlessly because they do not have the means to pay for medical or hospital care.

The people are perfectly willing to supply through taxation sufficient money to support such institutions. But they are not in favor of county hospitals whose doors will be thrown open to those with political influence and pull on the "pay" theory. Experience has shown that such "pay" is more often than not a delusion—a promise seldom expected to be fulfilled.

The Legislature will do well to leave the final decision of the policy in such matters to the counties themselves.

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. X, No. 4, April, 1912

From Some Editorial Notes:

Record Your Certificate.—To practice medicine legally in this State you must first get a license from the State Board of Medical Examiners and then have that license, or certificate, recorded in the county in which you reside and practice. The recording of the license is made as much a part of the law as the getting of it, and it is just as important. The Board of Examiners has found that this provision of the law has been very generally overlooked by a considerable number of physicians. . . .

Another Why?—Last month the JOURNAL published some editorial notes relating to distinguished physicians who had contributed articles to publications which continue to advertise nostrums and frauds that have been shown up. These remarks have created some little comment which, so far as it has come to the attention of the JOURNAL, has been entirely favorable. We shall continue to refer to the subject from time to time. In the *American Journal of Urology* for February, 1912, there is an article by Dr. ———, a distinguished physician of San Francisco and for many years a prominent member of our Society. In the same issue of that medical (?) journal are to be found the following advertisements: ergoapiol, antiphlogistine, glycothymoline, peptomangan, glycoheroin, antheol, and dioradin. The list is not so large as some, but that is probably because the publication is a special one and, doubtless, has but a limited circulation. Does Dr. ——— know anything about the things that that journal advertises? . . .

Hydrophobia.—Interest in rabies has been greatly intensified by its suddenly becoming prevalent in San Francisco. During the month of February many dogs developed the characteristic symptoms and a number of human beings were bitten. Proof of the presence of rabies was secured in many cases by the demonstration of Negri bodies in the ganglion cells of the brain tissue, and in some instances by the production of the disease in laboratory animals, through inoculation. The examinations were made in the State Hygienic Laboratory in Berkeley, in the laboratory of the San Francisco Health Department, and in the laboratory of the Letterman General Hospital at the Presidio.

The State Board of Health has done much to minimize the number of human deaths by providing Pasteur treatment with United States Government virus for the people who have been bitten by rabid animals and are unable to be immunized at their own expense. . . .

From an Article on "The Life of Radium and Its Therapeutic Use in Internal Medicine" by E. O. Jellinek, M. D., San Francisco.—You remember, that if you force a sufficient electric current through the so-called Crookes tube that this tube will display some characteristic light effects around the anode and the cathode. As the light effects displayed around the cathode are the only ones which have any bearing on the subject which we intend to investigate tonight, I will ask your permission to recall in a few words the phenomena displaying themselves around this terminal. . . .

From an Article on "A General Consideration of Some Points of Interest in the Diagnosis and Treatment of Syphilis" by George D. Culver, M. D., San Francisco.—Schaudinn and Hoffman's discovery of the Spirocheta pallida, Wassermann's application of the complement—

† This column strives to mirror the work and aims of colleagues who bore the brunt of Association work some twenty-five years ago. It is hoped that such presentation will be of interest to both old and new members.

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By CHARLES B. PINKHAM, M.D.
Secretary-Treasurer

News

"Alleging that [I.] Jesse Citron, Hemet physician, retarded his recovery when he was ill with pneumonia last summer and that \$12,000 is not a 'reasonable and proper' fee for medical services, W. C. Fields, screen comedian, last Friday filed a countercomplaint against the physician, asking \$25,000 damages. Doctor Citron seeks to collect \$12,000 through the courts for medical services said to have been rendered the film star during his illness. According to the cross complaint filed by the screen star in Riverside County Court, Doctor Citron 'wilfully treated the defendant in such a way as materially to retard the recovery of defendant; that plaintiff administered certain drugs and medicines to defendant which plaintiff well knew would retard recovery' of Fields. . . . Filed on January 11, the plaintiff's original complaint maintained he had labored twenty-five days and nights continuously and had 'completely cured' the actor. For such services the \$12,000 was declared a 'reasonable' fee. . . ." (*Hemet News*, February 26, 1937.)

"Al Williams, who advertises himself as a 'Conditioner of Men' at his offices in the Spring Arcade Building, overstepped bounds when he made actual medical diagnoses, according to charges yesterday in Municipal Judge Arthur Guerin's court. Williams went on trial accused of violating the State Medical Practice Act. Andrew Anagnos, bank clerk, testified Williams told him he was suffering from high blood pressure and could cure him in three months with three treatments a week for \$200. Anagnos paid Williams \$50, took nine treatments and was 'all tired out.' John Ronan, Inspector for the State Medical Board, testified Williams diagnosed his condition as serious, asserting he was suffering from heart disease. Ronan claims physicians state he is in perfect health." (*Los Angeles Illustrated Daily News*, March 6, 1937.) Acting Special Agent Ronan reported that following a jury trial, Al Williams was found guilty March 8, whereupon motion for a new trial was filed.

Our Investigation Department reports that J. Bruce Clark, D. C., said to be an office associate of Al Williams, on February 2, 1937, pleaded guilty to a charge of violation of the Chiropractic Act and on February 9 was sentenced to pay a fine of \$100 or serve fifty days in the city jail, the sentence being suspended and defendant placed on probation for one year.

"Dr. Jacques P. Gray, First Assistant Director of Public Health in San Francisco for the past seven years, will leave the San Francisco department early in April. He will accept a dual position of principal health officer and manager of the Angeline Elizabeth Kirby Memorial Health Center in Wilkesbarre, Pennsylvania. . . ." (*San Francisco Examiner*, March 9, 1937.)

"Superior Judge M. C. Glenn today upheld the right of the State Board of Medical Examiners to cancel the license of a physician for performing an illegal operation. Judge Glenn denied the petition for a writ of review, which was filed by Dr. George W. O'Donnell, San Francisco physician, who sought to annul the Board's order canceling his license." (*Associated Press dispatch*, dated Sacramento, March 2, and printed in the *Oakland Tribune*, March 2, 1937.)

(Continued in Front Advertising Section, Page 17)

† The office addresses of the California State Board of Medical Examiners are printed in the roster on advertising page 6.

BAXTER'S ARE THE PIONEER SOLUTIONS

In every page of history, in every conquest of science or geography or medicine there will be found a pioneer.

A pioneer, with imagination to conceive—with determination to do—with ability to execute—with vision to plan.

Baxter is the pioneer in the development of commercial ready-to-use solutions. Baxter developed intravenous solutions to a high point of perfection, then developed the incomparable Vacoliter — Baxter's dispensing container for intravenous solutions.

In recognition of Baxter's pioneering, the hospitals of America have, by their voluntary acceptance of the Baxter ideal, placed and continuously maintained Baxter in a position of pre-eminence in the field of commercial ready-to-use intravenous solutions.

It costs your hospital no more to use Baxter's Intravenous Solutions in Vacoliters. In fact, we can show you how you may use Baxter's, the pioneer solutions, at even less than your usual cost. Write for information about the Baxter plan.

Federal Courts Fine Thirty Food and Drug Shippers.—Thirty criminal actions brought under the Federal Food and Drugs Act were recently cleared through the federal courts, the Food and Drug Administration states in summarizing its activities for that month. The cases, involving many violations uncovered by the Administration's inspectors during the past year, resulted in a wide range of penalties, the size of which is within the discretion of the courts up to the maximum set by the terms of the law.

Seven west coast fish canners found guilty of shipping canned fish, some of which was in part decomposed, also were fined during January. Those shipping salmon and their fines: G. P. Halferty & Co., Seattle, Washington, \$10; Point Roberts Packers, Inc., Point Roberts, Washington, \$11; Pioneer Canneries, Inc., Seattle Washington, \$12.50; Lighthouse Packing Co., Point Roberts, Washington, \$24; Uganik Fisheries, Uganik, Alaska, and

Announcing...

PROTAMINE ZINC INSULIN, *Squibb*

Hagedorn, Jensen, Krarup and Wodstrup-Nielsen of Copenhagen reported, in 1935, that by addition of protamine to aqueous solutions of the active anti-diabetic principle they had succeeded in obtaining a modified, precipitated preparation having an effect much more prolonged than that of unmodified Insulin. Later it was demonstrated, at the University of Toronto, that by adding a small amount of zinc to a preparation of Insulin and protamine, both the stability of the preparation and the duration of its blood-sugar-lowering effect could be increased. These findings have led to the evolution of a product now designated Protamine Zinc Insulin. This product has been given extensive clinical trial and signifies a distinct advance in treatment of diabetes mellitus.

ADVANTAGES OF PROTAMINE ZINC INSULIN

1—The duration of action of a single dose is from about three to six times that of unmodified Insulin.

2—Hypoglycemic reactions both in children and in adults are not so frequent as those following use of unmodified Insulin. The incidence of ketosis is markedly reduced.

3—Results suggest that a somewhat less rigid dietary regimen, and an ample carbohydrate allowance may be permissible.

4—For most patients receiving the product, one injection a day is adequate.

5—Lessening of fluctuations in blood-sugar levels has a favorable effect upon patients' sense of well-being.

PROTAMINE ZINC INSULIN, *Squibb* complies with the rigid specifications of the Insulin Committee, University of Toronto, under whose control it is manufactured and supplied. It is available in 10-cc. vials. When this preparation is brought into uniform suspension, each cc. contains 40 units of Insulin together with protamine and approximately 0.08 mg. of zinc.

Seattle, Washington, \$25; and Alaska Year Round Canneries Co., Seattle, Washington, \$150. For shipping canned tuna fish in part decomposed, the Sun Harbor Packing Corporation, San Diego, California, was fined \$600. In all cases except the last, court costs in addition were assessed.

Drug Cases Terminated

The following terminations were entered in drug cases: Tricasco Laboratories, Chicago, Illinois, "Tricasco," a syrup containing licorice and plant extracts, offered for the treatment of fifty diseases and abnormal conditions of the stomach, intestines, liver, kidneys, and gall-bladder, fine \$25; Winfield R. Offutt and United Distributors, Inc., Louisville, Kentucky, "Wittone," essentially a colored and flavored solution of Epsom salt, for indigestion, coated tongue, headache, chronic malaria, rheumatism pains, impure blood, tired, dull, weak feeling, influenza, dysentery, bloody flux, and cholera infantum, fine \$30 against each defendant (\$60 in all); Kirby's Mineral Products (Hydrick L. and Frank O. Kirby), "Kirby's Miracle Mineral, a water solution of iron sulfate offered for the treatment of fifty serious disease conditions, including skin diseases, diabetes, rheumatism, pyorrhea, and venereal diseases," fines totaling \$250.

For drug preparations not conforming to the official standards or to the claims of composition made on labels, these were fined as follows: James Good, Philadelphia, Pennsylvania, \$500; Battle & Co., Chemists Corporation, St. Louis, Missouri, \$550 and costs; William H. Rorer, Inc., Philadelphia, Pennsylvania, \$10; Abbott Laboratories, North Chicago, Illinois, \$25; Chicago Pharmacal Co., Chicago, Illinois, \$50 and costs; National Drug Co., Philadelphia, Pennsylvania, \$50; and Boyle & Co., Los Angeles, California, \$600.

Drug Products Seized

Drug products seized during January included 330 gallons of substandard cod-liver oil, 250 bottles of substandard

and aromatic spirits of ammonia, one lot of ampoules of iron and arsenic, ampoules of iron, arsenic and phosphorus, and ampoules of glycerophosphates compound, showing shortages in the principal ingredients; 1,136 packages of unsterile gauze bandage, 87 packages of unsterile adhesive plaster.

Potent medicines seized included "Cal-O-San Stomach Tablets," made of bismuth subcarbonate, calcium and sodium bicarbonate, starch and peppermint, falsely offered as a treatment for stomach ulcers; "G. W. Davis Inflammatory Extirpator," containing 69 per cent alcohol, capsicum, volatile oils including turpentine, camphor, gum and water, for coughs, sore throat, diarrhea, chills, bilious colic, cholera morbus, urinary diseases, neuralgia, dyspepsia, grippe, toothache, piles, sores of all kinds, rheumatism, asthma, general debility, indigestion, sour stomach, loss of appetite, nervous headache, earache, dysentery, inflamed or weak eyes, croup, prolapsus uteri and cramps (the further charge was made that the alcohol declaration required by law was inconspicuously placed on the label).

"Elco-Rub," a petrolatum with eucalyptus, wintergreen, camphor, menthol, turpentine, and guaiacol, for persistent cough, sore throat, whooping cough, rheumatism, stiff neck, and nasal catarrh; "Harosma," capsules, each containing 2.5 grains phenacetin, 2.7 grains aspirin, and one-seventh grain caffeine, represented as containing 4 grains phenacetin, for the paroxysms of hay fever and asthma, for rose fever, sinus, rhinitis, grippe, running nose, and weeping eyes.

"Mentos," a perfumed water solution of sulphur, borax, ammonia, and sodium bicarbonate, for dandruff, falling hair, ringworm, scalp irritations, psoriasis, and eczema; "Miller's Antiseptic Oil," kerosene with small amounts of capsicum and volatile oils including turpentine, wintergreen, and sassafras, represented as "snake oil," for aches and pains, muscular rheumatism, lumbago, corns, burns, scalds, diarrhea, cramps, sore throat, influenza, colds, pneumonia, and croup.

"Naco Nature's Aid," iron sulphate in water, with small amounts of aluminum, calcium, magnesium, manganese, sodium, potassium, and phosphorus compounds, falsely represented as antiseptic, for sores, burns, cuts, indigestion, rheumatism, pus in the kidneys, irritated bladder, dysentery, ptomain poisoning, acute diarrhea, sore throat, ulcerated tonsils, toothache, erysipelas, and carbuncles.

"Old Trusty Cough Mixture," a syrup containing creosote, plant extracts including wild cherry, and aromatics including menthol, for bronchial and pulmonary troubles in pets; "Old Trusty Ear Canker Drops," consisting of an oil (found to be rancid), an emulsifier and small amounts of calcium sulphate crystals, for cankers, abscesses and other ear sores in pets; "Old Trusty Tonic," a glycerin and water solution of iron compounds, strychnin, creosote, and oil of anise, for distemper; "Old Trusty Vermifuge Jr.," castor oil with small amounts of tetrachlorethylene and oil of anise, for worms in young dogs; "Old Trusty Vi-Ti," yeast and salt, for distemper, harsh coat, scurvy, vitamin deficiencies, and chorea in dogs.

"Rawleigh's All-Medicine Hog Mixture," sodium chlorid, phosphate, thiosulphate and bicarbonate, ferrous sulphate, sulphur, charcoal, and a plant laxative, offered as a tonic for hogs, for fattening, to stimulate the liver and the appetite, overcome indigestion, gastric ulcers, catarrh of the stomach, fermentative dyspepsia, and necrotic enteritis; "Rawleigh's Nasal Relief," a petrolatum-base ointment, containing menthol, camphor, and chlorbutanol (the chlorbutanol was not declared on the label as a chloroform derivative), for nasal catarrh, hay fever, chronic sore throat, and catarrhal deafness.

"Silver Crown Hair-Scalp Tonic," water with one per cent alcohol, quinin, glycerin, and small amounts of iron, sodium and sulphur compounds, perfume, and coloring matter, for dandruff, itching scalp, falling hair, eczema, and other scalp conditions.

"Sitroux Aids," tissue-paper handkerchiefs with menthol, cedar oil, and oil of eucalyptus, for sinus, hay fever, rose fever, and other nasal irritations; "Sphinx Herb

the use of this

"PROTECTIVE FOOD DRINK"

is indicated

THE DIETETIC VALUES of Cocomalt establish it as a "protective food" in the opinion of many physicians.

For instance, Cocomalt is rich in Calcium and Phosphorus—but more than that Cocomalt also has a rich Vitamin D content which enables the system to utilize the Calcium and Phosphorus. Each glass of Cocomalt in milk provides .33 gram of Calcium, .26 gram of Phosphorus, 81 U.S.P. units of Vitamin D.

Furthermore, each ounce of Cocomalt, the amount used to prepare one cup or glass, contains 5 milligrams of Iron in readily-assimilated form. Thus, three glasses or cups of Cocomalt supply the average normal daily iron requirement.

These important and vital food essentials plus the protein and carbohydrate content signalize the value of Cocomalt for the diet of expectant mothers, undernourished children, elderly people, nursing mothers, convalescents. Cocomalt is easily digested, quickly assimilated.

Cocomalt is Palatable and Inexpensive

Two added virtues that make this "protective food drink" deservedly popular with physicians and patients alike. Of distinctive and appetizing taste, this protective food drink costs little in proportion to its merit. It may be served Hot or Cold as you prescribe.

Cocomalt is sold at drug and grocery stores in ½-lb. and 1-lb. purity sealed cans. Also, for professional use, in 5-lb. cans available at a special price.

*Cocomalt is the registered trade-mark of

Tea," consisting mostly of dried senna leaves and pods, with fennel seed, anise seed, elder flowers, buckthorn bark, dog grass, orange peel, ginger root and safflowers, for pimples, dizziness, toxemia, minor eruptions, bad breath, colitis, digestive disturbances, and fatigue.

"Vapor Balm," petrolatum with menthol and wintergreen, for local congestion, irritation and inflammation, rheumatism, neuralgia, chest colds, muscular soreness, bruises, headaches, skin irritation, and affections of the air passages; and "Vita-Mil," consisting of 23 per cent Epsom salt, and plant drugs including extract of cascara and anise oil, represented as "made from roots, herbs and bark from all parts of the earth, containing no harmful drugs."

Diagnosis of Silicosis.—Gardner thinks that, regardless of the history of exposure to dust, a diagnosis of silicosis should not be made until generalized discrete nodular shadows are visible in the lung fields. Large localized shadows suggest complicating infection, but there is a conglomerate type of simple silicosis that occurs in the absence of active infection. It may result from pulmonary damage by previous infection that has healed. It can be differentiated from active infection only by careful clinical study and by repeated roentgenograms to exclude change

For Acidity and Allied Conditions, we suggest ADAMS SPRINGS MINERAL WATER

●MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and manganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is marked drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

GOLF**and the
mountains—****WAWONA**

IF you were building your own country estate you would try to find a site like Wawona . . . a green valley surrounded by pine-clad mountains . . . clear air filled with "high country" ozone . . . tennis, trout fishing, swimming, miles of trails to ride or hike . . . and best of all, a sporty nine-hole golf course that is kept in real country club shape—one that you won't tire of no matter how many times you play it each day. No need to worry about the children—they'll have the time of their lives!

Wawona is less than an hour from Yosemite Valley. Rates are reasonable—from \$29.75 a week and upward, lodging and meals. May we send scenic folders? Ask at your nearest Yosemite office: in San Francisco, 39 Geary St. (EX-brook 3906); in Los Angeles, 608 So. Olive St. (VAndike 2396).

tuberculosis. These may be situated in the upper parts of the lung, where they result from reactivated apical foci of tuberculosis, but frequently they occur in the middle or lower part of the lung. They consist of a very chronic combination of tuberculosis and silicosis progressing simultaneously in the same area. They give rise to much less pronounced symptoms of intoxication than tuberculosis alone. More acute forms of tuberculosis, aspiration disease and military tuberculosis occur, but they are not very common. Nonsiliceous dusts are generally responsible for an exaggeration of the linear markings of the lung. As far as known, the slight parilymphatic reactions responsible for them do not interfere with pulmonary function and they do not alter the native susceptibility to tuberculosis. Asbestosis is not so well understood. The roentgenogram shows a diffuse haziness of the lower lung fields and later a very fine uniform stippling. Whether chronic pleurisy, increased linear markings and conglomerate shadows are due to the dust, to secondary changes incident to collapse of the lobules, or to complicating infection, has not been definitely settled. The appearance of a tuberculous lesion in the asbestosis lung is apparently not modified. There may be some tendency toward chronicity.—*Annals of Internal Medicine.*

Medical School at Oxford.—Lord Nuffield, automobile manufacturer, has made the munificent offer of \$6,250,000 to Oxford University for the establishment of a graduate medical school, which has been gratefully accepted. He has previously shown great interest in medical work by his benefactions to hospitals and otherwise. By discussion with the leaders of the medical profession he is well acquainted with the problems of practice and of research. He realizes that progress in medical science is reaching a stage at which it is desirable for those who work in the field of research to undergo a period of postgraduate training in modern methods of investigation, to keep in close touch with the sciences ancillary to medicine and to pur-

In Infant Feeding

THE DOCTOR IS CONCERNED ABOUT THE COMPOSITION OF A MILK-MODIFIER!

WHEN you prescribe Karo as the milk-modifier you are providing well-tolerated, readily digested maltose-dextrins-dextrose. The dextrins are practically non-fermentable; the maltose rapidly transformed to dextrose requiring no digestion; the sucrose added for flavor is digested to monosaccharides. Karo is prepared chemically and bacteriologically safe—non-allergic, practically free from protein, fat and ash.

★ Infant feeding practice is primarily the concern of the physician, therefore, Karo for infant feeding is advertised to the Medical Profession exclusively.

sue their studies unhampered by the cares of private practice and routine teaching. Thence it is an easy step to the conception that a postgraduate medical school in a university town, in which all the scientific departments are within easy reach of the hospitals and in which the coordination of health services are established, would improve the facilities of those engaged in clinical work, whether institutional or that of general practice. In his presidential address at the recent meeting of the British Medical Association at Oxford, Sir Farquhar Buzzard spoke of the development of such a school at Oxford as an ambitious dream, thus filling the one conspicuous gap in the system of medical services. There is already at Oxford an Institute of Medical Research on a small scale, which Lord Nuffield founded. It is largely due to him that the Oxford hospitals have been reequipped and enlarged and are now provided with 650 beds. It is a condition of his offer that administration of the funds should provide for harmonious cooperation between the university and the hospitals.

The basis of Lord Nuffield's proposal is that the university, offering an environment more favorable to research than a big training hospital, should widen the scope of its medical school and of the Nuffield Institute for Medical Research for the purpose indicated. This would involve the establishment of senior posts not subject to the distractions of private practice, under whose direction there would be a body of salaried clinical assistants and house officers selected for their aptitude for research. The university would establish clinical departments of medicine, surgery, obstetrics, and gynecology, as well as of such other departments as may from time to time seem desirable. Each department would be under the control of a full-time university professor, for whose payment the scheme provides.—J. A. M. A.

Wisdom consists in knowing what to do. Skill consists in knowing how to do it. Virtue consists in doing.—David Starr Jordan.

Agencies in leading cities

VISIT THE FAMOUS POLAND SPRING RESORT, POLAND SPRING, MAINE

A youth once fell heir to a book. Its like could be found only in the library of a seat of learning. The new owner had to be careful lest the volume be injured by moisture, rough usage, or sunlight, lest it be eaten by worms, burned, or stolen. At length, as a young man, he learned to read the book; for its matter was composed in an ancient tongue. Furthermore, becoming versed in philosophy, he brought the author's wisdom to bear upon his own life. What he thus learned turned out to be itself a possession, free, however, from anxiety and the hazards of water, fire, or theft. It was secure wealth, yielding steady returns as long as he lived.—Leon J. Richardson.

The work of the mason is to build, of the physician to heal, of the scholar to study. Through teaching he may share his knowledge with other inquiring minds. An age of fine culture is always one of effective study. In it scholars are unhampered in their search for truth. No tyrant forbids them to lift their eyes to the hills, nor prescribes what their findings shall be. Only through an unshackled spirit of inquiry can they find the truth that builds civilization and makes men free. George Eliot was not the one to observe the scholar's "power of persevering, devoted labor." The university, which Milton called the "house of scholarship," is a bulwark of the state and a mother to civilization. "What shall become of that commonwealth," says Hooker, "which hath not the eye of learning to beautify, guide, and direct?"

He who fears criticism is hopeless. Only those who do things are criticized. The idler is lost sight of in the march of events, but the doer is watched and criticized. . . . Take your part in life's stage and play your part to the end: Stand for what is good; be a doer, not a drone; look the world in the face and let the critics criticize.—Thomas Jefferson.

Managing the average case

of hay fever with... **POLLEN ANTIGENS**

Lederle

WITH THE DEVELOPMENT OF LEDERLE'S stable* glycerolated pollen extracts, the testing and treatment of pollen sensitiveness have been simplified and improved.

The scratch test provides a simple, standard, safe and accurate technique for measuring the degree of sensitiveness and, therefore, for guidance as to dosage.

The advantages of a reliably stable extract are obvious as far as safety and dependability are concerned.

Thus the full resources of leading authorities have placed in the hands of the general practitioner this valuable agent for diagnosis and therapy, enabling him to extend its benefits to the largest number of hay fever sufferers. The physician may now procure the extracts in economical bulk packages.

Colfax School for the Tuberculous

Colfax, California

(Altitude 2400 feet)

This institution is for the treatment of medical tuberculosis and of selected cases of extrapulmonary (so-called surgical) tuberculosis.

The Colfax School for the Tuberculous consists of five Hospital Units with beds for patients who come unattended and a Housekeeping Cottage Colony for patients and their families.

The Colfax School for the Tuberculous offers the following advantages:

1. Patients are given individual care by experienced tuberculosis specialists. The patient is treated according to his individual needs.
2. Patients are taught how to secure an arrest of their disease, how to remain well when once the disease is arrested, and how to prevent the spread of the disease.
3. Patients have the advantage of modern laboratory aids to diagnosis and of all modern therapeutic agencies.
4. The climate of Colfax enables the patient to take the cure without discomfort twelve months in the year. We believe climate is secondary to medical supervision and rest, but the fact remains that it is easier to "cure" under good climatic conditions than where these climatic conditions are absent.
5. Colfax is accessible. It is on the main line of the Ogden Route of the Southern Pacific R. R. and has excellent train service. It can be reached by paved highway, being on the Victory Highway, with paved roads all the way to Colfax.

SALUTATION FROM PRESIDENT PALLETTE

To the Members of the California Medical Association and their friends, your Officers and Committee Members extend a cordial greeting.

We are most fortunate this year that the Association is holding its sixty-sixth annual meeting in one of the most delightful places in all America. Monterey, this first capital city of California, with its surroundings, constitutes a spot unsurpassed in all the world for scenic beauty, historic interest, and facilities for hospitality.

Monterey is the very cradle of Californian history. Viscaino landed here in 1602 and took possession in the name of the King of Spain. In 1821, Monterey became the capital of the Mexican Province of California. The

first Constitution of the American State of California was framed here in the first capitol, Colton Hall, still standing, in September, 1849. Other historic buildings still to be seen here are the house of Governor Alvarado, the Presidio chapel, General Sherman's headquarters, the Larkin House, Robert Louis Stevenson's home, the first United States Customs House, and the first theater in California, where many noted actors appeared before and during the days of the gold-rush. Then there are the famous Seventeen-Mile Drive, Pebble Beach, Carmel, and Carmel Mission where Junipero Serra is buried. The numerous unexcelled golf courses in the neighborhood will appeal to many of our members. Hotel Del Monte, the meeting headquarters, has been well referred to as "the world's best-loved resort."

Several objectives are to be aimed at in a meeting of this kind. The opportunity of meeting colleagues and renewing old friendships is most valuable. Doctors who are acquainted are usually good friends. The solidarity of organized medicine is thus increased. Our health, both physical and mental, must be benefited by even a short period of relaxation from the responsibilities of practice. The consideration of the problems of medical economics and public relations is important.

After all, however, the presentation and discussion of the problems of the strictly scientific side of our profession is probably the most important. Much credit is due the Committee on Scientific Program, and to the writers of papers and their discussants for the preparation of the following program. The Section Officers have done their work well.

Those in charge have done their utmost with the hope that you will spend a most comfortable and enjoyable few days at Del Monte. The attendance should be large.

May all Association members, including those of the Auxiliary and their friends in attendance, have a most profitable and a most enjoyable time!

EDWARD M. PALLETTE, M. D.
President, California Medical Association
1937

Cordially yours,

EDWARD M. PALLETTE.

REGISTRATION INFORMATION

Registration and Information. The registration and information desk is located in the lobby, Del Monte Hotel. All persons attending the convention, whether members or not, are requested to register immediately on arrival. Beginning Monday, May 3, registration secretaries will be on duty daily from 9 a. m. until 5 p. m.

Programs and "Pre-Convention Bulletin." The registration clerks will give to every member a copy of the program. The "Pre-Convention Bulletin" will be printed in the April issue of CALIFORNIA AND WESTERN MEDICINE. Delegates and alternates are especially requested to read the reports of officers and committees.

Guests and Visitors. All guests and visitors are requested to register. All general meetings and scientific meetings are open to visitors and guests.

Badges. Four kinds of badges will be issued by the registration bureau:

1. **Members.** Only active, associate, retired or honorary members of the California Medical Association will be issued the usual membership badge.

2. **Guests.** A guest badge will be issued to all fraternal delegates and visiting physicians who are attending the 1937 session.

3. **Delegates and Alternates.** The usual official badge for each delegate and alternate is provided for this purpose, and will be issued only to one authorized to wear it.

4. **Officers.** An official badge is provided for all officers and members of the Council.

Suggestions and Constructive Criticism. The officers and committees have tried to do everything possible to make the session a success. Suggestions and constructive

criticism calculated to make future sessions more useful will be welcomed by any of the officers. Complaints of whatever character should be promptly made at the registration desk, where they will receive attention.

Announcements

Please register on arrival and secure program and special announcements. Registration Bureau, Del Monte Hotel.

Delegates will please file *credentials* with committee at 7:00 p. m., Monday, May 3.

Consult Bulletin Board daily for schedule of *Scientific Exhibit Demonstrations*.

I—GENERAL MEETINGS

All General Meetings Will Be Held in the Auditorium, Hotel Del Monte

First General Meeting

Monday, May 3, 10 a. m.

1. *Address of Welcome*—Garth Parker, M. D., President, Monterey County Medical Society.
2. *President's Address*—Edward M. Pallette, M. D., Los Angeles.
3. *A Summary of Changes in the White Blood Cells in Various Diseases*—Jesse G. M. Bullova, M. D., New York University College of Medicine, New York.

Consideration will be given to our present-day conception of the origin, the function of the different types of white blood cells and the changes which occur in them in various diseased conditions. The discussion will include the response of the leukocytes to different infections and a consideration of the variance of these cells from the standpoint of diagnosis, prognosis, and treatment in the leukemias, infectious mononucleosis, and agranulocytic angina.

4. *The Uterine Cervix: Its Disorders and Their Management*—Norman F. Miller, M. D., University of Michigan Medical School, Ann Arbor, Michigan.

In evaluating common lesions of the cervix the careful examiner sees more than just a local disorder. He envisions future disease located in the cervix and forecast by the insignificant appearing disorder before him.

To make the most of this opportunity for prevention of disease of the female pelvis, a clear understanding of the cervix and its diseases are essential.

This paper represents a careful and practical scrutiny of the subject.

Second General Meeting

Tuesday, May 4, 11:15 a. m.

1. *Clinical-Pathological Conference*—Conducted by Cyrus C. Sturgis, M. D., Professor of Internal Medicine, University of Michigan, Ann Arbor, Michigan.

This conference will present selected cases with comments by the Conductor. After the presentation of case histories and laboratory findings, an opportunity will be given to ask questions pertinent to the subject. The Conductor will then summarize the case, after which the protocol will be read.

The following cases will be presented:

Case 1—Heart disease.

Case 2—Blood, liver, spleen complex.

Case 3—Anomaly of the pancreas.

Copies of clinical histories will be given to all attending this Clinical-Pathological Conference.

Third General Meeting

Wednesday, May 5, 11:15 a. m.

1. *State Legislation*—Junius B. Harris, M. D., Sacramento.
2. *Hospital and/or Medical Care Under Insurance*—T. Henshaw Kelly, M. D., San Francisco.
3. *Alameda County Hospitalization Insurance Plan*—Daniel Crosby, M. D., Oakland.
4. *Federal Legislation and Summarization*—William C. Woodward, M. D., LL. D., Director of the Bureau of Legal Medicine and Legislation of the American Medical Association, Chicago.

This general meeting was arranged at the request of many members who desire authentic information upon social movements involving medical care.

II—HOUSE OF DELEGATES MEETINGS

34th ANNUAL SESSION—HOTEL DEL MONTE

Speaker, W. W. ROBLEE, Riverside

Vice-Speaker, J. M. GRAVES, San Francisco

1. Amendments to constitution:

A.—*Resolved*, That Section 1 of Article VII of the Constitution of this Association be and is hereby amended by inserting in the first paragraph thereof after the words "the President," the following:

"The Past President"; and, be it further *Resolved*, That Section 8 of Article VII of the Constitution of this Association be and is hereby amended by inserting in the first paragraph thereof after the words "the President," the following:

"The Past President"; and be it further *Resolved*, That Section 1 of Article X of the Constitution of this Association be and is hereby amended by inserting after the words "a president" the following:

"A Past president"; and, be it further *Resolved*, That Section 2 of said Article X of the Constitution of this Association and the title thereto be amended to read as follows: "Section 2—President-Elect, when and how elected; term of office. Past President."

"The House of Delegates at the regular annual session thereof shall elect the president-elect to serve until the adjournment of the final meeting of the House of Delegates at its next regular annual session. At the conclusion of the final meeting of the House of Delegates at its next regular annual session, such president-elect shall assume the office of president, and serve as such for the term of one year thereafter, or until his successor assumes office."

"At the expiration of his term of office the president shall become the past president and serve as such for a term of one year thereafter, or until his successor assumes office"; and be it further

Resolved, That Section 4 of Article X of the Constitution of this Association be and is hereby amended by inserting in the first paragraph thereof after the word "president" the following:

"Past president."

B.—*Resolved*, That Section 1 of Article XI of the Constitution of this Association be and is hereby amended as follows:

By striking out all of the fourth paragraph of said Section 1 of Article XI, reading as follows:

"All resolutions providing for appropriations shall be referred to the Council, and all appropriations approved by the Council shall be included in the annual budget."

And by inserting in lieu thereof the following:

"Any resolution passed and adopted by the House of Delegates at any regular or special session thereof, which provides for or contemplates the appropriation or expenditure of more than the sum of \$1,000, shall not be effective for any purpose unless and until approved by the Council. All appropriations, regardless of amount, approved and made by the Council shall, if expended, be reported to the House of Delegates at its next annual session, and any unexpended portion of any thereof shall be included in the annual budget."

16. Resolutions and new business.

(NOTE: All resolutions must be presented in writing and in triplicate.)

17. Approval of minutes.

18. In Memoriam—Deceased Members—Frederick C. Warnshuis.

19. Recess to Wednesday, 7:30 p. m.

SECOND MEETING

Wednesday, May 5, 8:00 p. m.

Auditorium

8. Unfinished business.
9. Presentation of the President.
10. Presentation of President-Elect.
11. Presentation of Speaker and Vice-Speaker.
12. Approval of minutes.
13. Adjournment.

III—OTHER MEETINGS

CANCER COMMISSION PATHOLOGY
CONFERENCE

Sunday, May 2, 9 a. m. to 4:30 p. m.

Hotel Del Monte, Del Monte

The annual Conference on Pathology, held under the sponsorship of the Cancer Commission of the California Medical Association, will take place at Del Monte on May 2, 1937.

The program will include a full morning and afternoon session. The plan at present is to present short symposia upon various groups of tumors, with interesting cases interspersed through the meeting. It is hoped that reports on tumors exhibited at former sessions will be made.

All those desiring to present cases and slides are requested to return the same to the chairman of the committee, Dr. Z. E. Bolin, 490 Post Street, San Francisco, at their earliest convenience, accompanied by one hundred slides and a case history which is to be mimeographed. Those who wish to participate in the conference are requested to register with the chairman of the committee as soon as possible.

CANCER COMMISSION RADIOLOGY
CONFERENCE

Sunday, May 2, 10 a. m. to 4 p. m.

Hotel Del Monte, Del Monte

The Cancer Commission is again sponsoring a Radiological Conference on Sunday, May 2, at Del Monte. The meetings will be held in one of the rooms of the Hotel Del Monte, between 10 and 12 in the morning and 2 and 4 in the afternoon. In previous years a large number of doctors have drifted into these meetings without registering. This year only those who register, up to the number of thirty, will be admitted. This is because any greater number than this makes the meetings less profitable for everyone concerned. Please send your registration at once to the offices of the California Medical Association if you intend to be present. Do not register and hold someone else from a position if you do not intend to come. These meetings have always been the high-spot of the radiologists of the convention. We believe they will be better this year than ever.

Table I—Time and Places of Various Meetings and Entertainment

IV—SCIENTIFIC EXHIBITS

West Sun Terrace and Corridors

1. *Malignant Lesions of the Large Bowel*—Franklin I. Harris, M. D., Mount Zion Hospital, San Francisco; Joseph Levitin, M. D., Mount Zion Hospital, San Francisco; and Gerson Biskind, M. D., Mount Zion Hospital, San Francisco.

A series of preoperative x-rays, demonstrating malignant lesions of the large bowel (ascending colon, transverse and descending colon), with photographs of the particular specimens removed at subsequent operations.

The photographs include the gross pathology and microphotographs to illustrate the cellular structures of these malignant tumors, and postoperative follow-up x-rays of the large bowel in these patients, to illustrate complete restoration of function.

This series of exhibits shows the relatively good prognosis for restoration of health and function, and the type of intestinal resections in these cases which have given us a relatively low mortality.

The exhibits show the close relationship necessary for success that must exist between the radiologist, the surgeon, and the pathologist.

2. *New and Simplified Physical Method for Blood Detection*—Frederick Proescher, M. D., San Jose; Jesse Carr, M. D., St. Francis Hospital, San Francisco; and A. M. Moody, M. D., University of California, San Francisco.

The exhibit shows the effects of various degrees of heat upon the physical characteristics of blood.

3. *Pneumococcus Pneumonia*—W. P. Shepard, M. D., Metropolitan Life Insurance Company, San Francisco.

The importance of the pneumococcus pneumonia problem is illustrated in graphic charts showing pneumonia the third cause of death for the country as a whole, and more prevalent in certain so-called "pneumonia belts." Incidence of various types is illustrated, and a graphic description of the Neufeld rapid typing method is shown. Mortality savings from the prompt use of specific antisera, when available, is presented, and an estimate is given of the number of lives which might be saved if rapid typing and prompt administration of the antisera in suitable cases were universal.

4. *Two New Surgical Approaches to the Sympathetic Nervous System*—Felix L. Pearl, M. D., 450 Sutter Street, San Francisco.

The exhibit consists of diagrams and halftone drawings with descriptive legends depicting two new surgical approaches to the sympathetic nervous system. The first shows completely muscle-splitting extraperitoneal lumbar ganglionectomy and trunk resection. The second shows sacral ganglionectomy and trunk resection in conjunction with presacral neurectomy.

5. *Believe-It-or-Nots in Urology*—Wirt B. Dakin, M. D., 523 West Sixth Street, Los Angeles.

This exhibit shows cases of strange pathologic conditions and anomalies; unique findings and results in surgery; rare etiologic and curative factors.

6. *A Method of Visualizing Pyelograms in the Three Dimensions*—Nathan G. Hale, M. D., 1127 Eleventh Street, Sacramento; Ralph S. Graham, M. D.,

Sutter Hospital, Sacramento; and Paul Guttman, M. D., Medico-Dental Building, Sacramento.

7. *Moving Pictures of Ureteral-Intestinal Implantation*—Frank Hinman, M. D., Fitzhugh Building, San Francisco.
8. *Hydronephrosis: Renal Circulation*—Frank Hinman, M. D., Fitzhugh Building, San Francisco.
9. *Some Phases of Dentistry Which Are Also of Interest to the Physician*—California State Dental Association.

This exhibit presents some phases of dentistry which are also of interest to the physician, and conditions where the cooperation of the two professions is required for the good of the patient. It includes roentgenograms, specimens, models, charts, etc.

10. *Dental Abnormalities and Their Occurrence in Patients with Endocrine Dysfunction*—Ralph A. Reynolds, M. D., 490 Post Street, San Francisco.

This exhibit will consist of x-ray plates of: Normal jaw bone; normal teeth and normal roots; progressive bone atrophy (osteoporosis); multiple root resorption following previous orthodontic treatment; multiple root resorption without orthodontic treatment; multiple root resorption in hyperpituitarism (acromegaly); hypercementosis; enamel hypoplasia in deciduous and prominent dentition; alveolar resorption, horizontal type; alveolar resorption, vertical type; peg teeth; and plate showing congenital absence of teeth.

The exhibit will consist primarily of x-ray plates with titles showing the type of endocrine disorder found in the same individual with such dental abnormality. There will also be some photographic reproductions of original roentgenograms.

11. *Tuberculosis*—California Tuberculosis Association, 45 Second Street, San Francisco.

The exhibit of the California Tuberculosis Association will feature a display on the subject of tuberculin-testing, consisting of a series of photographs showing the technique of giving the tuberculin test, a diagram schedule illustrated with

photographs showing how Tuberculin P. P. D. is made, and a set of wax models showing a positive and negative reaction and interpreting the meaning of both.

There will also be a display of x-ray films: a series of fifteen, showing active cases of tuberculosis discovered in high school surveys; and a series of one hundred, showing tuberculosis in different stages—pneumothorax, thoracoplasty, and phrenicotomy.

12. *Heart Disease*—California Heart Association, 45 Second Street, San Francisco.

The exhibit of the California Heart Association will feature a moving picture showing the action of the heart, and a display of pathologic specimens.

13. *Peritoneoscopy*—John C. Ruddock, M. D., 1930 Wilshire Boulevard, Los Angeles, and Robert B. Hope, M. D., 1930 Wilshire Boulevard, Los Angeles.

Diagrammatic visualization of the technique; drawings and photographs of various pathologic conditions for which this procedure is used; demonstration of the instrument; report and analysis of experiences in over five hundred cases demonstrated by tables and graphs.

14. *The Use of Autogenous Strips of Fasciata in the Repair of the More Difficult Abdominal Hernias*—Hall G. Holder, M. D., Medico-Dental Building, San Diego.

This exhibit consists of a motion picture on the technique of the Galli operation and additional material comparing the results in different types of hernioplasty.

15. *Experimental Studies on Vitiligo*—Sophie A. Lurie, M. D., 610 South Broadway, Los Angeles.

Dead, lusterless, chalky areas of vitiligo assume a hue of life promptly after treatment begins. They become gradually pinkish, changing to a brighter, livelier appearance. The spot shrinks from the borders. Pigmented pinhead dots appear one by one inside, gradually forming confluent groups, producing larger pigmented areas until ample parts are repigmented.

16. *Contact Dermatitis From Cosmetics*—Franklin I. Ball, M. D., 6253 Hollywood Boulevard, Hollywood.

Dermatitis produced by cosmetics has been only occasionally mentioned in the literature, which might lead one to believe that it is a rare condition. The part cosmetics play in developing a dermatitis is hard to evaluate. It is our impression that eruptions of this nature are not rare, but only exceptional cases consult the dermatologist. Case exhibits of this nature will be presented with photographs and procedure followed for the discovery of the noxious agent.

17. *Photographs of Primary Syphilis and Chancroid*—Irving R. Bancroft, M. D., 523 West Sixth Street, Los Angeles.

Photographs of primary syphilis and lesions suspected of being syphilis, mostly taken at the Los Angeles County Venereal Clinic, show that orthologically typical lesions may not be syphilis, and atypical lesions may be syphilis, and that negative darkfield examinations should be followed by repeated Wassermann tests.

18. *Facial Scars or Blemishes and the End-Result of Treatment*—H. C. L. Lindsay, M. D., 599 East Colorado Street, Pasadena.

Removal of facial defects from new growth, disease, accidents, or scars, falls within the scope of dermatologists. Raised scars offer less difficulty in the way of improvement than either sunken scars or raised keloids. Simple methods, including minor surgery and physiotherapy, are used to obtain results illustrated.

19. *A New Spirochete Stain*—Stanley O. Chambers, M. D., Roosevelt Building, Los Angeles.

Demonstration, microscopic and photographic, of the technique of the spirochete stain, using photographs of the tissue and application of the same comparative data from a review of one hundred cases of primary syphilis wherein the stain has been used for diagnosis in comparison with the darkfield procedure.

20. *Acne Conglobata of the Buttock Relieved by Cautery*—George F. Koetter, M. D., 1136 West Sixth Street, Los Angeles.

Acne conglobata treated by cautery; clinical photographs.

21. *Grass Dermatitis*—Saul S. Robinson, M. D., 1930 Wilshire Boulevard, Los Angeles.

This exhibit consists of photographs descriptive of the erythematous, vesicular, bullous and pigmented lesions found in grass dermatitis. Many cases of grass dermatitis have been recorded during the past ten years in Europe, especially by the Oppenheim Clinic in Vienna. The patient presented is one of the first cases of this disorder to be reported in California.

22. *Congenital Anomalies of the Skin*—Samuel Ayres, Jr., M. D., 2007 Wilshire Boulevard, Los Angeles; Nelson P. Anderson, M. D., 2007 Wilshire Boulevard, Los Angeles; and Paul D. Foster, M. D., 2007 Wilshire Boulevard, Los Angeles.

An exhibit of clinical photographs of various types of congenital defects, including anomalies of pigmentation, vascular tissue, elastic tissue, etc.

23. *Association of California Hospitals Educational Ex-*

hibit—The Trustees of the Association of California Hospitals.

This exhibit will offer a chart, outlining the Association's aims and objectives. A chart and descriptive material on hospital medical social service, and other educational features of interest to the medical profession will be available.

24. *Favus—Clinical and Mycological Studies*—Norman N. Epstein, M. D., 450 Sutter Street, San Francisco, and Edward A. Levin, M. D., 450 Sutter Street, San Francisco.

Photographs demonstrating the clinical features of true favus infection due to *Achorion schoenleinii*, with report of a case involving the scalp and nails.

Demonstrated also will be photomicrographs, showing the infected hairs as well as gross culture of the more common types of the *Achorion* group of ringworm.

25. *Benign and Malignant Histological Specimens*—Eric G. Liljencrantz, M. D., Stanford University Hospital, San Francisco, and George V. Kulchar, M. D., 450 Sutter Street, San Francisco.

Various dermatoses clinically simulating epithelioma which on histologic examination proved to be benign, and lesions which clinically appeared benign but on histologic examination proved to be malignant, are exhibited. The technique of x-ray therapy of cutaneous malignancies is illustrated.

26. *Peptic Ulcer*—Harold Lincoln Thompson, M. D., F. A. C. S., 1930 Wilshire Blvd., Los Angeles.

This exhibit on gastric ulcer includes statistical clinical data—pathologic specimens, diagrams, and charts—on peptic ulcer, with especial emphasis on acute perforation and methods and results of treatment.

27. *Plastic Surgery: Before and After*—Fred Lindenberg, M. D., 1680 North Vine Street, Hollywood.

28. *The Injection and Operative Treatment of Hernia*—Leigh F. Watson, M. D., 727 West Seventh Street, Los Angeles.

The injection treatment for the cure of selected cases of reducible hernia represents an important economic saving to industry. The importance of using an injection fluid that does not cause much pain as shown in the end-results. Charts and drawings. New fascia transplant operations for large hernias.

29. *Reconstructive Surgery*—Arthur E. Smith, M. D., D. D. S., 1930 Wilshire Boulevard, Los Angeles, and James B. Johnson, M. D., 1930 Wilshire Boulevard, Los Angeles.

Over two hundred illuminated transparent photographs will be shown of numerous reconstructive surgery cases. Many of the transparencies are hand-painted.

30. *Skin Malignancies*—William H. Sargent, M. D., Samuel Merritt Hospital, Oakland.

31. *Anomalies of the Spine*—R. A. Carter, M. D., Los Angeles General Hospital, Los Angeles.

32. *Irradiation Therapy*—R. A. Carter, M. D., Los Angeles General Hospital, Los Angeles.

33. *A New Amputation Through the Femur at the Knee*—C. Latimer Callander, 450 Sutter, San Francisco.

Exhibit consists of surgically dissected specimens prepared by a special process for permanency.

V—ENTERTAINMENT

Tuesday, May 3

Sunday Afternoon:

Annual North and South Golf Tournament. This is in addition to the Tuesday afternoon golf tournament.

Tuesday Afternoon:

Golf; skeet-shoot; automobile drives—Monterey Bay.

Tuesday Evening:

President's dinner and ball, 7:30 p. m., main dining room.

Entertainment in the ballroom, 9:30 p. m.

Dancing, 10:30 to 1:00 a. m.

Guests registered in Hotel Del Monte must secure dinner tickets from the Hotel Management.

Guests registered at other hotels or lodging places around Monterey Bay must secure dinner tickets at the registration desk *before noon, May 3*. Price, \$2.50 per plate.

The Management announces that it will be unable to make any special table reservations unless requests are made to the assistant manager.

MRS. ANDREW J. THORNTON
President, Woman's Auxiliary to the
California Medical Association
1936-1937

MRS. HOBART ROGERS
Secretary, Woman's Auxiliary to the
California Medical Association
1936-1937

VI—WOMAN'S AUXILIARY

Eighth Annual Session

WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION

Headquarters at Hotel Del Monte, Del Monte

MRS. ANDREW J. THORNTON, *President*

MRS. JOHN HUNT SHEPARD, *Convention Chairman*

Sunday, May 2

- Arrival of delegates, members and guests, greeted by delegation hostesses.
3:00-5:00 p.m.—Registration at registration desk.
4:00 p.m.—Informal tea—Hotel Del Monte.
7:30-9:30—Registration.

Monday, May 3

- 8:45 a.m.—Pre-Convention State Board meeting in Tower Room, Hotel Del Monte.
9:00 a.m.-4:00 p.m.—Registration.
10:00 a.m.—First general meeting of the California Medical Association. All Auxiliary members and wives of doctors are invited to attend.
12:30 p.m.—Informal luncheon at Hotel Del Monte, with local hostesses presiding.
2:00 p.m.—Motor trips to interesting points on the Monterey Peninsula.
9:00 p.m.—Reception and musicale in honor of Mrs. Edward M. Pallette, wife of the president of the California Medical Association, to be held in the Copper Cup Room of the Hotel Del Monte. Members of the State Board will serve on the Reception Committee.

Tuesday, May 4

- 9:00 a.m.-1:00 p.m.—Registration.
9:30 a.m.—First general session of the eighth annual convention at Del Monte Lodge, Mrs. Andrew J. Thornton presiding.
1:00 p.m.—Luncheon at Del Monte Lodge honoring Mrs. Andrew J. Thornton, with Mrs. Thomas J. Clark presiding. Members of the State Advisory Board will be guests of honor.
7:30 p.m.—President's dinner and dance of the California Medical Association at Hotel Del Monte.

Wednesday, May 5

- 9:00-11:00 a.m.—Registration.
9:30 a.m.—Second general session of the eighth annual convention at Del Monte Lodge, Mrs. Andrew J. Thornton presiding. Election of officers.
12:30 p.m.—Post-Convention State Board meeting.
1:30 p.m.—The Seventeen-Mile Drive.
1:30 p.m.—Women's Golf Tournament.
4:00 p.m.—Musical tea, Monterey Peninsula Country Club, in honor of Mrs. Robert E. Fitzgerald, national president, and the incoming president, Mrs. Hobart Rogers, and the past presidents.

President's Report

To the Members of the Auxiliary:

The Woman's Auxiliary to the California Medical Association has had a busy and profitable year. Early in the fall, the State President outlined the following four-point program to the county organizations:

1. A membership drive with the twofold objective of renewing the interest of lapsed members and attracting new ones.

2. A careful study of the various aspects of socialized medicine, animal experimentation, and the educational standards of all types of professional schools whose graduates may practice the healing art in California.

3. An active sponsorship of *Hygeia*.

4. A contribution to the health education of the community through a Public Health Day or Institute.

The cooperation received has been most gratifying. For example, Santa Barbara County conducted a successful three-day Health Institute and to date San Diego County has increased its membership 41 per cent.

Good work has been done in behalf of *Hygeia*, but since the records from all the counties are not at hand

a report of the number of subscriptions obtained cannot be given.

The Woman's Auxiliary is making a place for itself in the life of the community, and is being called upon more and more to assist in the programs of other health agencies. We feel this marks a step forward.

These are a few of the projects undertaken by the individual counties: an essay contest in the public schools, organization of the assembly districts, a health activities contest for parent-teacher associations with twenty subscriptions to *Hygeia* as prize for the winner, assistance in the examination of school

children for tuberculosis, coöperation in the Health Education program of the Y. W. C. A.

In addition, each Auxiliary has undertaken some philanthropic work. The State Board has acquired a collection of books and health plays which it is hoped will be the nucleus of a Lending Library for the use of county auxiliaries and other groups in preparing health education programs.

These achievements were made possible by the enthusiasm of the individual members and the helpful counsel of the Advisory Board of the California Medical Association, for both of which I am deeply grateful.

MRS. ANDREW J. THORNTON, *President*.

 Twin-bedded rooms with bath (two persons).. 4.50 per day

♦ ♦ ♦

ASILOMAR—PACIFIC GROVE, CALIFORNIA

Located in Pacific Grove—about six miles from Hotel Del Monte. *European plan*

Can accommodate 157 persons

The Lodge contains twenty-one rooms with a guest capacity of twenty-eight

3 doubles with connecting tub bath..... \$3.00 per person
 1 double with private toilet and balcony.... 3.00 per person
 3 doubles with connecting toilets..... 2.00 per person
 10 singles with connecting toilets..... 2.00 per person
 4 singles convenient to toilet..... 2.00 per person
 (All rooms have hot and cold running water and there

is a large, comfortable living room with open fireplace in the lodge.)

Scripps contains thirty rooms with a capacity of thirty-nine guests

4 doubles with connecting toilets and tubs..\$3.00 per person
 4 doubles with connecting toilets and show-
 ers 2.50 per person
 1 double with private toilet and shower.... 2.50 per person
 21 singles with connecting toilets and
 showers 2.50 per person

(All rooms have hot and cold running water and there is a comfortable living room with open fireplace in Scripps.)

Guest Inn contains forty rooms and accommodates ninety guests

10 rooms to accommodate three persons
 each\$1.00 per person
 30 doubles 1.50 per person

(In this building the toilets, showers and tubs are all detached, there is no running water in the rooms. There is a comfortable living room with open fireplace.)

Breakfast, 35c, 40c and 50c; luncheon, 65c; dinner, 85c.

RAILROAD INFORMATION*

May 2–6, 1937

Ticket Agents of principal rail lines in California, on presentation and surrender of identification certificates, will sell round-trip tickets to Del Monte or Monterey, Calif., costing approximately 1¼c per mile, which is less than the first-class one-way fare. Tickets will be sold from April 28 to May 6, inclusive, and return limit will be May 16, 1937. Stopovers allowed. If longer return limit is desired, consult railroad ticket agent at Del Monte or Monterey prior to May 16, 1937.

Following are examples of fares to Del Monte and illustrate the extent of reduction:

From	One Way 1st Class	One Way Coach	Convention R. T. (85%)	30-Day R. T. Coach	21-Day R. T. 1st Class
San Francisco	\$ 3.70	\$2.47	\$3.15	\$ 4.45	\$ 4.90
San Jose	2.25	1.50	1.95	2.70	3.00
Los Angeles	11.45	7.64	9.75	13.76	15.15

Send a stamped, self-addressed envelope to the State Secretary to secure a certificate in order to obtain convention rate, which is an 85 per cent reduction.

RAILROAD SERVICE

	DAYLIGHT	DEL MONTE EXPRESS	COASTER		DAYLIGHT	COASTER
Leave San Francisco.....	8:15 a. m.	4:00 p. m.	6:15 p. m.	Leave Santa Barbara	10:35 a. m.	9:05 p. m.
Arrive Del Monte.....	11:09 a. m.	6:50 p. m.	9:49 p. m.	Arrive Del Monte.....	4:11 p. m.	7:45 a. m.
	DAYLIGHT	COASTER			SANTA FE	
Leave Los Angeles.....	8:15 a. m.	6:05 p. m.		Leave San Diego.....	1:00 a. m.	2:00 p. m.
Arrive Del Monte.....	4:11 p. m.	7:45 a. m.		Arrive Los Angeles.....	5:00 a. m.	5:15 a. m.

Service afforded by Daylight Limited, the Del Monte and Coaster from San Francisco. Service from Southern California by Daylight Limited and Coaster.

* What is here given is printed for its general informative value. It is wise to check on your own ticket rates and time tables.

Best known of the many scenic spots along Del Monte's famous Seventeen-Mile Drive is Midway Point with the Lone Cypress.

VIII—SECTION MEETINGS

SCIENTIFIC SECTION PROGRAMS

(Numbers in parenthesis after each section indicate sequence reference numbers of papers read in each section.)

I.—General Medicine (1-20).....	19
II.—General Surgery (21-42).....	21
III.—Obstetrics and Gynecology (43-52).....	23
IV.—Eye, Ear, Nose, and Throat (53-64).....	24
V.—Anesthesiology (65-73).....	26
VI.—Dermatology and Syphilology (74-85)....	27
VII.—Industrial Medicine and Surgery (86-93).....	28
VIII.—Neuropsychiatry (94-100).....	29
IX.—Pathology and Bacteriology 101-114)....	30
X.—Pediatrics (115-125).....	31
XI.—Radiology (126-136).....	32
XII.—Urology (137-148).....	33

Rules Regarding Papers and Discussions at the State Meetings:

Upon the recommendation of the Executive Committee the following rules regarding papers have been adopted by the Council:

1. The maximum time that may be consumed by any paper is fifteen minutes, provided that not to exceed ten minutes' latitude may be allowed invited guests at the discretion of the presiding chairman.
2. Motions from the floor to extend the time of an author may be entertained by the presiding officer.
3. The maximum time permitted any individual to discuss a paper is four minutes. This also applies to the author in closing his discussion. No speaker may discuss more than once any one subject.
4. A copy of each and every paper presented at the state meeting must be in the hands of the chairman or secretary of the section or in the hands of the general secretary before the paper is presented.
5. All papers read at the annual meeting shall be published in full in CALIFORNIA AND WESTERN MEDICINE as soon after the meeting as space will permit, or at the option of the author, an abstract of the paper of about one column in length shall be published as soon as possible after the meeting, with reprints in full of the entire paper (the cost of setting up type for the reprint to be borne by the Association, and all other costs to be borne by the author).
6. Articles are accepted for publication on condition that they are contributed solely to CALIFORNIA AND WESTERN MEDICINE. Authors desiring to publish their papers elsewhere than in the JOURNAL may have their manuscripts returned to them upon written request to the State Secretary.
7. No paper will be accepted by the General Program Committee nor by Section Program Committees unless accompanied by a synopsis of not to exceed fifty words.
8. Papers shall not be "read by title."
9. No member may present more than one paper at any one state meeting, provided that a member may be a collaborator on more than one paper, if these papers are presented by different authors.
10. Failure on the part of an author to present a paper precludes acceptance of future papers from such author for a period of two years, unless the author explains to the satisfaction of the Executive Committee his inability to fulfill his obligation.

Number of Section Papers

For convenience in reference, papers are numbered in serial sequence for the entire session, instead of a separate sequence for each section.

Business Meeting of Sections

Time of business meetings and elections of officers of sections will be scheduled on section blackboards by section secretaries, and through preliminary announcements by section chairmen.

Unless otherwise announced, the business meetings of each section and the election of officers will be held immediately after the reading of the second paper on the second day's section program.

I

GENERAL MEDICINE SECTION

JOHN C. RUDDOCK, M. D., *Chairman*
1930 Wilshire Boulevard, Los Angeles

EDWIN L. BRUCK, M. D., *Secretary*
384 Post Street, San Francisco

First Meeting—Grill Room

Monday, May 3, 1:30 p. m.

1. *Gastric Ulcer: Indications for Medical or Surgical Treatment*—William C. Boeck, M. D., 1919 Wilshire Boulevard, Los Angeles.

The incidence of gastric ulcer is estimated to be about one-tenth that of duodenal ulcer, but while it occurs so much more infrequently, its clinical importance is inversely magnified. This is due to the fact that it must be differentiated from carcinoma. The question of medical treatment and operative interference involves a grave responsibility, and data are presented relating to this problem.

Discussion by Clarence G. Toland, M. D., Los Angeles; Fred H. Kruse, M. D., San Francisco.

2. *Functional Indigestion*—Alfred E. Koehler, M. D., 317 West Pueblo Street, Santa Barbara.

These studies are concerned with digestive disturbances in cases where organic lesions have been ruled out but where disturbances in gastro-intestinal motility, deficiencies in digestive secretions, and impairment of absorption are disturbing factors. Endocrine and autonomic nervous system regulation of these functional factors is discussed. The method of treatment is presented.

Discussion by William C. Boeck, M. D., Los Angeles; Hugh F. Freidell, M. D., Santa Barbara.

3. *The Effect of Cigarette Smoking on the Concentration of Acidity and the Volume of the Gastric Juices, with Particular Reference to Peptic Ulcer*—Harold H. Rosenblum, M. D., 450 Sutter Street, San Francisco.

The effect of the smoking of a cigarette on the acidity and volume of the gastric juice was determined in fasting patients with and without peptic ulcer. Comparison was made between the response in the gastric juice to smoking and the response to the administration of 50 cubic centimeters of 7 per cent alcohol.

Discussion by Arthur Bloomfield, M. D., San Francisco.

4. *Chairman's Address: Peritoneoscopy, Its Clinical Applications*—John C. Ruddock, M. D., 1930 Wilshire Boulevard, Los Angeles.

A short history of the development of the procedure of peritoneoscopy; description of the technique; contra-indications; selection of suitable cases; dangers of the procedure; analysis of over five hundred cases examined by this method.

Discussion by Lyle G. McNeile, M. D., Los Angeles; Clarence G. Toland, M. D., Los Angeles.

5. *The Diagnosis of the Unusual Appendix*—John V. Barrow, M. D., 1930 Wilshire Boulevard, Los Angeles.

Minimal pathology in the appendix initiates minimal symptom response. The clinical manifestations vary in intensity and in location so much that the so-called typical onset is not even imitated.

The average appendix recognized as acute is just another acute exacerbation on the chronic pathology. There is a typical clinical history leading up to the appendiceal tragedy, but the whole picture is badly named.

Discussion by William H. Olds, M. D., Los Angeles; Clarence G. Toland, M. D., Los Angeles.

Second Meeting—Grill Room

Tuesday, May 4, 8:30 a. m.

6. *Simonds' Disease—Hypophyseal Cachexia*—Roberto F. Escamilla, M. D., 384 Post Street, San Francisco; and Hans Lisser, M. D., 384 Post Street, San Francisco.

Simonds' disease is considered due to impaired function of the anterior pituitary. It is diagnosed clinically chiefly by (1) loss of weight, progressing to emaciation; (2) disturbance of sexual function; (3) definitely lowered basal metabolism, together with other characteristic but less constant findings. Treatment with anterior pituitary preparations is discussed.

Discussion by C. K. Canelo, M. D., San Jose; Lewis T. Bullock, M. D., Los Angeles.

7. *Clinical Experiences and Experiments with Protamin Insulin*—James W. Sherrill, M. D., Scripps Metabolic Clinic, La Jolla.

From the clinical standpoint, protamin insulin is a distinct improvement over the regular type of insulin. Although the number of injections required is not reduced, the diabetic patient can now be kept in a nondiabetic state over the greater part of the twenty-four-hour day. The effect of protamin insulin in diabetics of varying degrees of severity and various states of nutrition is discussed. The effect of various types of diet with relation to protamin insulin is also discussed.

Discussion by Howard F. West, M. D., Los Angeles; H. C. Shepardson, M. D., San Francisco.

8. *Pulmonary Involvement in Lymphosarcoma and Lymphatic Leukemia*—Ernest H. Falconer, M. D., 384 Post Street, San Francisco.

In 1935, twenty-nine cases of Hodgkin's disease were surveyed for evidence of pulmonary involvement. A report was compiled and published on the basis of these statistics. As part of this study the patients with lymphosarcoma and lymphatic leukemia treated either in the University of California Hospital or in the out-patient department between the years 1923 and 1936 are studied for evidence of pulmonary involvement. This report is based on a study of these cases from the clinical, roentgenologic and pathologic aspects.

Discussion by Paul Michael, M. D., Oakland; Robert Stone, M. D., San Francisco.

9. *Some Physical Phenomena Associated with Anxiety States and Their Relationship to Hyperventilation*—William J. Kerr, M. D., Paul A. Gliebe, M. D., and James M. Dalton, M. D. (by invitation), University of California Hospital, San Francisco.

The influence of emotional stress upon the individual is apparent to physicians, and even to laymen. The physiologic disturbances associated with anxiety states or resulting from them are not so well appreciated by any but the most skilled physicians. The functional disturbances which are due to altered physiologic states cause the symptoms, as we have been able to demonstrate. Biochemical changes are the result as well as the cause of altered function. The interactions in the individual augment the anxiety state and continue the symptoms.

Discussion by D. Schuyler Pulford, M. D., Sacramento; Frank R. Nuzum, M. D., Santa Barbara.

RECESS

Business meeting and election of officers.

Third Meeting—Grill Room

Wednesday, May 5, 8:30 a. m.

10. *Aleukemic Myelosis (Aleukemic Leukemia), with Special Reference to the Clinical Significance of the Myeloblast: Report of Twenty-One Cases*—Stacy R. Mettier, M. D., and Katherine Purviance, A. B. (by invitation), University of California Medical School, San Francisco.

The occurrence of immature leukocytes in the peripheral blood often occasions diagnostic difficulty. Especially is this true when associated with leukopenia and anemia. This is a report of twenty-one selected cases in which the myeloblast comprised from 2 to 80 per cent of the total circulating leukocytes. These cases were diagnosed aleukemic leukemia. The important clinical manifestations and laboratory data are discussed.

Discussion by B. O. Raulston, M. D., Los Angeles; A. G. Foord, M. D., Pasadena.

11. *Atypical Vincent's Infection Manifesting Itself as a Systemic Disease*—William H. Barrow, M. D., 1400 Medico-Dental Building, San Diego.

A series of cases is presented of Fusio-spirochetal infection of the mouth and throat without the usual easily recognizable local lesions, but with moderately severe symptoms of a general systemic reaction. These symptoms are described and tabulated. The differentiation between normal and pathologic oral spirochetosis is discussed. The possibility of the existence of an allergic sensitivity to bacterial toxins or endotoxins is suggested by the occurrence of urticaria in some of the cases. Treatment and its results are outlined briefly.

Discussion by A. Herman Zeiler, M. D., Los Angeles; Hiram Miller, M. D., San Francisco.

12. *Treatment of Thrombocytopenic Purpura Hemorrhagica with Massive Doses of Moccasin Snake Venom: Report of a Case with Complete Recovery in Four Days and Review of the Literature*—Carlyle P. Imerman, M. D., 802 Taft Building, Hollywood.

Male, age forty-seven, with extreme pyorrhea, Vincent's angina and caries of the teeth, had hemorrhages from gums for two weeks. Carious teeth were extracted and five cubic centimeters dose of snake venom administered. Platelet count rose from 18,660 to 231,000 in four days. It is plausible that the suggested doses of snake venom are inadequate in certain cases.

Discussion by Ernest H. Falconer, San Francisco; Verne R. Mason, Los Angeles.

13. *The Significance of Changes in the White Blood Cells in Various Diseases*—Cyrus C. Sturgis, M. D., University of Michigan, Ann Arbor, Michigan. (By invitation.)

Consideration will be given to our present-day conception of the origin and function of the different types of white blood cells and the changes which occur in them in various disease conditions. The discussion will include the response of the leukocytes to different infections and a consideration of the variations of these cells from the standpoint of diagnosis, prognosis, and treatment in the leukemias, infectious mononucleosis, and agranulocytic angina.

Fourth Meeting—Auditorium

Wednesday, May 5, 1:30 p. m.

SYMPOSIUM ON PNEUMONIA

14. *Management of the Pneumonias*—Jesse G. M. Bullock, M. D., New York University College of Medicine, New York. (By invitation.)

Pneumonia will be discussed from the standpoint of a specific infection. Pneumonia described according to bacteriologic classification rather than anatomically. Therapy by use of specific therapeutic agents will be described in detail.

15. *Empyema, Interlobar and General*—Harold Brunn, M. D., 384 Post Street, San Francisco.

Acute empyema will be discussed mainly from the standpoint of errors that have been made in cases presenting themselves at the University of California Thoracic Clinic and their resultant com-

plications; also a résumé of the methods of treatment inaugurated in various stages of the diseases.

Interlobar empyema will be discussed from the standpoint of modes of infection, diagnosis, and treatment.

The subject will be discussed for the most part with lantern slides.

Discussion by H. Edward Stafford, M. D., Oakland; Lowell S. Goin, M. D., Los Angeles; A. M. Moody, M. D., San Francisco; David A. Wood, M. D., San Francisco; H. E. Schiffbauer, M. D., Los Angeles; E. J. Krahulik, M. D., Los Angeles; Clyde Harner, M. D., Long Beach; Harold Fletcher, M. D., San Francisco.

Fifth Meeting—Grill Room

Thursday, May 6, 8:30 a. m.

16. *A Dynamic Approach to Pulmonary Tuberculosis*—Harold G. Trimble, M. D., 707 Latham Square Building, Oakland, and Bulford Wardrip, M. D., San Jose.

Understanding that adequate rest is essential to promote healing, it is obligatory to control the mechanical problem in the chest. A résumé of various types of collapse procedures as they are commonly used by us is presented; their indications, combinations, and what we may reasonably expect to accomplish from them.

Discussion by Sidney J. Shipman, M. D., San Francisco; Carl Howson, M. D., Los Angeles.

17. *A Review of Tuberculous Tracheobronchitis*—Philip H. Pierson, M. D., 490 Post Street, San Francisco, and Paul C. Samson, M. D., 411 Thirtieth Street, Oakland. (By invitation.)

The term "tuberculous tracheobronchitis" means specific tuberculous infection of the trachea and bronchi, and is almost always secondary to active parenchymal pulmonary tuberculosis. In an experience with over eighty cases we are convinced of its danger as a complication. The paper will summarize the signs, symptoms, roentgenographic appearance and bronchoscopic findings in tuberculous tracheobronchitis, and will cover the incidence, prognosis, relationship to collapse therapy and the various forms of symptomatic and curative therapy.

Discussion by John C. Jones, M. D., Los Angeles; Sidney J. Shipman, M. D., San Francisco.

18. *The Nutritional Problem in Toxemias of Acute Contagious Diseases*—Milton J. Tobias, M. D., 1052 West Sixth Street, Los Angeles.

A severe toxemic state with its peculiar physical, chemical and energy phenomena, requires a compatible nutritional intake, differing from that of the well individual.

Predicated upon this hypothesis, severe toxemic patients were fed (in addition to high carbohydrate high vitamin diet) an augmented intake of nucleoproteins and lecithin, with salutary results.

Discussion by Hilario Marquez, M. D., San Francisco; A. G. Bower, M. D., Glendale.

19. *A Case of Extreme Obesity, Amenorrhea, Hypertension, and Diabetes Mellitus Successfully Treated with Anterior Pituitary Sex Hormones*—William M. Moffatt, M. D., The Santa Barbara Clinic, Santa Barbara.

Lantern slides are used to show the apparent effects of treatment on the weight, basal metabolism, pulse rate, periods of uterine bleeding, glucose tolerance, glycosuria, glycemia, and blood pressure, over a period of eighteen months. The syndrome is discussed and some of the possible explanations of results of treatment are suggested.

Discussion by Hans Lisser, M. D., San Francisco; P. A. Gray, Jr., M. D., Santa Barbara.

20. *The Value of Repeated Fundus Oculi Studies to Better Diagnosis and Treatment in General Medicine*—George L. Kilgore, M. D., Bank of America Building, San Diego.

An attempt is made to stimulate the more frequent use of fundus oculi examinations by internists in their routine practice, particularly those interested in cardio-vasculo-renal disorders. The findings in the more common diseases are summarized and evaluated as to importance in diagnosis and prognosis of the general disorders.

Discussion by L. H. Redelings, M. D., San Diego; William P. Corr, M. D., Riverside.

II

GENERAL SURGERY SECTION*

JOHN HUNT SHEPARD, M. D., *Chairman*
Medico-Dental Building, San Jose

J. M. SCHMOELE, M. D., *Secretary*
1930 Wilshire Boulevard, Los Angeles

NELSON J. HOWARD, M. D., *Assistant Secretary*
2814 Lyon Street, San Francisco

First Meeting—Auditorium

Monday, May 3, 1:30 p. m.

21. *Pseudobiliary Dyskinesia*—Stanley H. Mentzer, M. D., 450 Sutter Street, San Francisco.

New problems in diagnosis have been raised by the diagnosis of biliary dyskinesia evolved from the early anatomical work of Oddi and the physiologic work of Ivy. The application of these studies to clinical medicine has brought new difficulties that need clarification.

Discussion by Harold Brunn, M. D., San Francisco; Donald C. Collins, M. D., Los Angeles.

22. *Postoperative Evisceration—An Analysis of Thirty-Four Cases with a Review of Recent Literature*—Arthur Bowen, M. D., 1930 Wilshire Boulevard, Los Angeles.

A study of thirty-four cases of eviscerations with remarks based on a review of over two hundred cases from recent literature, with the object of analyzing the mechanism of production; suggestions in the presentation and treatment; and a consideration of the intrinsic factors of catgut affecting absorption and tissue reaction.

Discussion by Charles T. Sturgeon, M. D., Los Angeles; H. H. Searls, M. D., San Francisco.

23. *Traumatic Rupture of the Spleen—Report of Twenty-Three Cases*—Edmund Butler, M. D., 490 Post Street, San Francisco.

The paper will be a discussion of: (1) Various types of injuries, as subcutaneous, penetrating, explosive, and indirect. (2) Complications: Secondary hemorrhage and infection. (3) Symptoms: Particularly pain and its variability. (4) Diagnosis: Very difficult in the presence of other injuries.

Discussion by Lee Cohn, M. D., San Francisco; Herbert Chapman, M. D., Stockton.

24. *Report of a Series of Traumatic Rupture of the Liver*—Herbert S. Mooney, M. D., 1930 Wilshire Boulevard, Los Angeles.

A statistical study of a series of sixty cases of traumatic injuries to the liver emphasizing the etiologic factors; the symptoms, physical findings; indications for surgery; operative findings; operative procedure; complications; and end-results.

Discussion by Harlan Shoemaker, M. D., Los Angeles; Howard W. Stephens, M. D., San Francisco.

25. *The Place of Partial Gastrectomy and Duodenectomy in the Surgery of Duodenal Ulcer*—Ernst Gehrels, M. D., 490 Post Street, San Francisco.

Among surgeons and internists there is increasing dissatisfaction with the results of gastro-enterotomy and pyloroplasty. The late results of partial gastrectomy and duodenectomy are much better. In the experience of the author the mortality of

* Monitors: D. D. McKinnon, M. D., Los Angeles, and C. S. Stone, M. D., Santa Barbara.

partial gastrectomy and duodenectomy for ulcer is small. The indications for the radical operation should be very strictly drawn, and are given in detail.

Discussion by Emile Holman, M. D., San Francisco; J. Homer Woolsey, M. D., Woodland.

26. *Posterior Vaginal Hernia*—Ray B. McCarty, M. D., The Mission Inn Rotonda, Riverside.

Posterior vaginal hernia is a surgical oddity which has frequently been mistaken for rectocele, with resultant recurrence following surgery. A case report will be presented with a discussion of the subject, particularly from the standpoint of etiology, diagnosis, and treatment.

Discussion by Clarence G. Toland, M. D., Los Angeles; Bon O. Adams, M. D., Riverside.

Second Meeting—Auditorium

Tuesday, May 4, 8:30 a. m.

27. *Chairman's Address: Looking Forward*—John Hunt Shephard, M. D., Medico-Dental Building, San Jose.

28. *Prevention of Lymphedema of the Arm Following Radical Operation for Breast Cancer*—Alson R. Kilgore, 490 Post Street, San Francisco.

Causes of lymphedema: (1) Operative removal of main lymph trunks, (2) less than average collateral bed, or (3) destruction of collateral bed by lymphangitis.

Means of avoiding the last-named cause: (1) Incision so planned that fat-necrosis in healing will not occur in the collateral bed. (2) Technical operative procedures to avoid lymphangitis in this bed.

Outline of plan of operation.

Discussion by Orville N. Meland, M. D., Los Angeles.

29. *Experimental and Clinical Studies on Repair of the Dura Mater*—Mark A. Glaser, M. D., 727 West Seventh Street, Los Angeles; C. H. Thienes, M. D., Ph. D., School of Medicine, University of Southern California, Los Angeles. (By invitation.)

A series of twenty dogs have been studied for the purpose of determining the rapidity of dural repair with and without grafts; the type of cells which go to form new dura have been studied.

Grafts of animal membrane and fascia have been introduced and a comparison of the repair of all these have been carried out.

A clinical study of dural repair in tumors and depressed fractures will be reported to supplement these animal experiments.

Discussion by Howard Naffziger, M. D., San Francisco; James B. McNaught, M. D., Stanford University School of Medicine.

30. *Surgery in the Diabetic—A Ten-Year Survey*—Irving Wills, M. D., 1421 State Street, Santa Barbara.

This presentation outlines the management of a group of surgical diabetic patients seen during a ten-year period. It includes the dietetic regimen used by the author with a discussion of acidosis and peripheral circulatory collapse. Illustrative case reports are detailed.

Discussion by Gerald H. Beck, M. D., Glendale; Emile Holman, M. D., San Francisco.

31. *Subcutaneous Glomus Tumor*—L. R. Chandler, M. D., Stanford University Hospital, San Francisco.

Glomus tumor is a clinical entity presenting definite signs and symptoms. These consist primarily of pain of a peculiar type, resulting from pressure on a small pigmented tumor of the skin. Glomus tumors usually are in the extremities and most often under or near the nails. The typical history and physical findings are illustrated by a case report, which is accompanied by the pathologic findings.

Discussion by David A. Wood, M. D., San Francisco.

32. *Chronic Duodenal Stasis: A Syndrome with Neurologic Symptoms*—Frederick L. Reichert, M. D., Lane Hospital, San Francisco.

Chronic duodenal stasis is mentioned very briefly in textbooks of surgery. In the past decade several excellent articles have called attention to the symptoms, signs, and treatment of this condition. One of the common etiologic factors has been compression of the third portion of the duodenum by the superior mesenteric vessels. Symptoms of headache, vertigo, and vomiting have been sufficiently misleading as to suggest some neurologic disturbance. Illustrative case histories are presented briefly.

Discussion by Nelson J. Howard, M. D., San Francisco; John Homer Woolsey, Woodland.

RECESS

Business meeting and election of officers.

Third Meeting—Auditorium

Wednesday, May 5, 8:30 a. m.

33. *Parathyroid Adenoma*—William W. Washburn, M. D., 384 Post Street, San Francisco.

A case of hyperparathyroidism associated with osteofibrosis cystica and nephrolithiasis is presented. The clinical aspects, blood chemistry, bone and kidney changes are discussed. The anatomy of the parathyroids, indications for surgery and technical steps of the operation are outlined. The article is supplemented by photographs, photomicrographs and roentgenograms, and is followed by a bibliography.

Discussion by Hans Lisser, M. D., San Francisco; Robertson Ward, M. D., San Francisco.

34. *Inflammatory Strictures of the Rectum Associated with Lymphogranuloma Inguinalis*—Carleton Matthewson, Jr., M. D., Mattei Building, Fresno.

A historical, clinical, and pathologic study of the rectal lesions associated with lymphogranuloma inguinale is presented, with particular consideration of the early manifestations of the disease, the mode of infection, and treatment. (Lantern slides.)

Discussion by Robert A. Scarborough, M. D., San Francisco; Arthur Haim, M. D., San Francisco.

35. *The Nature and Treatment of Acute Ischio-rectal Abscesses*—Paul C. Blaisdell, M. D., 102 North Madison, Pasadena.

An analysis of a hundred cases of acute ischio-rectal abscesses and chronic fistulas reveals a common misunderstanding of the nature of the former, and their relation to the latter. Because they are called "abscesses," spontaneous acute ischio-rectal abscesses are too often regarded in nature, and treated as common abscesses elsewhere, with regrettable results.

Discussion by William H. Daniel, M. D., Los Angeles; A. J. Murrieta, M. D., Los Angeles.

36. *Acute Intestinal Obstruction*—J. Norman O'Neill, M. D., 1930 Wilshire Boulevard, Los Angeles.

An analysis of two hundred and fifty cases treated in the Los Angeles County General Hospital over a five-year period: Morbidity, mortality, signs and symptoms, early diagnosis, importance of exploratory laparotomy, x-ray, blood chemistry, leukocytosis, types of obstruction, etiology, age incidence, treatment, prophylactic, preoperative, postoperative, merits of ileostomy, Wetzel tube, Holden's method, resection, enterotomy, morphin, Levine suction, misleading factors, Hartman's solution, hypertonic and normal saline, pituitrin and enemas, pitressin.

Discussion by E. Vincent Askey, M. D., Los Angeles; Edward C. Palette, M. D., Los Angeles.

37. *Nonspecific Enteritis*—Charles S. Roller, M. D., Woodland.

Summary of newer knowledge since 1934 of this disease entity, with complete studies and observations of three proved cases. Diagnosis, variable appearance as seen at time of surgery, theories as to cause, treatment advised and subsequent clinical courses over a period of years. (Lantern slides.)

Discussion by Frederick Reichert, M. D., San Francisco; H. Glenn Bell, M. D., San Francisco.

✽

Fourth Meeting—Auditorium

Wednesday, May 5, 1:30 p. m.

SYMPOSIUM ON LOBAR PNEUMONIA

This will be a joint meeting of the following sections: Medicine; Surgery; Obstetrics and Gynecology; Pediatrics; Pathology; Eye, Ear, Nose, and Throat; and Radiology.

The program of this joint meeting is printed under the fourth meeting of the General Medicine Section. (See page 20.)

✽

Fifth Meeting—Auditorium

Thursday, May 6, 8:30 a. m.

38. *Reconstruction of the Enlarged Breast*—H. O. Barnes, M. D., 727 West Seventh Street, Los Angeles.

The technique of reconstructing the benign enlarged breast is given in word and by simultaneous running of Kodachroma film. Preoperative design and delineation, as well as postoperative result, are presented for evaluation and discussion.

Discussion by Eric Larson, M. D., Los Angeles; William Olds, M. D., Los Angeles.

39. *Branchial Cysts*—E. Eric Larson, M. D., 1930 Wilshire Boulevard, Los Angeles.

Author's paper based on fifteen patients with branchial cysts. The embryologic origin, signs and symptoms, as well as surgical care, will be discussed. (Motion pictures.)

Discussion by Arthur E. Smith, M. D., Los Angeles; J. Homer Woolsey, M. D., Woodland.

40. *Surgery of the Cleft Palate*—Arthur E. Smith, M. D., 1930 Wilshire Boulevard, Los Angeles.

Motion pictures.

Discussion by E. Eric Larson, M. D., Los Angeles; Gerald B. O'Conner, M. D., San Francisco.

41. *Recent Advances in the Surgical Treatment of Pulmonary Tuberculosis Through Selective Collapse by Partial Thoracoplasty*—Emile Holman, M. D., Stanford University Hospital, San Francisco.

Complete unilateral thoracoplasty is being supplanted by partial operations which endeavor to collapse only the affected lung. This obviates needless sacrifice of good lung, and prevents unnecessary reduction in vital capacity. The operative procedures being utilized are complete removal of first, second and third ribs, partial removal of additional ribs as indicated, removal of transverse processes, and partial resection of scapula in selected cases.

Discussion by Philip Pierson, San Francisco; Hans Schiffbauer, Los Angeles.

42. *The Use of Autogenous Strips of Fascia Lata in the Repair of the More Difficult Abdominal Hernias*—Donald C. Collins, M. D., 1930 Wilshire Boulevard, Los Angeles.

The development of the use of autogenous fascia lata sutures in hernioplasties is reviewed and important contributions are mentioned. The technique is outlined. A series of forty-four cases treated by this method are reported. There were no deaths. One case had a slight questionable recurrence.

Discussion by Hall G. Holder, M. D., San Diego; C. Latimer Callander, M. D., San Francisco.

III

SECTION***

DONALD G. TOLLEFSON, M. D., *Chairman*
511 South Bonnie Brae, Los Angeles

R. GLENN CRAIG, M. D., *Vice-Chairman*
490 Post Street, San Francisco

GEORGE W. COON, M. D., *Secretary*
3770 Twelfth Street, Riverside

First Meeting—Copper Cup Room

Monday, May 3, 1:30 p. m.

43. *Episiotomy*—George D. Huff, M. D., 806 Medico-Dental Building, San Diego.

The mediolateral episiotomy is most commonly used. Novocain solution (one-half per cent) is injected along the line of incision, and the tissues are then carefully divided, layer by layer, with a sharp scalpel. After delivery, the wound is closed, layer by layer, with chromic catgut. Subcuticular stitches are used for the skin.

Discussion by A. M. McCausland, M. D., Los Angeles; Hall G. Holder, M. D., San Diego.

44. *Postpartum Hemorrhage*—Clarence A. De Puy, M. D., 230 Grand Avenue, Oakland.

In the study of maternal mortality, hemorrhage ranks second as a cause of death in the last trimester of pregnancy. This paper deals with preventive and curative measures, which, if adopted, will lessen our maternal mortality. It offers some suggestions to the health department that proper inspection be made of all maternities before permits are issued.

Discussion by Thomas Wier, M. D., San Diego; L. A. Emge, M. D., San Francisco.

45. *Roentgen-ray Pelvimetry: A Study of Three Hundred and Twenty Labors*—C. T. Hayden, M. D., University of California, San Francisco. (By invitation.)

In a series of 410 unselected cases which have been studied by the Caldwell and Moloy classification (using the Thoms plate for mensuration of the superior strait). It was found in our material at the University of California Hospital that 75 per cent of the pelves were of pure type, and 25 per cent mixed. Of this group, 320 primiparous labors were evaluated as to type of pelvis, duration of labor, size of baby and obstetrical index as a means of comparison.

It is apparent that, regardless of the type of pelvis, the character of the pains was most important from the standpoint of nonsurgical intervention in labor.

Discussion by A. V. Pettit, M. D., San Francisco; E. J. Krahulik, M. D., Los Angeles.

46. *The Relation of Hormones to Tumor Growth*—L. A. Emge, M. D., Stanford University School of Medicine, San Francisco.

After a brief review of the present status of the cancer problem, some of the newer theories about malignant behavior of cells are discussed. The relation of endocrine changes to tumor growth in man is analyzed and compared with the results of extensive laboratory research attempting to link carcinogenesis and tumor growth with endocrine dysfunctions. The estrogenic factor is discussed in detail and supplemented by personal experimental studies. (Lantern slides.)

Discussion by E. M. Hall, M. D., Los Angeles; Chauncey D. Leake, Ph. D., San Francisco. (By invitation.)

47. *Birth Injuries to the Bladder and Bowel: Their Management*—Norman F. Miller, M. D., University of Michigan Medical School, Ann Arbor, Michigan. (By invitation.)

* Monitors: R. W. Dunn, M. D., San Francisco, and George Huff M. D., San Diego.

Serious birth trauma to bladder and bowel has undoubtedly decreased with insistent demand for better obstetrics and resultant improved care. Even so, the mental and physical suffering from certain injuries to these organs warrants increasing effort toward their prevention and correction. This discussion is confined to the cause and cure of vesico-vaginal fistulae and complete perineal tears.

**Second Meeting—Copper Cup Room
Wednesday, May 5, 8:30 a. m.**

48. *The Cervix After Hysterectomy*—Erle Henriksen, M. D., Pacific Mutual Building, Los Angeles.

Six thousand five hundred and fifty cervical stumps examined clinically and pathologically. Four-tenths per cent developed cancer, 2.5 per cent returned for further treatment of benign lesions. Dilatation and curettage of canal indicated in examination of stump. Clinical symptoms arising from the stump are multiple. No indication for routine total hysterectomy. Microscopic examination of material obtained under direct vision important.

Discussion by Henry N. Shaw, M. D., Los Angeles; R. Glenn Craig, M. D., San Francisco.

49. *Progress in Maternal and Child Welfare Under the Social Security Act and Their Relation to Obstetrics*—Lyle G. McNeile, M. D., 3780 Wilshire Boulevard, Los Angeles.

The meeting of the Advisory Committee of the Children's Bureau will not be held until April 8, 1937. The meeting is to be held in Washington, and it will be absolutely impossible to obtain an adequate picture of the situation in so far as the relation of the medical profession to Title III of the Social Security Act is concerned until after this meeting. The meeting is to be attended by fifteen or twenty of the leading obstetricians and will afford an opportunity to obtain a fairly accurate idea of what is going on over the entire United States.

Discussion by Frank Lynch, M. D., San Francisco; Karl Schaupp, M. D., San Francisco.

50. *Chairman's Address: Hospital Consultation in Private Obstetrics*—Donald G. Tollefson, M. D., 511 South Bonnie Brae, Los Angeles.
51. *Radium Reaction in Cancer of the Cervix*—Frank Lynch, M. D., University of California Medical School, San Francisco.

A histologic study of uteri removed after radiation of cancer of the cervix. Has given findings of interest in the study of radiation. A paper presenting fifteen such uteri radiated by various methods in general usage, and showing the inadequacy of most of them. The study will be presented from lantern slides.

Discussion by L. A. Emge, M. D., San Francisco; Lyle G. McNeile, M. D., Los Angeles.

52. *Skin and Chemical Tests for Pregnancy*—R. D. Dunn, M. D., 2000 Van Ness Avenue, San Francisco; Paul E. Hoffmann, M. D., 2286 Jackson Street, San Francisco, and Florence L. Fouch, M. D., 490 Post Street, San Francisco.

The experience with chemical and skin tests for pregnancy in seven hundred patients is reviewed. The technique of these tests and certain modifications are discussed.

The study includes observations made in relation to normal and abnormal pregnancy, abortions, and nonpregnant conditions. Simplicity in technique make these tests attractive, but the end-results indicate that their reliability, as compared with biologic tests, is still uncertain.

Discussion by D. G. Morton, M. D., San Francisco.

RECESS

Business meeting and election of officers.

**Third Meeting—Auditorium
Wednesday, May 5, 1:30 p. m.**

SYMPOSIUM ON LOBAR PNEUMONIA

This will be a joint meeting of the following sections: Medicine; Surgery; Obstetrics and Gynecology; Pediatrics; Pathology; Eye, Ear, Nose, and Throat; and Radiology.

The program of this joint meeting is printed under the fourth meeting of the General Medicine Section. (See page 20.)

FRANK BAXTER, M. D., *Secretary*
1624 Franklin Street, Oakland

**First Meeting—Copper Cup Room
Tuesday, May 4, 8:30 a. m.**

53. *Pulmonary Injury Caused by Intratracheal Instillation of Liquid Petrolatum*—George H. Houck, M. D., 2007 Wilshire Boulevard, Los Angeles.

An illness which followed therapeutic intratracheal instillation of liquid petrolatum and which resembled the so-called lipid pneumonia is described. The patient lived for six years and eight months, during which period oil globules were frequently found in the sputum. Serial roentgenograms made throughout this long illness showed at first a fine granular mottling over the lower lung fields. Later the left lower, right lower, and middle lobes were seen to shrink slowly and were finally represented by small, round, dense shadows, just above the diaphragm. During the same period both upper lobes of the lungs became abnormally translucent and the physical signs of emphysema appeared. At necropsy the characteristic picture of an oil foreign body was found, together with extensive and long-standing fibrotic changes. A quantity of this oil was removed and identified as mineral oil.

Discussion by George McClure, M. D., Oakland.

54. *A Planned, Complete Tonsillectomy*—William Remfrey Hunt, M. D., 1525 State Street, Santa Barbara.

Discussion is made of a planned, complete removal of the palatine tonsil and its lymphoid appendages. Slides of seven consecutively removed tonsils with appendages attached are shown. A dissection and snare method with an anatomical approach is used. The plica triangularis is routinely incised from the margin of the anterior pillar at the onset. Careful dissection under direct vision with good lighting frees the upper pole, the posterior and anterior pillars completely. When snaring, the tenaculum includes the lower pole, the tongue depressor is removed, allowing the lateral lingual and subtonsillar tissue to rise into the snare, which is forced downward. While this often completes the removal, a thorough inspection with the tongue depressor, pillar retractor, and Allis forceps is made. This may reveal extracapsular lymphoid masses at the upper pole, behind the anterior pillar, or on the extreme lower lateral surface of the tongue. These are removed with the Allis or Allis and snare. Any other methods accomplishing similar results are approved.

Discussion by Herman Semenov, M. D., Los Angeles.

* Monitor: Clifford B. Walker, M. D., Los Angeles.

55. *Infection in the Danger Area of the Lips, Face, and Nose*—G. W. Walker, M. D., 2014 Tulare Street, Fresno; Hugh Awtrey, M. D., 532 Patterson Building, Fresno. (By invitation.)

In the literature of the subject of infections in the danger area of the lips, face, and nose, there is caution about injuring the tissues by picking, squeezing, or even wide cutting through the diseased area into the healthy tissues either laterally or deeply. With all of this we agree. All agree to careful expectant treatment as for patient gravely sick. Many advise no surgical treatment should be used at all. About all the others advise operation only on the grave cases. We urge gentle handling, but evacuation of pus wherever pus forms, sterilizing all cuts with pure phenol followed in two minutes by alcohol to stop the action of the phenol. If the pustule be small it is most simple; if threatening, it is promptly stopped. Large carbuncles should be cautiously entered, septa broken and made into one or fewer cavities to arrest diseased process. Further venous involvement will not then take place. Such treatment is effective. Watchful waiting allows deaths from cavernous sinus thrombosis, meningitis, and septicemia.

Discussion by George F. Keiper, M. D., Los Angeles.

56. *Irrigation of the Maxillary Sinuses Through the Ostium—Moving Pictures of Technique, with Anatomical Demonstration*—Charles E. Futch, M. D., 1930 Wilshire Boulevard, Los Angeles.

Irrigation of the maxillary sinus is an established diagnostic and therapeutic procedure in the usual practice of rhinology. The less trauma inflicted upon the nasal mucosae in treatment the more rapidly the tissues approach the normal state, and the patient will suffer comparatively little discomfort. Irrigation through the ostium is not new or unusual, but a simple demonstration of the technique may stimulate even a wider use of this method. The approach to the antrum through the ostium or accessory ostia is not always applicable. There are indications, contra-indications, advantages, and disadvantages. The anatomical accessibility makes this method impossible in some cases, and it is well to recognize these exceptions rather than force cannulization. The modified instruments and technique of procedure are shown in motion pictures, both upon the cadaver and patient. Complications and end-results are presented with a summary for the consideration of the assembled Society.

Discussion by J. Randolph Sharpsteen, M. D., Oakland.

✱

Second Meeting—Art Gallery Wednesday, May 5, 8:30 a. m.

57. *Ear Manifestations Following Head Injuries*—Frank Hand, M. D., 490 Post Street, San Francisco.

The most common ear symptoms encountered following severe head injuries are a loss of hearing or decrease in hearing for high tones. The next symptom in order of frequency is hyperirritability of the labyrinth, which is manifested by dizziness and aggravated by quick head movements. Ear symptoms are usually found following severe concussions of the brain with or without skull fracture and irrespective of whether or not the fracture extends through the petrous portion of the temporal bone. Following severe concussions of the brain with or without fracture, patients suffer from hyperirritability of the labyrinth, which is characterized by dizziness and a diminution of hearing for high tones. These patients, if insurance cases, must be given a permanent disability because the symptoms will not improve and we have no satisfactory treatment for this condition. The longitudinal fracture through the petrous portion of the temporal bone is the typical middle ear fracture, and is usually characterized by bleeding from the

ear and progressive loss of hearing for low tones. A crossing fracture through the petrous portion of the temporal bone will leave the patient totally deaf in the affected ear if he recovers.

Discussion by Harold A. Fletcher, M. D., San Francisco.

58. *Ionization in Allergic Rhinitis*—H. James Hara, M. D., 432 South Boyle Avenue, Los Angeles.

Ionic medication has fascinated the medical profession for more than a century. When a weak solution of sulphate of zinc is used as electrolyte it coagulates the superficial epithelium of the nasal mucosa. Discussion of various operative techniques, armamentaria, indications and contra-indications in allergic rhinitis is given. Review of one hundred consecutive cases from the author's private and dispensary cases is presented. Slides are shown, demonstrating the reaction of the nasal mucosa at various periods during and following ionization.

Discussion by G. W. Walker, M. D., Fresno.

RECESS

Business meeting and election of officers.

59. *The Use of Snake Venom in Postoperative Hemorrhage of the Eye*—Wilber F. Swett, M. D., 490 Post Street, San Francisco.

During the past six months I have had several stubborn postoperative hemorrhage cases which failed to respond to the usual procedures. The continuous oozing of blood from the iris into the anterior chamber following cataract extraction prolongs the healing and in many instances results in the failure of the wound to close, or even a painful eye with rupture of the wound and prolongs seepage from the anterior chamber. In the first case, hemorrhage occurred the first day after operation and continued to ooze in spite of all treatment for ten days. In search of some more radical means of stopping this hemorrhage, I decided to try Moccasin Venom, put out by Lederle. I was very pleasantly surprised when the oozing immediately stopped after the injection of 0.4 cubic centimeter. The blood disappeared rapidly from the anterior chamber, the wound healed, and the man was discharged four days later. I have used it in three cases since with identical results. I believe Moccasin Venom has a very definite place as a prophylactic procedure in all intra-ocular surgery.

Discussion by Warren D. Horner, M. D., San Francisco.

✱

Third Meeting—Auditorium Wednesday, May 5, 1:30 p. m.

SYMPOSIUM ON LOBAR PNEUMONIA

This will be a joint meeting of the following sections: Medicine; Surgery; Obstetrics and Gynecology; Pediatrics; Pathology; Eye, Ear, Nose, and Throat; and Radiology.

The program of this joint meeting is printed under the fourth meeting of the General Medicine Section. (See page 20.)

✱

Fourth Meeting—Art Gallery Thursday, May 6, 8:30 a. m.

60. *The Usefulness of the Detailed Diet History in the Practice of Ophthalmology and Otolaryngology*—Ray M. Moose, M. D., 3170 Valencia Street, San Bernardino.

There are various types of cases for which the detailed diet history is useful not only in treatment but in diagnosis and prognosis and in study of etiology, hence increased efficiency with its aid. Chart of returns of questionnaire on extent diet history is used by California specialists. Evaluation of data obtained on a detailed diet history form.

Discussion by Eugene R. Lewis, M. D., Los Angeles.

61. *Microsurgery in Glaucoma*—Otto Barkan, M. D., 490 Post Street, San Francisco.

The writer has recently reported an operation which consists of opening Schlemm's canal under direct magnified vision for the relief of chronic simple glaucoma. Its effect is to remove the block to the circulation of intra-ocular fluid which is the mechanical cause for the increased intra-ocular pressure. It restores the physiologic direction of outflow to the intra-ocular fluid. By means of a surgical contact glass, under which the operation is performed, the surgeon can see the area of blockage and can watch and guide his instrument during the operation. Occasionally, when Schlemm's canal has been insufficiently opened the intra-ocular pressure is only partially reduced. In these cases the use of miotics or further operation at a later date secures normalization of pressure. In the present article a technical improvement is suggested which facilitates the operation on Schlemm's canal. It consists of increasing the magnification from 4 x, as used heretofore, to 20 x. This magnification is obtained by using the binocular corneal microscope attached to the surgeon's head by means of a helmet. This would seem to secure the proper striking and opening of Schlemm's canal in those cases where it is indicated.

Discussion by A. R. Irvine, M. D., Los Angeles.

62. *Abnormal Retinal Correspondence*—K. C. Brandenburg, M. D., 110 Pine Avenue, Long Beach.

Attention is called to a neglected aspect of the problem of strabismus, which must be considered when operation or orthoptic training is contemplated. Since abnormal retinal correspondence is present in about 50 per cent of all squint cases and must be corrected as a preliminary to successful or orthoptic training, its recognition, and treatment are a matter of interest and importance. The recurrence of a deviation following operation may be due to an attempted reestablishment of this old defective sensorial relationship, especially in cases where there is a small angle of deviation and the visual acuity is good in both eyes. Ordinary methods of orthoptic training in cases showing abnormal retinal correspondence results in failure to influence the deviation and serve only to fix the anomaly, doing more harm than good. Methods of diagnosis and treatment of this condition are described.

Discussion by John Lordan, M. D., Los Angeles.

63. *Critical Decisions in Cataract Surgery*—Harold F. Whalman, M. D., 1148 Roosevelt Building, Los Angeles.

A presentation of opinions regarding the opportune time to operate congenital cataract, unilateral cataract, complicated cataract, traumatic cataract, and dinitrophenol cataract. Controversial points are considered. The subject is presented with a view to encourage discussion and criticism.

Discussion by K. C. Brandenburg, M. D., Long Beach; Dohrmann Pischel, M. D., San Francisco.

64. *A New Surgical Procedure for the Correction of Spastic Entropion*—Alfred R. Robbins, M. D., 1930 Wilshire Boulevard, Los Angeles.

Many surgical procedures, varying from simple igni punctures to mutilating operations on the lower eyelid, have been advocated for the treatment of spastic entropion. None of them offer a permanent relief of the entropion, and recurrences are common in obstinate cases. An effective and simple solution of the problem has been recently proposed by Poulard. Following an ordinary canthectomy, the muscle and connective tissue fibers, responsible for excessive traction upon the upper border of the tarsal plate, are severed by means of a deep incision. The latter is carried out perpendicularly to the course of the fibers. In closing the wound, the modification by Pochisow seems to offer a better cosmetic result.

Discussion by Julian M. Dow, M. D., Los Angeles.

V

ANESTHESIOLOGY SECTION*

HARRY J. SMITH, M. D., *Chairman*
3115 Webster Street, Oakland

WILLIAM LEROY GARTH, M. D., *Secretary*
233 A Street, San Diego

First Meeting—Private Dining Room
Wednesday, May 5, 8:30 a. m.

65. *Chairman's Address: Pertinent Comments on Anesthesia*—Harry J. Smith, M. D., 3115 Webster Street, Oakland.
66. *Recent Studies of Local Anesthesia*—M. L. Tainter, M. D., Stanford University Medical School, San Francisco (by invitation); A. H. Thronson, D.D.S., College of Physicians and Surgeons, San Francisco (by invitation), and S. M. Moose, D.D.S., College of Physicians and Surgeons, San Francisco (by invitation).

Over two thousand observations were made of the power of various drugs to anesthetize the oral mucosae by surface application. Blank control solutions were tested simultaneously to rule out factors of suggestion and technical errors. The drugs studied, in order of increasing efficiency, were: tuto-cain, metycain, procain, cocain, diothane, phenol in water, pantocain, nupercain, butesin, butyn, laro-cain, benzyl alcohol, orthoform, "butyn topical solution," saligenin, benzocain, menthol, chlorbutanol, and phenol in alcohol. Some of the most effective were not clinically usable because they caused tissue necrosis. The alkaline procain borate (boracain) solution was tested as an injection anesthetic against the acid procain hydrochlorid. Although the differences were small, the borate solution produced less damage in the tissues, but more systemic reactions than the hydrochlorid solutions. The three commonly available vasoconstrictors—epinephrin, cobe-frin, and neosynephrin—were also compared in these anesthetic solutions. The results show points of advantage and disadvantage for each.

67. *The Explosion Hazard in Anesthetic Gas Mixtures*—Clarence G. Toland, M. D., 1930 Wilshire Boulevard, Los Angeles.

The advantage of the closed system of administering inhalation anesthetics, using mixtures of cyclopropane-oxygen, nitrous oxid-oxygen, and ethylene-oxygen, with or without ether, is discussed. The risk of explosion is considered and the literature reviewed. Suggestions are given for the diminution of the explosive hazard.

68. *Regional Anesthesia for Orthopedic Operations*—Charles F. McCuskey, M. D., 3435 Amesbury Road, Los Angeles.

The use of regional anesthesia for time-consuming orthopedic operations frequently offers the patient greater safety and comfort during and after the surgical procedure than can be obtained with general anesthesia. The technique for cervical, brachial, and paravertebral block is described.

Second Meeting—Copper Cup Room
Wednesday, May 5, 1:30 p. m.

69. *Spinal Anesthesia—Present Status*—Louis H. Maxson, M. D., 1424 Fourth Avenue, Seattle, Washington. (By invitation.)

Spinal anesthesia now established. Substantial agreement on principles. The problem of spinal anesthesia. Intraspinal action of anesthetic governed by fixed laws. No rapid mass movements. Dispersion, convection, diffusion. Ways of controlling height. Safety margin, "brake action," safety

* Monitors: Hal Kelly, M. D., San Diego, and John Dunlop, M. D., Los Angeles.

factor. Limitation of the method; diminished mortality. Sequelae. Pontocain; nupercain. Supplementary anesthesia.

70. *Compensatory Pressure in Anesthesia for Thoracic Surgery*—W. Lawrence, M. D., 54 Brentwood Avenue, San Francisco.

(1) A brief review of normal intrathoracic pressures. (2) The physics and anatomy of disturbed intrathoracic pressures during surgery. (3) Compensatory pressure and an analysis of its operation. (4) Observations regarding anesthetic agents in relation to this subject.

Discussion by G. D. Delprat, M. D., 384 Post Street, San Francisco.

71. *Avertin Anesthesia*—Dorothy A. Wood, M. D., 1390 Seventh Avenue, San Francisco.

An appreciation of the use of this drug in the preoperative preparation of the patient, based on seven years' experience. Dosage: Combination of tribromethanol with local anesthesia, ether anesthesia, and nitrous oxid and oxygen anesthesia.

72. *Systemic Adrenalin Reaction in Local Anesthesia*—Karolina B. Jump, M. D., Mills Memorial Hospital, San Mateo.

The use of adrenalin in local anesthesia—its method of administration and its effects in normal individuals; unfavorable reactions from its use; conditions under which reactions may not be expected; contra-indications for its administration and experimental evidence for its physiologic effects. Suggestions for the prevention and treatment of unfavorable adrenalin reactions.

73. *American Society of Anesthetists, Incorporated: Its Aims and Accomplishments*—W. W. Hutchison, M. D., 1930 Wilshire Boulevard, Los Angeles.

A history of the organization from the founding of the parent society in 1905. The accomplishments of the organization in the advancement of ethical medicine and particularly the specialty of anesthesia during its existence.

The future objectives of the society to advance anesthesia throughout the medical profession, beginning with adequate instruction in medical schools, in an endeavor to attract capable men to the specialty. And, finally, the certification of recognized specialists under the National Board of Certification.

RECESS

Business meeting and election of officers.

DERMATOLOGY AND SYPHILOLOGY SECTION*

THOMAS J. CLARK, M. D., *Chairman*
400 Twenty-Ninth Street, Oakland

PHILIP K. ALLEN, M. D., *Vice-Chairman*
Medico-Dental Building, San Diego

GEORGE V. KULCHAR, M. D., *Secretary*
450 Sutter Street, San Francisco

First Meeting—Directors' Room
Monday, May 3, 1:30 p. m.

74. *Chairman's Address: The Education of a Dermatologist*—Thomas J. Clark, M. D., 400 Twenty-Ninth Street, Oakland.

A dermatologist is a well-trained physician who is fitted, by special preparation, to comprehend the skin and its ills as an organ of the body.

There are three phases to this preparation period: the academic, the medical, and the postgraduate dermatologic training. The time values for these periods should be four years in the academic

branches, receiving general education; then follows basic medical education, which should occupy four years. At the conclusion of a year's hospital work as an intern, the student has his literary or science degree and the M. D. degree.

Four years of general medical practice, followed by a year's postgraduate work in dermatology, prepares the student for a successful career at thirty years of age, and with high capacity.

75. *Drug Eruptions Due to the Barbiturates*—Frederick G. Novy, Jr., M. D., 411 Thirtieth Street, Oakland.

This paper will discuss the various types of cutaneous manifestations seen following the use of the different barbiturates. Special reference will be made to the fixed eruption which can be caused by this group. A case will be reported in which this type of eruption was found to be due to sodium amytal.

Discussion by Stanley O. Chambers, M. D., Los Angeles.

76. *Rhinoscleroma in California*—Harry E. Alderson, M. D., 490 Post Street, San Francisco.

The symptomatology, pathology, and epidemiology are discussed. Three additional cases occurring in California are reported. In some, lesions occurred only in the mouth and nasopharynx without external evidence of the disease. It is probable that more cases exist in California among the Mexicans and Central Americans, in whose countries the disease is quite prevalent. Treatment is discussed.

Discussion by Rea Ashley, M. D., San Francisco; Arne E. Ingels, M. D., San Francisco; Samuel Ayres, Jr., M. D., Los Angeles; Otto P. Diederich, M. D., Fresno.

77. *Endocrine Therapy in Acne*—Harry J. Templeton, M. D., 3115 Webster Street, Oakland, and Stanley R. Truman, M. D., 1904 Franklin Street, Oakland.

Because of its onset at puberty, its frequent exacerbation at menstrual periods and its disappearance during the postpuberty period, it is felt by the authors that acne vulgaris is intimately associated with certain as yet unknown endocrine influences. Several writers have reported good results from treating acne by means of various glandular extracts.

We have treated one series of students with amniotin and another series with antuitrin S. Report of results. Photographs. Our results were rather poor in each series although some students were benefited. In spite of our poor results, we feel that this field is worthy of further study.

Discussion by Laurence Taussig, M. D., San Francisco.

78. *The Clinical Management of Cutaneous Malignancy*—Eric Liljencrantz, M. D., 2361 Clay Street, San Francisco, and George V. Kulchar, M. D., 450 Sutter Street, San Francisco.

A review of available material has revealed many instances in which cutaneous malignancy has been mismanaged. The reasons include inaccurate clinical diagnosis and inadequate treatment and follow-up.

An attempt is made to formulate a more rational approach to this important problem.

Discussion by Clyde K. Emery, M. D., Los Angeles; Harry J. Templeton, M. D., Oakland; David A. Wood, M. D., San Francisco.

79. *A New Spirochete Stain: Its Clinical Application in Primary Syphilis*—Stanley O. Chambers, M. D., 727 West Seventh Street, Los Angeles, and Julius R. Scholtz, M. D., 1930 Wilshire Boulevard, Los Angeles.

The percentage difference in the clinical and serologic care of early syphilis between the darkfield positive seronegative group and the seropositive is roughly 25 per cent. Early identification would, therefore, seem a great advantage; likewise, any method which would increase accuracy and simplicity in the identification of the early phase would seem a most welcome advance. This would be particularly true in the public health respect.

* Monitor: Herman V. Allington, M. D., Oakland.

A new spirochete stain has been utilized in primary lesions to identify the disease in its earliest manifestation. A comparison has been carefully made with the darkfield procedure and subsequent serologic or clinical changes.

Results would appear gratifying.

Discussion by Norman Epstein, M. D., San Francisco; Louis F. X. Wilhelm, M. D., Los Angeles.

✽

Second Meeting—Directors' Room

Tuesday, May 4, 8:30 a. m.

80. *Vitamin D in the Treatment of Acne Vulgaris*—Merlin T.-R. Maynard, M. D., Medico-Dental Building, San Jose.

A series of cases of acne are presented in which full doses of viosterol accompanied the standard treatment. These are compared with a similar group without viosterol. The survey covers five years of observation. Mention is made of observations of the use of viosterol in a few other conditions.

Discussion by George V. Kulchar, M. D., San Francisco; Harry J. Templeton, M. D., Oakland.

81. *Favus in California*—Norman N. Epstein, 450 Sutter Street, San Francisco, and Edward A. Levine, M. D., 450 Sutter Street, San Francisco.

Report of a case from California with a consideration of the clinical picture, the classification and types of organisms involved. The contagiousness, treatment and incidence of this disease in California and the United States are also considered.

Discussion by Hiram E. Miller, M. D., San Francisco; Nelson P. Anderson, M. D., Los Angeles.

82. *Grass Dermatitis (Dermatitis Bullosa Striata Pratensis)*—Saul S. Robinson, M. D., 1930 Wilshire Boulevard, Los Angeles.

Grass dermatitis or "dermatitis bullosa striata pratensis" has been described in Europe since 1926. No cases of the condition have been recorded heretofore in California. The patient is a female, age fifteen, who presents the typical pigmentary lesions of the disorder. A complete survey of the literature with a discussion on the etiology, differential diagnosis, and treatment of the condition is given. Photographs accompany the presentation.

Discussion by William H. Goeckerman, M. D., Los Angeles; Samuel Ayres, Jr., M. D., Los Angeles.

83. *The Plan for Combating Syphilis in California*—Howard Morrow, M. D., 384 Post Street, San Francisco.

Syphilis is a serious public health problem. It merits a well-developed campaign to decrease it to the lowest possible level. A number of plans have been developed, and the following will be discussed: (1) The Scandinavian plan; (2) The Massachusetts plan; (3) The New York plan; and (4) The plan of the California State Board of Health.

Discussion by William H. Goeckerman, M. D., Los Angeles.

84. *The Role of the Physician in the Control of Syphilis*—Charles W. Barnett, M. D., Stanford University, San Francisco.

The two factors of incidence and morbidity in determining the public health importance of a disease are pointed out. These are estimated for syphilis. The effectiveness of treatment in preventing transmission and late sequelae is demonstrated. In spite of the present lack of legal control, it is possible to greatly reduce the incidence of the disease and the damage produced by it if physicians would regularly give patients detailed information about the disease before treatment is started, and also if they would regularly attempt to bring under treatment sources of recent infections.

Discussion by George V. Kulchar, M. D., San Francisco.

85. *Vitiligo as a Manifestation of Possible Dysfunction of the Suprarenals Due to Congenital Syphilis*—Sophie A. Lurie, M. D., 610 South Broadway, Los Angeles.

Millian's idea of vitiligo as congenital syphilis manifestation induced us to use bismuth salicylate.

Dead chalky areas responding promptly, more noticeable on exposed parts of the body. Asthenic symptoms, metabolic changes associated with loss of pigment, speak for endocrine involvement, possibly suprarenals. Kinney's fundus' paravascular streakings as syphilis manifestations showed in our patients' eyes.

Discussion by Francis M. Pottenger, M. D., Los Angeles; Samuel Ayres, Jr., M. D., Los Angeles.

RECESS

Business meeting and election of officers.

VII

INDUSTRIAL MEDICINE AND SURGERY SECTION*

SAMUEL S. MATHEWS, M. D., *Chairman*
1913 Wilshire Boulevard
Los Angeles

H. G. McNEIL, M. D., *Secretary*
523 West Sixth Street
Los Angeles

First Meeting—Art Gallery
Tuesday, May 4, 8:30 a. m.

86. *Problems of Industrial Surgery*—Ross W. Harbaugh, M. D., 350 Post Street, San Francisco.

(a) A discussion of malignant tumors in relationship to trauma and decisions made before the Industrial Accident Commission.

(b) A discussion of silicosis, with reference to decisions before the Industrial Accident Commission.

Discussion by Arthur B. Fisher, M. D., San Francisco; E. B. Towne, M. D., San Francisco.

87. *Trauma and Malignancy*—Edwin I. Bartlett, M. D., 490 Post Street, San Francisco.

May trauma cause development of malignant growth?

May trauma cause a benign growth to become malignant?

May trauma stimulate a malignant growth to greater malignancy?

In a given case, what factors must be proved to establish a relationship?

In the doubtful or not positively proved instance, where does the responsibility lie?

Discussion by Zera E. Bolin, M. D., San Francisco; George D. Maner, M. D., Los Angeles.

88. *Pulmonary Manifestation of Coccidioidal Granuloma*—Frank Porter Miller, M. D., 523 West Sixth Street, Los Angeles.

The cases that came under this study were largely of an acute character and were characterized by a rapid migrating type of pneumonia with generalized septicemia and a fatal termination. From a medico-legal viewpoint they were most interesting, and the risk of communicability is a big factor in determining whether an award should be granted.

Discussion by Roy W. Hammack, M. D., Los Angeles; J. Mark Lacey, M. D., Los Angeles.

89. *The Relationship of Atmospheric Impurities to Industrial Problems*—Munford Smith, M. D., Barlow Sanatorium, Los Angeles.

This paper does not refer to pneumoconiosis. It owes its origin to the many cases seen by its author

*Monitors: John J. Loutzenheiser, M. D., San Francisco, and Richard B. McGoveny, M. D., Santa Barbara.

whose only justification for filing a compensation claim was the presence in the atmosphere of an odor.

It is an attempt to differentiate the imaginary from the real, the sentimental from the scientific.

Discussion by L. R. Chandler, M. D., San Francisco; William P. Shephard, M. D., San Francisco; John Ruddock, M. D., Los Angeles.

Second Meeting—Billiard Room

Wednesday, May 5, 8:30 a. m.

90. *Anomalies of the Spine: An Anatomical, Radiological, and Clinical Correlation*—Wilbur Bailey, M. D., 1212 Shatto Street, Los Angeles, and Ray A. Carter, M. D., General Hospital, Los Angeles.

Most anomalies of the spine have an origin of which the embryology is well understood. Correlation of the anatomical and radiological findings is, therefore, usually not difficult.

About the relationship of the radiological to the clinical findings, in some types of anomalies there is no general agreement. While certain anomalies, such as failure of fusion of the spinous process of the fifth lumbar vertebra (spina bifida), are universally considered as not producing symptoms, the discovery of other anomalies such as partial sacralization of the last lumbar vertebra is often taken as sufficient explanation for any symptoms which may be present.

Discussion by Richard F. Taylor, M. D., Los Angeles; John Saunders, M. D., San Francisco. (By invitation.)

91. *Newer Methods of Recognition and Treatment of Gas Bacillus Infection*—C. Latimer Callander, M. D., 450 Sutter Street, San Francisco, and Arthur Haim, M. D., 450 Sutter Street, San Francisco.

1. Definition, purpose, and reasons for interest in the subject.

2. Nomenclature and biological characteristics of gas bacilli.

3. History of gas gangrene.

4. Pathogenesis of disease.

5. Incidence of various anaerobes in gas gangrene in war wounds.

6. Pathology. (a) Essentially a disease of the muscles.

7. Treatment. (a) Prophylactic treatment other than serum; (b) Prophylactic serum; (c) Inspect wound frequently; (d) Early active treatment; (e) Late active treatment.

Discussion by Arthur Haim, M. D., San Francisco; F. C. Warnshuis, M. D., San Francisco; Thomas O. Burger, M. D., San Diego.

92. *What the Doctor Should Know About Law for His Own Protection*—William M. Rains, Attorney, 453 South Spring Street, Los Angeles. (By invitation.)

(a) The nature of the legal obligation imposed upon the doctor when the relationship of physician and patient begins.

(b) How long does that obligation continue?

(c) How may the doctor terminate the relationship of physician and patient and relieve himself of that obligation?

(d) What is malpractice?

(e) How is it proved in court? This includes a discussion of expert testimony, and conditions where expert testimony is not necessary.

(f) Fees for the expert witness.

(g) Responding to subpoenas.

(h) Cause for malpractice cases.

(i) Desirability of adequate records.

(j) Necessity for x-rays.

(k) The rule as to the Statute of Limitations and when a doctor should and should not bring his suit for fees.

(l) Some suggestions for keeping out of trouble.

Discussion by Harold Dewey Barnard, M. D., Los Angeles; Carl W. Rand, M. D., Los Angeles.

93. *Use Destruction in the Human Body*—A. W. Meyer, Department of Anatomy, Stanford University, Palo Alto. (By invitation.)

Lesions in the subcutaneous bursae. The articular capsules, ligaments, tendons, cartilages and sometimes even of the bones and muscles, up to complete local destruction and sometimes of dislocation, not attributable to any known pathologic process, will be discussed and demonstrated.

Discussion by Donald E. King, San Francisco; Vernon P. Thompson, M. D., Los Angeles.

RECESS

Business meeting and election of officers.

VIII

NEUROPSYCHIATRY SECTION*

J. M. NIELSEN, M. D., *Chairman*
727 West Seventh Street, Los Angeles

FRED O. BUTLER, M. D., *Secretary*
Sonoma State Home, Eldridge

First Meeting—Play Room

Monday, May 3, 1.30 p. m.

94. *Criminal Insane in a State Institution*—R. A. Cushman, M. D., Mendocino State Hospital, Talmage. This paper embodies the following:

1. Conflict between criminal laws and psychiatry.

2. The psychiatrist in criminal proceedings.

3. Suggested changes in laws governing trials of psychotic criminals.

Discussion by B. W. Black, M. D., Oakland; Glenn Myers, M. D., Los Angeles.

95. *Psychiatric Manifestations Ascribable to Focal Cerebral Lesions*—Samuel D. Ingham, M. D., 727 West Seventh Street, Los Angeles.

While the separation is not absolute between psychiatric and neurologic manifestations, there are, nevertheless, certain symptoms commonly considered psychiatric which relatively recently have been shown to be caused by focal cerebral lesions. Disorientation, hallucinations, and loss of power of recognition are examples of these. Cases are cited showing the value of these symptoms in neurologic diagnosis when caused by focal lesions.

Discussion by George S. Johnson, M. D., San Francisco; Walter F. Schaller, M. D., San Francisco.

96. *Is General Paresis Curable?*—Walter F. Schaller, M. D., 909 Hyde Street, San Francisco.

Survey of recent literature on treatment and prognosis. The clinico-pathological syndrome and diagnosis. Detailed record of personal cases observed over a considerable period following adequate treatment. Conclusions.

Discussion by George S. Johnson, M. D., San Francisco; Samuel Ingham, M. D., San Francisco.

97. *Development of the Idea of the Psychopathic Personality From Koch*—Edward W. Twitchell, M. D., 909 Hyde Street, San Francisco.

Especially from the time of Kraepelin to the present, the early years of the child, especially prior to the juvenile court period and the type of case which never comes into the juvenile court. The different types and the variety of problems presented. What can one do for the parents and families? Management of the child at home and in school. The adolescent period and its particular problems. The psychopathic personality in adult life with relation to his effect upon his family. Protection for the family and methods of arriving at it.

Discussion by Paul Gliebe, M. D., San Francisco.

* Monitors: George S. Johnson, M. D., San Francisco; C. W. Mack, M. D., Livermore.

Second Meeting—Play Room

Tuesday, May 4, 8:30 a. m.

98. *Migraine*—Henry Alsop Riley, A. M., M. D., Columbia University, New York. (By invitation.) In Children; Accepted and Questionable Types; Hypophyseal Theory and the Vascular Theory of Genesis; Pain in the Head; Radiology and Migraine; Treatment.

99. *Handwriting a Neurological Study*—H. Douglas Eaton, M. D., 1136 West Sixth Street, Los Angeles.

A brief discussion is presented of the mechanism of disorders of handwriting in neurologic conditions. The value of a study of handwriting as an aid in neurologic diagnosis is stressed and will be illustrated by a lantern-slide demonstration of types of handwriting with organic and functional neurologic diseases.

Discussion by Samuel Ingham, M. D., San Francisco; Walter F. Schaller, M. D., San Francisco.

100. *Chairman's Address: Function of the Minor (Usually Right) Cerebral Hemisphere in Language*—J. M. Nielsen, M. D., 727 West Seventh Street, Los Angeles.

The two cerebral hemispheres are structurally identical, but functionally very different. This applies especially to the function of the various areas concerned with language. After destruction of these anatomical areas on the major side, a patient is more or less incapacitated for the function formerly performed through (not to say by) these structures. The degree of disability will depend largely on the facility with which the corresponding area of the minor side can take over the function. This facility varies as much in various persons as does general facility in language or general intellect. Cases are presented to demonstrate this.

RECESS

Business meeting and election of officers.

IX

PATHOLOGY AND BACTERIOLOGY SECTION*

DAVID A. WOOD, M. D., *Chairman*
Stanford Hospital, San Francisco

GEORGE D. MANER, M. D., *Secretary*
657 South Westlake Boulevard, Los Angeles

ZERA E. BOLIN, M. D., *Assistant Secretary*
490 Post Street, San Francisco

First Meeting—Billiard Room

Monday, May 3, 1:30 p. m.

101. *Clinical and Postmortem Survey of the Incidence of Trichinosis in San Francisco*—James B. McNaught, M. D., Stanford University, San Francisco.

A general presentation of the subject of trichinosis, the life history of the parasite, symptomatology and pathology of the disease, diagnostic procedures, with particular attention to the use of Trichinella antigen, therapy, and preventive measures and the results of a Trichinosis survey in San Francisco.

102. *New and Simplified Physical Method for Blood Detection*—Frederick Proeschner, M. D., San Jose; Jesse Carr, M. D., University of California, San Francisco; and A. M. Moody, M. D., St. Francis Hospital, San Francisco.

Recent observation on the physical and physiochemical changes in full blood upon heating be-

tween the ranges of 500 degrees and 1000 degrees Fahrenheit have led to the development of several new principles in blood identification. While originally undertaken simply to ascertain whether or not blood could be identified as such above 500 degrees Fahrenheit, these studies have led to the conclusion that blood cannot only be identified at high temperatures, but that heating in the upper ranges, between 600 degrees and 800 degrees, actually causes physical changes in blood which are specific and which offer an easy, rapid, and safe method for medical-legal use.

103. *Chairman's Address: Changing Trends in Pathology*—David A. Wood, M. D., Stanford University, San Francisco.

104. *Quick Method for Photometric Determination of Total Protein and Albumen-Globulin Ratio in Body Fluids*—W. Parker Stowe, M. D., St. Luke's Hospital, San Francisco.

Method is based on precipitation of total proteins by 5 per cent sulphosalicylic acid. Globulin precipitation by half saturation with ammonium sulphate, centrifugation of precipitate, resolution in saline and reprecipitation with sulphosalicylic acid. Protein equivalents determined in Cenco-Sheard photometer after five minutes standing room temperature, against a known standard curve of protein, Kjeldahl determined. Galvanometer needle brought to 50 through W. & W. filter No. 74.

Tabulation of protein values corresponding to galvanometer readings is furnished.

105. *Blood and Bone Marrow Studies in Monocytic Leukemia*—Harry A. Wyckoff, M. D., Stanford University, San Francisco.

Cases of monocytic leukemia so far studied have exemplified the necessity of careful identification of both mature and primitive monocytes in the blood. Observations require repeated verification. This is the more true because of the close similarity of the clinical picture to that of other types of acute leukemia.

The sudden although transient appearance of considerable numbers of myelocytes and myeloblasts in the blood during the course of monocytic leukemia and the occasional finding of noticeable numbers of cells closely like or identical with mature and primitive monocytes in the blood of cases of acute myeloblastic leukemia suggest a close relationship of these cell types.

106. *The Development of Tumors in Female Mice Treated with 1:2:5:6 Dibenzanthracene, and Estrone*—Isabella H. Perry, M. D., University of California Medical School, San Francisco.

Spayed and intact mice were treated through their adult life by painting with 1:2:5:6 dibenzanthracene and estrone. A large number and variety of tumors developed. The results are interpreted as far as possible in regard to their own interrelationships and as related to other contemporary data and theories.

107. *Brief Discussion of Reticulum-Cell Sarcoma*—G. Y. Rusk, M. D., Mount Zion Hospital, San Francisco.

Brief discussion of reticulum-cell tumors and sarcomata of the breast. Illustrative cases of subcutaneous reticulum-cell sarcomata will also be shown.

108. *An Unusual Case of Diffuse Myeloma with Hyperproteinemia*—I. C. Schumacher, M. D., University of California, San Francisco; O. O. Williams, M. D., University of California, San Francisco (by invitation); G. S. Coltrin, M. D., University of California, San Francisco.

A case of myeloma of the plasma cell type, diffuse, showing hyperproteinemia with autohemagglutination, hemorrhage, and renal damage.

Woman sixty-four years of age, who had had a proclivencia for several years. Eight months ago she began to have hemorrhages from the nose, and experienced a gradual loss of weight. A diagnosis of multiple myeloma was made clinically on the basis of hemorrhage, autohemagglutination, renal

* Monitors: Z. E. Bolin, M. D., San Francisco, and Paul Michael, M. D., Oakland.

insufficiency, and hyperproteinemia. The only bone changes present were found in the skull. These were very minute areas of rarification.

At necropsy the bone marrow of all the bones showed a diffuse infiltration with plasma cells.

RECESS

Business meeting and election of officers.

Second Meeting—Billiard Room

Tuesday, May 4, 8:30 a. m.

109. *Stomach Mucosal Changes in Avitaminosis*—Alvin J. Cox, Jr., M.D., Stanford University, San Francisco.

Since 1923, ulcerative and proliferative lesions in some way related to deficient diets have been described in animals, and have been ascribed to vitamin deficiency as well as other causes. Evidence is presented to indicate that the effect of vitamin A deficiency upon gastric mucosa is not primarily an obvious structural change, but some modification rendering the mucosa more vulnerable to other injurious processes.

110. *Ochronosis*—G. R. Biskind, M.D., Mount Zion Hospital, San Francisco. (By invitation.)

Alcaptonuria and ochronosis are the incidental findings in a seventy-year-old white male who died from hemorrhage due to an arteriosclerotic ulcer of the stomach. Necropsy revealed the characteristic charcoal appearance of the cartilage, destruction of the left hip joint, and a large black prostatic calculus. A historical review, classification of reported cases and the chemical nature of the disease are discussed.

111. *Cystein Determinations in Finger and Toe Nails*—Zera Bolin, M.D., Mary's Help Hospital, San Francisco.

Cystein determination in nails. Method of use. Clinical results. Results of treatment of arthritis by sulphur as shown by cystein determinations.

112. *Acute Mononucleosis*—A. G. Foord, M.D., Huntington Memorial Hospital, Pasadena, and E. M. Butt, M.D., University of Southern California Medical School, Los Angeles.

A discussion of the laboratory methods of diagnosis. Significance of the heterophile antigen reaction in the diagnosis of suspected cases.

113. *Diverticula of the Jejunum*—Hugh A. Edmondson, M.D., University of Southern California Medical School, Los Angeles. (By invitation.)

Ten cases of acquired or "false" diverticula of the jejunum found in five thousand consecutive autopsies are presented. Less than one hundred have been reported. The one fatal hemorrhage occurred; the remainder were found incidentally.

Studies of etiology in relation to arteries and preservation of connective tissue compared with controls were made.

114. *Comparison of the Relative Merits of the Complement Fixation and Precipitation Tests in the Diagnosis of Syphilis*—W. H. Kellogg, M.D., 1700 Le Roy Avenue, Berkeley. (By invitation.)

(Above title suffices for abstract.)

Report of Nominating Committee.

Third Meeting—Auditorium

Wednesday, May 5, 1:30 p. m.

SYMPOSIUM ON LOBAR PNEUMONIA

This will be a joint meeting of the following sections: Medicine; Surgery; Obstetrics and Gynecology; Pediatrics; Pathology; Eye, Ear, Nose, and Throat; and Radiology.

The program of this joint meeting is printed under the fourth meeting of the General Medicine Section. (See page 20.)

X

PEDIATRIC SECTION*

EDWARD B. SHAW, M.D., *Chairman*
384 Post Street, San Francisco

E. EARL MOODY, M.D., *Secretary*
3780 Wilshire Boulevard, Los Angeles

HARTZELL H. RAY, M.D., *Assistant Secretary*
23 Second Street, San Mateo

First Meeting—Tower Room

Monday, May 3, 1:30 p. m.

115. *The Adrenal Cortical Syndrome in Little Girls—With Report of Surgical Cure and Complete Review of Literature*—William A. Reilly, M.D., 384 Post Street, San Francisco; Hans Lissner, M.D., 384 Post Street, San Francisco; Frank Hinman, M.D., 384 Post Street, San Francisco.

In little girls, adrenal cortical hyperfunction produces a unique and highly characteristic clinical picture. Early appearance of pubic hair and marked hypertrophy of the clitoris constitute outstanding symptoms; a sort of pseudosexual precocity with masculinization. Menstruation before eleven years is exceptional, likewise precocious mammary gland development. Syndrome differs definitely from true sexual precocity (very early menses, breast development, pubic hair, but no clitoris hypertrophy) produced by ovarian granulosa cell tumors. Early recognition of these adrenal tumors is important not only for surgical cure of the endocrinopathy, but to forestall death from metastases. (Illustrated by lantern slides.)

Discussion by E. Kost Shelton, M.D., Santa Barbara.

116. *The Endocrines and Behavior in Puberty*—Clara H. Spalding, M.D., 331 Eighth Street, Richmond.

Age scope, eleven to sixteen years. Problem is universal. It is important physically, emotionally, and socially. Physiology of pubescence showing development crisis with anatomic and endocrinologic changes and emotional responses. An endocrine basis for the precocious, normal, and retarded. Juvenile endocrinopathies and delinquency stress the need for early recognition, correct diagnosis, and correction of dyscrasias. Rationale of the misguided.

Discussion by S. N. Weil, M.D., Rodeo; Myrl Morris, M.D., San Francisco.

117. *Creatinuria of Childhood*—E. Kost Shelton, M.D., 34 West Micheltorena Street, Santa Barbara, and B. N. Tager, M.D., Cottage Hospital, Santa Barbara. (By invitation.)

Creatinuria was studied under basal conditions in fifty-six children, ranging in ages from six to thirteen years. Children with bone retardation of no more than two years and without frank hypothyroidism excreted more creatinin than the controls. Six frankly hypothyroid children with marked bone retardation showed diminished creatinuria. It is concluded that a low creatinin excretion in the presence of retarded bone development is corroborative evidence of hypothyroidism of childhood.

Discussion by Hans Lissner, M.D., San Francisco.

118. *Growth and Treatment of Dwarfs—Observations on Twelve Cases for Periods of One to Eight Years*—Leona M. Bayer, M.D., 2535 Vallejo Street, San Francisco, and Horac Gray, M.D., Stanford University School of Medicine, San Francisco.

The dwarfism was attributed to various causes. Age at beginning of observations ranged from one to eighteen years. All treated cases had control periods; five received growth hormone; four

* Monitors: Harry R. Lusignan, M.D., Monterey, and Margaret Swigart, M.D., Monterey.

received thyroid. Effectiveness of growth hormone is analyzed from our own material and from critical review of clinical literature.

Discussion by E. Kost Snetton, Santa Barbara; William P. Lucas, M. D., 490 Post Street, San Francisco.

119. *Phases of Adolescent Development in Girls*—Helen B. Pryor, M. D., Stanford University, Palo Alto.

A longitudinal study of adolescent development with cumulative records of physical and physiological data shows a close relationship between skeletal maturation and sexual development.

X-ray of hands show broad-built girls to have age equivalent greater than their chronological ages, while slender-built girls had age equivalents less than their chronological ages.

Discussion by William A. Reilly, M. D., San Francisco; William M. Happ, M. D., Los Angeles.

120. *The Physical and Mental Needs of Deaf Children*—Rexford Hoobler, M. D., Franklin Building, Oakland.

The causes of deafness as found at the California State School for Deaf. Preventive measures and phases of development stressed. Mental needs show necessity for nursery schools and special tests to determine mental capability. The state laws facilitating medical care explained.

Discussion by Mr. E. A. Stevenson, Superintendent of State School for Deaf, Oakland (by invitation); J. C. Edwards, M. D., Berkeley.

RECESS

Business meeting and election of officers.

Second Meeting—Directors Room

Wednesday, May 5, 8:30 a. m.

121. *The Value of Diet Analysis in Pediatric Practice*—Reita C. Hough, M. D., 1212 Medico-Dental Building, San Diego.

A series of cases upon which careful diet analysis have been made, showing most frequent errors discovered in the average diet and demonstrating the difficulties in arranging an adequate diet without the addition of accessory food factors. (Illustrated by lantern slides.)

Discussion by Helen B. Pryor, M. D., Palo Alto; E. Earl Moody, M. D., Los Angeles.

122. *Chairman's Address: The Practice of Pediatrics as a Specialty*—Edward B. Shaw, M. D., 384 Post Street, San Francisco.

123. *The Social Security Act*—Ellen S. Stadtmuller, M. D., Bureau of Child Health, California State Health Department, San Francisco.

I. Provisions of the Act. (1) Promotion of maternal and child health in rural areas and among special groups. (2) Expanding and developing local facilities. (3) Technical requirements such as matching, reporting, State participation in expenditure, etc. (4) Coöperation with medical group.

II. Presentation of figures and charts upon which the needs for work in California are based.

III. Plans for service. (1) Districting the State. (2) County nurses placed in areas not provided with this service. (3) Prenatal service. (4) Preschool conferences. (5) Dental program. (6) Educational possibilities.

IV. Crippled children's program. (1) Program under the State law of 1927. (2) Extension of the program under the Act. (3) Report of progress.

Discussion by Oscar Reiss, M. D., Los Angeles; Clifford Sweet, M. D., Oakland; Francis Scott Smyth, M. D., San Francisco.

124. *Mental Hygiene Viewpoints on Some Common Pediatric Problems*—Forrest N. Anderson, M. D., 1325 West Adams Street, Los Angeles.

Concepts of psychiatry as an attitude versus a technique and their application to views on the psychosomatic development of the child. What

help may be derived from these psychiatric contributions on several common problems of childhood: eating, toilet habits, behavior management, etc.

Discussion by George Kryder, M. D., Glendale.

125. *Nephritis in Childhood: A Survey*—Howard R. Cooder, M. D., 3875 Wilshire Boulevard, Los Angeles.

Nephritis divided into three classes. Fifty cases admitted to the Los Angeles Children's Hospital classified.

Group I. A majority became symptom-free, with normal urine findings within a month or less.

Group II. A large number have findings lasting longer, but were cured within nine months.

Group III. A small percentage have symptoms and findings persisting and advance to chronic nephritis or nephrosis.

Discussion by William W. Belford, M. D., San Diego; Louis M. Earle, M. D., Los Angeles.

Third Meeting—Auditorium

Wednesday, May 5, 1:30 p. m.

SYMPOSIUM ON LOBAR PNEUMONIA

This will be a joint meeting of the following sections: Medicine; Surgery; Obstetrics and Gynecology, Pediatrics; Pathology; Eye, Ear, Nose, and Throat; and Radiology.

The program of this joint meeting is printed under the fourth meeting of the General Medicine Section. (See page 20.)

XI

RADIOLOGY SECTION*

WILLIAM E. COSTLOW, M. D., *Chairman*
1407 South Hope Street
Los Angeles

JOHN D. LAWSON, M. D., *Secretary*
California State Life Building
Sacramento

First Meeting—Art Gallery

Monday, May 3, 1:30 p. m.

126. *Chairman's Address: Radiation Therapy—Its Status in Medical Practice*—William E. Costlow, M. D., 1407 South Hope Street, Los Angeles.

127. *The Application of Physics to Roentgen Therapy*—Robert E. Pugh, Jr., 1944 Summit Avenue, Pasadena. (By invitation.)

A presentation of an understandable definition of the r-unit and its use in assuring exact duplication of successful dosages in roentgen therapy, and a more lucid explanation of the fundamental physical concepts determining the choice of therapy technique. The present status of therapy calibration and the most desirable method of reporting dosage values in the literature and clinical records are discussed together with some notes on superficial therapy and its limitations.

128. *The Complications of X-Ray Therapy*—Richard T. Taylor, M. D., 1212 Shatto Street, Los Angeles.

A summary of various untoward and unforeseen occurrences which enter into the practice of roentgen therapy.

129. *Radiation Treatment of Squamous-Cell Carcinoma*—Clyde K. Emery, M. D., 445 South Kingsbury Drive, Los Angeles.

Comparative radiosensitivity of squamous-cell carcinoma in various locations in the body, lethal doses with x-ray and radium, the dangerous limits and the sequela to various types of radiation.

* Monitor: Charles A. Galligan, M. D., Monterey.

130. *Unfiltered X-Ray as a Treatment for Superficial Malignancies*—William H. Sargent, M. D., Samuel Merritt Hospital, Oakland.

This discussion is based upon observations made during the last six years of the use of large doses of unfiltered x-ray in the treatment of superficial malignancies. Its range of action, the technique, the possible causes of failure, and the results so far obtained.

RECESS

Meeting of the Pacific Roentgen Club.

Second Meeting—Tower Room

Wednesday, May 5, 8:30 a. m.

Business meeting and election of officers.

131. *Experience with the Rotating Anode Tube*—Robert A. Powers, M. D., Medico-Dental Building, Palo Alto.

A discussion of advantages and disadvantages of this apparatus as related to radiography.

132. *Case Reports of Lymphosarcoma of the Upper Jejunum*—Russell Gates, M. D., Cottage Hospital, Santa Barbara.

Two cases of lymphosarcoma of the upper jejunum will be presented in detail with histories, roentgenographic, surgical and pathologic findings. The lesion in each case was clearly demonstrated by x-ray before operation.

133. *Roentgenological Examination of the Cervical Vertebra*—Charles S. Capp, M. D., University of California Hospital, San Francisco.

Lantern slide demonstration of the common and uncommon anomalies of development, their demonstration, recognition, and correlation of their clinical significance and importance. The methods of special examination for bony lesions originating in or secondarily involving the vertebrae will be demonstrated, and a discussion as to the differential diagnosis in each type of case will be presented.

134. *The Shape of the Female Pelvis and Its Clinical Significance: Further Studies*—L. H. Garland, M. D., 450 Sutter Street, San Francisco.

Female pelvises may be classified according to definite architectural or morphologic characteristics into four main types. These four main types are termed gynecoid, android, anthropoid, and platypelloid. The roentgen technique and methods of interpretations are outlined and certain conclusions regarding the reliability of interpretation, based on approximately three hundred examinations, are given. The clinical significance of the various types of pelvis are recorded. The feasibility of combining in a relatively simple examination both pelvimetry and pelviography is discussed.

135. *The Relation of the Orthopedist to the Radiologist*—Donald McNeil, M. D., Medico-Dental Building, Sacramento.

A practical discussion of the necessary close relation of these specialties with suggestions as to mutual assistance through coöperation.

136. *Removal of Lead Shot From Vitreous by Use of Biplane Fluoroscope*—W. E. Borley, M. D., Stanford University Hospital, San Francisco, and Edward Leef, M. D., Stanford University Hospital, San Francisco.

Description of localization and removal of lead shot from the vitreous through the use of special forceps and biplane fluoroscopy. A review of the literature and photographs of the equipment used.

Third Meeting—Auditorium

Wednesday, May 5, 1:30 p. m.

SYMPOSIUM ON LOBAR PNEUMONIA

This will be a joint meeting of the following sections: Medicine; Surgery; Obstetrics and Gynecology; Pediatrics; Pathology; Eye, Ear, Nose, and Throat; and Radiology.

The program of this joint meeting is printed under the fourth meeting of the General Medicine Section. (See page 20.)

XII

UROLOGY SECTION*

ADOLPH A. KUTZMAN, M. D., *Chairman*
1930 Wilshire Boulevard, Los Angeles

LLOYD KINDALL, M. D., *Secretary*
400 Twenty-Ninth Street, Oakland

First Meeting—Tower Room

Tuesday, May 4, 8:30 a. m.

137. *Chairman's Address: Anuria*—Adolph A. Kutzmann, M. D., 1930 Wilshire Boulevard, Los Angeles.

138. *Plastic Operation on the Pelvis of a Solitary Kidney*—John A. Dougherty, M. D., 3115 Webster Street, Oakland.

A female, age two years; gave past history of fever, chills, and pyuria; duration, one year. Investigation revealed a right, infected hydronephrosis with a stricture at the uteropelvic junction and an absence of a kidney on the left. Description of operation and subsequent history. Lantern slides before and after operation. Review of literature.

Discussion by Frank Hinman, M. D., San Francisco; L. P. Player, M. D., San Francisco.

139. *Enterovesical Fistula with Paraffinoma*—S. T. Ragan, M. D., 3875 Wilshire Boulevard, Los Angeles.

A case of enterovesical fistula, secondary to paraffin injection for the cure of hernia, is reported. A short review of the literature follows. Symptomatology and diagnostic methods are emphasized. Motion pictures in color demonstrate the lesion and the author's technique of repair.

Discussion by Carl F. Rusche, M. D., Los Angeles.

140. *Urological Surgery in Tuberculosis Patients*—J. C. Negley, M. D., 527 West Seventh Street, Los Angeles. Collaborator, F. M. Miller, M. D., Olive.

There is a belief among the laity and the profession that surgery in tuberculous patients is not warranted by the results obtained and the risk entailed. The authors review histories of some 300 or 400 tuberculous patients who have had surgery or cystoscopic studies. Reciting end-results as to condition for which surgery was done and end-results as to patients' general condition.

Discussion by Thomas E. Gibson, M. D., San Francisco.

141. *Ureteral Papillomas as a Cause of Hydronephrosis*—Jay J. Crane, M. D., 1921 Wilshire Boulevard, Los Angeles.

This paper deals with the diagnosis and treatment of papillomas of the ureter as well as the frequency with which it appears in our urologic clinics at Los Angeles County General Hospital. The summary takes up diagnosis by intravenous and retrograde pyelograms, with a review of the cases.

Discussion by James R. Dillon, M. D., San Francisco.

* Monitors: Thomas I. Buckley, M. D., Oakland, and Morrell Veckl, M. D., San Francisco.

142. *Believe-It-or-Nots in Urology for 1937*—Wirt B. Dakin, M. D., 523 West Sixth Street, Los Angeles. These reports were selected from a large group of urologic cases for their unbelievable nature and outstanding interest. They include cases of strange pathologic conditions and anomalies; unique findings and results in surgery; rare etiologic and curative factors.

RECESS

There will be a Urology Section luncheon at 12:30 p. m., May 4, 1937, at which Frank Hinman, M. D., of San Francisco, will present a summary of the urologic meetings attended by him in Europe in 1936, namely, the Clinical Society in London, the International Congress in Vienna, and an extemporaneous extension of this conference in Budapest. Please make reservations for this luncheon with the secretary as early as possible.

**Second Meeting—Tower Room
Wednesday, May 5, 1:30 p. m.**

143. *Brucellosis of the Male Genitalia*—Thomas I. Buckley, M. D., 411 Thirtieth Street, Oakland.

The paper deals with a review of *Brucella* infection of the male genital tract with a case report on involvement of the testicle. Gross and microscopic sections of lesions produced, experimentally, in animals will be shown.

Discussion by Morrell Vecki, M. D., San Francisco.

144. *Differential Diagnosis of Acute Fatty Necrosis in the Scrotum*—Frank Hinman, M. D., 384 Post Street, San Francisco, and Clark Johnson, M. D., 384 Post Street, San Francisco.

Two instances of fat necrosis in the scrotum in young boys have been encountered. The onset was acute. The differential diagnosis was difficult, the final diagnosis being made at the operating table. Discussion of the clinical picture, etiology, pathology, and treatment.

Discussion by A. Elmer Belt, M. D., Los Angeles.

RECESS

Business meeting and election of officers.

145. *Water Balance in the Surgical Patient*—Donald A. Charnock, M. D., 727 West Seventh Street, Los Angeles.

Adequate fluids during postoperative procedures is often an important factor in the patient's recovery. Fluid loss must be carefully balanced with liquid intake. The factors of fluid elimination are discussed, together with methods for their balance.

Discussion by Carl Rusche, M. D., Los Angeles.

146. *Sympathetic Surgery in Bladder Infections*—Felix Pearl, M. D., 450 Sutter Street, San Francisco, and Bernard Strauss, M. D., 999 Sutter Street, San Francisco.

The authors review the pertinent anatomy and physiology of the autonomic nerve supply to the bladder, and discuss the basis for operations on the sympathetic nerves in the treatment of neurogenic vesical dysfunction and painful bladder states. The operative technique is described and illustrated. Cases are reported.

Discussion by Sidney Olsen, M. D., San Francisco.

147. *Vesicosigmoid Fistula*—Paul A. Ferrier, M. D., 65 North Madison Avenue, Pasadena.

(1) Causes of vesico-sigmoid fistula. (2) Early symptoms. (3) Treatment. (4) Report of two cases.

Discussion by Irving Wills, M. D., Santa Barbara.

148. *Specificity of Nonspecific Urethritis*—James Steinberg, M. D., Professional Building, Los Angeles.

Series of one hundred consecutive cases of nonspecific urethritis establishing the etiologic agent to be a certain food or drink for which each individual has been discovered to have a specific sensitization or idiosyncrasy, the elimination of which has brought about a complete cure in most cases and marked improvement in others, with methods of procedure and tabulation of results.

Discussion by Louis C. Jacobs, M. D., San Francisco.

IX—COMMERCIAL EXHIBITS

(For alphabetical list of Commercial Exhibits, see page 9)

Commercial exhibits are located in the main lobby and on the ground floor of Hotel Del Monte. Members are urged to call on these exhibitors and form their acquaintance. These business men merit your patronage.

The following exhibitors will occupy booths:

Aloe Company, A. S., 932 South Hill Street, Los Angeles, Booths Nos. 19 and 20.

Our exhibit consists of a complete line of stainless steel surgical instruments, which are rapidly replacing the chrome and nickel-plated lines; our *Contempora* line of wooden furniture for the physician's office; our latest ultra short-wave diatherm with the Elliott Treatment Regulator; other physical therapy apparatus approved and accepted by the Council of Physical Therapy of the American Medical Association.

Four years have been spent in developing our laboratory department. We are sure that the profession will be greatly interested in consolidating their laboratory needs into their surgical supplies source.

Ayerst, McKenna & Harrison, Ltd., 781 Williams Street, Montreal, Canada. Booth No. 2.

Baxter, Don, Inc., 1505 Gardena Avenue, Glendale, Booth No. 5.

Baxter's Intravenous Solutions—Don Baxter, Incorporated, Glendale, Chicago and New York, will display their Council accepted solutions in Vacoliter in Booth 5. Baxter's Double-size Vacoliter (200 cc.) for continued Venoclysis will be demonstrated for physicians interested in prescribing doses larger than 1,000 cc.

Bilhuber-Knoll Corp., 154 Ogden Avenue, Jersey City, New Jersey. Booth No. 9.

In prescribing for your patients you can expect highly satisfactory results with the reliable newer preparations of Bilhuber-Knoll. In heart diseases, Theocalcin aids in reducing dyspnoea and edema, and attacks of angina pectoris. Dilaudid hydrochloride, the powerful analgesic, for pain relief in cancer, terminal tuberculosis, surgery and obstetrics; as well as a cough sedative. The non-barbiturate sedative and hypnotic, Bromural, and the quickly acting cardio-respiratory stimulant, Metrazol, are of much interest in their fields of usefulness. Representatives will be pleased to discuss these products with you.

Borden Company, The, 354 Madison Avenue, New York City, New York. Booth No. 31.

Calso Company, The, 524 Gough Street, San Francisco. Booth No. 25.

Physicians are cordially invited to visit booth No. 25, where they will find palatable and sparkling, ice cold Calso Water. (Alkaline.) If you will leave with us your room number, we will see that your Calso needs will be supplied.

Coca-Cola Company, The, Atlanta, Georgia. Booth No. 14.

Coca-Cola will be served to the delegates with the compliments of The Coca-Cola Company.

Cutter Laboratories, Berkeley. Booth No. 13.

Cutter Laboratories exhibit consists of specimens and literature of their complete line of California-produced vaccines, antitoxins, and allied specialties. Featured are their simplified but effective California test and treatment

sets for hay fever and their line of dextrose solutions in Saitiflasks.

DeVilbiss Company, The, Toledo, Ohio. Booth No. 22.

The complete DeVilbiss line of atomizers, steam vaporizers, and nebulizers will be on display. Specially featured in the exhibit are illustrations graphically showing the superior coverage afforded by the atomizer in the application of solutions to the nose and throat. These illustrations are based on x-ray research carried on by DeVilbiss under ethical supervision.

Copies of the illustrations for reference may be secured from A. O. Narveson, DeVilbiss representative in charge of the display.

Dictograph Products Company, Inc., 457 Powell Street, San Francisco. Booth No. 15.

Exhibit of acousticon hearing aids for hard of hearing, new aurogauge for prescribing hearing aids, church acousticons and portable group hearing aids, silent radios, telematic inter-office communication, Glolite cigarette lighters, Packard Lifetime Lektro Shavers.

H. G. Fischer & Company, 450 Sutter Street, San Francisco. Booth No. 37.

This is the twenty-fifth anniversary of the H. G. Fischer & Company, manufacturers of x-ray, short wave equipment, physical therapy equipment and their accessories.

The exhibit will consist of mobile x-ray and other physical therapy equipment and their accessories.

General Electric X-Ray Corporation, 2012 Jackson Boulevard, Chicago. Booth No. 17.

Gerber Products Company, Fremont, Michigan. Booth No. 1.

Gerber's strained foods for infant feeding and special diets will be on display in Booth No. 1. We invite you especially to stop and see the new product—strained apricots and apple sauce.

Literature will be available for examination, including both reprints for professional use and booklets which are available for distributing to your patients.

Golden State Company, Inc., 425 Battery Street, San Francisco. Booths Nos. 27 and 28.

Heinz, H. J., Corporation, 2998 San Pablo Avenue, Berkeley. Booth No. 30.

H. J. Heinz Company, makers of the 57 Varieties, invites you to visit their exhibit featuring strained foods, breakfast cereals, and olive oil.

Stop for a cold drink of Heinz' Tomato Juice and register for the third edition of the Nutritional Chart. The two previous editions were so enthusiastically received that it was thought advisable to make frequent revisions in order to keep abreast with the rapid advances in the field of nutrition.

Kellogg Sales Company, 155 Montgomery Street, San Francisco. Booth No. 26.

Lederle Laboratories, Inc., 450 Sutter Street, San Francisco. Booth No. 11.

Libby, McNeill & Libby, Chicago. Booth No. 3.

The most outstanding recent development in the science of infant feeding—Libby's Homogenized Foods. This new process mechanically ruptures the food cells of vegetables, fruits, and cereals, and refines the cellulose tissue, releases the contained nutriment, and makes these foods more easy to digest and more completely assimilated. Photomicrographs of strained and homogenized foods graphically illustrate the advantages of the newer process. The research laboratories of Libby, McNeill & Libby invite you to inspect their display in Booth No. 3.

Liebel-Flarsheim Company, 303 West Third Street, Cincinnati, Ohio. Booth No. 32.

Mead, Johnson & Company of California, 670 Third Street, San Francisco. Booth No. 12.

Dextri-Matrose, Dextri-Maltose with Vitamin B

Mead's Standardized Cod-Liver Oil

Mead's Yeast Tablets and Yeast Powder

Mead's Casec

Mead's Protein Milk

Mead's Lactic Acid Milk

Mead's Pablum and Cereal

Mead's Oleum Percomorphum

Mead's Cod-Liver Oil fortified with Percomorph Liver Oil

"Servamus Fidem"

Medical Protective Company, The, Wheaton, Illinois. Booth No. 21.

The Medical Protective Company is represented at Booth No. 21, where you are invited to call. Medical Protective Service is an institution of the medical profession whose legal liability problems we have concentrated upon for thirty-eight years. Bring your professional liability questions and problems to Booth No. 21.

Mennen Company, The, 345 Central Avenue, Newark, New Jersey. Booth No. 36A.

The Mennen Company, Newark, New Jersey, will exhibit their two famous baby products—Antiseptic Oil and Antiseptic Borated Powder. Be sure to register at their exhibit and receive samples of these products, as well as the opportunity to participate in the lucky number drawing for two de luxe fitted leather travel kits.

Merck & Company, Inc., Rahway, New Jersey. Booth No. 6.

A display of interesting new products will be featured at Booth No. 6. A booklet containing useful anatomic charts of the autonomic system is available upon request. Attendants will gladly supply full information regarding such new preparations as Mecholyl (a parasympathetic stimulant), and Cebione (crystalline vitamin C).

Middlewest Instrument Company, 1870 Ogden Avenue, Chicago, Illinois. Booth No. 29.

Middlewest Instrument Company, in Booth No. 29, will feature as their display the Jones motor basal metabolism apparatus.

A special feature of this unit is that it contains no water and requires no calculation in the determination of the basal metabolic rate.

The attendant in charge of the exhibit, Mr. Baransky, will be glad to make demonstration of the technique. He will also make metabolism tests to anyone wishing to have this done. No obligation.

Pet Milk Sales Corporation, Saint Louis, Missouri. Booth No. 16.

The Pet Milk Company display consists of a miniature plant. This exhibit shows in detail the various steps in the process of making Irradiated Pet Milk from the receiving room through the evaporator, the irradiator, the homogenizer, as well as through the sterilizer.

Petrolagar Laboratories, 8134 McCormick Boulevard, Chicago. Booth No. 10.

There are now five types of Petrolagar available for the specialized treatment of constipation.

Each type serves a special purpose, and enables the physician to fit the treatment to the particular need of the patient. Samples and further information may be obtained at Booth No. 10.

Philip Morris & Company, Ltd., 119 Fifth Avenue, New York. Booth No. 7.

Philip Morris & Company, Ltd., Inc., will demonstrate the method by which it was found that Philip Morris cigarettes, in which diethylene glycol is used as the hygroscopic agent, are less irritating than ordinary cigarettes in which glycerine is employed.

S. M. A. Corporation, Cleveland, Ohio. Booth No. 8.

S. M. A. Corporation will exhibit, at Booth 8, their line of infant diet materials and Smaco Vitamin products:

S. M. A. for infants deprived of breast milk; Hypo-Allergic Milk and Alerdex, for allergy patients; Carotene (pro-vitamin A) for vitamin A deficiencies, both in adults and children; and other milk and vitamin products.

Stacey, J. W., Inc., Flood Building, San Francisco. Booth No. 18.

In Booth No. 18 there will be found the new medical and scientific books, comprising the largest display of such publications shown at the State meeting. J. W. Stacey, Inc., of San Francisco, publishers and distributors of medical books, cordially invite you to inspect the volumes at your leisure.

Stokeley Brothers & Company, Inc., South East Street, Indianapolis. Booth No. 4.

Now there is a complete line of Stokeley's Strained Foods for baby.

Strained vegetables, soups, fruits and cereals—specially prepared, from choice products by methods which retain natural flavor and food value in high degree. Correctly seasoned for absolute uniformity and protected in golden enamel lined cans, these foods have a natural, delicious flavor that baby really likes.

Travers & Hennig, Inc., 429 Sutter Street, San Francisco. Booth No. 36B.

Travers & Hennig, Inc., one of the oldest surgical supply houses of Northern California, will occupy Booth No. 36B. They will particularly specialize and show the Allison Directoire and Hamilton Steeltone physicians' office furniture.

The National line of diagnostic instruments and cauterizers of advanced design will also be shown.

Vitamin Products Company, 2023 West Wisconsin Avenue, Milwaukee. Booth No. 23.

A booklet, called *Vitamin News*, may be had with the compliments of the Vitamin Products Company by registering at their booth, which also entitles you to receive subsequent issues of *Vitamin News*, which are mailed monthly.

Information may also be had on their full line of vitamin concentrates, obtained from natural food sources, from A to G, inclusive, in tablet form.

Western Surgical Supply Company, Ltd., 1926 Wilshire Boulevard, Los Angeles. Booths Nos. 33 and 34.

We invite you to see our exhibit, Booths Nos. 33 and 34. Come and peruse at your convenience. We expect to show several new items, besides the most up-to-date, modern equipment for your approval.

Zweegman School for Medical Secretaries, 450 Sutter Street, San Francisco. Booth No. 24.

X—DEL MONTE AND THE MONTEREY PENINSULA

DEL MONTE

An observing traveler once said that Del Monte is all things—at once. His description, however brief, doesn't come far from the mark. For within Del Monte's vast estate of 20,000 acres is nearly every description of recreation and sport imaginable.

Golf.—Would you golf? Within a three-mile radius of Del Monte are five courses; more, in such a concentrated area, than is to be found elsewhere in the world. One of these courses, famous Pebble Beach, was the scene in 1929 of the National Amateur championship. At that time Bobby Jones called it the most picturesque and playable layout of his experience. Cypress Point, Del Monte, the Monterey Peninsula Country Club courses, and Pacific Grove's fine municipal course complete the list.

Tennis.—Is tennis your sport? Del Monte has eleven courts. Every June witnesses the Del Monte tennis championship when fine players from all parts of the coast gather to match their skill.

Trapshooting.—Do you go in for trapshooting? Del Monte has the largest and one of the best equipped set of traps in the country. Official gathering place of the Pacific International Trapshooting Association, the Del Monte grounds present the sport at its best. State and sectional tournaments are held there annually as well as the yearly sports powwow of the California Indians in April.

Fishing and Hunting.—Perhaps your sport is fishing. Or hunting. There, too, Del Monte offers the best to be found. But one hour by motor from Del Monte, up the Carmel Valley, is San Clemente, Del Monte's guest ranch. Adjoining and extending into the great national forest that lies between the Salinas Valley and the coast, San Clemente offers the nimrod and hunter their heart's desire. Then, of course, there are the world-famous waters of Monterey and Carmel Bays for deep-sea fishermen.

Swimming.—Perhaps your favorite pastime is swimming, and the popular and healthful fad of sun-bathing. Del Monte provides complete facilities to satisfy your desires. The Roman Plunge in the beautiful and spacious hotel park has heated salt water and is open the year round, with a smaller and safe plunge for children. The Beach Club at Pebble Beach has an open-air tank at the water's edge. Then there are the white sandy beaches on Monterey and Carmel Bays and the Pacific Ocean to enjoy surf bathing, and the ol' swimmin' hole at the Monterey Peninsula Country Club is another favorite spot.

Trails.—Have you tried the bridle paths at Del Monte? If not, you have missed a treat. There are more than one hundred miles of privately owned and signed scenic paths in the forest and along the beaches. A stable of fine mounts is maintained. By all means bring your riding togs.

MONTEREY

Monterey Peninsula is richly endowed with travel interest. Here are attractions for everyone. Historic-minded motorists who travel with guide book and camera, and others who merely poke around for the fun that's in it, both find their heart's desire within California's famous "Circle of Enchantment."

Good roads, clearly marked, lead the willing motorist to points of special charm and reveal vistas and scenes which artists have chosen to proclaim the most beautiful anywhere. A trip to the Monterey Peninsula and along the coast to the Big Sur may indeed be called a trip so memorable as never to be forgotten.

The city of Monterey is in itself enough reward for having made the trip. Monterey was discovered by the Spaniard Cabrillo in 1542. He called it "Bay of the Pines," and as such was it known until 1602, a decade before the Pilgrims landed on eastern shores, when Vizcaino rediscovered it and called it Monterey (King of the Forests) after the Comte de Monterey, then Viceroy of Mexico. Over a century and a half elapsed before white men again set foot on the soil of California. Then came Portola in 1770, who established the Monterey Presidio, and Padre Junipero Serra, who founded the San Carlos Mission.

Monterey was a gay place under Spanish rule. All the glamor of old Spain held forth then, and life there was a perpetual care-free fiesta. In 1821 Mexico threw off the Spanish yoke and a period of unrest followed, culminating in 1846, when Commodore Sloat raised the Stars and Stripes over the historic Customs House and Monterey became an American possession.

Monterey abounds with historic and beautiful points of interest. Visitors there would do well not to miss the following landmarks: *San Carlos Church*, founded in 1770 by Junipero Serra and once the place of worship for representatives of the Spanish throne, governors and Presidio officers; *Monterey Presidio*, established by Portola in 1770 and prominent throughout Monterey's history; *First Theater in California*, used by picturesque strolling players as early as 1847. Of great interest, this building is now open as a public museum. *Customs House*, over which have flown the flags of Spain, Mexico and the United States; *Colton Hall*, first capitol building of California. Here was drafted the constitution of California. *Stevenson House*: The beloved Robert Louis Stevenson spent three months here in 1879, and wrote one or two of his memorable works in Monterey. Praise of Monterey and its coast is to be found in some of his books.

Seventeen Mile Drive.—No trip to the Monterey Peninsula is complete, of course, without including the world-famous Seventeen Mile Drive. The combinations of pines, age-old cypress and the sparkling blue of the Pacific is one that hundreds of artists have honored with their canvases.

PRE-CONVENTION BULLETIN*

FOREWORD.—The official reports which follow are to be presented at the coming session of the House of Delegates.

Delegates are urged to familiarize themselves with their contents.

Members, likewise, are requested to become familiar with the recommendations of these reports, and to discuss them with other members and delegates.

* * *

I

REPORTS OF GENERAL OFFICERS

REPORT OF THE PRESIDENT

To the Members of the House of Delegates and the Members of the California Medical Association:

Pursuant to a well-established custom and good usage, your general officers are giving to you, and through you, to the membership, an account of their stewardship for the past year.

The House of Delegates is the final source of authority in the California Medical Association. The general officers, under the Constitution and By-Laws, function during the intervals of the House's meeting.

As your president during the past year, I have an apology to make: I have not been able to equal the record of meetings held with component county societies made by my immediate predecessors.

Until recently the general officers, excepting the councilors, met only occasionally with the local societies. Two years ago President Toland deemed it his duty and pleasure to introduce the then new secretary, Doctor Warnhuis, to the members-at-large, and so they visited many county associations up and down the State.

Last year, President Peers, with his ever present habit of doing things well and of excelling, visited every county association in California. This is a record to which I have not been able to attain. I have, however, visited many of the societies, both in the North and in the South, with the President-Elect, Speaker of the House, Secretary, and various Councilors. I had gone, too, on a number of these society-visiting tours throughout the State with both Doctor Toland and Doctor Peers during their terms of office. I have also attended many medical meetings in my home town—Los Angeles having an average of about one medical meeting daily throughout the year.

The county associations throughout the State, I am pleased to report, are in a most prosperous condition. Their meetings are very well attended, much interest is manifested, and their officers apparently are doing their work well.

Looking back over nearly forty years of progress in medical organization work in California, we cannot but be greatly encouraged. Far more interest is being shown than ever before. Notwithstanding the recent years of depression and the general increase in dues, the membership has uniformly increased each year.

While California ranks fourth among the American states in number of members, our percentage of members, based upon the number of licentiatees, is among the lowest, being only about 53 per cent. This is due largely to the number of retired and semiretired licentiatees in the State. A survey made by the Secretary's office shows that about 85 per cent of the really eligible or "desirable" licentiatees are members. On this basis two counties—Imperial and Santa Barbara—rank 100 per cent, while the following counties rank 95 per cent or higher: Humboldt, 97 per cent; Fresno, 96 per cent; Marin, 97 per cent; Monterey, 96 per cent; Sacramento, 95 per cent; San Bernardino, 95 per cent.

A recent survey shows that there are nearly six hundred men in each of the metropolitan counties—Los Angeles and San Francisco—who are not members, but who should be. We would urge a renewed campaign for members in these two counties.

It is estimated that in the list of California licentiatees there are 500 nonresidents, 50 full-time teachers, and 500

* Section 3, Article XII, of the California Medical Association Constitution states, in part: "The Association, prior to the annual session, shall print a 'Pre-Convention Bulletin,' which shall contain reports of officers and committees. . . . A copy of the 'Pre-Convention Bulletin' shall be given to each delegate and alternate on or before registration."

full-time men and women, including internes and residents, in federal, state, and county institutions.

As your president I have attended regularly the meetings of the Council, Executive Committee, Trustees, Committee on Public Relations, and other committees of which the president is ex officio a member. These groups are all composed of sincere, able and energetic men. No doubt much more work is done by them than is usually appreciated by the membership at large.

The State Legislature is now in session. This entails an enormous amount of work by the Committee on Public Policy and Legislation, of which Dr. Junius B. Harris of Sacramento has been chairman for several years. The medical profession in California is under deep obligation to this committee.

Another hard-working group is the Department of Public Relations, of which Dr. Charles A. Dukes is chairman. Due to its multiplicity of activities it is of great importance.

After the meeting at Coronado a year ago, Doctor Toland and his Committee on the Scientific Exhibit in the Hall of Medical Sciences at the California Pacific International Exposition at San Diego continued, with the local committee from the San Diego County Society, an active interest in the exhibit, making frequent visits to it, till the Fair closed in the fall.

Reports in regard to the interest shown in this medical exhibit by the public were pleasing. It was stated that only one other building at the Exposition had as many visitors as did the Medical Science Building.

The Committee on Postgraduate Activities has continued the good work it began a year ago, and has recently enlarged its personnel with the aim of broadening its activities. In future, the deans of the five medical schools in the State, the Tuberculosis and Heart Associations, and probably two of the Bureaus of the State Department of Public Health, will cooperate with this committee in presenting postgraduate clinics with the different county societies outside the larger centers of population.

As the time approaches when I shall turn over to my successor the gavel of the president, I wish to extend my most cordial thanks to the officers, committeemen, and members generally who have contributed so much toward making the past year one of progress to our Association.

I wish again to thank you for the honor bestowed in making me your president, for it is indeed a very great honor—and I shall always esteem it such.

Respectfully submitted,

Edward M. Palette, *President*.

REPORT OF THE PRESIDENT-ELECT

To the President and the House of Delegates:

Your president-elect has attended all but one of the meetings of the Council and the Executive Committee. In addition, he has visited several county societies in company with general officers and councilors. He has been and is now serving on a Special Committee of the Council, requested by the United States Public Health Service Surgeon-General to act in liaison on the State's venereal disease program.

In conclusion, your president-elect embraces this opportunity to express a very genuine personal appreciation for the consideration and courtesies extended to him by many members.

Respectfully submitted,

Howard Morrow, *President-Elect*.

REPORT OF THE SPEAKER OF THE HOUSE OF DELEGATES

To the President and the House of Delegates:

In addition to presiding over the deliberations of the 1936 session of the House of Delegates, the Speaker has attended all meetings of the Council and the Executive Committee, and he has also cared for such special committee assignments as have been appointed by the chairman of the Council.

The delegates are urgently requested to read the reports of the year's work of the Association, as published in the Pre-Convention Bulletin, and to be prompt in attendance at all meetings, in order that intelligent action may be taken on all matters brought before the House. This will insure both rapid and efficient handling of its business and an early adjournment.

Respectfully submitted,

W. W. Roblee, *Speaker.*

REPORT OF THE CHAIRMAN OF THE COUNCIL

To the President and the House of Delegates:

In order that the Council may present to the House of Delegates a report that embraces all of its official actions up to the time that the House of Delegates convenes, the annual report of the Council will be presented at the first meeting of the House of Delegates.

Respectfully submitted,

Morton R. Gibbons, *Chairman.*

REPORT OF SECRETARY-TREASURER

To the President and the House of Delegates:

Your secretary-treasurer, appreciative of the honor and privilege, respectfully submits to your body, and through you to the House of Delegates and members, this annual report for the calendar year of 1936. Interspersed through the factual statements there will be found comments and explanatory paragraphs that amplify and clarify Association activities and business transactions.

It is pertinent to preface this report by the general statement that we have passed through a year to which we may point with justifiable pride as one in which our Association attained in full degree the aims and purposes of organization, and discharged its obligations to the public and to members in a most commendable manner. Our house is well in order.

MEMBERSHIP

The numerical strength of our Association, the fourth largest in the American Medical Association federation, is represented by the following figures:

On January 1, 1936, our membership was 5,402. Our membership on January 1, 1937, is classified as follows:	
Members in good standing.....	5,492
Honorary members.....	9
Retired members.....	60
Associate members.....	6
Total members.....	5,567

A net gain of 170 members is quite satisfactory, and discloses that our Association has affiliated 83 per cent of the eligible and desirable licensed physicians and surgeons in California. We may point to this record with considerable pride, as the average for the country is about 63 per cent. The fact is observed that, as an Association, we are representative of the profession in California and can rightfully claim that we are its authoritative spokesman.

County society officers and committees, too, merit generous credit and appreciation for their efforts to obtain the affiliation of desirable members.

DEATHS

Death claimed sixty-five members. By action of the House of Delegates, deserved tribute will be paid to these departed members during a memorial hour at the first general meeting.

Comments:

- (a) Net profit for 1936 was \$5,323.15.
 (b) Advertising sales income was \$27,849.87—a gain of \$4,033.37 over 1935.
 (c) Unpredictable expenses and replacement of equipment entailed the following expenditures:

Kardex—additional unit	\$ 112.00
Typewriters	427.00
Council appeal hearings	342.10
Extra legal expense and attor-	
neys	2,054.64
Dr. Campbell P. Howard	166.75
Special Committees	396.31
Printing Cancer Report	930.00
	<u>\$4,418.80</u>

- (d) Annual meeting profit was \$1,052.25.

(e) The economy measures and operation savings inaugurated in 1935 were continued during 1936. Additional economies were established during the current year. Attention is directed to the income derived from commercial exhibits during the annual meeting. The revenue received paid all of the expenses of an annual meeting, in the sum of \$2,942.45, and produced a net profit of \$1,052.25. The annual budget, approved by the House of Delegates, is strictly conformed with in every item.

The gain of \$5,323.15 for the year is gratifying when all of the Association's action and business is reviewed. It should be remembered that our Association is an active-going organization whose operation involves financial expenditures. These expenditures receive the critical supervision of the Auditing Committee and the Council. Funds are not disbursed without careful review and control of all expenditures.

In considering finances it is germane to direct the attention of all members to the fact, often overlooked or forgotten, that our organization expenses are not greater by reason of the fact that the members of the Council and of standing committees serve without receiving a per diem for their time. This is an important fact, and represents a very sizeable sum of money. Every member of the Council contributes about thirty-five full days of his time, and loses those days from his practice income, in discharging official duties and attending Council meetings.

The members of the Council during 1936 gave 665 days of time to Association business. Had they received a stipend per diem of \$10, Association expenses would have been increased by \$6,650. Our members should be, and I believe they are, grateful for this unselfish contribution on the part of Council members. A similar contribution is made by committee members. These facts constitute an inspiring and unique feature of medical organizations.

COUNTY SOCIETY UNITS

In company with either the president, president-elect, or councilor and, in certain instances, with the speaker, your secretary has again visited and attended a meeting of every county society.

It has been a real privilege and an inspiration to make these visits and to attend county meetings. These visits have accomplished a better understanding, brought about a truer insight of Association activities, and accomplished a cohesive unity of purpose among all constituent units.

Additional Meetings.—Your secretary has attended and addressed meetings of the following bodies:

Parent-Teacher Organizations
American Legion
Kiwanis and Rotary clubs
Western Hospital Association
State Secretaries Conference, Chicago
Woman's Auxiliaries
Postgraduate Conferences
Y. W. C. A., San Francisco
State Traffic Safety Group
Code Commission

In addition to train travel, 8,914 miles were traveled by automobile.

Contacts.—Contacts were made and new contacts were established with the following:

Heads of Departments of State Government
Parent-Teachers' Organization
American Legion
California Hospital Association
Newspaper Editors' Association
Red Cross
State Chamber of Commerce
San Francisco Chamber of Commerce
Junior Chamber of Commerce
United States Public Health Service
Airline Pilots' Association
Associated Press
Nurses' Association
Y. W. C. A.
Code Commission
State Dental Association
Medical Secretaries' Association
California International Exposition
Golden Gate International Exposition
Officers, Hamilton Field
Convention Bureau
American Executives' Association

These contacts afford desirable opportunities to present our activities and policies.

No attempt has been made to keep a record of the many lay inquiries received or of the lay and laymen representatives that have called at the office. Each day brought one or more of these to the office and afforded opportunities, which were embraced, to bring about better understanding and information as to Association purposes and functionings.

ANNUAL MEETING

The report of the Scientific Committee—of which the secretary by by-law provision is chairman—transmits details and recommendations regarding the scientific program. Arrangement provisions are supervised by the secretary in joint labor with local committees. The appraisal can be made that our annual meetings fully repay a member for time and money spent to attend. This is being recognized. Registrations have been steadily increasing each year.

ASSOCIATION ACTIVITIES

Through issues of our official journal, by means of bulletins, monthly letters, and special reports, comment has been made upon all Association activities for the information of members. Specific comment and summary is, therefore, omitted from this report, as it is assumed that the detailed information has been made available, and repetition is not indicated.

ASSOCIATION HEADQUARTERS

It has been repeatedly stated before all county meetings and in correspondence that the office of the Association is the personal headquarters of every member. Its re-

sources are always available whenever a member feels the need of information or assistance. A sustained effort is made to cause it to be in a position to meet all the needs and requirements of our Association. Reference files, an expanding library, and reports on subjects related to medicine and medical service are kept available. Administrative methods are systematized, and detailed records of membership are complete.

The office staff is composed of four individuals. To them, for the Association, and personally, I express a very genuine appreciation for the services rendered during the year, their loyal and willing coöperation, and for their faithful discharge of duties.

CALIFORNIA AND WESTERN MEDICINE

As business manager of the Association's official publication, all business matters have been directed from the central office. These managerial details relate to advertising, exchanges, book reviews, reprints, mailing, and the mechanics of publication. I have endeavored to closely coöperate with the editor, Dr. George H. Kress, to assist him in causing the JOURNAL to be the outstanding medical journal that it is. I desire to express to the editor my appreciation for his generous consideration and helpfulness.

MISCELLANEOUS ACTIVITIES

This office has sought to be of material assistance to all standing and special committees. All office facilities have been made available to every committee. Committee achievements will be reported upon by the chairmen.

SUGGESTIONS

The following suggestions are tendered for Council consideration and recommendation to the House of Delegates:

1. Recreation of certain standing committees and the abolishing of others. Changing conditions have terminated the purposes for which some of these committees were created.
2. The securing of property for a permanent headquarters.
3. The establishment of a packet library reference service.
4. The holding in October of each year of a two-day session for an annual conference of county secretaries and members of standing committees.
5. A campaign for detailed solicitation to establish a permanent endowment fund.
6. Sponsorship for an annual conference of representatives of the three state medical organizations on the Pacific Coast.

CONCLUSION

Your secretary continuously seeks to administer the specific instructions of the House of Delegates, officers, and the Council. Unswerving compliance with and observance of established policies and procedures is ever the rule for administrative action. The faithful discharge of all of the reposed responsibilities of this office has been my constant quest regardless of time, place, or occasion. It is always my desire and effort to render every possible service and assistance, and as expeditiously and efficiently as it is humanly possible to serve. During the year I have been absent from the office and Association work on personal affairs on two occasions, once for three days and once for four days.

Finally, I desire to record a very real appreciation and gratefulness for the many courtesies shown me, for the trust reposed in me, and for the generous assistance rendered by so many officers and members. It is an honor to be privileged to serve this Association and its members. My thanks are sincere.

Respectfully submitted,

Frederick C. Warnshuis, *Secretary.*

REPORT OF THE EDITOR

To the President and the House of Delegates:

The editor's report on papers received, printed, awaiting publication, or declined, is as follows:

(a) *Report on papers of the annual session at Coronado, May 25-28, 1936:*

At last year's annual session a total of 155 papers were read before the general meetings and different sections.

A summary of the disposition of the papers read at last year's annual session is as follows:

Coronado annual session papers published in 1936.....	31
Coronado annual session papers published in 1937.....	20
Coronado annual session papers, read but published elsewhere, declined, or not sent in.....	86
Coronado annual session papers in CALIFORNIA AND WESTERN MEDICINE files still awaiting publication (annual session papers in this April issue to be deducted)	18

Total annual session papers read at Coronado.....155

(b) *Report on all special articles which have been printed in CALIFORNIA AND WESTERN MEDICINE during the period April, 1936 to April, 1937 inclusive.*

Special and original articles which were published in CALIFORNIA AND WESTERN MEDICINE during the past year (April, 1936 to April, 1937 inclusive) are as follows:

Section papers from annual session at Yosemite, 1935....	44
Section papers from annual session at Coronado, 1936....	47
Papers read before general sessions at Coronado, 1936....	4
Lure of Medical History articles.....	12
Papers read before county and other medical societies....	4
Papers accepted from miscellaneous sources (original articles, abstracts of speeches, reprints from other publications, etc.).....	27
Clinical Notes and Case Reports.....	27
Editorials.....	53
Editorial Comment articles.....	26
Bedside Medicine symposia.....	12
Special articles.....	52

Total papers published during past year.....308

(c) *Report on manuscripts in CALIFORNIA AND WESTERN MEDICINE files and awaiting publication in April, 1937, and later issues:*

Unpublished papers from annual session at Coronado*....	18
Unpublished papers read before county and other societies.....	3
Unpublished papers not read before other societies.....	8
Lure of Medical History articles.....	4
Clinical Notes and Case Reports.....	16
Editorial Comment articles.....	1
Bedside Medicine symposia.....	3

Total manuscripts on hand awaiting publication..... 53

(d) *Report on non-annual session papers submitted:*

A total of twenty-nine papers from county societies and other sources, which were submitted for publication in CALIFORNIA AND WESTERN MEDICINE during this past fiscal year (April, 1936 to April, 1937 inclusive) could not be accepted for various and special reasons.

Non-annual session papers submitted, but declined..... 29

During the last year, no innovations in form of the official journal were introduced, with the exception of supplements authorized at our suggestion by the Council, as recorded on page 189 of the March, 1937, issue.

Concerning finances, this subject was discussed in last year's report given on pages 411 and 412 of the issue of May, 1936. As then and there pointed out, the federal postal authorities require that all organizations publishing official journals shall fix a subscription price for members. During the last two years the Council has placed this figure at \$3 per member (one-half the regular subscription price), which, with the advertising income of some \$27,849.87, permits a paper or bookkeeping profit of almost \$5,000. The real cost, therefore, of the official journal to its members is the difference between its total advertising and miscellaneous income and its total cost; a sum which, when divided by 5,500 (the number of California Medical Association members), gives the actual cost of the JOURNAL to each member (less than \$3 per year).

As will at once be seen, there is a distinct advantage in having the JOURNAL departments maintain a somewhat permanent form and a regular place in the magazine, for then readers are enabled to peruse the publication with greater ease and satisfaction. It is possible that some of the usual departments may have little appeal for certain members; however, since tastes differ, and we have this large reading group of 5,500 members, each of whom pays exactly the same amount in support of CALIFORNIA AND WESTERN MEDICINE, it is proper and only fair that effort should be made to cater somewhat to their varying preferences.

* By contrast, last year's report on annual session papers showed forty-five unpublished papers from the previous annual session at Yosemite. With the appearance of the May issue all but five of the accepted Coronado annual session papers will have been printed.

It must also be remembered that CALIFORNIA AND WESTERN MEDICINE is primarily the printed mouthpiece of organized, rather than technical scientific medicine, thus explaining the large and increasing amount of space given to Association activities, and why annual session papers of a technical character are often released for publication in specialty journals. In fact, it may be said that papers which should have an appeal to physicians in general practice have better opportunities for acceptance than those of more limited scope and interest. The latter, when of real worth, can nearly always find acceptance in the publications devoted to the specialties.

Finally, a few words may not be out of place concerning certain phases of the JOURNAL's format. In its report at the Yosemite annual session, the Committee on Publications called attention

to the advantage of having no advertising on the outside front cover, the reasons for this being that it made for greater ease in studying the contents and also added to the attractiveness and dignity of the appearance of our official journal. In our judgment, this procedure should be continued.

The Reference Committee on Reports of Officers and Committees reported:

Committee on Publications

The Reference Committee recommends that the procedure of having no advertising on the outside front cover be continued. And the present high standards laid down for advertising copy be continued.

The Committee recommends adoption.

With the above action of the Yosemite House of Delegates, the editor is in full accord, and would call attention to the fact that an increasing number of state medical society publications are freeing their front cover of advertisements because it is probably true that the greater income of such front-cover advertising is not all real or net (coming as it often does from advertisers who give up a larger amount of inside-page advertising to get a better position in preferred space). The editor is of the opinion that there would be an immediate and heavy protest if the table of contents on the front cover, so easily referred to, were carried over to inside advertising pages, thus creating for all readers an inconvenience soon apparent.

Some comment may also be in order concerning two regular features which find place in single columns on the text page of each issue: The Twenty-Five Years Ago column and the State Board of Medical Examiners department. Concerning the first, it may be stated that, though almost one hundred years have elapsed since our Association was founded, very little attention has been paid to the past history of the Association. This column frequently contains paragraph items to indicate that our colleagues of twenty-five years ago were quite as alert to existing medical problems as we are of the present day. Regarding the State Board of Medical Examiners department, it is the duty of every physician to know somewhat of that Board's problems. The newspaper items, from the ordinary journalistic standpoint, have real value, the printing alone of the sad fate of those who transgress being of the highest educational importance. In fact, it is shocking to note how, in spite of the deplorable penalties to those who, for instance, violate federal and state narcotic laws, such offenders continue to present themselves.

In connection with these two departments it must also be remembered that the front and back advertising folios or signatures of each issue must be printed a week or so in advance of the pages of text, and that these folios or signatures, for greater ease in printing and lesser cost, must be in multiples of four. That necessitates the use of "fillers," which advertisers welcome, as they make their pages more attractive. Without the Twenty-Five Years Ago and State Board copy for preferential filler use, it would be necessary to use items from other medical journals, of lesser interest and value to California physicians. Owing, then, to recent discussion as to possible economies in printing, the above explanation is given. From the editor's experience, no printing expense would be eliminated by doing away with these two columns, of real interest to so many members.

In similar manner, if space permitted, the merits of all departments of the official journal could be discussed.

The editor wishes to thank the many members who have coöperated, and whose contributions have made possible the issuance of a state journal that, it is hoped, is a credit to the California Medical Association and its members.

Respectfully submitted,
George H. Kress, *Editor*.

REPORT OF THE LEGAL DEPARTMENT

To the President and the House of Delegates:

During the past year a number of problems falling within the field of jurisprudence have come before the Association, and many are before it at the present time. The legal department has at all times endeavored to assist and aid your Council and Executive Committee with respect to those problems of a legal nature which have faced and now face the medical profession.

A brief résumé of the more important phases of the past year's work of the legal department will be undertaken in this report.

Disciplinary Appeals to the Judicial Council of the American Medical Association.—After the adjournment of the House of Delegates at Coronado May 27, 1936, several members of the Association, who had previously been disciplined by their component county societies and whose appeals to the Council of the California Medical Association had resulted in an affirmation by the Council of the disciplinary measures taken by the component county societies, appealed to the Judicial Council of the American Medical Association. Under the rules of procedure governing appeals to the American Medical Association's Judicial Council, it became necessary for the California Medical Association, through its Council, to prepare and file written briefs. The legal department gave its assistance and a great deal of its time to the Council in this matter, in order to aid the Council in matters of procedure.

Expert Witnesses.—It is an open question in California whether a physician who, voluntarily or in obedience to a subpoena, gives expert opinion testimony in a legal proceeding without having first secured compensation for his services in furnishing such opinion testimony, may subsequently recover from the party calling him the reasonable value of his services. In many states a physician who so testifies without having first been paid can recover nothing if the party calling him refuses to pay for his services. At the direction of the Council, this department undertook to represent a member of the Association who had refused to give opinion evidence unless first paid therefor. It was thought at the time that this proceeding might become a test case; however, the litigant who had insisted upon asking the physician questions calling for opinion evidence did not press the matter. Subsequently, and also at the direction of the Council, this department prepared a legislative bill for the purpose of adding to the statutes of this State a provision requiring litigants seeking opinion evidence from a physician (or other expert) to pay the reasonable value of the expert's services.

The proposed bill prepared by this department was approved by the Council and has been introduced at the present session of the Legislature by Senator McGovern, as Senate Bill 446. This bill is of great importance to the medical profession, and should be carefully considered by all members of the Association.

Corporate Practice.—This department's report for the year 1935 (CALIFORNIA AND WESTERN MEDICINE, May, 1936, page 412), summarized the decision in *Pacific Employers Insurance Co. vs. Insurance Commissioner*, which firmly established the California law to be that a corporation cannot practice medicine or surgery. In June, 1936, the District Court of Appeal for the Second Appellate District decided the case of *Benjamin Franklin Life Assurance Co. vs. Insurance Commissioner*. This case extended the rule that a corporation cannot practice medicine to include indirect corporate practice; the court held that an insurance company could not, through the medium of insurance, engage in the sale of medical services, regardless of the methods and forms used. The House of Delegates at its last annual session adopted a resolution directing the Council to prepare, with the assistance of

the legal department, a letter setting forth the legal and ethical aspects of the corporate practice of medicine, and further directing that the letter be sent to all members of the Association.

In accordance with the House of Delegates' resolution, this department prepared an opinion, which was submitted to the Council, dealing with the legal aspects of corporate practice.

California Code Commission: Business and Professions Code.—Several years ago the California Legislature created the California Code Commission. It is the Commission's duty to correlate and restate, without changing the substantive law, all of the legislative acts enacted by the California Legislature since its first session in 1850, which have not been repealed and which are, therefore, in full force and effect. Each general field of legislation has been given a title, and all of the statutes relating to that particular field are being collected and placed in codes bearing the title of the field concerned. We have, for example, the Motor Vehicle Code, Agricultural Code, Insurance Code, and School Code.

During the past year the California Code Commission has been engaged in the preparation of a Business and Professions Code. This code is to include all statutes relating to the various professions and businesses within the State. One portion of the Code will contain all statutes relating to the practice of medicine, including, of course, the Medical Practice Act. This department has kept in constant touch with the California Code Commission and with the officers of the Association, the members of the Board of Medical Examiners; and their counsel, Deputy Attorney-General Browne, and your general counsel and his assistant have spent several full days with Mr. Arthur McHenry, Statute Reviser for the Code Commission. Each draft of the Business and Professions Code has been carefully reviewed by this department, and in several instances suggestions have been made to the California Code Commission and adopted by it which, in our opinion, materially strengthen the legal position of the medical profession.

Physicians' Handbook.—The Council has directed your general counsel, secretary-treasurer, and editor to prepare a physicians' handbook containing, in summarized form, the various principles of law and statutes governing the practice of medicine and surgery. A tentative outline of the subjects to be included in the handbook has been prepared by this department and the secretary-treasurer. Further progress is being made as rapidly as possible.

Medical Jurisprudence Column.—Several months ago the Council established a department in CALIFORNIA AND WESTERN MEDICINE, entitled "Medical Jurisprudence," and each month since its creation by the Council, this department has appeared in CALIFORNIA AND WESTERN MEDICINE. Your general counsel has prepared each month, for this department, articles upon medico-legal problems and other legal matters of interest to the medical profession.

Hospital Service Insurance.—During the past year the Council has given a great deal of its time to the subject of hospital service insurance. A committee of the Council has devoted an immense amount of time to the study of this subject. The legal department has endeavored to do its part in aiding and assisting the Council and the Committee on Hospital and/or Medical Insurance. Much time and study has been given by this department to the subject of indemnity riders on hospital insurance contracts to provide for x-ray and clinical pathologic services. At the direction of the Council this department gave its aid and assistance to the Associated Hospital Service of Southern California in its endeavor to secure a permit from the Insurance Commissioner under the Nonprofit Hospital Service Act of 1935. This department has also worked with the Insurance Commissioner's office and the representatives of the Association of California Hospitals in the preparation of necessary amendments to the Nonprofit Hospital Service Act. At the present time the Legislature has before it Assembly Bill 1132, which is a semifinal draft of the amendments formulated as the result of conferences between representatives of the Insurance Commissioner, the Association of California Hospitals, and this department. The legal department is now de-

voting considerable study to further amendments which have been submitted by the hospital group.

Medical Service Insurance.—Pursuant to requests from the Committee on Medical and/or Hospital Insurance, and at the direction of the Council, this department has assisted the committee in the preparation of a medical service bill. Considerable research work has been done in order that the Association may be fully informed with respect to the constitutional and statutory problems involved in medical service insurance, and in order that the bill may not run afoul certain constitutional principles. At the present time the Association's medical service bill is before the Legislature as Senate Bill 605. This department is also assisting the committee with respect to proposed amendments to the bill.

Miscellaneous.—During the year, opinions of considerable interest have been requested and furnished, dealing with such subjects as the California Unemployment Reserves Act, the Federal Social Security Act, the effect of city ordinances imposing license taxes on physicians, the legal and ethical aspects of certain types of group practice, the scope and legality of various hospital insurance policies, the relative protection afforded members by various physicians' liability insurance policies, and the duties of an employee under copyright law with respect to material compiled in the course of employment. A bill (suggested by the San Diego County Medical Society) to amend the Medical Practice Act so that advertising that services will be performed for fixed fees shall be unprofessional conduct has been prepared. The usual examination of all bills introduced in the Legislature relating to the medical profession has been made, and amendments to a number of the bills have been drafted. Among these, bills pertaining to county hospitals, and the private records of physicians are of the first importance.

Attendance at meetings of the Council, Executive Committee, and other standing committees has obtained throughout the year. In addition, your general counsel has been present at meetings of the Committee of Five, and assisted it in various legal matters of importance to the Association.

Respectfully submitted,

Hartley F. Peart, *General Counsel.*

II

REPORTS OF DISTRICT COUNCILORS

FIRST COUNCILOR DISTRICT

Imperial, Orange, Riverside, San Bernardino, and San Diego Counties

To the President and the House of Delegates:

All county organizations have been visited several times and found to be active and highly interested in affairs of the day. Uniformity in the ranks is everywhere noted, and regular medicine and surgery can well be proud of the defense that is everywhere seen and ready to solve our economic and professional problems. State Secretary Warnshuis and President Palette joined me in visiting all of the societies of the First District. Their presence was welcome, and their coming again is anticipated.

Situations have not been so tense in this district as experienced by some of the metropolitan areas, but with a high percentage of membership on any county roster a more satisfactory solution of questions can be expected than when medical men are divided. Orange, Riverside, San Bernardino, and Imperial counties have all the eligible and desirable medical men on their roll.

Opposition to the opening of county hospitals to all residents is generally opposed, and should be prevented if possible, as it is one of the entering wedges to the regimentation of the medical men.

Postgraduate meetings have been held in Orange, Riverside, and San Bernardino counties, and where the clinical picture was carried along with the case presentation it proved to be more interesting to the men than where a paper was read.

This year the second session of county secretaries with the state officers was held in San Francisco. The secretaries of the First District in attendance, as well as those

from the other counties, are enthusiastic about the gatherings and are desirous of their continuance.

Every society "went into politics" this year. Our State Medical Legislative Committee, therefore, will find that our lawmakers have been "talked to" before coming to Sacramento, and will know something about what they are expected to do to keep peace with the boys at home.

Respectfully submitted,

Calvert L. Emmons, *Councilor,*
First District.

SECOND COUNCILOR DISTRICT

Los Angeles County

To the President and the House of Delegates:

During the past year there has been a very satisfactory increase in membership, which now stands at 2,378.

Our political strength is being continually augmented, as our organization is improved. The coöperation of the Public Health League has been invaluable here.

Our radio broadcasting is attracting increasing attention. We have recently been requested by the local Parent-Teachers' Association to supply them with our programs in advance.

Much attention has been devoted to the development among our members of a speakers' bureau. Quite a number of them have taken a course of instruction in public speaking, and an organization has been formed which meets regularly for further development along these lines. We are having numerous calls for appointments for this department.

The social activities of the Association have done much to increase interest and good fellowship. These have included bridge tournaments and a chess tournament. A hobby show was held early this year at which extensive exhibits of a very high order and great variety were shown. So much interest was aroused that it is planned to repeat it on a larger scale. At the time of writing, arrangements have been completed for an amateur night, with entertainment entirely supplied by members, each branch of the Association being responsible for one number on the program. These activities have been made possible because of our commodious quarters, and are in addition to the scientific meetings, of which there is an average of twenty a month, a dinner being served for the members before the meetings.

Through the generosity of the Southern California Medical Golf Association, we now have a grand piano in the auditorium. A loudspeaker system has also been installed and is available for all meetings.

Not the least of our growth has been in our library. Many new volumes have been added, and additional stacks for 60,000 volumes have been installed.

We feel that the prospects for continued healthy growth are most promising.

Respectfully submitted,

Carl R. Howson, *Councilor,*
Second District.

THIRD COUNCILOR DISTRICT

Kern, San Luis Obispo, Santa Barbara, and Ventura Counties

To the President and the House of Delegates:

All the component county societies have taken an active interest in the question of hospital insurance. San Luis Obispo, Santa Barbara, and Ventura County Societies met with the Alameda Hospital Group, in the hope that some arrangement might be made to furnish hospital insurance for their counties. It was found, however, that insurance through the Alameda group was not possible at this time. The Santa Barbara Society's Insurance Committee is in close contact with the development of an insurance plan in Los Angeles, and it is hoped that some approved form of hospital insurance will eventually be available. Kern County has negotiated with the Intercoast group at Sacramento, but had not definitely accepted their plan at the time of writing this report. There is no question of the success of hospital insurance in the Third District, once a suitable form is made available. The hospital situation in Kern County is still far from

settled. The report of progress in combating this intolerable condition is omitted, as it appears in the report of the legal department.

It is encouraging to note that influential members of the societies who have never before taken any particular interest in economics are now becoming active in meeting the question of insurance, and through this contact are appreciating for the first time the work of the State Association in protecting the public as well as the medical profession.

Respectfully submitted,

Henry J. Ullmann, *Councilor,*
Third District.

FOURTH COUNCILOR DISTRICT

Fresno, Madera, Kings, Tulare, Merced, Mono, Mariposa, Inyo, Calaveras, San Joaquin, Tuolumne, and Stanislaus Counties

To the President and the House of Delegates:

The councilor has tried to serve the district and the California Medical Association by a sustained effort in reporting developments on such important matters as the proposed voluntary health insurance legislation, and has attempted to ascertain, so far as possible, what action the membership of the district desired the Council to take on these matters.

To help promote public good will and better understanding by the laity of the ideals and aims of our profession, publicity, as sponsored by the Fresno County Society, has been suggested to other county societies. The Public Health hour service idea, advanced by our secretary, Dr. F. C. Warnshuis, has been endorsed as of probable great value in promoting public favor. The use of the radio and other means of public education on medical problems and activities has been advocated.

The membership has been frequently reminded of the necessity for continuous interest in candidates for public office and elections, and that eternal vigilance may help prevent legislation disastrous to public health, and further proper functioning of medical service.

Hospital insurance, as endorsed by the California Medical Association Council, has been urged as a possible answer to the growing demand for free hospital care at county hospitals. Considerable progress has been made in the sale of such insurance in the district.

The advantages and desirability of postgraduate conferences, now available, have been explained.

The Woman's Auxiliary activities have been commended and their extension urged. More such organizations have been recommended, and activities to this end commenced.

An encouraging *esprit de corps* is manifest throughout the district, and full coöperation with the California Medical Association policies and activities is readily given.

Respectfully submitted,

A. E. Anderson, *Councilor,*
Fourth District.

FIFTH COUNCILOR DISTRICT

Monterey, San Benito, San Mateo, Santa Clara, and Santa Cruz Counties

To the President and the House of Delegates:

A variety of important activities have occupied the attention of the county societies of the Fifth Councilor District during the past year. Some of the most important have been attempts to raise the ethical standards of lodge and panel practice, coöperation with the Red Cross in a program of tuberculin testing in the schools, and participation with the authorities in reorganizing public health, county welfare and county hospital administration. Work along these lines should be of benefit to the communities involved and to organized medicine.

Better scientific programs, in some instances, have resulted from these efforts of the Society officers.

Each county society in the district, where regular meetings are held, has been visited by me at least twice during the year. One Council meeting was not attended because of illness.

Respectfully submitted,

Alfred L. Phillips, *Councilor,*
Fifth District.

SIXTH COUNCILOR DISTRICT

San Francisco County

To the President and the House of Delegates:

During the past year, as in the preceding four or five, the interest of the members has been largely centered on health and hospital insurance, on the periodic payment basis.

In some districts of the State, members have felt that fear among physicians has been the inciting factor in the development of plans for the provision of such service, but in our district we find marked evidence to the contrary.

Our committees have had many meetings on this subject with many groups, among which are the Municipal Employees' Association of San Francisco, numbering over 14,000; the State Employees' Association, numbering many thousands; branches of Credit Unions; and a number of private business concerns which employ large groups. All of these insist that unless the medical profession provides means through which insurance can be secured, they (the various groups) will support legislation to provide it.

In San Francisco a charter amendment has been proposed which, if passed, will make payroll deduction for health service compulsory among the municipal employees. It has fallen upon the members of this district to see that proper provision is made in this amendment for safeguarding the interest of the public as well as that of the physician. In this we feel that we have been reasonably successful. This measure of success, however, did not come easily. In fact, it was made possible only by the aid of the hospitals, the nurses, the dentists, the retail druggists, retail merchants and labor, as well as the very loyal support of individual physicians and groups of physicians.

Real progress has been made in the matter of hospital insurance, and no doubt before you read this, such a type of insurance will be available to employed groups in San Francisco, through the Insurance Association of Approved Hospitals (Alameda County Plan), which has kindly consented to enter San Francisco upon the invitation of the local County Medical Society.

We look hopefully toward the future, but our work has only just begun.

Respectfully submitted,

Karl L. Schaupp, *Councilor,*
Sixth District.

SEVENTH COUNCILOR DISTRICT

Alameda and Contra Costa Counties

To the President and the House of Delegates:

The most important accomplishment of the Seventh District, comprising Alameda and Contra Costa counties, has been the completion during the year just past of the Alameda County Medical Association's hospital plan. In conjunction with the approved hospitals of the East Bay area a mutual insurance company has been organized, and this is operated by the Medical Association and the hospitals jointly. Policies, effective since November 16, 1936, and covering a generous hospital service, are being sold at present to gainfully employed groups only.

Both Alameda and Contra Costa counties hold regular, well-planned, monthly meetings except during the summer months, and both county societies show an increase in membership during the past year.

Alameda County Medical Association has recently revised its Constitution and By-Laws increasing the Association's Council from nine to twelve members, and increasing the term of office of each from one to three years. Provision has been made for continuous representation of the rural parts of the county, as well as for the cities of Alameda and Berkeley.

Respectfully submitted,

O. D. Hamlin, *Councilor,*
Seventh District.

EIGHTH COUNCILOR DISTRICT

Alpine, Amador, Butte, Colusa, El Dorado, Glenn, Lassen, Modoc, Nevada, Placer, Plumas, Sacramento, Shasta, Sierra, Sutter, Tehama, Yolo, and Yuba Counties

To the President and the House of Delegates:

The past year has been rather a quiet one in the activities of the medical societies in the Eighth District. There have been several local problems which have been ironed out to the satisfaction of the Society members.

The Intercoast Hospitalization Insurance Association has extended activities to several of the northern counties, and their hospital insurance plan has met with the approval of the various county societies and has been a most excellent step forward in hospitalization economics.

During the week of October 8 to 11, President Pallette, President-Elect Morrow, Secretary Warnshuis, and the Councilor visited several of the societies in this district. The meetings were well attended and the officers were very enthusiastically received. Much interest was expressed relative to recent court decisions that have been rendered relating to the healing art and their encroachment upon the field of medicine. The stress of a legislative year was impressed upon the members, and they were cautioned to be alert in all matters pertaining to hospital and medical economics.

The Secretaries' Conference was well attended, considering the climatic conditions which prevented many of the far northern societies from attending.

The memberships in the societies are being kept up, and scientific and economical problems of medicine are keenly observed.

Respectfully submitted,
C. E. Schoff, *Councilor,*
Eighth District.

NINTH COUNCILOR DISTRICT

Del Norte, Humboldt, Lake, Marin, Mendocino, Napa, Siskiyou, Solano, Sonoma, and Trinity Counties

To the President and the House of Delegates:

A brief report of the medical societies' activities in the Ninth Councilor District during the year 1935 is submitted: During the past year, since the submission of the pre-convention report for 1935, I have made councilor visits to all the county medical societies in this district, and to most of the societies repeated visits have been made in order to inform them of the work of the Council and the activities of organized medicine in California.

Respectfully submitted,
Henry S. Rogers, *Councilor,*
Ninth District.

III**REPORTS OF COUNCILORS-AT-LARGE***To the President and the House of Delegates:*

As councilor-at-large my duties have principally been those of chairman of Committee on Legislation and Public Policy. I have attended meetings throughout the North, have had the honor of serving on a committee recodifying the Medical Practice Act, and on another committee, to write the Medical Service Act, and assisted in the formulation of the Hospital Service Act (all these are now before the Legislature), talked on the subject of medical legislation at the secretaries' and officers' conference in San Francisco, held Legislative Committee meetings with keymen in Los Angeles and San Francisco, and addressed, by invitation, the San Francisco County Medical Society on the subject of legislation.

As this is written, the legislators are beginning to gather at the Capitol to start the study of 3,879 bills. About 7 per cent of these bills are ones in which we have an interest. From my acquaintance with the holdover legislators and with the new ones I have just met, I am inclined to the opinion that this Legislature will be one which will uphold standards and qualifications in medical practice. It, however, appears to be a more social-minded group than heretofore, and I predict a strong and possibly successful fight will be waged by groups among them

to open up county hospitals to all, regardless of ability to pay.

In this report, may I thank the alert members of the county society legislative committees who have contacted their legislators and told them Medicine's story. It has been most helpful to us whose duty it is to carry on at the front.

Respectfully submitted,
J. B. Harris, *Councilor-at-Large.*

To the President and the House of Delegates:

It is my general observation that there are far more members interested in and familiar with the work and value of the California Medical Association than there were a few years ago.

This interest is stimulated, more than by any other factor, by the activities of the Presidents and the Secretary, who have, at no small sacrifice, made personal contact with so many members in their home neighborhoods.

Respectfully submitted,
Morton R. Gibbons, *Councilor-at-Large.*

To the President and the House of Delegates:

During the past year most of my time, as a councilor-at-large, has been spent acquainting the members of the San Diego County Medical Society with developments in hospital insurance and medical service associations. Our society is almost unanimously in favor of hospital insurance, and I believe it will favor any type of health insurance, provided it is sponsored by the California Medical Association.

The inertia within the ranks of the local society is fading away, and the individual members are much more interested in medical economics than they were.

I believe the visits of our new state secretary, Doctor Warnshuis, and the annual secretaries' conference are creating very beneficial effects.

Respectfully submitted,
C. O. Tanner, *Councilor-at-Large.*

To the President and the House of Delegates:

During the past year we have contacted many members in the southern counties. They have shown particular interest in the question of hospitalization on a periodic payment plan. The bill that is now in the Legislature will undoubtedly pass, and will enable the hospitals to sell that sort of insurance.

There are a number of other problems affecting the profession that will require more coöperation from all our members.

Respectfully submitted,
W. H. Kiger, *Councilor-at-Large.*

To the President and the House of Delegates:

During the year I have attended all Council meetings and have served as a member of the Auditing Committee and as chairman of the Special Committee, created by the Council for the study and formulation of plans for voluntary health and hospital insurance. This has necessitated considerable work within and without the membership of the Association, and I am impressed with the fact of a growing trend in the creation of various instrumentalities for providing health insurance.

My experience during the year as councilor-at-large leads me to stress the importance of this tendency and study by the California Medical Association of the means by which its development can be kept within the hands of the profession.

Respectfully submitted,
T. Henshaw Kelly, *Councilor-at-Large.*

To the President and the House of Delegates:

As councilor-at-large I have missed but one meeting of the Board during the past year, and right or wrong, alone or with concurring voices, have never hesitated to express my opinion, and upon occasion fight for any point that affected the welfare of Medicine.

Respectfully submitted,
Harry H. Wilson, *Councilor-at-Large.*

IV

REPORTS OF STANDING COMMITTEES*

COMMITTEE ON ASSOCIATED SOCIETIES AND
TECHNICAL GROUPS

Executive Group

William J. Kerr, Chairman, 1938
John V. Barrow, 1937 W. H. Geistweit, 1939

To the President and the House of Delegates:

The past year your committee has served in an advisory capacity only to the Woman's Auxiliary. Doctor Barrow has been active, and I am quoting from his report. "During the past year I have kept in touch with the Woman's Auxiliary and have been a quiet advisor. I have advised continuous work in health education through the Auxiliaries, which, to my mind, is the finest *entrée* of the medical profession to lay groups. I have urged others to contribute, and have myself contributed to lectures for laymen in service clubs of the city. I would advise the chairman of this committee to deputize a certain number of medical men, whose specific business it shall be to present things of medical interest to lay groups."

I have not been able to secure a report from one of our members.

In line with the suggestion of Doctor Barrow, it would seem that the State Medical Association should appoint representatives in each county to speak on public relations, or have committees of the county societies working with our committee and the Woman's Auxiliary. It should be called to the attention of the State Medical Association that the antivivisectionists have an initiative measure ready for the next general election to prevent all laboratories from securing any experimental animals from pounds or other private sources. It may be necessary to have the help of all possible agencies and groups to combat this measure, or to introduce an initiative measure which will really protect the public, agricultural interests, and the medical profession from those who are acting against the best interests of the State.

Respectfully submitted,

William J. Kerr, *Chairman*.

COMMITTEE ON HEALTH AND PUBLIC INSTRUCTION

Executive Group

Fred B. Clarke, Chairman, 1938
Benjamin W. Black, 1937 W. R. P. Clark, 1939

To the President and the House of Delegates:

Your standing Committee on Health and Public Instruction respectfully reports that its major activities have been evidenced through the Department of Public Relations.

Your committee directs attention to the publicity that is concerned with the venereal disease educational program inspired by the United States Public Health Service. We feel that this program rightly belongs under the administrative guidance of the State Board of Health.

We recommend that the House of Delegates endorse the action of the Council upon this subject. We recommend that every member and group cause their activities to be in conformity with the plans outlined by the Board of Health, and that unity of action be not diverted by independent or disassociated efforts which are bound to cause confusion and reduplication of work and lessen the effectiveness of the program of the Board of Health. Your committee records its confidence in the Board of Health and fully believes that that Board will ever be mindful of the interests of the private practitioner.

Your committee would further recommend that the Association's secretary confer with the officers of the Woman's Auxiliary for the purpose of inspiring a definite yearly program of public health education under the sponsorship of the several branches of the State Auxiliary.

Your committee has been particularly interested in the development of a speakers' bureau in each and every

county unit, to the end that the public may be better informed in matters relating to sickness and health.

Some county units are doing exceedingly fine work in this respect, and it is urged that during this next year this work will be extended.

Respectfully submitted,

Fred B. Clarke, *Chairman*.

COMMITTEE ON HISTORY AND OBITUARIES

Executive Group

Frank R. Makinson, Chairman, 1938
George D. Lyman, 1937 J. Marion Read, 1939
The Secretary, ex officio The Editor, ex officio

To the President and the House of Delegates:

While no formal meeting of the committee was held during the year, there were conferences and correspondence between committee members.

An effort has been made through the columns of CALIFORNIA AND WESTERN MEDICINE, by President Pallette and the committee, to have county historians appointed. Such a step is indispensable to the greatest degree of success in collecting historical material.

A considerable amount of work has been done on the history during the year, yet only the surface has been scratched.

It is my opinion and recommendation that a full-time worker should be employed by the Council to do the research work on the history before an increased period of time is permitted to circumvent a high degree of success. It is impossible for a man busy with a practice to do the time-consuming detail research work necessary to obtain the information concerning the early history of the Association, yet its value, its tradition and history of Medicine in the State highly justify it.

Following is a list of members of the California Medical Association whose deaths occurred during the last year:

IN MEMORIAM

Allen, John, October 4, 1936, Raymond.
Ames, Elwin Witt, April 6, 1936, Los Angeles.
Arnold, Mott Hutton, December 9, 1936, San Diego.
Ball, Jau Don, November 25, 1936, San Francisco.
Baumeister, Edward Emery, May 3, 1936, San Francisco.
Beard, John Lyman, November 9, 1936, Martinez.
Beattie, Hugh, September 18, 1936, Elk Grove.
Beckett, Wesley Wilbur, June 3, 1936, Los Angeles.
Bigby, Margaret H., September 26, 1936, Downey.
Bixby, Edward Marcellus, April 24, 1936, San Francisco.
Bonta, Maurice Buford, January 5, 1936, Los Angeles.
Brendel, Frank Philip, May 24, 1936, Sacramento.
Brewer, Lambert Cleveland, May 11, 1936, Los Angeles.
Burg, Beatrice Victoria, April 4, 1936, Oakland.
Buskirk, William H., August 7, 1936, Los Angeles.
Chase, Raymond E., July 14, 1936, Glendale.
Chidester, Walter Clifford, April 21, 1936, San Mateo.
Collings, Harry Andrews, March 8, 1936, Susanville.
Doig, Robert L., May 9, 1936, San Diego.
Dougherty, Edwin E., July 17, 1936, Los Angeles.
Duffield, William, September 9, 1936, Los Angeles.
Fisher, Charles Albert, June 20, 1936, Los Angeles.
Gatliff, William Walker, May 12, 1936, Butte City.
Golding, Daniel G., April 28, 1936, Santa Monica.
Graham, John Alexander, January 1, 1936, Barstow.
Goodenow, Norman H., October 14, 1936, Monrovia.
Harc, George Andrew, April 4, 1936, Fresno.
Harrison, Fred, April 24, 1936, Gridley.
Hawley, Max Charles, January 1, 1936, Agnew.
Heald, Alfred Henry, March 12, 1936, San Mateo.
Hemken, Louisa, November 20, 1936, Los Angeles.
Hicks, John R., August 1, 1936, Tulare.
Hieronymus, Arthur, December 5, 1936, Alameda.
Hubble, J. Edgar, July 30, 1936, Pomona.
Kendall, Oscar J., November 18, 1936, San Diego.
Kirkpatrick, John L., May 17, 1936, Los Angeles.
Lackay, Howard Julian, May 15, 1936, Oakland.
Lagan, Edward, May 17, 1936, San Francisco.
Langnecker, Harry Leslie, September 23, 1936, San Francisco.
Latta, Samuel E., June 13, 1936, Stockton.
Liliencrantz, August, October 9, 1936, Oakland.
Lund, Charles W., November 4, 1936, Willows.
Macleish, Archibald Campbell, May 4, 1936, Los Angeles.
March, William Bright, June 23, 1936, Burson.
Matsumura, Kiyoshi, January 5, 1936, San Francisco.
Merrill, Edward Roscoe, February 13, 1936, Santa Barbara.
Miner, Lucien L., June 5, 1936, Los Angeles.
Moore, Thomas Verner, June 6, 1936, San Jose.

* Members of standing committees are urged to meet during the annual session and organize for the coming year, and to hold at least one regular meeting of their respective committee during the annual session.

Newman, Henry Parker, September 23, 1936, San Diego.
 Noggle, George Elliott, April 8, 1936, Chino.
 Oatman, Homer Clifton, January 1, 1936, San Diego.
 O'Donnell, Earl William, February 16, 1936, Los Angeles.
 Offield, Archie Leonard, September 17, 1936, Burlingame.
 Rathbun, William T., January 2, 1936, Colusa.
 Richter, Clemens Max, May 19, 1936, San Francisco.
 Rigdon, Rufus Lee, January 21, 1936, San Francisco.
 Roath, Clinton, January 26, 1936, Los Angeles.
 Rosoff, James A., January 24, 1936, Compton.
 Rothschild, Max, July 11, 1936, San Francisco.
 Striegel, Raymond John, February 26, 1936, Long Beach.
 Thieme, Derk Anthony I., October 5, 1936, Los Angeles.
 Vowinkel, Ferdinand Wilhelm, February 24, 1936, San Francisco.
 Wheeler, Ira Abbey, January 2, 1936, Colfax.
 Witherbee, Orville O., December 24, 1936, Los Angeles.
 Woods, Donald Kendrick, December 10, 1936, San Diego.
 Respectfully submitted,
 Frank R. Makinson, *Chairman.*

COMMITTEE ON HOSPITALS, DISPENSARIES CLINICS

Executive Group

Daniel Crosby, Chairman, 1939
 Karl L. Schaupp, 1937 John C. Ruddock, 1938

To the President and the House of Delegates:

In the matter of report of the Committee on Hospitals, Dispensaries and Clinics, please be advised that, inasmuch as all questions of this sort have been handled by the Public Relations Committee, this committee has had no meeting and, therefore, has no report to make at this time.

Respectfully submitted,
 Daniel Crosby, *Chairman.*

COMMITTEE ON INDUSTRIAL PRACTICE

Executive Group

Morton R. Gibbons, Chairman, 1938
 Harry E. Zaiser, 1937 *Mott H. Arnold, 1939

To the President and the House of Delegates:

No question concerning this subject has been brought to the attention of the committee in the past years; whether or not no one has considered inquiry or complaint worth while is not known. It is inferred that the practice of industrial medicine is running smoothly.

Respectfully submitted,
 Morton R. Gibbons, *Chairman.*

COMMITTEE ON MEDICAL DEFENSE

Executive Group

George G. Reinle, Chairman, 1938
 John P. Nuttall, 1937 Fred R. DeLappe, 1939

To the President and the House of Delegates:

The Medical Defense Committee begs to advise that during the past year nothing has been referred to it; therefore, it has no report to make, although advised that the premiums for malpractice insurance have been increased.

Respectfully submitted,
 George G. Reinle, *Chairman.*

COMMITTEE ON MEDICAL ECONOMICS

Executive Group

John H. Graves, Chairman, 1938
 Willard Stone, 1937 William R. Molony, Sr., 1939

To the President and the House of Delegates:

Correspondence between the members of the committee has been maintained, and the chairman of the committee has attended the meetings of the Committee on Public Relations.

No independent action by this committee has been inaugurated during the past twelve months in view of the extensive program outlined by the Committee on Public Relations, to which this committee gives its full support.

Respectfully submitted,
 John H. Graves, *Chairman.*

* Deceased, December 9, 1936.

COMMITTEE ON MEDICAL EDUCATION AND MEDICAL INSTITUTIONS

Executive Group

Loren R. Chandler, Chairman, 1939
 John B. Doyle, 1937 B. O. Raulston, 1938

To the President and the House of Delegates:

Your Committee on Medical Education and Medical Institutions has held no meetings during the year. The activities of the four medical schools in California are well known to this society. Your committee has cooperated with the deans of these schools and the Society's Committee on Postgraduate Education at informal discussions, but there have been no formal meetings of this committee.

Respectfully submitted,
 Loren R. Chandler, *Chairman.*

COMMITTEE ON MEMBERSHIP AND ORGANIZATION

Executive Group

E. Vincent Askey, Chairman, 1938
 G. Dan Delprat, 1937 Dewey R. Powell, 1938
 The Secretary, ex officio

To the President and the House of Delegates:

The Committee on Membership and Organization has held no official meetings during the year.

Due to efficiency in our component county association set-ups, specific expansive campaigns for membership have not been necessary. A steady, healthy increase of membership has been apparent.

In the hands of each county society secretary has rested the responsibility of seeing that those eligible physicians of his county are informed of the needs and advantages of membership in our Association. Our state secretary, Dr. F. C. Warnshuis, has placed at the disposal of these county secretaries all the facilities and help necessary in carrying out their plans.

At the yearly county meeting of secretaries at San Francisco, the duties and responsibilities regarding membership were discussed, and renewed effort in urging every qualified physician to join our ranks was pledged. The larger centers of population still lag in the ratio of the number of members in relation to eligible physicians, as compared with the smaller localities. Some counties have 100 per cent representation; others approach closely this percentage.

The importance of keeping the California Medical Association the actual representative of more than a majority of all the licensed doctors of medicine should be remembered.

To achieve the utmost value from our organization it must remain the spokesman and wheelhorse of the medical profession. For that reason every doctor of medicine who meets our requirements, and is an ethical practitioner, should be given the opportunity of becoming a member of the medical society of his county, and thereby of the California Medical Association and the American Medical Association.

As need arises, your committee stands ready to initiate and carry through such plans and programs as are deemed wise and best.

Respectfully submitted,
 E. Vincent Askey, *Chairman.*

COMMITTEE ON POSTGRADUATE ACTIVITIES

Executive Group

Clarence G. Toland, Chairman, 1938
 John C. Ruddock, 1937 F. F. Gundrum, 1939
 The Secretary, ex officio

To the President and the House of Delegates:

During the past year your committee has been active and has caused to be given, in various communities throughout the State, conferences available to the membership of the California Medical Association residing in these various localities.

On February 6, 1937, a meeting of the Committee on Postgraduate Activities was held in San Francisco in the Sir Francis Drake Hotel. An invitation was extended by Dr. Clarence G. Toland, Chairman of the Committee,

to the deans of the medical schools of the University of California, Stanford University, University of Southern California and the College of Medical Evangelists, and to Mr. W. F. Higby of the California Tuberculosis and Heart Association and Dr. Charles A. Dukes, Chairman of the Committee on Public Relations of the California Medical Association, to confer with the committee and offer suggestions as to the best method of presenting postgraduate programs during the coming year. Those present were: Dr. Clarence G. Toland; Dr. John C. Ruddock; Dr. Charles A. Dukes; Dr. Loren R. Chandler, Dean of the Stanford University Medical School; Dr. R. Langley Porter, Dean of the University of California Medical School; Dr. Paul S. McKibben, Dean of the University of Southern California Medical School; and Mr. W. F. Higby of the California Tuberculosis and Heart Association.

A complete discussion of the problem of postgraduate activities and the method of making available to the membership of the California Medical Association the latest advances of medical science was had. A uniform and coöperative program was agreed upon by the various universities and units in order to make this proposed activity successful.

It has been realized and evidenced in the past that physicians who practice and live in the metropolitan centers have available to them the refresher and review classes conducted by the medical schools. These refresher and review classes offer the most successful postgraduate instruction today. However, it is impossible for physicians not in the immediate vicinity of the universities offering these classes to take advantage of them. Because of the demand made upon these practitioners by their practice they are unable to absent themselves from their communities, except for short periods of time; nor are they more able to follow the current literature thoroughly; and, further, libraries are not easily available to them.

The committee, when organized, was given the task of bringing to the physicians of California so situated the advantage of the opportunities of those physicians who were in metropolitan districts, and the committee now proposes a certain definite program for postgraduate activities conducted by the California Medical Association.

The committee feels that the proposed postgraduate activities of the California Medical Association is the most important thing that the California Medical Association can do today to offset criticism, and to raise the standard of the medical profession in this State. Most of the movements which have started under the term of "medical economics" have their inception in a criticism of services rendered. It is a sad but true commentary, therefore, on the medical profession that many physicians neglect their education upon beginning the practice of medicine.

The California Medical Association should realize that by means of postgraduate activities they are being given the greatest available weapon for combating the criticism of the medical profession.

With these facts in mind, the committee desires to make the following proposals:

1. The medical schools and the California Medical Association coöperate in presenting postgraduate conferences in order to avoid conflicting programs.
2. The office of the California Medical Association be used as the central bureau through which programs are arranged.
3. Conferences should be aimed to cover one subject thoroughly with clinical and case demonstration, and it is proposed that where more than one speaker or clinician instructor participate, each should demonstrate various phases of the subject, such as clinician, surgeon, pathologist, x-ray, etc., rather than four or five speakers on four or five subjects. Conferences should not be a series of didactic lectures such as are available at the various county medical meetings.
4. All conferences be held, if possible, in a local county hospital in order that a clinical demonstration may be given, and all facilities necessary therefor will be at hand. Case demonstration is important.

5. It is hoped that the local men may use these clinical case demonstrations as a consultative service for diagnostic problems by submitting their patients for demonstration.

6. All expenses incurred in the giving of postgraduate conferences to be borne by the California Medical Association and the county medical societies, these expenses to include remuneration to clinicians for travel and hotel expenditures.

7. Credits, in the form of certificates by the California Medical Association, to be issued to members attending these conferences for a specified number of hours.

8. Men to conduct postgraduate conferences to be obtained from the following sources:

(a) The teaching staffs of the University of California, Stanford University, the University of Southern California, the College of Medical Evangelists, and the Los Angeles Medical Department of the University of California.

(b) The rosters submitted by the California Tuberculosis Association, the California Heart Association, and the Cancer Commission of the California Medical Association.

(c) Men selected by the Committee on Postgraduate Activities from the membership of the California Medical Association.

The California Tuberculosis Association and the California Heart Association have offered their assistance in making postgraduate conferences a success, and either or both associations would pay one-half the expenses of a conference if the conference were given in lieu of one of their meetings. This statement was confirmed by Mr. W. F. Higby, Executive Secretary of the California Tuberculosis Association, and Dr. John C. Ruddock, President of the California Heart Association.

9. The Secretary of the California Medical Association to prepare a printed bulletin containing information as to courses and speakers for postgraduate conferences.

10. The Secretary of the California Medical Association to obtain information regarding available clinical conferences from: The University of California Medical School; Stanford University Medical School; the University of Southern California Medical School; College of Medical Evangelists; Los Angeles Medical Department of the University of California; California Tuberculosis Association; California Heart Association; Cancer Commission of the California Medical Association; Maternal and Child Welfare, Crippled Children, Department of Health; and such other departments as come under the Social Security Act.

Respectfully submitted,

Clarence G. Toland, *Chairman*.

COMMITTEE ON PUBLICATIONS

Executive Group

Percy T. Magan, Chairman, 1937	
Ruggles A. Cushman, 1938	Oscar Reiss, 1939
The Editor, ex officio	The Secretary, ex officio

To the President and the House of Delegates:

The chairman of your Committee on Publications takes pleasure in again calling to the attention of the members of the California Medical Association the excellence of its official journal, judged by the publications of other state medical societies as we find them on the shelves of our medical libraries.

We are glad to know that CALIFORNIA AND WESTERN MEDICINE appears on its monthly visits with splendid regularity. The articles it contains are the writings, for the most part, of the members of our California Medical Association, as given in the annual session of the State organization or in its component county societies. Therefore, it stands to reason that they represent in all probability the best we can produce. Your Publication Committee is of the opinion that the papers are of very good standard. If we have members who are able to write better papers, we trust they will awaken to the responsibility which they owe their professional brethren, and ask for places on the annual session programs.

We have no criticism to make of the general make-up of CALIFORNIA AND WESTERN MEDICINE. To us it appears

that the publication bears favorable comparison with those of other state medical societies.

In routine matters the editor is kind enough to bear the burden, and it is only occasionally that our committee is called upon to take part in the solution of extraordinary problems.

There has been proposed a plan for supplements. This was suggested by the editor and authorized by the Council, and with it we are in entire sympathy. Experience with such will soon decide whether they shall be permanent features for "Pre-Convention Bulletin," "Scientific Program," "Annual Directory of Members," and like special features.

In closing, we can only say that CALIFORNIA AND WESTERN MEDICINE is, for the most part, what the members of the Association choose to make it. This Committee on Publications makes an earnest appeal to our members to give the official journal the fullest possible support. It is the mouthpiece of organized and scientific medicine in California, and it should be an expression of the best we can produce. Moreover, it is our official journal, and the members of the California Medical Association are its owners. It should at all times be worthy of our great organization. *It can be* if each of us does his part!

Respectfully submitted,

Percy T. Magan, *Chairman.*

COMMITTEE ON PUBLIC POLICY AND LEGISLATION

Executive Group

Junius B. Harris, Chairman, 1938
E. T. Remmen, 1937 T. Henshaw Kelly, 1939
The President, ex officio The President-Elect, ex officio

To the President and the House of Delegates:

The Legislature being in session, your committee is refraining from making a formal report at this time. Your committee will be prepared to submit a complete report upon all legislative matters and events as they exist at the time when the House of Delegates will convene for its first 1937 session.

Respectfully submitted,

Junius B. Harris, *Chairman.*

COMMITTEE ON SCIENTIFIC WORK

Executive Group

Frederick C. Warnshuis, Chairman, ex officio
Lemuel P. Adams, 1937 F. M. Pottenger, 1939
J. Homer Woolsey, 1938 Edwin L. Bruck, ex officio
John M. Schmoele, ex officio

To the President and the House of Delegates:

The Scientific Committee respectfully submits this as its annual report.

The official program, governing the general meetings and section meetings, record the major activity of this committee. In joint cooperation with section officers, your committee studiously endeavored to arrange the scientific program along lines and subjects that would be productive in the enhancement of the medical knowledge of members. Your committee is of the opinion that it has been successful in attaining that purpose. Generous thanks are tendered to section officers for their valuable experience, the commendations expressed, and the interest shown in the past two years in the Clinical-Pathological Conference conducted during the second general session, induces your committee to request that the House of Delegates adopt the following resolution:

Resolved, That the second general session of each annual meeting shall be devoted to a Clinico-Pathological Conference conducted under the auspices of the Scientific Committee.

Scientific Exhibits.—Your committee has devoted much time to the development of and encouragement of a department of scientific exhibits as a part of the scientific program. We are convinced that it possesses increasing educational value and interests. The request is made that the House of Delegates endorse this program feature and authorize this committee to create a policy of awards in the form of certificates and nominal monetary prizes.

Scientific Committee Fund.—Your committee observes that during the past two years the Association's secretary has been able to return a financial profit from the commercial exhibits, after paying all of the expenses of an annual meeting. Your committee is of the opinion that this monetary profit should be used to create a scientific fund, this fund to be used for the development of scientific exhibits and scientific demonstrations at annual meetings.

Your committee recommends that the House of Delegates direct the Council to create such a fund from this source of revenue, disbursement of these funds for the mentioned object to be under control of the Council; and that a budget of expenditures be under control of the Council, and that a budget of expenditures be submitted to the Council for approval before any financial obligations are incurred.

Section Meetings.—Over a year ago your committee directed attention to the increasing attendance at annual meetings. The difficulties in providing adequate meeting places for twelve sections was pointed out. The suggestion was made that there be a rearrangement of sections and the amalgamation of certain sections. The suggestion was referred to the Council and again referred to this committee for further study and report.

Section officers were requested to discuss the subject with section members. At the meeting of section officers in January, plans were discussed. At that conference the following plan and proposal was agreed upon:

That the following full-time sections, holding four full sessions, be continued: General Medicine; Surgery; Obstetrics and Gynecology; Eye, Ear, Nose, and Throat; Pediatrics; Dermatology and Syphilology; and Urology.

That the following sections be transferred to the Department of Scientific Exhibits: Pathology and Bacteriology; Industrial Medicine and Surgery; and Radiology.

That Anesthesiology and Neuropsychiatry be amalgamated with Surgery and Medicine.

That officers of the seven scientific sections be directed to provide for program assignments for the three sections transferred to the Department of Scientific Exhibits.

That the five named sections be authorized to retain their identity, to elect officers, and to hold one session during the annual meeting for the presentation of certain specific subjects and questions that are of special interest to those engaged in these special fields.

Your committee recommends the adoption of this plan for experimental purposes for the 1938 annual meeting.

Respectfully submitted,

F. C. Warnshuis, *Chairman.*

COMMITTEE ON PUBLIC RELATIONS

The Committee on Public Relations consists of the chairmen of the following standing committees and of certain general officers of the Association, all serving ex officio. The chairman of the committee is Charles A. Dukes, the secretary is Frederick C. Warnshuis. The director of the Department of Public Relations is Frederick C. Warnshuis. The chairman of the Committee on Public Relations is ex officio a member of the Council.

Fred B. Clarke, Chairman, Committee on Health and Public Instruction.

Daniel Crosby, Chairman, Committee on Hospitals, Dispensaries, and Clinics.

Morton R. Gibbons, Chairman, Committee on Industrial Practice.

E. Vincent Askey, Chairman, Committee on Membership and Organization.

John H. Graves, Chairman, Committee on Medical Economics.

Junius B. Harris, Chairman, Committee on Public Policy and Legislation.

Charles A. Dukes, Chairman, Cancer Commission.

Clarence G. Toland, Chairman, Committee on Postgraduate Activities.

Edward M. Pallette, President of California Medical Association.

Howard Morrow, President-Elect.
Frederick C. Warnshuis, Secretary-Treasurer.

To the President and the House of Delegates:

Your Committee on Public Relations respectfully transmits this annual report for the past Association year.

I. EXPLANATORY

During the year, in each issue of CALIFORNIA AND WESTERN MEDICINE, in the pages assigned to the Depart-

ment on Public Relations, your committee has diligently sought to keep the Association members informed in regard to this committee's plans and activities. In this report your committee will, therefore, confine itself to general summarizations.

II. PUBLIC HEALTH INSTITUTES AND HALL OF MEDICAL SCIENCE

Public Health Institutes were conducted in Santa Barbara, San Francisco, and Monterey.

Through the untiring efforts of Dr. Lyell C. Kinney, Dr. William H. Geistweit, Jr., and the Special Committee of the San Diego County Medical Society, and with the assistance of Dr. Clarence G. Toland and his State Committee, the Hall of Medical Science in the California Pacific International Exposition in San Diego was sponsored and operated by our Association. The Exposition closed in September, 1936. The exhibits were dismantled and returned.

(See Appendix to this report.)

Your committee is unable to evaluate the end-results of this outstanding activity. It may be concluded that the public gained much dependable health information for its future welfare. The profession gained in good will and the establishment of better public relations.

III. PUBLIC RELATIONS

Our relations with the public and lay organizations were strengthened, and were productive of desirable results by means of the following contacts, conferences, presentations and joint action with: Health Committee, Parent-Teachers' Association; State Highway Traffic Department; State Nurses' Association; State Chamber of Commerce; Federal and State Forestry Departments; Y. W. C. A.; State Hospital Association; Hospital Insurance Associations; and State Tuberculosis Association.

Through these and similar contacts, your committee feels assured that it is creating relationships that beget sound understandings conducive to the establishment of sound public opinions in regard to scientific medicine and private health welfare.

Your committee cites the encouraging fact that never before have so many lay inquiries for information and guidance been received at the Association's central office.

IV. RECOMMENDATIONS

1. Your committee recommends that the House of Delegates approve the state-wide establishment of the Public Health Hour in physicians' offices. Your committee requests that approval be given to this movement that will return clinic patients to the private offices of physicians, and that this committee be instructed to accomplish this as speedily as possible. The plan has been outlined on several occasions. Your committee feels that county societies should be directed to assume a prominent rôle in this very desirable health-conservation activity.

2. Because of the expense involved, the tremendous amount of local work to secure publicity and public interest, your committee recommends that Public Health Institutes be discontinued.

Your committee requests approval for its plan to acquire a library of educational films for public meetings to continue its program for public health education under county society sponsorship, and in coöperation with the Woman's Auxiliary.

Your committee recommends that it be empowered to aid in the formation of, and exercise guiding direction of Associated Medical Services under Senate Bill 605, or similar bill, if that legislation is enacted.

Respectfully submitted,

Charles A. Dukes, *Chairman.*

SUPPLEMENTARY REPORT: ON THE MEDICAL EXHIBITS AT THE 1936 CALIFORNIA INTERNATIONAL EXPOSITION IN SAN DIEGO

The Council of the California Medical Association and the Council of the San Diego County Medical Association:

You have had presented to you the official report of the committee appointed by the San Diego County Medical

Society to have charge of the Hall of Medical Sciences at the California Pacific International Exposition. That report has covered the matter in detail.

I feel that it is only proper that the director make a supplemental report to you. Your committee served faithfully and well: each member carried out, to the fullest, the duties assigned to him. The record presented to you deserves your highest commendation. I desire to make special mention of Dr. M. C. Harding and Dr. L. C. Kinney, the latter being too modest to mention himself in the committee report. Doctor Harding's advice and moral backing, whenever it was necessary for Doctor Kinney to be away, was of invaluable service to your director. Without him we should have been in rather serious difficulty that would have jeopardized the exhibit. Doctor Kinney carried the heavy financial load until the Exposition Management reimbursed him through you. Without his help in that regard, the Hall of Medical Sciences would never have been presented as it was to the public. His advice and assistance, even in the actual installation of exhibits, made the exhibit what it was. I feel that it is only just that the medical profession know what these two men did. It is not flattery, but a simple statement of fact.

In some ways the work was onerous; yet all of us, now that it is over and past, take some pleasure and satisfaction in the efforts put forward to advance the medical profession in the eyes of the public.

Sincerely,

(Signed) W. H. Geistweit, Jr.,
Director, Medical Science Exhibit.

SUPPLEMENTARY REPORT: ON MEDICAL EXHIBITS AT THE 1936 CALIFORNIA PACIFIC INTERNATIONAL EXPOSITION AT SAN DIEGO

To the Council of the California Medical Association and to the Council of the San Diego County Medical Society:

On December 20, 1935, the Council of the San Diego County Medical Society appointed the undersigned committee to assemble and take charge of an exhibit on medical sciences at the 1936 California Pacific International Exposition. This committee was later appointed by Mr. Phillip Gildred, managing director, to be the official committee of the Exposition in charge of the Hall of Medical Sciences. The Committee appointed Dr. William H. Geistweit, Jr., to be Director of Medical Exhibits, and this appointment was, in turn, officially confirmed by Mr. Gildred.

Doctor Geistweit, coöperating with the sales department of the Exposition, put on a strenuous campaign to sell space to commercial exhibitors in order to finance the medical exhibit. This campaign was well planned and carefully and forcefully carried out, but was a complete failure. The collapse of this sales campaign was not known until the building was well under way and the exhibits partially assembled. The agreement with the Exposition was contingent on selling commercial space and neither the Exposition nor the Committee could foresee the failure of the commercial program.

Realizing that a project, sponsored by the American Medical Association, California Medical Association, and the San Diego County Society, could not be allowed to fail for any reason whatever, and that they had no legitimate right to call upon the Exposition to further finance an apparent failure, the Exposition Committee advanced the necessary funds to complete the Hall of Medical Sciences. Naturally, the Committee hoped to be reimbursed if the project was carried to a successful conclusion and proved to be an asset to the Exposition Company. This hope was realized and the Exposition Management has reimbursed the local committee through the sponsoring societies for all expenses incurred in assembling the exhibit, maintaining the building, dismantling, and return of the exhibits to their source.

This program, however, has involved the expenditure of money by the Committee and, therefore, a detailed report of that expenditure to the sponsoring societies is necessary, both to protect the societies and the Committee. Most of these accounts have been audited by the Expo-

sition Management, but they are presented in detail to you for final audit and approval. For convenience, this expenditure will be presented under six headings.

1. On December 22, 1936, the Exposition Management sent to Doctor Kinney a check to cover his promotion trip to Chicago, Detroit, Milwaukee, and Rochester for \$357.30. This check was endorsed to Doctor Geistweit, Director of Medical Exhibits, and used by him for promotion expense in his office. Doctor Geistweit's statement of this expenditure is presented herewith (No. 1). The balance in this account of \$42.31 is closed by a check for that amount, payable to Miss Verne Anderson, Secretary to the Director of Medical Exhibits.

2. During the assembly and installation of exhibits, the Committee spent \$2,907.33. The details of this expenditure and the receipted bills are presented herewith (No. 2). On April 27, after the Hall of Medical Sciences was completed and proved to be an accepted and valuable attraction, a statement of this expense was sent to Mr. Hal Hotchkiss, Vice-President of the Exposition Company. This expense account was audited by the Exposition, approved by the Board of Directors and reimbursement ordered. Payment was made in two checks of \$1,453.66 each on June 20 and August 28, payable to the California Medical Association and the San Diego County Medical Society. These checks were deposited by the California Medical Association and reimbursement checks issued to Doctor Kinney to cover the amount expended by the Committee.

3. During the interval between April 24 and the close of the Exposition, several late exhibits were received and installed, largely at the expense of the Committee. Also during this interval there was a considerable upkeep expense in the replacement of light and projection bulbs and repair of projection apparatus. These items amounted to \$251.42, the detail of which, including the receipted bills, is attached (No. 3). On September 3, a statement of this expense was sent to Mr. Frank Belcher, President of the Exposition, together with a late bill from the Stanford University for \$203.44 and a renewed request for the honorarium for Doctor Geistweit that had been promised by the Management on his appointment. These bills were also audited by the Exposition Company and paid October 8 by a check to the San Diego County Medical Society and the California Medical Association, amounting to \$854.86. The check was deposited by the California Medical Association and distributed as follows: Stanford University, \$203.44; Doctor Geistweit, \$400; and reimbursement to Doctor Kinney, \$251.42.

4. On the closing of the Exposition, the Committee assumed the expense of dismantling exhibits not otherwise provided for and the return of these exhibits to their source. Two other items of expense arose at this time, the bill for the incoming transportation of the exhibit of the Chicago Roentgen Society and the replacement of two losses by theft—a hat from the Western Costume Company, and a microscope belonging to Dr. John Flude. The Committee paid these bills, settling all claims and accounts, amounting to \$687.36. A statement of this expense (No. 4) was forwarded to the Board of Directors of the Exposition and paid by them without audit on November 20. This check was also paid to the San Diego County Medical Society and the California Medical Association and deposited by the California Medical Association.

5. A motion-picture film on laboratory procedure was prepared by Dr. A. G. Foord of Pasadena for the Hall of Medical Sciences, and this was authorized by the chairman of the Exposition Committee of the California Medical Association and by the chairman of the local committee. This film was to have been used as a part of the educational program in the auditorium, which program proved to be unsuccessful and had to be abandoned. The film was not ready until after the closing of the auditorium and was not used. However, Doctor Foord had offered to present this film to the California Medical Association for use in their Public Health Institute and the film was prepared for this ultimate use. This expense, while not chargeable to the Exposition Company, is a liability of the Committee. This one item of expense incurred in the Hall of Medical Sciences is presented to the Council of the California Medical Association for

their consideration. If the Council can use Doctor Foord's film as ultimately planned in their program of public health education, and if the Council sees fit to reimburse him for the \$250 spent in the preparation of the film, this action will close all liability of the Committee of the California Medical Association and the local Exposition Committee.

6. During the Century of Progress, the Council of the California Medical Association passed a resolution, requesting the American Medical Association to prepare a folio of photographs of the medical exhibits. Stimulated by this action of the Council in 1933, the local committee had photographs made of all exhibits and thus prepared a permanent record of the Hall of Medical Sciences. Copies of these books were sent to the American Medical Association, the California Medical Association, and the San Diego County Medical Society. Books were also given to the Director of Medical Exhibits, the Chairman of the California Medical Association Committee, and to the assistant director, Dr. M. C. Harding. The total expense of preparing these six books was \$243.67 (No. 5). The Committee respectfully suggests that the Council of the California Medical Association pay one-third of this expense, namely, for the records filed in the California Medical Association office, and the American Medical Association headquarters. The remaining two-thirds of this account is a charge against the local committee and will be absorbed by them.

Thus, the Committee for the San Diego County Medical Society and the Exposition have expended during the Exposition, \$5,300.53. In spite of the complete failure of the Committee to obtain commercial exhibits, the Exposition Management has paid all bills presented to them and have reimbursed the California Medical Association and the San Diego County Medical Society by checks amounting to \$4,806.86.

When the proposal of a medical exhibit was first made to the Committee of Public Relations of the California Medical Association, Doctor Kinney, for the Exposition Company, agreed to hold the California Medical Association free from all liability for the Hall of Medical Sciences. This obligation has been fulfilled; all bills have been paid and all liabilities covered, and reimbursement has been made by the Exposition Company. Only two items of expense are herewith presented to the Council, namely, Doctor Foord's educational film and the permanent records for the California Medical Association and the American Medical Association. While these seem to be a legitimate expenditure of California Medical Association funds, and apart from the expense of the Hall of Medical Sciences, the Committee assumed these two items without previously granted authority from the Council and will gladly pay them if the Council of the California Medical Association so directs.

The Committee, in compliance with its agreement with the California Medical Association and the American Medical Association, has submitted all its actions, every item of policy, all proposed exhibits, and all questions of conduct to Dr. C. G. Toland, Chairman of the Committee of the California Medical Association, and has received from him his approval. No action has been taken without such approval. Further, the Committee calls attention to the fact that no local exhibits were invited or accepted in the Hall of Medical Sciences, except that of the San Diego County Board of Health. Many local physicians assisted in loaning necessary items for the completion of general exhibits, but no recognition was given or permitted for this courtesy and assistance. Grateful recognition should be made at this time to Doctors C. W. Brown, Ray Lounsbury, Clyde Osborne, H. A. Thompson, M. C. Harding, Howard Ball, and C. E. Rees. The Committee cannot close this final report without acknowledgment of the splendid support it has received throughout the year.

1. The officials of the Exposition Company have kept their agreements to the letter. They have deferred in all matters of policy to Doctor Toland, Chairman of the California Medical Association Committee, and have accepted without question the decisions of Doctor Geistweit, the director, in all matters of detail in the installing and conducting of the exhibits of the Hall of Medical Sciences.

Finally, they have paid, without discussion, all bills presented to them by the Committee.

2. The Committee appreciates the constant and sympathetic support of Dr. C. G. Toland and the Committee of the California Medical Association. They have never called upon the California Medical Association Committee without receiving their wholehearted support. Their liaison with the California Medical Association, their procuring numerous and valuable exhibits and their advice and coöperation, were indispensable to the success of the project.

3. The Committee cannot too warmly commend the coöperation of the many organizations that contributed exhibits to the Hall of Medical Sciences. While lack of time made it impossible to meet the hope and expectations of the Committee in placing exhibits, the uniformly courteous, generous, and harmonious participation should be as gratefully appreciated by the state and county societies, as it was by the Committee in charge.

4. The Committee extends its sincere thanks to the Director of Medical Exhibits, Dr. William H. Geistweit, Jr., for his untiring effort and his splendid executive ability in representing the medical profession of California in this project. We feel that the Committee and the profession are deeply indebted to him for the successful completion and conduct of the Hall of Medical Sciences.

5. One of the finest achievements of the Exposition was that of the Woman's Auxiliary to the San Diego County Medical Society and of the Chairman of the Committee, Mrs. C. E. Howard. Every day throughout the nine months, members of the Auxiliary were on duty in the hostess booth of the Hall of Medical Sciences. This constant and complete coverage by the loyal women of the Auxiliary was a welcome surprise to all concerned, and was a splendid example of the power and efficiency of that organization.

6. The thanks of the Committee are extended to the Council of the San Diego County Medical Society for their approval and support throughout the year. The Committee finally extends its thanks and appreciation to the Council and officers of the California Medical Association for their confidence, support, and coöperation. Without the initial approval of Dr. C. A. Dukes and Dr. F. C. Warnshuis and their prompt action, the exhibit would never have been attempted. Without the effort of Doctor Warnshuis, the essential coöperation and the exhibit of the American Medical Association could not have been obtained. Without the action of Doctor Dukes, the fine exhibit from the Mayo Foundation was impossible. Also, the Committee fully realizes the great value and the popular attraction of the exhibit of the Public Health Institute and appreciates the action of the Council in loaning this exhibit for the duration of the Exposition.

The Committee of the San Diego County Medical Society submits this final report with the request that it be audited by the Council of the Society and the Council of the California Medical Association. If found in order and approved by your honorable bodies, and if the consent of the Council of the California Medical Association is granted, the Committee requests that it be relieved from further responsibility and discharged.

Respectfully submitted,

(Signed) James F. Churchill

V

REPORTS OF SPECIAL AND COUNCIL COMMITTEES

COMMITTEE ON ARRANGEMENTS

Executive Group

Paul M. Hunter	J. A. Merrill, Chairman	Mast Wolfsohn
E. F. Kehr		H. Spencer Hoyt

To the President and the House of Delegates:

Your committee has had several conferences with the State Secretary. Your committee's efforts are represented in the official program of this annual session.

On behalf of all the members of the Monterey County Medical Society, we extend a cordial and hearty greeting and fraternal welcome to every member attending this annual Session. During your session it will be our sustained endeavor to accord to every member the fullest hospitality.

Respectfully submitted,
J. A. Merrill, *Chairman*.

AUDITING COMMITTEE

(A Council Committee)

Executive Group

Karl L. Schaupp, Chairman	T. Henshaw Kelly
O. D. Hamlin	

To the President and the House of Delegates:

In compliance with the provisions of the by-laws, we will submit a draft of the 1937-1938 budget at the opening session of the House of Delegates.

Respectfully submitted,
Karl L. Schaupp, *Chairman*.

CANCER COMMISSION

Executive Group

Charles A. Dukes, Chairman	
Lyell C. Kinney, Vice-Chairman	
Alson R. Kilgore, Secretary	
Orville Meland, Secretary for Southern Section	
A. Herman Zeiler	Harold Brunn
Gertrude Moore	Henry J. Ullmann
Clarence G. Toland	

To the President and the House of Delegates:

Activities of the Cancer Commission have been devoted during the current year to public education.

The American Society for the Control of Cancer was invited to extend its national campaign to California. The Commission is working with the Society's representatives in the development of the 1937 Woman's Field Army drive.

Respectfully submitted,
Alson R. Kilgore, *Secretary*.

SUPPLEMENTAL REPORT OF THE CANCER COMMISSION

To the President and the House of Delegates:

At the Coronado session, a resolution was introduced instructing the Council of the California Medical Association to undertake the study of the relationship of trauma to malignancy. This matter was referred by the

Council to the Cancer Commission under date of September 29, 1936.

Your committee respectfully desires to report that this is a matter that will require much longer study than the time available before the 1937 meeting. Your committee, therefore, is not able to report on this question and resolution at this time and substitutes this report of progress.

Respectfully submitted,

Alson R. Kilgore, *Secretary*.

SPECIAL COMMITTEE ON A QUALIFYING CERTIFICATE (BASIC SCIENCE) LAW

Executive Group

George H. Kress, General Chairman

Morton R. Gibbons, Chairman (for Bay Region)

Edward M. Palette, Chairman (for Southern California)

Junius B. Harris, Chairman (for Remainder of State)

To the President and the House of Delegates:

The need of a qualifying certificate or basic science law is attested by the efforts of the naturopathic group to secure legal recognition from the Legislature now in session through the establishment of another cultist board of examiners in the State. If a previous experience with a cultist group is a precedent, such a board could and might probably license some hundred or perhaps one or more thousand healing-art practitioners who, professing allegiance to its tenets at the present time, would claim the right to have licenses without examination! The educational influence upon the mind of the layman through such lowering of standards is demoralizing and leaves its depreciating effects even upon scientific medicine. At the time of this writing it is not possible to state with any accuracy what will be the course of this supposed naturopathic board licensing law.

In previous reports your special committee has listed the reasons why a qualifying certificate (basic science) law must be an initiative law.

The cost of securing the 186,387 needed signatures (the number based on the 1936 Presidential-State elections) will be very considerable, but that cost, high though it may seem, is only a faint fraction of the indirect cost which every physician in the State would have if an additional 1 to 5,000 cultists secure legal recognition to practice in California on what, in the minds of many voters, would be equal rights with nonsectarian physicians and surgeons. The House of Delegates at Del Monte must keep this prospective expense in mind, because if initiative petitions for a qualifying certificate (basic science) law are to be circulated for the State election in October, 1938, the proposed law in its final draft and the petitions must be started on their course in the first months of 1938, in all probability before the 1938 annual session. The matter is of extreme importance, and decision should be made at Del Monte. For those who wish to acquaint themselves with the subject, a list of references is appended in a footnote.*

Respectfully submitted,

George H. Kress, *General Chairman*.

* A list of reports on qualifying certificate laws, printed in CALIFORNIA AND WESTERN MEDICINE, includes:

Vol. 32, No. 4, April, 1930, page 288. One hundred and eighty-sixth meeting of the Council of the California Medical Association. Item 30, Medical Practice Act and Basic Science Act.

REPORT OF THE COMMITTEE OF FIVE

Executive Group

William R. Molony, Sr., Chairman

Harry Wilson

Alson R. Kilgore

Robert Peers

Rodney Yoell

To the President and the House of Delegates:

Your Committee of Five, which was charged by the House of Delegates with the responsibility of supervising a medical economic survey for the State of California, reports that this survey was made possible through the joint action and coöperation of the federal authorities, acting through the Works Progress Administration and the California State Board of Health on the one hand, and the California Medical Association on the other. The expenses of the offices, stationery, and supervising director and assistant personnel were borne by the California Medical Association, something like \$35,000 having been disbursed through requisition upon the State Association. The expense of field workers was covered by moneys received from the federal authorities, as above noted. The Committee of Five employed Prof. Paul A. Dodd of the University of California at Los Angeles to act as director of the survey, he working under the Committee of Five.

A large mass of material has been collected, but we understand this is construed to be the property of the federal authorities, who, until other arrangements are made, will place the same under the custodianship of the California State Board of Health.

Professor Dodd, in February of this year, submitted to the Federal Authorities and the State Board of Health his complete report which is now being studied by representatives of the various interests concerned.

Your Committee of Five will make an additional report to the Council of the California Medical Association, which body, in turn, may wish to make certain recommendations to the House of Delegates.

In closing, it is only proper to state that many difficulties have been encountered in this work, but it now looks as if the survey can be brought to a proper conclusion through the kind coöperation of the Federal Authorities and the State Board of Health.

Respectfully submitted,

The Committee of Five

By Harry H. Wilson

Alson Kilgore

Robert Peers

Rodney Yoell

William R. Molony, Sr., *Chairman*.

APPENDIX

HISTORICAL NOTES — PAST PRESIDENTS

CALIFORNIA MEDICAL ASSOCIATION:
HISTORICAL NOTES.

The California Medical Association came into existence in the year 1856 with B. F. Keene, M. D., of El Dorado as its first president, he being succeeded in office by H. Gibbons, M. D., of San Francisco.

The organization in its earlier days was known as the Medical Society of the State of California, the present name being adopted in the year 1924 in order to conform to the nomenclature in use by the constituent state medical units of the American Medical Association.

During the sixties the state medical society was somewhat quiescent; but in 1870 it was reorganized, when the first president under the reorganization was T. M. Logan, M. D., of Sacramento.

In 1873 appeared the first copy of the annual "Transactions of the Medical Society of California," a volume published each year, until Volume 31 was issued in April of 1901. In that year it was recommended that, since the annual transactions were "an extravagant and unnecessary way of perpetuating the proceedings of the society, the more rational one of publishing a monthly journal" be adopted. Thus, "The California State Journal of Medicine" came into existence, its name being changed to "California and Western Medicine" in the year 1924. The late Philip Mills Jones, M. D., may be looked upon as the founder of the official journal.

The first volume of Annual Transactions, printed in 1873, is interesting to glance through, with a roster of some 195 "permanent members" of the state society; for under that name the regular members were so designated at that time.

In the earlier days, owing to the difficulties of travel, the state medical society was practically an almost exclusively northern organization, its counterpart in Southern California being the Southern California Medical Society, which was founded in the year 1888.

It gives one, therefore, a distinct shock to note that, of the 195 members in the year 1873, all but seven were from north of the Tehachapi, the seven southern members being credited as follows: Santa Barbara, four; San Diego, two; and Los Angeles, one! The Los Angeles representative at that time was J. P. Widney, M. D., who was the founder of the Los Angeles County Medical Association. Doctor Widney was also the founder and the first dean of the College of Medicine of the University of Southern California, and later, for a time, the president of that university.

With the reorganization of the state society, which followed on that of the American Medical Association in 1901, the picture changed.

For in that year began the national association system made up of state society units, and these in turn composed of component county societies, only one such county unit being permitted for each county.

From that time, too, to the present day the state organization has increased in numbers of members, scope and influence, until now it is among the largest of the state units which make up the American Medical Association.

With a record of service well rendered over a period of many decades, the California Medical Association looks forward in firm faith to promising days still to come, which shall be full of even greater achievement.

IF YOU GAVE

Each Patient

HALF A DAY

You Might Just Cover What This Booklet Covers For You

WHEN a patient is sensitive to such common foods as wheat, milk or eggs, the task of explaining the necessary diet is a tedious one. And all the "musts" and "don'ts" at once are apt to be confusing.

Why not take a simpler way that's really better for your patient and for you? Just hand him a copy of this booklet—marking the section which applies to his particular sensitivity. There, plainly stated for easy and repeated reference, are exactly the foods he may or may not have—and even suggestions for safe and tempting recipes to enhance restricted menus.

You can distribute this booklet with perfect confidence. It is approved and used by many leading allergists, in private practice and allergy clinics. With the direction and assistance of recog-

nized authorities, it was prepared in our laboratories, where years have been devoted to research and the study of allergy problems. These booklets are for professional use only. None are distributed to the laity.

Notice, when you examine this booklet, how frequently Ry-Krisp appears in the lists of accepted foods. That's because these tempting and delicious wafers are simply made of flaked whole rye, salt and water, double baked. They're perfectly safe—and inviting that they actually encourage closer adherence to the diet. For free samples and copies of the Allergy Diet booklet, use the coupon.

RY-KRISP *Whole Rye Wafers*

RALSTON PURINA COMPANY, Dept. CW, 1962 Checkerboard Sq., St. Louis, Mo.

Without obligation, please send me samples of Ry-Krisp and Allergy Diet Booklet

COÖPERATE WITH YOUR ADVERTISERS

CALIFORNIA AND WESTERN MEDICINE, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention CALIFORNIA AND WESTERN MEDICINE.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this JOURNAL to members and readers.

A SERVICE AGENCY—FOR READERS

THE JOURNAL of the California State Medical Association and the Cooperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely free to every member of the California Medical Association. The Cooperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in CALIFORNIA AND WESTERN MEDICINE, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Cooperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. CALIFORNIA AND WESTERN MEDICINE and the A. M. A. Service Bureau desire to serve you.

Special Offer

a complimentary pollen test, set for your district, also our booklet on "Hay, fever, Its Diagnosis and Treatment." Write Hollister-Stier Laboratories, 2030 Wilshire Boulevard, Los Angeles; C. Rodolph Guth, Flood Building, San Francisco, Calif.

COUNCIL ACCEPTED

VIOFORM, "CIBA"

An effective antiseptic agent
and amebicide

Because of its antiseptic action and its ability to dry up wound secretions, Vioform (iodochloroxyquinoline) has long been used as a non-irritating dusting powder.

Recent investigations have demonstrated the effectiveness of treatment internally with Vioform in cases of amebiasis, either in carriers or where dysentery is present.

Not Advertised to Laity

"Benzedrine Sulfate" in Chronic Exhaustion.—Nathanson (J. A. M. A., 108:531, Feb. 13, 1937) studied "Benzedrine" (beta-aminopropylbenzene—benzyl methyl carbinamine) in forty patients complaining of chronic exhaustion. It was administered also to fifty-five normals, who answered a detailed questionnaire as to the effects of the drug.

Small doses (20 milligrams given in divided doses during the morning) gave satisfactory results in a high percentage of cases. Some unpleasant side reactions were reported, such as dryness of the mouth, loss of appetite with consequent loss of weight, sweating, and disturbed sleep, but these were relatively infrequent.

Favorable results included a sense of well-being, increased mental efficiency and energy, coupled with a greater capacity for work.

Of the twenty-five subjects who were given lactose tablets as controls, 84 per cent reported no reaction of any kind.

Allen, Wilbur, and McLean (Proc. Cent. Soc. Clin. Res., Nov. 6, 1936) also report 80 per cent improvement of symptoms in ninety-five cases suffering from melancholia, chronic fatigue or exhaustion.

Dry Serum Tests at University of California Hospital Are Encouraging.—Experiments made by the University of California Medical School with dry serums, including human serum, have proved so encouraging that every effort will be made to increase their scope and effectiveness, it is announced by the Pediatrics Department of the School. It has been found that the dry serums are less likely to undergo change or deterioration than the wet serums, and this long-sustained potency is having a very definite effect in the treatment of such diseases as scarlet fever and measles in the University Hospital.

So successful has been the work with these dry or desiccated serums, that the Medical School has purchased a specially constructed contrivance, known as the Lyophile, to prepare the serums experimentally. The wet serums are first frozen and then reduced to the dry stage in vacuum

by the Lyophile. However, due to a number of governing conditions, the pediatrics department has been unable to use the Lyophile output on human patients, finding it necessary to obtain the desiccated substances elsewhere for this purpose. It is hoped that some means will be found to obtain a larger apparatus and to so adjust present restrictions, that the department will be enabled to desiccate all of the serums used in its clinic and hospital treatments.

Various processes for the preservation of serums through drying have been tried for more than twenty-five years, but only in recent years has a reasonably successful process been evolved, and the Lyophile has played a large part in this development. Clear sera when treated in this manner yields a product which shows no material reduction in volume, is porous in texture, breaks up readily into a fine powder, is readily soluble in water and yields, when restored to the fluid state, a clear solution—all features of great importance in disease and convalescent treatment.

POSITION WANTED BY X-RAY AND LABORATORY Technician with B. S. Degree, age 38. Training obtained in Minneapolis General Hospital, 13 years experience including electrocardiographs, Basal Metabolisms and Physiotherapy. Last 9 years head technician class A hospital in Middle West. Knowledge of typing. Address, Box 500, California and Western Medicine, 450 Sutter St., San Francisco, Calif.

FOR SALE—COUNTRY MEDICAL AND SURGICAL PRACTICE. Completely furnished offices and living quarters (combined), including new x-ray and diathermy equipment. Low overhead. Very little competition. Draw from twenty-five hundred population. Hospital ten miles away. Leaving to specialize. Priced to sell. Write, Karl F. Pelka, M. D., Morgan Hill, Calif.

Preliminary Pain in Coronary Thrombosis.—Feil believes that in about 50 per cent of patients the attack of coronary thrombosis is preceded by angina, unrelated to effort or emotion. He has seen fifteen cases with sub-sternal pain preceding the onset of the severe symptoms by hours or days. Substernal or epigastric (rarely precordial) pain is complained of—mild, not related to effort or emotional strain, not severe enough to confine the patient to bed and often not severe enough to lead the patient to consult a physician. This pain is more or less constant, is of a burning and oppressive character and is not relieved by rest or by nitrites. The pain lasts from a few hours to four weeks. If the physician is consulted, he finds no change in the objective symptoms—the blood pressure is unaltered and there is no fever or leukocytosis. The heart sounds are unchanged. After a variable period of preliminary pain, the clinical picture of acute coronary thrombosis suddenly makes its appearance and with it the typical electrocardiographic changes. This preliminary pain occurred in approximately 50 per cent of the cases of coronary thrombosis observed in the last two years. The nature of the preliminary pains was suspected in three of the fifteen cases.—*American Journal of Medical Sciences.*

Years of Experience

Illustrated here is a factory operation demanding rare skill and experience—checking the “proof,” judging by eye alone a sample of glass melt for completion. Many a craftsman spends his entire business life accumulating such skill—which very often is transmitted from father to son and then to grandson—in order to maintain the standard of excellence we require for the manufacture of ophthalmic glass.

This standard of excellence prevails throughout our entire prescription service. Every operation in the production of the $\mathbb{R}$ is executed by skilled craftsmen, trained to know that nothing short of absolute fidelity to your $\mathbb{R}$ will meet with either our requirements or your own.

BOOK REVIEWS

Surgical Pathology of the Thyroid Gland. By Arthur E. Hertzler, M. D., University of Kansas. Pp. 298. Philadelphia: J. B. Lippincott Company.

One of a series of monographs by this author. A well-written and illustrated presentation of present knowledge. It is a clinical text that will be of dependable assistance to clinician and surgeon. There is naught to criticize and much to commend because it is up to date.

The Thyroid and Its Diseases. By J. H. Means, M. D., Professor of Clinical Medicine, Harvard University. Pp. 590. Philadelphia: J. B. Lippincott.

This text is an account and record of the experience had in the thyroid clinic of the Massachusetts General Hospital by physicians and surgeons of that clinic staff.

As such it is a useful contribution to the literature. Many special features characterize the text in addition to extended references to all the literature. Clear in description, extended where detail is indicated with sound deductions and conclusions. Doctor Means has compiled a helpful text. Physicians and surgeons will find it to be a frequently used reference.

Medical Greek and Latin at a Glance. By W. R. Agard and C. H. Bunting, M. D. Second edition. Pp. 88. Price, \$1.50. New York: Paul B. Hoeber.

An excellent handbook and guide to commonly used words.

Senile Cataract. By W. A. Fisher, M. D., F. A. C. S., Chicago. Third edition. Pp. 150. Price, \$2.

An honest endeavor to describe this condition and to present operative procedures. Interesting to all eye men.

Ophthalmoscopy, Retinoscopy, and Refraction. By W. A. Fisher, M. D., Chicago. Fourth edition. Pp. 210. Price, \$2.

A practical guide and outline for students and practitioners.

Sexual Power. By C. T. Stone, M. D. Pp. 171. New York: D. Appleton Company.

A casual discussion and little that is new.

Handbook of Orthopedic Surgery. By Alfred R. Shands, M. D., Duke University, in collaboration with R. R. Raney, M. D. Pp. 593. Price, \$5. St. Louis: C. V. Mosby Company.

Fundamentals and principles in orthopedics is the theme of this compilation. It is an index to subjects which will require recourse to more extended texts and references.

Clinical Laboratory Diagnosis. By S. A. Levinson, M. D., and R. P. MacFate, Ch. E. Pp. 877. Price, \$9.50. Philadelphia: Lea & Febiger.

All that one can say of this text is that it consists of a complete description of laboratory procedures for diagnostic purposes. It is a dependable laboratory guide and reference.

TWENTY-FIVE YEARS AGO

You'll Feel Justifiably Proud In Owning This X-Ray Unit

—not only because it equips you for a more complete diagnostic service which patients appreciate, but also because the quality of films it enables you to produce will reflect credit to yourself.

Everywhere, the G-E Model R-36 Shockproof Unit is acclaimed the most practical and efficient moderately-priced apparatus ever designed for general radiographic and fluoroscopic diagnosis. Here you find ample power for radiography of all parts of the body, including fractional-second chest exposures at a 6-foot distance. Fluoroscopic examinations, too, over the entire table-top, in all angular positions, with new conveniences providing distinct advantages.

Compact and self contained, the R-36 requires very little floor space. With both tubes oil-immersed, it is 100% electrically safe, with operation independent of climatic conditions. A double-focus Coolidge tube provides for both light and heavy types of radiography.

Correct design, unusual conveniences, simplicity of operation and consistent performance—these are reasons why you can rely on the Model R-36 for a strictly high quality of results.

Mail this coupon today for full particulars—without obligation.

TWENTY-FIVE YEARS AGO

(Continued from Page 15)

clinical results obtained in some infections by the use of appropriate sera and vaccines, the treatment of inflammatory lesions of the lungs is still largely symptomatic and supporting, no specific therapy being as yet available in combating this group of diseases. . . .

From an Article on "Salvarsan in Cutaneous Syphilis" by Howard Morrow, M.D., San Francisco.—Since December, a year ago, nearly all our salvarsan injections have been given intravenously. A few intramuscular injections of salvarsan in iodipin were given, but this method was found as painful and unsatisfactory as the original suspension for subcutaneous use. The greatest number of injections, given to one person, was in the case of malignant syphilis, reported before this Society last December. This man had two subcutaneous and two intravenous injections. His last injection was given in May, 1911. Since then he has had no symptoms of lues and his Wassermann reaction has remained negative.

The following cases will be reported briefly to demonstrate the various forms of syphilis suitable for treatment with salvarsan. . . .

From an Article on "The Intravenous Application of Salvarsan, with Special Reference to Its Technique" by George W. Hartman, M.D.: From the Genito-Urinary Service of the German Hospital, San Francisco.—Since salvarsan became available we have treated one hundred and one patients with one hundred and eighty injections, mostly in the genito-urinary department of the German Hospital. The largest number of injections given any one patient was seven, the largest amount, three grams. . . .

From an Article on "Alcoholic Injection of Superior Laryngeal Nerve" by H. S. Moore, M.D., San Francisco. This paper is merely a sketch to try to bring out some ideas that have come to me since I have seen the work of Doctor Hoffman of Munich. During the year I spent in his Nose and Throat Clinic I assisted him with his first experiments of alcoholic injections of the superior laryngeal nerve. . . .

San Francisco Polyclinic Society, February 7, 1912.—Dr. Vard H. Hulén described the technique and demon-

We Repeat

NOT ALL NITROUS OXIDE IS OF THE SAME PURITY

March 16, 1933, the **first** cylinder of Stuart Hi-Pure was delivered to a San Francisco hospital. So far as we know, it was then the only nitrous oxide of 99%+ purity made in the United States*.

From this modest beginning the use of Stuart Hi-Pure has increased steadily. Now it is used by many leading hospitals in California, Washington, Oregon, and Arizona. These hospitals believe that a nitrous oxide of maximum practical purity (99% plus) is a valuable aid to more even anesthesia. For complete clinical data, address us at 211 Bay Street, San Francisco.

**So far as we know, it is NOW the only nitrous oxide of 99%+ purity manufactured in the United States.*

PORTLAND

TACOMA

strated the apparatus for doing his operation for extracting a cataract in its capsule, this method having appeared in the July 15, 1911, issue of the *Journal of the American Medical Association*.

Doctor Hulén does not at present select his operation for private patients, owing to the novelty of the principle of using vacuum fixation of the lens, etc., and the as yet unsettled position of the method in ophthalmic surgery. It is hoped that further experience will prove this method suitable for all senile cataracts of any degree of maturity, and superior to any intracapsular operation yet advanced.

It cannot be hoped that the Smith method will be generally adopted in this country or Europe when Major Smith himself says that to do his operation properly the surgeon must first have been trained under his (Smith's) personal direction through hundreds of extractions, and also that an experienced assistant therein is almost as necessary as a carefully trained operator. . . .

TWENTY-FIVE YEARS AGO

(Continued from Preceding Page)

Good Suggestions for County Medical Societies—Issued by the New York State Society.—1. Improved programs. Interest in the meeting depends largely on the attractiveness of the program.

2. Take up postgraduate course as recommended by American Medical Association. This systematizes the programs.

3. Confer with State Board of Health for at least one meeting a year on public health matters. Coöperation with the Health Department is essential to the welfare of the community.

4. Have at least one reader a year from a distance. Confer with Committee on Scientific Work of State Society if necessary. It will be glad to suggest names of those willing to render such service.

5. Arrange for one or more clinical meetings a year. Select subject and request all who have proper cases to bring them before the Society; then have a discussion on the same, always with the understanding that discussion of the case shall not be held in the presence of the patient; otherwise, frequently patients cannot be shown for obvious reasons.

6. Arrange for demonstrations by bacteriologists and pathologists with specimens, lantern slides, etc.

7. Arrange for social part of meeting. Some light refreshments at the close of the meeting are an adjunct to fraternal intercourse.

8. See that meetings are held often enough to keep up interest. Once or twice a year is not enough. Invite every member of the profession in the county to at least one meeting a year, not necessarily inviting them all to the same meeting. In counties where men do not show a willingness to write papers, either designate writers for different meetings or see that outsiders are invited—in other words, see that the meetings are made interesting. It should be the aim of every county society to secure a permanent home; a small library, with a supply of current

journals, and the use of the larger libraries for reference books, will greatly increase interest in the county organizations.

9. Arrange the time of meeting to accommodate the largest number of members. Where men come from long distances, an evening session is obviously the most inconvenient. An afternoon session will often appeal to a larger number of men when it permits them to reach their home at a seasonable hour.

10. Select as officers men who are willing to work. Keep good men in office. Do not promote those who have shown they will not attend to the duties assigned them. Efficiency is the only criterion of leadership. "No physician should accept office unless he is prepared to give the position the attention that it deserves and unless he is interested in the work."

11. In small societies do not unduly multiply offices—the secretary's and treasurer's duties can be best done by one man. Always supply officers with clerical help if work is onerous. Detailed drudgery work should not be asked of men serving for others without compensation.

12. Make the dues large enough to warrant conducting the Society work in a proper manner. Those who object to the amount of their dues usually do so because they are not receiving full value for them. Give back a dollar in value for every dollar paid in and complaints will be few.

13. Provide a Committee on Entertainment, who shall welcome new or prospective members or guests at meetings. The officers of the Society may be active or ex officio members of such committee. Newly registered physicians should be visited by such committee or written to and asked to join the County Society.

14. See that the meetings, programs, and proceedings are published regularly and promptly in the *State Journal*.

15. Have high ideals. Be liberal yet firm in maintenance of a high ethical standard. Educate the public. Be a power for good in the community. Do not be ashamed of the County Society or apologize for it; make it better. Attend all meetings and see that others do the same. "The County Society is a conservator of patriotism and worthy citizenship."

VITAMIN REQUIREMENTS OF MAN

III. VITAMIN A

• The importance and multiple functions of vitamin A in human nutrition are widely dealt with in clinical literature. Xerophthalmia resulting from severe vitamin A deficiency is rare in this country, yet the etiology of many pathogenic conditions, namely, night-blindness, urinary calculi, lesions of the nervous system, impairment of epithelial tissue and subnormal growth, has been linked with chronic avitaminosis A (1).

Minimum human requirements for vitamin A are influenced by such variables as size of the individual and efficiency of absorption. The minimum daily requirement of infants has been estimated at 1500 International units, based upon the vitamin A content of milk. The need for the vitamin is not supplied by 1200 International units, while 2000 International units appear to be sufficient (2).

Although the minimum requirement of the adult has been estimated to be as low as 500 International units, the optimum level for both older children and adults is probably between 3000 and 5000 International units

per day (3). The League of Nations Technical Commission recommends over 5000 International units of vitamin A for the pregnant and for the lactating woman (4).

Since the human requirement is evidently high, it is fortunate that vitamin A and carotene (pro-vitamin A) are more or less widely distributed in natural foods. Outstanding sources are some of the highly pigmented fruits and vegetables—especially the yellow varieties—and also dairy and marine products (5).

These protective foods, preserved by modern commercial canning, are readily available in all parts of the country throughout the year. It has been repeatedly demonstrated that commercially canned foods retain their vitamin A potency to a high degree (6). The vitamin A potencies of certain commercially canned products have been recently reported in International units (7). From these reports it is apparent that commercially canned foods can be relied upon to supply quantities of vitamin A entirely consistent with the vitamin A of the raw product.

department March 8, 1936, on a charge of suspicion of burglary. He was granted three years' probation, with the provision that he make restitution of \$200 as soon as possible. They quote from the report of their officers as follows:

Upon information that the Los Angeles Wholesale Drug Company was losing merchandise over the weekends, we staked out on the place and observed Clark and Co-defendant Beswick drive up in an Essex sedan, belonging to Co-defendant Beswick, observed defendant enter this store and remove seventeen cases of assorted drugs. Apprehended Beswick at Twelfth and San Pedro, and we came back with him and found this defendant Clark hiding behind packing cases upstairs.

Doctor Clark points out:

I was charged with receiving of stolen goods—not burglary. There is a vast difference between these two charges, the charge of burglary being much more detrimental to my character and constitutes felony.

and asks that a correction of the statement appearing in the index above referred to be made. In accordance with the doctor's request, we are glad to state that he was only found guilty of receiving stolen goods and not of burglary.

According to the San Leandro Reporter, March 26, 1937, an impostor calling himself "Dr. Hugh Enright, Dr. Everett Harman, and Dr. Wayne Harvey," has been passing worthless checks on the various merchants of San Leandro. "Captain Henry M. Bradow of the local Police Department yesterday said that communications have been forwarded to the Pittsburgh Police Department requesting information on and pictures of a suspect who was arrested Tuesday for passing fictitious checks in that city. It was reported that the suspect had confessed to passing checks in more than fifty California communities. . . ."

"Jung Shek, one time Chinese herb doctor here, pleaded guilty in the Superior Court today to a charge of having opium in his possession. Judge D. M. Young set April 12 for hearing a report on his probation plea. The man was arrested November 23. . . ." (Stockton Record, March 29, 1937.)

"Charges of conspiracy to perform an illegal operation were on file today against Dr. J. C. Coleman, twenty-nine (colored), Oakland physician. Bail was fixed at \$5,000. Doctor Coleman was arrested on the complaint of Raymond Lombardi, father of Mary Lombardi, nineteen, who died as the result of an illegal operation, according to the police. . . ." (Oakland Post Enquirer, March 30, 1937.)

"Police Chief Louis Belloni of South San Francisco, said today he would investigate the death of Mrs. Mary Shell, twenty-one, who died April 1 of peritonitis. His announcement followed the arrest of the dead woman's mother, Mrs. Yanka Zlataroff, forty-two, on a charge of performing an illegal operation and practicing medicine without a license. Mrs. Zlataroff, police said, admitted having performed two illegal operations, but refused to divulge the names of the women. . . ." (San Francisco News, April 9, 1937.)

"Sheriff Howard Durley reported today that Dr. Jasper J. Mayer, psychologist, recently sentenced to twenty years in Folsom prison, was found in his jail cell with both wrists slashed. Mayer was convicted of having defrauded Mrs. Annie Bateman, Ojai widow, of \$17,000." (San Francisco Examiner, March 26, 1937.) (Previous entry, May, 1936, Adv. p. 18.) No record can be found of anyone by the name of Jasper J. Mayer licensed to practice medicine in the United States.

S. M. A. is a food for infants—derived from tuberculin-tested cows' milk, the fat of which is replaced by animal and vegetable fats including biologically tested cod liver oil; with the addition of milk sugar and potassium chloride; altogether forming an antirachitic food. When diluted according to directions, it is essentially similar to human milk in percentages of protein, fat, carbohydrates and ash, in chemical constants of the fat and in physical properties

BREAST MILK from the Normal Mother is the IDEAL FOOD for the HUMAN INFANT . . . That is Why S. M. A. is Made to RESEMBLE BREAST MILK

in percentages of carbohydrate, protein, fat and total salts (ash) content, and why even the chemical and physical constants of the fat in S. M. A. are like those of breast milk fat. This similarity makes it easy to start the infant on supplementary feedings of S. M. A., gradually shifting over to complete feedings of S. M. A. The physician finds S. M. A. simple to prescribe and the mother gratefully finds it simple to prepare. Physicians are invited to write for samples and literature.

BOARD OF MEDICAL EXAMINERS

(Continued from Page 20)

"Dr. Wesley M. Coates, a student at the Sacramento Junior College six years ago, became a martyr to science when he was electrocuted Saturday night in New York by an x-ray machine he had developed to fight cancer. Coates was twenty-nine years old. . . . Coates' machine is capable of developing a million volts of electricity, producing radiation equal to a hundred million dollars' worth of radium. . . . It is believed he accidentally stumbled against the machine while working in his laboratory at the Columbia Presbyterian Medical Center." (Sacramento *Bee*, March 23, 1937.)

"A particular admonition that he must not diagnose, treat or give advice to patients in the future was given to Al Williams, who advertised himself as a 'conditioner of men' yesterday, when he was granted probation by Municipal Judge Arthur S. Guerin on a charge of violating the State Medical Practice Act. Judge Guerin placed Williams on probation for one year and suspended the thirty-day jail sentence." (Los Angeles *Illustrated Daily News*, March 17, 1937.)

"Mrs. Millie Williams, twenty-eight, of 2751 Newell Street, died today after accusing a woman of performing an asserted illegal operation. Following her death, police detectives arrested Mrs. Sarah Hernandez, thirty-three, of 1956 McAllister, who is held on suspicion of manslaughter. Mrs. Hernandez denied she performed the operation on Mrs. Williams. . . ." Los Angeles *Herald-Express*, April 1, 1937.)

"Charging she suffered extreme nervous shock and burns to her left leg when she visited a health institute in Huntington Park, Lela B. Britton had on file a suit

for \$25,000 damages. In her complaint for malpractice, Miss Britton named Rex C. McArthur, Chiropractor, and the McArthur Health Institute, as defendants. The incident occurred, she said, when she was treated with a diathermy machine." (Huntington Park *Independent*, March 25, 1937.)

"The District Court of Appeal today upheld a decision of the San Francisco County Superior Court, denying restoration of a license to practice as a chiropractor to Emerson D. Hartman of San Bernardino." (United Press dispatch, dated San Francisco, March 31, printed in the Los Angeles *Daily News*, April 1, 1937.) (Previous entries, January, March, April, July, September, November, 1935, and January, March, April, 1936.)

"The United States Circuit Court of Appeals' mandate, confirming the conviction in 1934 of Dr. F. T. Cary on narcotic charges, signaled the start of a one-year term for the prominent physician, when he surrendered yesterday to United States Marshal Robert Clark. The mandate also confirmed the conviction of Dr. E. H. Williams, jointly tried with Doctor Cary. Doctor Williams has been placed on probation for five years. The two physicians were convicted of issuing prescriptions for quantities of morphin, ranging from 22 grains in one prescription to 60 grains in another." (Los Angeles *Illustrated Daily News*, March 25, 1937.)

"After judgment had been rendered in favor of Ellene Kelleck, whom he was suing, Dr. S. G. Sonneland, former Pasadena physician, assertedly grabbed the woman as the two left the courtroom in the Justice Court this morning, and began shaking her, drawing upon himself arrest on two counts, assault and battery. He pleaded guilty and waived a jury trial, was fined \$50 and \$25 on each of the

LIVERMORE SANITARIUM

• The Hydropathic Department devoted to the treatment of general diseases excluding surgical and acute infectious cases. Special attention given functional and organic nervous diseases. A well equipped clinical laboratory and modern X-ray Department are in use for diagnosis.

• The Cottage Department (for mental patients) has its own facilities for hydropathic and other treatments. It consists of small cottages with homelike surroundings, permitting the segregation of patients in accordance with the type of psychosis. Also bungalows for individual patients, offering the highest class of accommodation with privacy and comfort.

GENERAL FEATURES

1. Climatic advantages not excelled in United States. Beautiful grounds and attractive surrounding country.
2. Indoor and outdoor gymnastics under the charge of an athletic director. An excellent Occupational Department.
3. A resident medical staff. A large and well trained nursing staff so that each patient is given careful individual attention.

two counts, the sentence suspended for two years by Judge William E. Fox. Records revealed that he formerly had sued Miss Kelleck for the same purpose, a \$50 bill, in the Los Angeles court, which also gave judgment in her favor. Deputy Constable W. E. Stevens arrested the man, handcuffing him until order was restored." (Pasadena *Star News*, April 2, 1937.)

"The gates of the California State Prison at San Quentin opened Tuesday of last week to release Dr. M. J. Marmillion, principal in a tragic nationally famous abortion case back in 1933, it became known here this week. After four years' incarceration, Doctor Marmillion, former practicing physician at 3311 Central Avenue, was paroled to Dr. E. A. Mitchell, local pharmacist, for a period of ten years. The doctor was sentenced in June, 1933, to from five years to life imprisonment in the penitentiary for second-degree murder. . . ." (Los Angeles *Eagle*, April 2, 1937.) (Previous entries, April, August, November, 1933; February, 1934.)

The Texas Board of Medical Examiners reports an alleged impostor named Harold William Bradshaw is assertedly using the name of a licensed Texas physician named Bedford F. Floyd. The report indicates that this impostor has a criminal record.

John David Dunlop, reputed "habitual violator of the Medical Practice Act," was reported arrested by Acting Assistant Special Agent Anderson of the Los Angeles Investigation Department of the Board of Medical Examiners, March 25, and arraigned before Highland Justice of the Peace J. W. Moore, who sentenced him to 180

days in the county jail. Dunlop thereafter, on the twenty-ninth day of March, pleaded guilty before Justice of the Peace P. G. McIvor, Redlands, and was again sentenced to 180 days in the county jail, said sentence to run concurrently with the Highland sentence. Reports indicate that Dunlop had been arrested four times since 1928 on other charges. (Previous entry, February, 1935.)

Report filed by Acting Special Agent John R. Ronan, Los Angeles office of the Board of Medical Examiners, states that Levon Garabed Kassabian, M.D., was on April 2, 1937, arrested in Los Angeles on a warrant issued August 31, 1936, charging violation of the Medical Practice Act.

United States post-office inspectors recently reported the arrest on March 6, 1937, in Nashville, Tennessee, of Raymond B. Hall and Ernest Mandell, both assertedly charged with misuse of the mail as alleged eyesight swindlers; Raymond B. Hall to be removed to Norfolk, Virginia, to stand trial on an indictment in connection with the swindle of Roberta M. Ridley of Boykins, Virginia, and Mandell for removal to Milwaukee, Wisconsin, in connection with the swindle of Hermann Volker of Ripon, Wisconsin. Ernest Mandell's removal will be delayed because of his attempted suicide in the jail following his arrest, he having been reported to have dived from the third-floor balcony to the first floor, resulting in serious injuries. Reports also indicate that James Henry Howard, alias Jimmy Head, William Sacks, Susie Sacks, and Edward Robinson, all indicted for misuse of the mails in connection with the alleged swindle of Lucy Finger of Stanley, North Carolina, have been apprehended by federal authorities. Edward Robinson on March 15, 1937, was given a two-year sentence. Roy L. Martin, apprehended in Los Angeles, Curtis Yeager and Jack Holtkamp, all charged with fraudulent use of the mails in

TO THE DOCTOR'S WIFE

It is our conviction that cosmetics should be selected to suit the individual's requirements. We cater exclusively to you, the individual. Our representatives are trained to help you select suitable beauty preparations and to show you how to apply them.

It is only sensible to realize that a truly beautiful skin is first of all a healthy skin and secondly a well-cared-for skin.

Cosmetics serve to enhance your appearance, to present you at your best. In this regard it is well to bear in mind that a natural appearance is by far the most charming.

Carefully selected, and artistically applied, make-up preparations lose their identity as cosmetics and become an indistinguishable part of your personality.

We want it clearly understood that we in no way undertake to treat skin disorders. If you are thus afflicted we had rather that you not use our preparations without the consent of a skin specialist. Our formulary is available to the medical profession.

A card addressed to us will be referred to the manager of the territory in which you reside. It is our pleasure to be at your service.—LUZIER'S, Inc.

connection with the swindle of Mrs. S. E. Fifield, Remington, Virginia, were given penitentiary sentences.

Theodore Jacobsen, on March 15, was reported to have pleaded guilty in the Los Angeles court to a charge of violation of the Medical Practice Act and on March 22 was sentenced by Municipal Judge LeRoy Dawson to pay a fine of \$250 or serve 180 days in the city jail, the sentence being suspended on condition the defendant cease using the suffix "M. D."

Theodore H. Niemann, M. D., placed on five years' probation on March 7, 1933, after a hearing before the California Board, based upon narcotic addiction, according to the records was arrested in Denver, Colorado, January 4, 1937, and sentenced to six months in the county jail because of narcotic derelictions.

There is no royal road to reconstruction for a failing heart; but by knowledge and perseverance, interest can be stimulated in something which will often successfully restore a person to usefulness and rescue him from invalidism.

Bad Foods Under Fire: Federal Officials Seize Larger Quantities of Unfit Merchandise.—Insect damage, infestation, mold and decomposition in canned vegetables, fruits and seafoods, and in frozen eggs, fresh fish and nuts placed these commodities at the head of recent seizures under the Food and Drugs Act, the Federal Food and Drug Administration reports. Economic frauds, represented by weight shortage or the unannounced substitution or abstraction of ingredients, ran second in importance. The presence of poisonous contaminants was the least conspicuous violation of the law uncovered.

Poisonous Adulterants in Foods.—Poisonous adulterants account for the remainder of food seizures. They were: 25 bushels of apples bearing arsenic and lead residues, 548 sacks of lima beans containing lead, and 342 pounds of crude edible gelatine containing arsenic.

Continuation of the work on surgical dressings brought the seizure of 3,150 packages of absorbent cotton, 336 packages of gauze bandage, and 28,200 envelopes of an "adhesive compress," all found to be unsterile although labeled "sterilized." Four boxes of surgical catgut sutures, likewise unsterile, also were picked up.

Other drug items seized were: 1,860 bottles of low-strength tincture of iodine, 168 cans of impure anesthetic ether, 69 bags of jalap root found to vary from the official variety, 632 bottles of below-standard aspirin tablets, labeled "100" per bottle, but with an average of only

ninety-one per bottle; 623 bottles of so-called rubbing alcohol made up principally of isopropyl alcohol.

One shipment each was seized of "Cereal Lactic," represented as a good source of lactobacillus acidophilus although in fact practically inert, and "Hygem Mineral Oil Emulsion with Acidophilus," found to contain only negligible numbers of lactobacillus acidophilus, and contaminated with large proportions of other microorganisms.

Patent Medicines Seized.—The following patent medicines were seized under the authority of the Food and Drugs Act, on allegations that claims made for the treatment of the disease conditions named below were beyond the capabilities of the articles:

"Dr. Brigadell's Camphorole," petrolatum and lanolin with volatile oils, and "Dr. Brigadell's Camphorole Nose Drops," liquid petrolatum with essential oils, represented as a treatment for nasal irritations, irritation of the bronchial tubes, acute hoarseness, chronic rheumatism, aching feet, itching piles, tired nerves, skin irritations, throat irritations, and colds and coughs in dogs.

"Cadum Ointment," consisting of 20.4 per cent zinc oxid, 4.6 per cent sulphur, with salicylic acid, oil of cade, petrolatum, and wax, the label of which declared 13.25 per cent zinc oxid and 8.98 per cent sulphur, offered as a treatment for eczema, pimples, pustules, blotches, warts, inflammation, skin diseases, ulcers of the skin, boils, piles, and scalp diseases in children.

"Chambers' Pills," containing potassium nitrate, potassium carbonate and plant drugs including buchu, coated with green-colored calcium carbonate and sugar, for backache, weak back, rheumatism, dropsy, congestion of the kidneys, inflammation of the bladder, urinary trouble, gallstones, gravel, diabetes, Bright's disease, and leukorrhea.

"Colac Pile Pills," containing magnesium oxid, plant extracts and a tar-like material, coated with sugar, chocolate, and iron oxid, for relief from piles in twenty-four hours; "Dunlap's Colic Remedy for Horses and Mules," consisting of 50 per cent alcohol, with water, ether, ammonia, camphor, nitrite, and plant extracts, including asa-fetida, for colic and gravel, and to strengthen the digestive organs of live stock and give appetite.

"Fairey Oil," turpentine and wintergreen, colored green, for neuralgia, rheumatism, toothache, headache, stiff neck, lame back, sore throat, cold in the chest, pains in the head, side, stomach, feet, limbs and shoulders, cramps, colic, hacking cough, bunions, stiff joints and muscles, flu and fever.

"Dr. Gram's Grandmother Medicine," powdered plant material containing aloe, an emodin-bearing drug and ginger, for blood, liver, kidney and stomach diseases, rheumatism, chills, fever, malaria, dyspepsia, sick or nervous headache, scrofula, neuralgia, biliousness, constipation, palpitation of the heart, erysipelas, syphilitic troubles,

LET YOUR OWN EXPERIENCE GUIDE YOU

NOTHING is so convincing as your own experience. May we suggest therefore that you not only read the reports* on the effect of hygroscopic agents on the irritant properties of cigarette smoke, but that you follow up your reading with your own tests.

Studies show that Philip Morris cigarettes, in which diethylene glycol is used as the hygroscopic agent, are considerably less irritating than ordinary cigarettes in which glycerine is employed.

But make your own tests. Smoke Philip Morris. Try them on your patients. Verify for yourself Philip Morris superiority.

catarrh, asthma, diabetes, bronchitis, consumption, cancer, tumor, fits, spasms, heart disease, Bright's disease, hardening of the liver, and spinal complaints.

"Help Nature Tablets," containing phenolphthalein and plant drugs including another laxative, for dyspepsia, stomach, liver, kidneys, and blood; "He-She Antiseptic Vaginal Suppositories," cocoa butter with boric acid and small amounts of salicylic acid and quinin, for women's ailments.

"Malto-Hopo Herb Phosphate Health Beverage," a brown-colored liquid containing sugar and plant extracts benzoic acid 0.6 per cent of inorganic compounds including phosphates, but represented as containing "phosphates, herb phosphates and acid phosphates, including those of lime, magnesia and soda," which were in fact insignificant, offered for toning the stomach and nervous system, inducing refreshing natural sleep, invigorating the nerves, promoting digestion, and for indigestion, nervous dyspepsia, wakefulness, headaches, mental or physical exhaustion, insomnia, severe colds, nervous chills, and to overcome the liquor, tea, or coffee habit.

"R-P 60 Bladder and Gland Remedy," a water extract of plant drugs including a laxative and some salicylate, for ailments of the prostate and bladder; "Ra-Ed-O Pile Suppositories," cacao butter with small amounts of quinin, salicylates, iron compounds and sulphates, not antiseptic as represented, and offered as a treatment for piles.

"Rozel Douche Powder," boric acid, sodium chlorid, ammonium alum and small proportions of phenol and menthol, for inflammations, irritations, leukorrhea, itching, and minor hemorrhages; "Rozel Effervescent Cones," containing tartaric acid, sodium bicarbonate, talc, starch, and a chlorin-liberating compound, falsely represented as germicidal, for the relief of inflammation, and as a protection against social diseases.

"Sasa Scalp and Skin Hair Tonic," water and alcohol, containing borax, caramel and oil of cinnamon, for dandruff, falling hair, eczema and itchy scalp; "Summus,"

APPROVED CLINICAL PATHOLOGISTS

American Medical Association Essentials for An Approved Clinical Pathologist

An approved clinical pathologist should be a licensed graduate of medicine. He shall have specialized in clinical pathology, bacteriology, pathology, chemistry, and other allied subjects for at least three years, and he should be reasonably familiar with the manifestations of disease in the body. The director of a clinical laboratory shall be on full time or have definite hours of attendance, devoting the major part of his time to this specialty. A clinical laboratory is an institution organized for the practical application of the fundamental sciences by the use of specialized apparatus, equipment and methods, for the purpose of ascertaining the presence, nature, source, and progress of disease in the human body.

The following Clinical Pathologists directing private laboratories in California are approved by the Council on Medical Education and Hospitals of the American Medical Association:

**Clinical Laboratory of Drs. W. V. Brem, A. H. Zeiler, Roy W. Hammack
and G. D. Maner, 657 So. Westlake Avenue, Los Angeles, California.**

Zera E. Bolin, M.D., 490 Post Street, San Francisco, California. ✓ ✓ ✓

These laboratories use standard methods and are fully equipped to make all clinical examinations of recognized value in: Tissue Pathology, Bacteriology, Hematology, Serology, Bio-Chemistry, Kolmer Wassermanns, Kahn test, Medico-legal, Basal metabolism, Blood chemistry, Hormone Test for Pregnancy, Parasitology, Cardiology, Autogenous vaccines, etc.

Mailing containers sent on request. Special delivery postage insures prompt, accurate service.

water, alcohol, borax, sodium bicarbonate, small amounts of a zinc compound, color and flavor including cassia, for tonsillitis, nasal catarrh, and spongy and bleeding gums.

"Verified Magnesia Dental Cream," bearing a statement alleged to create the impression that the product had been tested and approved by some branch of the United States Government, the product being further alleged misbranded in that it was offered for the prevention of decay, and as a "triumph in mouth, teeth and gum prophylaxis," regarded as being beyond the capabilities of a tooth paste; "Victory Vapor Balm," an ointment containing camphor, menthol, eucalyptol and pine oil, for hay fever, catarrh, influenza, asthma, croup, whooping cough, quinsy, sore throat, bronchitis, tonsillitis, and cold in the head.

"Wah-Poo-Sah Kee-Kee-Kee," water and alcohol with small proportions of plant extractives and a plant laxative, for activating the muscles of the bowels, and for building up the blood; and "Zonalife," Epsom salt in water, with small amounts of iron and sodium compounds, salicylic acid, wintergreen and saccharin, for indigestion, headaches, sluggish kidneys, rheumatism, and high blood pressure.

Cases Terminated

Actions brought against shippers under the criminal provisions of the Federal Food and Drugs Act were terminated as follows: Zo-Ro-Lo, Inc. (a firm operated by Ralph Runyan and Charles Collett), Ada, Ohio, shippers of "Zo-Ro-Lo," a solution of Epsom salt in water, with glycerin, benzoic acid, citric acid and menthol, colored red, offered as a treatment for ailments traceable to intestinal auto-intoxication, to insure proper elimination, and for indigestion, fine \$50 and costs.

Keystone Laboratories, Inc., Memphis, Tennessee, shippers of "Keystone Rx 4344," "Ruherb Tonic," "White Pine Compound Expectorant," variously offered for the relief of kidney and bladder ailments, indigestion, torpid liver, backache, rheumatism, coughs and bronchial affections, fine \$300 and costs.

For shipments of below-standard pharmaceuticals, Armour & Company, Chicago, Illinois, \$25 and costs; Standard Pharmacal Company, Chicago, Illinois, \$50 and costs; Cumberland Manufacturing Company, Nashville, Tennessee, \$200; Warren-Teed Products Company, Columbus, Ohio, \$800; Columbus Pharmacal Company, Columbus, Ohio, \$1,200; and A. E. Mallard, Detroit Michigan, \$4,800, fine suspended and defendant placed on probation for five years.

P. R. Bodle Company, Seattle, Washington, insect-infested and wormy raspberries, fine \$50 and costs; Robinson Canning Company, Robinson, Arkansas, tomato juice made from moldy material, \$75 and costs; Scotty Packing Company, Cordova, Alaska, partially decomposed canned salmon, \$25 and costs; Malvern Cold Storage Company, Malvern, Iowa, diseased and decomposed poultry, \$25 and costs; Robinson Canning Company, Robinson, Arkansas, canned spinach containing worms, insects, and extraneous filthy material, \$50; and Libby, McNeill & Libby, San Francisco, California, dirty dried peaches, \$200.

Summer Diarrhea in Babies.—Casec (calcium caseinate), which is almost wholly a combination of protein and calcium, offers a quickly effective method of treating all types of diarrhea, both in bottle-fed and breast-fed infants. For the former, the carbohydrate is temporarily omitted from the twenty-four-hour formula and replaced with eight level tablespoonfuls of Casec. Within a day or two the diarrhea will usually be arrested, and carbohydrate in the form of Dextri-Maltose may safely be added to the formula and the Casec gradually eliminated. Three to six teaspoonfuls of a thin paste of Casec and water, given before each nursing, is well indicated for loose stools in breast-fed babies. Please send for samples to Mead Johnson & Company, Evansville, Indiana.

Better keep yourself clean and bright; you are the window through which you must see the world.

FORM OF CLAUSE OF WILL PROVIDING FOR DEVISE OF REAL PROPERTY

I give and devise unto Trustees Of The California Medical Association, a nonprofit corporation of California [here describe the property], the same, or the proceeds thereof, to be held as a perpetual fund, to be known as the [here insert name desired] Fund, the income whereof shall be used for and applied to the support and maintenance of scientific, educational, or hospital purposes. The said corporation shall have the power to sell said property and to invest and reinvest the proceeds arising from the sale thereof from time to time as it may deem advisable for the purpose of producing as large an income as may be compatible with safety.

* These Bequest Forms were discussed editorially in CALIFORNIA AND WESTERN MEDICINE, for March, 1936, p. 145, and June, 1936, p. 460.

Behind MERCUROCHROME

(dibrom-oxymercuri-fluorescein-sodium)

is a background of

Precise manufacturing methods insuring uniformity

Controlled laboratory investigation

Chemical and biological control of each lot produced

Extensive clinical application

Thirteen years' acceptance by the Council of Pharmacy and Chemistry of the American Medical Association

A booklet summarizing the important reports on Mercurochrome and describing its various uses will be sent to physicians on request.

Hynson, Westcott & Dunning, Inc.

BALTIMORE, MARYLAND

Vitamin Deficiency in Diets in Diabetes.—Sindoni investigated the diets of eighty-five diabetic patients, who suffered also from disturbances involving the gastrointestinal, genito-urinary, gynecologic and cardiovascular systems, as well as the visual field and oral, neurologic, skin, joints and endocrine glands. The patients were obese; 5.4 per cent suffered from gangrene and 3.5 per cent from malignancy. They were still ignorant of the true nature of their condition—a factor in the causation of increased diabetic complications and mortality. They were on restricted diets, but none adhered to their prescribed diets. Avitaminosis and hypovitaminosis were found in every one of the patients. These disturbances were not the result of one vitamin but of several, as amply evidenced by the patient's dietary history, symptoms and physical disturbances. Many physicians adjust insulin dosage to the carbohydrate allowance only, disregarding proteins, fats, vitamins and other elements of diet. There was a marked correlation in vitamin-deficiency diets to the rise in the incidence of diabetes, diabetic complications or concurrent diseases, but no correlation in overeating. These observations determined the author to correct the diet of these patients. He strongly advocates a more detailed study of the patient's diet history as well as of the symptomatology. The diabetic patient's diet should consist of natural foods, rich in the essential vitamins and other elements, since such diet will more often result in greater adherence by the patient to his instructions. The following advantages will be obtained: (1) better coöperation of patient with physician; (2) less complications, symptoms or physical disturbances; (3) less insulin; (4) better metabolic equilibrium; (5) better outlook on life; (6) prolongation of the span of usefulness; (7) greater resistance to infection; (8) avoidance of avitaminosis and hypovitaminosis; and (9) more energy. Diets consisting of a variety of natural foods, such as vegetables, fruits, milk and its products, meat and cereals in prescribed proportions, with hygienic measures, such as sunshine, fresh air and exercise, will result in little need to worry about vitamin deficiency in diabetes.—*Journal A. M. A.*

THEY LOOK ALIKE

BUT THERE'S A BIG DIFFERENCE

Two diamonds, side by side . . . each has dazzling brilliance. To the average purchaser they seem identical. But only one is perfect; the other's value is far less because of carbon flaws. Yet only an expert can detect the difference.

The ordinary purchaser has no way to tell a fully potent vitamin product from a deficient one, either. They may look alike . . . weigh, taste and smell the same. Only an expert with elaborate equipment can measure true vitamin content.

Realizing this and knowing, too, that deficient vitamin products are sold, many careful physicians protect their patients by prescribing

Haliver Oil with Viosterol and specifying Abbott in writing whenever vitamins A and D are indicated.

Your confidence in Abbott vitamin products is warranted because of the rigid bio-assays, elaborate equipment and beginning-to-end control of production Abbott maintains in manufacture. Prescribe routinely for growing children, expectant and lactating mothers and all others who require additional vitamins A and D. Available at prescription pharmacies everywhere in soft, tasteless, 3-minim capsules in boxes of 25, 50, 100 and 250. Also in 10-cc., 20-cc., and 50-cc. vials with droppers.

ACTUAL MICRO-PHOTOGRAPHS

Perfect, well-cut diamond.

Diamond of same size and cutting, its perfection marred by carbon.

Specify in Writing... **ABBOTT'S HALIVER OIL** with VIOSTEROL

Essential Deficiency in Pernicious Anemia

"Bricks without straw"—more practicable than adequate treatment of pernicious anemia without the antianemic material such as is contained in liver.

● The essential nature of pernicious anemia appears to be a nutritional deficiency. Such "building stones" as are required for normal red blood cell formation are available to the blood-forming organs only in less than optimal amounts. These deficient elements may be supplied by adequate liver therapy.

The parenteral administration of the anti-

anemic material contained in liver assures utilization by the body of the necessary anti-anemic substance.

Solution Liver Extract Concentrated, Lilly, is supplied in 10-cc. rubber-stoppered ampoules and in packages of four 3-cc. rubber-stoppered ampoules.

Solution Liver Extract, Lilly, is supplied in 10-cc. rubber-stoppered ampoules.

Address editorial communications to Dr. George H. Kress as per address above; advertising and business communications to Secretary-Treasurer, Dr. Frederick C. Warnshuis, also at above address.

EDITOR GEORGE H. KRESS

Advertisements.—The Journal is published on the seventh of the month. Advertising copy must be received not later than the fifteenth of the month preceding issue. Advertising rates will be sent on request.

BUSINESS MANAGER . FREDERICK C. WARNSHUIS
Advertising Representative for Northern California
L. J. FLYNN, 544 Market Street, San Francisco (DOuglas 0577)

Copyright, 1937, by the California Medical Association.

Subscription prices, \$5 (\$6 for foreign countries); single copies, 50 cents.

Volumes begin with the first of January and the first of July. Subscriptions may commence at any time.

Change of Address.—Request for change of address should give both the old and the new address. No change in any address on the mailing list will be made until such change is requested by county secretaries or by the member concerned.

Responsibility for Statements and Conclusions in Original Articles.—Authors are responsible for all statements, conclusions and methods of presenting their subjects. These may or may not be in harmony with the views of the editorial staff. It is aimed to permit authors to have as wide latitude as the general policy of the Journal and the demands on its space may permit. The right to reduce or reject any article is always reserved.

Contributions—Exclusive Publication.—Articles are accepted for publication on condition that they are contributed solely to this Journal. New copy must be sent to the editorial office not later than the fifteenth day of the month preceding the date of publication.

Contributions—Length of Articles; Extra Costs.—Original articles should not exceed three and one-half pages in length. Authors who wish articles of greater length printed must pay extra costs involved. Illustrations in excess of amount allowed by the Council are also extra.

Leaflet Regarding Rules of Publication.—CALIFORNIA AND WESTERN MEDICINE has prepared a leaflet explaining its rules regarding publication. This leaflet gives suggestions on the preparation of manuscripts and of illustrations. It is suggested that contributors to this Journal write to its office requesting a copy of this leaflet.

C. M. A.'S SIXTY-SIXTH ANNUAL SESSION

President Edward M. Pallette Becomes Past President: President-Elect Howard Morrow Assumes Office as President.—The current, May issue of CALIFORNIA AND WESTERN MEDICINE will be in press while the meetings of the sixty-sixth annual session of the California Medical Association are being held, so that it will not be possible, through the printed page, to give convention news other than the Addresses of the Retiring and Incoming Presidents. Component county societies should, therefore, ask their delegates to make reports at the May meetings. Comments on the proceedings and official minutes will appear in the June number of the OFFICIAL JOURNAL.

On the evening of Wednesday, May 5, Dr. Edward M. Pallette of Los Angeles, former Speaker of the House of Delegates and, during 1936-1937, president of the California Medical Association, will have laid down the responsibilities of the presidential office, his place being taken by the president-elect of last year, Dr. Howard Morrow of San Francisco. In expressing appreciation of the services which the retiring president, Doctor Pallette, has rendered to organized medicine in the years gone by, the Association turns to welcome his successor, Doctor Morrow of San Francisco, whose faithful performance of duty on the professorial staff of the University of California's Medical School and as president of the California State Board of Health, is ample warrant, as he takes up his new work, of a successful administration to come.

* * *

President-elect is Dr. William W. Roblee of Riverside.—There cometh also unto us, in a different rôle than has been his in the recent past, a new president-elect, who is none other than Dr. William W. Roblee of Riverside, California, a graduate of Cooper Medical College, Class of '95, and who, as a laborer in the vineyard of organized and scientific medicine, has long enjoyed the highest esteem of colleagues from all portions of the State. He gives up his duties as Speaker of the House to assume new responsibilities, and how well he will fulfill these with credit to himself, his

†Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

many friends know. The Association, therefore, extends to him its congratulations and good wishes.

In the June issue, full reports of the 1937 annual session meetings will be given.

DENTAL SURVEY OF SAN FRANCISCO ELEMENTARY SCHOOL CHILDREN: A COMMENDABLE REPORT

Facts Concerning the Dental Survey of San Francisco Elementary School Children.—Recently there came into our hands a copy of the "Dental Survey of San Francisco Elementary School Children," a Federal Works Progress Administration (WPA) project, having, as its legal or public sponsor, the San Francisco Department of Public Health, through Dr. J. C. Geiger, and, as its contributing or co-sponsor, the San Francisco Dental Society, through Dr. Ernest Sloman, Survey Director. This survey, conceived in November, 1933, was put into operation on August 17, 1934, and the report, brought off the press in October, 1936, was carried out under the supervision of James B. Sharp, Ph.D., Coördinator of Statistical Projects in California; the final summary making a compact brochure of twenty-one pages of text, tables and graphs, set up in typewritten form.

* * *

Why Attention Is Called to It.—Attention is called to this report for several reasons: first, because it is in line, regarding contents and presentation, with what one would expect from such a survey report; secondly, because the California Medical Association, as co-sponsor of the California Medical Economic Survey, has itself already had an expensive and unpleasant experience in a work project of somewhat similar nature which, with the California State Board of Health, it took up in good faith, only to see its search for accurate knowledge concerning sickness costs of California citizens take on controversial sidelights because of the improper orientation of one or more lay individuals, whose services had been engaged to supervise the collection and compilation of the statistical information gathered by the clerical force and field workers; these misguided persons seemingly being under the impression that they were the beginning and end of the survey, instead of only being hired to do supervisory work and statistical compilation that would establish factual data from which the legal sponsor (the California State Board of Health) might indicate its interpretations and conclusions. It is quite possible that at the California Medical Association Del Monte session (only two weeks away) the matter will be discussed, and that delegates will be able to carry back to the component county societies the story of how thirty-five thousand dollars of the Association's funds were expended by its appointed lay experts, and what kind of report is at last being submitted in manuscript form.

What Was Done With a Bulky Report.—Several paragraphs in the Dental Survey report, here referred to, may indicate why it was carried through to successful completion with fair promptness; the opinions expressed being worthy of reflection, when one would consider the delays which were met with in the California Medical Economic Survey:

A great deal could be written regarding dental infection, the nature and importance of caries, diet, dental research, preventive dentistry, and other related problems, *but this formal report is intent upon one major problem, i. e., reporting what was found on this federally subsidized survey as clearly and as briefly as possible. . . .* (Italics our own. Editor.)

* * *

A preliminary bulky report prepared by the project supervisor, Mr. Harries, was submitted and has been completely redrafted (Parts A and B) by Dr. James B. Sharp, Coördinator of Statistical Projects for the Works Progress Administration in California. In this report only such data are utilized as were tabulated on the project. The concluding remarks appearing in Part C were prepared by Dr. Ernest Sloman. . . . (Italics our own. Editor.)

* * *

Significance of Dental Caries in Childhood.—From the concluding remarks by Ernest Sloman, D.D.S., the following significant comments on facts elicited by this survey of San Francisco school children are also worthy of consideration by dentists, physicians and the public:

The problem of dental caries is a challenge to civilization. Unless and until science develops a preventive formula or an individual whose contribution to mankind has the same effect on our fight against caries (as did Jenner's discovery on the prevention of smallpox), we can use only those measures afforded by dental science to eliminate or control the most prevalent, and by far the most expensive disease that man knows of today. A careful study of the disease and the facilities available in civilized countries for its control, indicates that the disease can be controlled. The tardiness with which these facilities are employed is nearly wholly responsible for a devastating waste of our most precious possessions, health and vitality. . . .

* * *

We can make little or no progress towards increasing the percentage of American people with clean, healthy mouths, until the people, as well as the profession, learn and appreciate that the investment of comparatively small amounts of time and money for dentistry during childhood and youth adds years of health and comfort and, in most instances, eliminates the necessity for large and costly dental restorations in middle life and during the years of decline of physical vitality. . . .

* * *

The control of dental caries, which is probably the most expensive and extensively devitalizing disease that mankind has today, lies in promoting public appreciation of the following facts: (1) that the cost of dental care for the individual can be reduced by providing early and adequate attention to the teeth, and (2) that, although dental caries is apparently a localized disease of childhood and youth, it is a primary or initial lesion involving painful, expensive, lingering or protracted diseases of old and middle age. . . .

* * *

Federal WPA Instructions Which Should Have Been Observed in the California Medical Economic Survey.—Before leaving this subject, attention may likewise be called to a letter, dated March 22, 1937, sent by Dr. James B. Sharp, Coördinator of Statistical Projects, to the Direc-

tor of the Survey to the preparation of which the California Medical Association gave \$35,000 support as a coöperating sponsor; because, in that letter some important rules are laid down, which, had they been observed in California, would in all probability have done away with the confusion and delay (in part occasioned through the attempt by the Director to secure a copyright), which thus far has kept from publication this State Board of Health-California Medical Association "California Medical Economic Survey" as a completed project. We quote:

Under date of March 13, the Works Progress Administration, Washington, D. C., has issued Operating Procedure No. W-11—"Regulations for Publication of Statistical, Survey and Research Materials." One or two of the sections in that Operating Procedure will be of interest, and give you the latest information that we have on the subject. . . .

Section 3. Within a reasonable time after completion of a study, the Works Progress Administration shall be provided with at least ten copies of the final report. In most studies, the report should include the following sections:

- Scope
- Objectives
- Methodology
- Findings and Conclusions.

. . . In the publication of statistical, survey and research material, the sponsoring agency [California State Board of Health, for the California Medical Economic Survey] shall be responsible for any interpretations or conclusions made from data collected on the work project. . . .

Section 6. Data secured or reports published from studies financed in whole or in part by funds allotted to the Works Progress Administration are intended for public use. Copyrighting of any such statistical, survey and research material by an individual or organization, public or private, shall not be sought. . . .

Subsequent to the receipt of Coördinator Sharp's letter of March 22, quoting the WPA's bulletin of March 13, 1937, in which operating rules for projects such as the California Medical Economic Survey were outlined (some excerpts are given above), a letter of date of April 12, 1937 was received from the Director of the California Medical Economic Survey (who had previously received a copy of the March 13 rules laid down by the central authorities at Washington), and in this letter the Director of the California survey again outlined a list of stipulations, of such nature as to indicate his inability or unwillingness to understand the instructions from the Washington office. From this later letter of April 12 we quote only one item (leaving to our readers the right to imagine the other contents of his communication). Section 5 of his letter of stipulations reads:

5. It is agreed that final authority for any and all changes in the report as submitted by Dr. Paul A. Dodd shall rest with Doctor Dodd himself, as Director of the Survey.

From all of which the members of the California Medical Association may again remind themselves of the old saw,

Experience is the best teacher.

TWO IMPORTANT ANNUAL-SESSION PAPERS: ONE BY RETIRING PRESIDENT PALLETTE, AND THE OTHER BY PRESIDENT MORROW*

In this issue of CALIFORNIA AND WESTERN MEDICINE appear two of the addresses given at the general meeting of the California Medical Association's recent Del Monte session, and, since each paper deals with important subjects, the facts and opinions expressed by these ranking officers are worthy of every member's most careful reflection.

Some of the thoughts to which Doctor Pallette gives expression will be startling, and to a few readers, perhaps, unacceptable. Nevertheless, his arguments, based on demonstrated scientific knowledge and historical records of civilization are such that counter-statements of equal force and value will be most difficult to find. Portions of the picture, too, which Doctor Pallette outlines are not pleasing to contemplate but physicians, as members of a scientific and learned profession, would reflect no credit upon themselves by refusing to acknowledge the existence of trends which our Retiring President so courageously has brought into the open for our joint and individual consideration.

President Morrow's paper, on the other hand, discusses governmental ways and means of combating the deplorable results of syphilis and gonorrhea; diseases which, together, have been and still are among the most potent of all causes that make for a devitalization of the human race. At the present time, and in overabundance, we are being subjected to almost superbuoyant "alpha-to-omega" solutions of problems connected with these two scourges, whose wide prevalence has been so fully demonstrated; the two diseases, in both medical and lay circles, having too long been cloaked with a covering of secrecy and hypocritical modesty. Now that federal moneys will be brought into the battle against syphilis and gonorrhea, it should be possible to bring about new and more successful alignments to eradicate the dreadful maladies. Because the Federal Government is obligated to work through a constituted commonwealth authority, such as a state board of health, and since active governmental participation in plans to make the diagnosis and treatment of venereal diseases available to all citizens necessarily implies private practice modification of procedures in the handling of these transmissible diseases, it is important for members of the medical profession in this State to orient themselves concerning the present and possible future activities of the Board of Health of the State of California in the great fight. Doctor Morrow's message, therefore, has special value, not only through his standing as professor of dermatology and syphilology at the University of California, but because he is also president of the California State Board of Health, the agency through which the newer procedures must be transmitted to local health officials and the profession at large.

We again commend to our readers the perusal of these two suggestive and important papers.

* Doctor Pallette's paper appears on page 296; Doctor Morrow's on page 300.

"AMERICAN MEDICINE": TWO VOLUMES OF REAL VALUE

Extensive Literature on Sickness Costs.—Discussions of medical relief problems, in both medical publications and the press of recent years, have brought to the attention of physicians volume after volume, and also many articles, seemingly without end. In the beginning the temptation to purchase each work presented was naturally great; but this desire lessened as the inadequacy of the printed material made itself evident. Indeed, were it not for the importance of the subject, and the prominence given to it in public-welfare propaganda, together with the hope that a forthcoming publication might outline a clearer or a better solution of some of the problems involved, one would be inclined to abstain from adding such book and magazine literature to a library.

* * *

"American Medicine" has 2,200 Physician Contributors.†—It is, therefore, refreshing to be able to call attention to a scholarly work of some 1,435 pages, entitled, "American Medicine: Expert Testimony Out of Court,"* edited and published by the "American Foundation," 565 Fifth Avenue, New York, and issued in two large, well-printed volumes, presenting compactly and in an interesting manner, reports, in the form of letters, from some 2,200 representative physicians of the United States; many of the comments dealing with the present status of American medicine, and also the much-discussed subject of ways and means for securing adequate medical care to all citizens, no matter what may be their social or economic position.

These contributors hail from every state of the Union, and represent all divisions of general prac-

tice, the specialties (both urban and rural), and medical education. In securing the information so compiled, six letters of inquiry were used: one going to men of twenty years or more in medical practice; a second to recent graduates; a third devoted to medical education; a fourth bearing on group practice; a fifth dealing with standards of surgical practice; the sixth covering group hospital insurance.

* * *

Scope of the Report.—The scope of the report may be better appreciated by noting the subjects considered, some of which include:

What is "adequate" medical care?

Is the cost of it the only reason why it is not generally available?

How much modern scientific medical care of high grade exists at all?

If it were "available" now to all, would a large part of the population still choose quacks, cults and patent medicines?

How far is government responsible for the health of the individual?

What part should government have in promoting public health and providing medical service?

Who should pay for the medical care of the indigent sick?

Is the old line of demarcation between preventive and curative medicine any longer practicable or desirable?

Is improving medical education and the personnel of the medical profession the first step in improving the organization and distribution of medical care?

Is there too much specialization?

Can an individual doctor really furnish scientific medical care alone, or are organized laboratory and consultative assistance an absolute necessity?

In the medicine of the future will the practitioner function as an individual or as a member of a group?

What is the present status of the family doctor—is he "passing"; or is a new version of him just coming into being?

Is the "doctor-patient relation" an absolute sentimentality or has it a practical value in modern scientific medicine?

Is there too much surgery?

* To be obtained from the publisher at the price of \$3.50.

How can self nominated specialists and ill qualified surgeons be controlled?

Now that the age of philanthropy is passing, how are hospitals to be supported?

Is insurance—3 cents a day—or direct use of tax funds the answer?

Should the United States have a ministry of health and set up a Federal Department of Health in the President's Cabinet?

Which, if any, of the following is the answer to present problems: the status quo? compulsory insurance? various forms of voluntary insurance? thoroughgoing state medicine? evolutionary increase in governmental authority and functioning, integrated with private practice?

* * *

The American Foundation's Approach to the Subject.—While it is not possible, here, to dilate upon this welcome contribution to the literature on the medical-economic and welfare topics discussed by the 2,200 physicians who give expression to their individual views on different phases of the problems, it may be permissible to state that the two volumes are free from open or furtive support of preconceived solutions of the problems considered; and that the "American Foundation Studies in Government,"—which concerned itself in the years 1924-1935 with studies in the field of international law and international relations,—have approached this first study in the field of domestic relations in the broadest spirit. Witness the following from the foreword by Judge Curtis Bok, chairman of the Foundation's Governing Committee:

In sending our inquiry to doctors in the first instance there was no assumption that doctors alone could solve the problem. Social scientists, economists, government administrators have certainly a contribution to make. But it seemed to us that the group best able to define the problem in the first instance are the qualified medical men of the country. They should have a better idea of what constitutes adequate medical care than any economist or any government administrator. The very nature of their work, moreover, puts them in touch with conditions that are social and economic as well as medical and scientific. . . .

To the above may be added an excerpt or two from the Introduction by Truman G. Schnabel, associate professor of medicine in the University of Pennsylvania:

The inquiry sent to these contributors was in effect as follows:

Has your experience led you to believe that a radical reorganization of medical care in this country is indicated? If so, in what direction? If you do not believe that radical reorganization is indicated, what, if any, changes or revisions in the present system would you like to see made? What evolutionary possibilities would you stress?

* * *

Doctor Schnabel adds that the objective of the Foundation's inquiry

was not to poll the medical profession upon anything whatever, but rather to assemble ideas. . . .

The intent and purpose of this report is to illumine and not to prove.

* * *

The American Foundation Studies in Government.—Concerning this organization, and its governing committee of thirteen, it may be observed that the name of Dr. Robert A. Millikan, Director, Norman Bridge Laboratory of Physics, California Institute of Technology, adds lustre to

the roll; while in addition to the 2,200 contributors, the Foundation appointed a Medical Advisory Committee of 134 physicians, on which California is represented by

Philip King Brown, San Francisco; Thomas O. Burger, San Diego; William F. Cheney, San Francisco; Arthur L. Fisher, San Francisco; William J. Kerr, San Francisco; Eugene S. Kilgore, San Francisco; Langley Porter, San Francisco, and F. M. Pottenger, Los Angeles.

Speaking of the Medical Advisory Committee, it is stated:

The American Foundation would like to make it explicit that the members of the Medical Advisory Committee who are hereby joined with us in presenting this report, of course, assume no responsibility either individually or collectively, for any of the ideas quoted or presented. The Medical Advisory Committee endorses this report as a fair summary of the views of their colleagues that replied to the inquiry; the committee endorses the integrity of the work, agrees with The American Foundation in the usefulness of making it available and commends it to the study and consideration of medical men and of the public.

* * *

How Subject Matter Is Divided.—For those who would know still more about the two volumes and how they cover the topic, "American Medicine," the following may suffice:

The report falls roughly into two divisions, as follows:

The first seven sections (890 pages) describe present trends in medical practice and in medical education. They analyze without reserve what is wrong and what is right with American medicine today.

The last four sections (440 pages) discuss various proposals—social and economic as well as medical—for "distributing" medical care and lowering its cost, and for organizing medical care and public health services.

In other words, in the first (and the larger) part of the report the doctors discuss chiefly medicine itself. In the latter part they venture into the field of social and economic theory. The much greater space and emphasis given to the discussion of medicine itself is not without significance. Medical scientists do not see any possibility of separating the social and economic aspects of medical care from the quality of medical care itself, as a dominant and controlling factor in all planning.

* * *

The Place of These Studies in the Literature.—It is our belief that these two volumes of American Foundation Studies on "American Medicine" are, thus far, the most valuable contributions on the subjects discussed, and that they will be studied and referred to when other reports of much greater length, but containing the outpourings of theorizing laymen will have been almost forgotten, except for some of their statistical information.

Fact-finding studies and surveys have been much the vogue in recent years; so much so, that most folks are apt to view with suspicion many such efforts. Here in California, the sad experience of spending some \$35,000 of the California Medical Association's funds, under instructions from the House of Delegates, is still too vividly near not to make us share with others the mistrust concerning the value of some of these so-called surveys. For our part, we believe that, had the two volumes on "American Medicine" been off the press at the time the California Medical Association embarked on its survey adventure, some three years ago, and had the House of Delegates ordered the purchase, and given to each member, for his own library, the two

volumes on "American Medicine," then our Association would have had, for less than half the money it expended, twice or thrice of what we shall ultimately receive in either value or satisfaction from the California Medical-Economic Survey.

The editor believes that members who secure the two volumes on American Medicine (at the moderate price for both of only \$3.50), will not regret their purchase.

ON PROPOSED LAWS BEFORE THE CALIFORNIA LEGISLATURE

Present Status of Certain Bills.—Late numbers of the OFFICIAL JOURNAL have given brief comments on various public health measures that are now before the two houses of the California Legislature awaiting consideration and action. In this issue, the status of these bills, to date of April 16, as given in the official publications of the Legislature may be learned by scanning the excerpts found on page 347.

Below appear some memoranda received from the California Medical Association's Committee on Public Policy and Legislation, and these give additional information of interest. The attention of readers is called to the proposed law that would bring into existence in California an additional cultist examining board, this having already been passed out to the Assembly floor, for consideration and vote by that body. It is to be hoped that members of the California Medical Association appreciate the significance of that situation. Comment on the naturopathic measure and other bills is made below:

County Hospitals.—Not one of the bills designed to open up county hospitals to pay-patients has thus far passed the Legislature. Assembly Bill 51 was tabled in committee. After a lengthy hearing, Senate Constitutional Amendment No. 5 was finally sent to the floor of the Senate for a vote, but the Committee recommended that it "do not pass." Assembly Bill 1196 failed to receive a favorable vote in committee.

Chiropractic and Naturopathic.—Assembly Bill 1472, to set up a Naturopathic Board with broad powers, came out of committee with a favorable recommendation by a margin of one vote, and is now before the Assembly for action. A deluge of "mail lobbying" by its sponsors has been let loose in favor of this bill.

Two Chiropractic proposals to extend the scope of the Chiropractic Act are still in committee.

Code Bills.—The bills prepared by the California Code Commission to codify the existing laws relating to medical practice, dental practice, and nursing, etc., are on the floor of the Senate, awaiting passage of the budget bill before they can be acted upon.

Board of Health—Dentistry.—Assembly Bill 1262 increasing the membership of the State Board of Health from seven to eight, and requiring that one member be a dentist, has passed the Legislature and has been signed by the Governor.

Osteopathic Bills.—Assembly Bill 1880 (osteopaths in schools) passed the Assembly, but failed to secure favorable vote in the Senate committee. An identical measure—Assembly Bill 684—has now been started through the Assembly by the osteopaths.

Health and Hospital Insurance.—Assembly Bill 1132, sponsored by the Association of California Hospitals to provide hospitalization insurance, has passed the Assembly and is now before the Senate committee. No action has been taken in committee upon Senate Bill 121 (Williams) and Senate Bill 605 (McGovern). Assembly Bill 1283

(Welsh) and Assembly Bill 1491 (Boyle, Cronin, and McMurray) are still in the hands of a subcommittee of the Assembly Committee on Insurance.

Venereal Disease Bills.—Assembly Bill 1089 and Assembly Bill 2790 have been reported to the floor of the Assembly with recommendation, "do pass as amended." Assembly Bill 2790† is the measure having the approval of the State Board of Health.

Compensation Act Amendments.—None of the bills proposing to open up the Compensation Act to free choice of healer (not confined to M.D.'s) has been acted upon by the Committee.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 331.

EDITORIAL COMMENT†

SYPHILIS AT THE CROSSROADS

The golden opportunity for the control of syphilis is at hand. The public conscience has been aroused. If medicine is ready to act, it can completely command the situation. Now is the time to pass the legislation that we have long desired. Teeth can be put into existing laws or the requisite new legislation can be passed. If medicine will accept the challenge of the public to show them the way, victory over venereal diseases is assured. The effect of the recent publicity given by the lay press to both syphilis and gonorrhea has aroused more public interest than any other medical subject for some time. It has stimulated frank discussion of venereal diseases in service clubs, women's organizations, and friends at the fireside. If the physician is listening, he will find that the majority of individuals are vitally interested in the problem. The family itself with growing children is vitally concerned; for certainly, no matter how careful the upbringing of children, a time may come when the tide of emotion may lead the growing youth into a venereal exposure. Alcohol adds unmeasurably to the danger. The example set by more experienced companions is rarely resisted by the young man early in college when they travel together to see the night life of the city. We cannot say that our own sons will not be so foolish, for we do not know all the secrets of their minds. To the average youth, sex is an exciting mystery, and no matter how thorough his moral training, a natural instinct will often set aside moral judgment.

The challenge is, therefore, thrown to the physicians. We must teach the danger that lies in promiscuous exposure, as well as an understanding of the disease itself, and proper protective measures. We must also be able to give hope to those who are already infected, and who consider their

† This department of CALIFORNIA AND WESTERN MEDICINE presents editorial comments by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California Medical Association to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

‡ See also letter on page 345.

disease incurable. We must substitute facts for superstition. We must also teach that an infection of syphilis is often an unfortunate accident, and not a shame to be hidden from the rest of the family. The physician is likewise put on the defensive by the public itself, which is learning what is proper diagnosis and proper treatment. They will be coming to the doctor in a position to criticize, if incompetent methods are used. The man of medicine must, therefore, examine himself as to shortcomings in knowledge of the disease, and be sure that the handling of each case is thorough and efficient.

The physician should also examine his conscience in regard to the cost to the patient. It has often been the practice in the past to place a special charge on venereal cases. This should be considered pernicious and, therefore, be discontinued. Only a fair charge, in which the cost of the medicine is considered, should be made for the physician's services. The public health departments must also develop a better liaison between themselves, the clinics of teaching institutions, and the doctors. They must be willing to assist the physician in the control of his cases. They must have police powers both to control the infected individual and to see that he receives the necessary treatment for cure. The work should not be taken out of the hands of private physicians except in the case of indigents. If possible, the boards of health should be able to supply the drugs so that the physician can treat his cases at a cost less prohibitive to the great mass of common people.

Men and women of the Profession of Medicine, this is the opportunity of our greatest service to humanity in our present century. Let us not be derelict in accepting the challenge.

BENZEDRIN SULPHATE

There has been a tremendous amount of research recently in the field of pharmacology concerned with drugs having soporific, depressant or analgesic effects. It far outshadows, in volume at least, that concerned with drugs of a contrary action. The search for oblivion to pain, in other words, still occupies its traditional place in medicine, as it should, but lags with characteristic human inconsistency far behind the search for stimulation. Yet the latter, in the long run, will probably prove to be more important and fundamental in explaining the physiology of consciousness.

Among the more interesting groups of substances falling in the category of stimulants are those which bear a chemical resemblance to epinephrin. Ever since the chemical formula of this naturally occurring drug was discovered, attempts have been made to find chemically related substances that have all its desirable pharmacologic effects, but that would be active on oral administration, which epinephrin is not. In the search for such substances, the first of any importance to be discovered was ephedrin, also a naturally occurring

compound but, unlike epinephrin, from the vegetable rather than from the animal kingdom. Ephedrin, as compared with epinephrin, was found to have essentially the same therapeutic, if not pharmacologic, action, except that it was active by mouth and had a more prolonged, although weaker, vasopressor and broncho-dilator effect. In addition, certain side effects were noted which were not characteristic of epinephrin, particularly that of producing insomnia. With this property in mind Janota¹ used ephedrin for treatment of narcolepsy with encouraging results.

Meanwhile Alles,² studying synthetic compounds related to epinephrin, noted that they varied in their central stimulant actions; and of these compounds one has been introduced into medicine under the name benzedrin, in the form of its sulfate. It has long been known that pharmacologic action is often related to chemical constitution, and this has been further confirmed in the case of the related substances epinephrin, ephedrin and benzedrin.

Just as ephedrin differs in its action, in some respects, from epinephrin, so does benzedrin differ from both epinephrin and ephedrin. All belong to a group of chemically related, vasopressor compounds. Their vasopressor (peripheral or sympathomimetic) activity differs, however, in intensity and duration. Epinephrin acts with the greatest intensity and for the shortest time. Ephedrin is intermediate in both these qualities, and benzedrin is the least effective (1/100 to 1/200) that of epinephrin, but has a more prolonged effect. Like ephedrin, benzedrin is also effective on oral administration. Also like ephedrin, benzedrin has a marked central stimulating effect. Prinzmetal and Bloomberg³ have shown that it is more intensely and more certainly effective than ephedrin, as measured by its efficacy in the treatment of narcolepsy, being successful even when ephedrin fails.

It is this central effect that led Nathanson⁴ to investigate the action of benzedrin sulphate both in patients complaining of fatigue and exhaustion and in normal individuals. The results of this investigation have been most striking and distinctly unique in the field of therapeutics. In summary, Nathanson⁴ has found that the drug ameliorates fatigue and drowsiness, and produces a feeling of exhilaration, accompanied by an increase in mental

⁴ Nathanson, M. H.: The Central Action of Beta-amino-propylbenzen (Benzedrin), *J. A. M. A.*, 108: 528 (Feb. 13), 1937.

activity and efficiency. This is often associated with a tendency to loquaciousness and unusual friendliness. Loss of weight, from prolonged use, is ascribed not to an increase in metabolic rate, but to an increased activity, lessened sleep and diminution of appetite. This latter may be due to dryness of the mouth, an atropin-like effect often noted. Nasal congestion from acute or chronic affections of the upper respiratory tract is often markedly relieved. Unpleasant effects noted, usually of mild degree, were sweating, tremor of the hands, palpitation, headache, nausea, dysuria and diminution of libido.

The optimum dosage varies with individuals. Generally, 10 milligrams before breakfast and 10 milligrams before lunch results in onset of effect within thirty minutes to one hour after taking the first dose, and persists for seven to twelve hours after the second dose.

Unlike epinephrin and ephedrin, prolonged use does not seem to diminish the effectiveness of the drug nor produce cardiac irregularities. Nathanson,⁴ however, warns that the increased activity, if carried beyond the capacity of a handicapped individual, carries with it obvious dangers. It is for this reason that its administration is to be undertaken only with the guidance of a physician.

In conclusion, it may be said that benzedrin is a drug which increases in great degree the awareness of an individual, a relatively unique pharmacologic phenomenon that opens new fields in the study of the physiology of consciousness.

HYMAN MILLER,
Los Angeles.

Dentistry of 1864.—J. R. Dillingham of 12 Winter Street, Boston, sends us the following rules for the preservation of the teeth:

First: Let care be given to the teeth of children. Deciduous teeth (first set) may be extracted too soon, or left too long. If the fangs of the first teeth are absorbed, drop out, and give place to the second, all will be well. But if they appear on either side of the arch, lose no time in applying to a good dentist.

Second: When a concretion of tartar collects upon the teeth of a person of any age or sex, lose no time in applying to a dentist for its removal. Many lament the loss of a whole set of teeth from this concretion alone.

Third: When a tooth becomes sensitive from taking cold or warm drinks, or a cavity appears ever so small, lose no time in applying to a judicious dentist, as many teeth are totally lost by not being timely filled with metal. But when filled with proper materials, and by a skilful dentist, it will preserve them, not for a few months only, but for a whole life. The bad effects produced by bad breath, occasioned by one or more diseased teeth, are not of small consideration. If the effects produced by such breath be so extremely unpleasant to the olfactory nerves of other individuals, what must be the effect upon the delicate tissues of our own lungs?

Fourth: All teeth too much decayed to be saved by plugging, and all roots, should be extracted, lest they injure the health of the general system.

Fifth: Lost teeth should be artificially restored, since they are rendered at once permanent, beautiful, and answer all reasonable expectations of the patient as regards articulation, mastication, and natural appearance.—*Found by R. S., New York, in Godey's Lady's Book and Magazine, July, 1864, p. 93.*

ORIGINAL ARTICLES

HUMAN BETTERMENT*

By EDWARD M. PALLETTE, M.D.
Los Angeles

FOREWORD.—Everyone, no doubt, is influenced more or less by his immediate surroundings. The following paper was written by me on a very recent six weeks' cruise along the shores and among the islands of the Gulf of California; or, as the Mexicans call it, the Vermilion Sea, or the Sea of Cortez.

Our ship† was a beautiful 200-foot Diesel-powered steel cruiser, ideally constructed for the purpose of making expeditions of exploration and doing scientific collecting. The accommodations were most comfortable, the food was excellent, the scenery inspiring, and the collecting very interesting. The ship possessed an excellent library of travel and natural science. Our company was a group of biologists and other scientists, all industrious and enthusiastic in their work. Life seemed full and well worth living.

I was, of course, influenced by the immediate environment, which was distinctly biological; but after returning home and rereading the paper, it was decided to leave it as written, although with the consciousness that it probably presents to a group of physicians some elementary biology with which they are already familiar.

I would make a plea for a wiser distribution of charity. I would call the attention of educators, preachers, social workers, lawmakers, and physicians to certain well-recognized findings of the science of biology.

BEGINNINGS OF LIVING THINGS

To even the casual reader of history it is obvious that the story of the long life of man upon earth has been one of a succession of civilizations, each more or less distinct, in time and place, from the others. Archaeologists tell us that there are evidences of at least seven of these civilizations in very remote and prehistoric times. There have been at least an equal number since man began leaving written evidence of his doings.

It is estimated that life first appeared upon the earth about five hundred million years ago, beginning with microscopic, single-celled, marine forms, these becoming more complex and more highly developed through the ages. About five million years ago our remote ancestors gradually acquired those characteristics which entitled them to be called human. Then followed long ages of savagery to be succeeded by other long ages of barbarism and semi-barbarism, men living the lives of wild beasts in the jungle.

THE FIRST CIVILIZATIONS

Back along this long line of darkness there was an occasional gleam of light. Some group of men

* Address of the retiring president. Read before the first general meeting of the California Medical Association at the sixty-sixth annual session, Del Monte, May 3 to 5, 1937.

† *Velerio III*, Captain G. Allan Hancock.

somewhere had developed those superior traits of mind and body which had enabled them to emerge from barbarism into those ways of living which we call civilized. This civilization would flourish for a time and then decline and disappear. After many centuries, another bright spot would appear in the darkness, usually in a different part of the world and among a different people. Then this light would go out, to be followed by long ages of semi-barbarism. Many theories have been advanced as to the causes of the downfall of these civilizations, especially during historic times. It is said that the Greco-Roman culture, the greatest of all before our own, declined; because of the invasion of the barbarians; then came the adoption of Christianity, with its policy of nonresistance and turn the other cheek; corruption in living and government; the breeding of the incompetent among themselves; and malaria.

EPIDEMICS A FACTOR IN DECLINE OF CIVILIZATIONS

In writing the story of the decline of civilizations, too little attention would seem to have been given to the influence of epidemic disease. Some day a historian will write with more knowledge of epidemiology, and a different story may result.

Egypt is a good example. Shut in by desert and sea, the ancient Egyptians, through untold ages, developed a high grade of culture. Then they began going out and conquering other people and bringing the conquered tribes home with them as slaves. With these they brought diseases, against which they had no resistance, and they themselves were weakened and went into a decline. The mummy of Seti II, one of the greatest of the Pharaohs, in his glass case in the museum at Cairo, plainly shows the fresh lesions of smallpox, of which he died. A very large percentage of the poor, incompetent inhabitants of Egypt at the present time suffer from schistosomiasis. The cysts of the organism of this disease are found in the mummies of Tutankhamen's time.

Malaria contributed much toward the fall of ancient Greece and Rome.

In Yucatan and Guatemala, the twelfth century, A. D., showed a highly developed culture among the Mayans, who left a record in stone of the number who died each year from "black vomit," or yellow fever, until none was left to longer make the record.

In Cambodia, in French Indo-China, the wonderful ruins of Angkor were discovered seventy years ago, where they had been lost and forgotten for five centuries. Little is known of the people who built there, and nothing of what became of them. It is significant, however, that the last buildings erected by these people, a group a few miles away in the jungle, was a hospital. They seem to have been destroyed by an epidemic which they did not know how to fight.

COMMUNICABLE DISEASES AND PRESENT-DAY CIVILIZATION

It is safe to assume that our own civilization will not be destroyed by communicable disease. Our knowledge of epidemic diseases and their con-

trol and prevention is too complete. Diseases which have, in centuries gone by, ravaged the civilized world, and all but depopulated whole countries, such as bubonic plague, yellow fever, cholera, smallpox, and malaria, are now almost exterminated, and others, such as tuberculosis and diphtheria, are well under control.

THE FATE OF OUR OWN CIVILIZATION?

What then of our own boasted civilization? Will it continue indefinitely, or will it go the way of all others and disappear? It is not pleasant to think that our children's children may go into another age of darkness or live subservient to a people of another race and language, perhaps of another color.

ORGANIC EVOLUTION

The doctrine of organic evolution is a very old one. The Greek, Empedocles, of the fifth century, B. C., has been called the father of the evolution idea. This was developed more fully by Aristotle a hundred years later. Then the idea declined, and during the Middle Ages only an occasional thinker referred to it. Following the Renaissance several natural philosophers revived interest in the subject. Among these were Bacon, Descartes, Leibnitz, and Kant. Then came the great naturalists of the eighteenth century, Linnaeus, Buffon, Erasmus Darwin, Lamarck, and Couvier—all evolutionists.

Charles Darwin, whose name is so closely associated with the evolution idea, advanced, in his *Origin of Species*, the Theory of Natural Selection, that evolution has taken place because of the struggle for existence among all organisms, and the resultant survival of the fittest. This is Darwinism. A great controversy followed the publication of Darwin's books, but since his time practically all scientists and most other educated men have been supporters of the doctrine of evolution.

Charles Darwin and Abraham Lincoln were born the same day, February 12, 1809, and have been referred to as the two great liberators—one of men's minds, the other of their bodies.

Most scientists have accepted the theory of natural selection. The differences of opinion and many efforts of research have been along the lines of attempting to discover the methods by which the fit are produced. The paths by which living things acquire those qualities which enable them to survive are several. It is generally agreed that whatever forces are operative in producing variations in plants and animals, the principle of natural selection is a constant and dominant factor in organic evolution.

SURVIVAL OF THE FITTEST: APPLICATION OF THE DOCTRINE TO PRESENT-DAY TRENDS

Ever since life first appeared upon the earth the ancestors of mankind have struggled to exist and only the fittest have survived. You and I may not be very smart, but we can be quite sure that our ancestors of a few hundred years ago were very smart men and women, because in all the ages past only the smartest survived to that time of life when they could bear offspring. This is not so true in recent times.

Ancient Rome divided her people into six classes. The lowest of these were supported by the state and were excused from all civic duties, including the payment of taxes, voting, and military service. They were called the proletarians, and were expected and urged to have many children in order that the population might be maintained. No wonder Rome fell!

But are we not doing the same thing and worse? We not only support our ever-increasing proletariat, giving them, without charge, housing, food, clothing and the best of medical and hospital care, and excuse them from paying taxes and encourage them to have large families—which they would do without any encouragement!—but we permit them to choose, often from among themselves, the men who make our laws, and the men who execute our laws, and the men who sit in judgment upon our laws.

WORLD WAR INTELLIGENCE TESTS

During the World War an intelligence test was made upon nearly two million United States soldiers. The results were not very encouraging. Sixty per cent of these picked men, including the officers, gave a rating of fourteen years or under. If 60 per cent of our men in the World War had an intelligence of only fourteen years or under, it is safe to say that at least an equal percentage of all American men are in that class. And how about the women? There are no corresponding figures for women, but it is fair to assume that we are not overchivalrous if we give them the same rating. We hear somewhat of the adolescent female mind, but it is probable that for all the adolescent female minds there are an equal number of adolescent male minds running loose.

At least 60 per cent, then, of our adult population is adolescent. Most of what is published in our newspapers is for adolescent consumption. The majority of the books and magazines now being printed are written for adolescents. A large part of the broadcasting over the radio is for the doubtful benefit and entertainment of adolescents and morons. The "movies" are supported by the same group, for these people need a great deal of entertainment. Jazz music is all definitely moronic—composers, producers, consumers. We would not exactly recommend that all jazz orchestra leaders be lined up and shot at sunrise, but the suggestion has been made, and it is perhaps quite worthy of consideration. And much of this ultra new art stuff is worse than moronic. To the average mind it is imbecilic if not positively psychopathic.

And morons all have large families of physically healthy little morons—always morons.

Only 50 per cent of the graduates of leading women's colleges in America marry, and each of these has only one-third as many children as does the noncollege woman. In other words, the graduate of the women's college bears only one-sixth as many children as does the average American woman. We have not the figures for the alumnae of coeducational institutions; they may not be so bad. Phi Beta Kappas have still fewer children than do the average college graduates.

STREAM OF HEREDITY

A fairly accurate mental test of adults could be based upon the number of children born—the fewer the children the higher the intelligence of the parents. Many statistics could be adduced showing that the normal and supernormal are bearing fewer children, while the subnormal and dependent are bearing more and more; and it is also true that, while the offspring of the normal and supernormal may not always be supernormal or even normal, the offspring of the subnormal are always subnormal. No heredity stream ever rises higher than its sources.

RELATION TO POLITICAL ORGANIZATION

If the legal age for voting, instead of being twenty-one calendar years as at present, were based upon an intelligence test and placed at, say, sixteen years, it would reduce the number of voters much more than one-half and might solve some of our problems. Many believe that an intelligent government, even if not altogether honest, is much safer than an unintelligent government even though this be thoroughly honest. It is too often both unintelligent and dishonest.

We are fast approaching a condition when we will be a nation of adolescents governed by adolescents, for adolescents. Or, if you will, a nation of subnormals, governed by subnormals, for subnormals.

But this is not the worst of it; for the world has much work for the 12 to 14-year-old man and woman to do. They play an important part in the social and economic set-up. It is the low-grade moron, the feeble-minded, the insane, the criminal, the drug and liquor addicts, the confirmed pauper, that should worry us.

I will not burden you with figures, but we all know that feeble-mindedness, insanity, crime, drug and liquor addiction, and pauperism are all rapidly on the increase.

Since time began, our ancestors had to fight to survive. They all had to struggle, and it was a case of the devil taking the hindmost. The devil took not only the hindmost, but he took all but the foremost. We are changing all this and making it possible for the devil to take the foremost.

PRESENT-DAY CIVILIZATION: SOME RECENT FACTORS

In comparatively recent years our civilization has come to differ from all others in two outstanding respects—the marvelous development of mechanical inventions, and the wonderful discoveries of science. A third element has entered the picture which is new to the world—an enormous development of emotional sympathy for the down-and-out, the weak, the sick, the insane, the incompetent, the poor, all those who in all previous times, even in previous civilizations, have been exterminated by a pitiless nature.

Professor E. G. Conklin writes:

"If society had deliberately set about the propagation of the unfit, it could hardly have devised more effective means than many of those which are now in vogue.

"For the first time in the history of life upon the earth, a single species now has the power of controlling to a large extent its own evolution, and it has begun by radically changing some of the conditions of progress which have prevailed hitherto. A large part of the human race is now engaged in the most stupendous and dangerous experimentation upon itself; without any adequate knowledge of the mechanism of evolution, it has begun to tinker with that mechanism, throwing certain parts out of gear, destroying others, and in general paying little or no attention to the results."

We would not for a moment recommend less of sympathy for the unfortunate and incompetent. They must be cared for by every means possible. We can, however, do much to prevent them from propagating, for they cannot propagate any other kind than their own kind.

HEREDITY AND ENVIRONMENT

The heredity and environment discussion is very old, but all modern biology teaches that heredity plays the preponderant part in shaping men's real natures and abilities. Environment gives men opportunity for achievement, but heredity determines which men will avail themselves of that opportunity and the extent to which they will achieve.

Our knowledge of the laws and mechanism of heredity has increased enormously since the beginning of the present century. Biologists believe that environment and training are very minor factors in human development.

Heredity may be defined as the tendency of offspring to resemble their parents. Until the time of Weismann, fifty years ago, it was generally believed that the offspring inherited from the entire bodies of the parents, and that characteristics acquired by the parents were transmitted to the offspring. Weismann taught, and this has since been generally accepted, that inheritance takes place from the germ plasm only, of which the parents are mere carriers, and that acquired characters are not transmitted.

The science of genetics seeks to determine the physical basis of heredity. Much progress has been made along this line. All are familiar with the laws of Mendel.

In the right to life, liberty, and the pursuit of happiness all men are equal. In all other respects all men are born unequal and they will always be unequal. Due to the all-powerful influence of heredity, they are unequal in their natures and in their capacities.

It is not only the biologists who tell us that heredity is far more influential than environment. The behaviorists among the psychologists insist that "ninety per cent of a man's behavior is due to his heredity."

It has been said, "It is man who makes his own environment, and not environment that makes the man."

EUTHENICS

Euthenics, the science of learning to live well, applies to education and environment. Eugenics,

"the science of being well born," has to do with heredity. Both are attempts at human betterment. The biologist teaches the importance of the germ plasm. The sociologist emphasizes the importance of educational endeavor and environment. Each of these must learn his lesson from the other. Without an educational and environmental opportunity, the best of heritages is handicapped.

EUGENICS

Doctor Davenport, working in the field of eugenics, urges that we "dry up the streams that feed the torrent of defective and degenerate protoplasm." Toward this end it is suggested that, in the United States, the following agencies be employed:

1. A more strict control of immigration.
2. Marriage laws requiring medical examination and other restrictions.
3. Education of the public in matters of eugenics.
4. A more extended sexual separation of defectives in public institutions.
5. Sexual sterilization of certain types of defectives.

AMERICA AS A MELTING POT

The idea of America as a melting pot and asylum for the down-trodden of all the world, conceived in the days of our ignorance of matters eugenic, arose from an exaggerated sympathy and an overconfidence in our own ability to extend aid. America owes much to her early immigrants, but in later years many undesirable and unassimilable stocks have come in. Both statistical studies and animal experimentation show that the offspring of stocks which are widely separated are weaker than either parent stock. This is especially true after the second generation.

A few years ago I made a Mediterranean tour, visiting all the countries bordering on that historic inland sea—southern Spain, southern France, southern Italy, Greece, Turkey, Syria, Palestine, Egypt, Tunis, Algiers—and came home with the feeling that I would like to build a wall around America a mile high and shoot anyone who tried to look over it.

IMMIGRATION

Goddart, in discussing mental tests for immigrants into America, states that "the average steerage passenger is of low-grade intelligence, perhaps even feeble-minded." An examination made by him of those arriving, by Binet tests, showed that only one in seventy-four scored as high as twelve years, "which is regarded as the line between feeble-mindedness and normal." These immigrants were from the south of Europe.

It is stated that in one year more than seven thousand were refused admission to the country at Ellis Island alone. These included idiots, feeble-minded, insane, paupers, applicants with communicable diseases, prostitutes, and criminals.

It has been suggested that our laws of immigration be made more strict, and that trained inspectors be placed abroad in those countries from which immigrants are coming, and that they look into the ancestry as well as make personal examination of applicants.

MARRIAGE AND STERILIZATION

All applicants for license to marry should be required to pass a strict medical examination. Those found to be eugenically unfit to have children should be permitted to marry only after sterilization.

STUDY OF EUGENICS IS NEEDED

The public should be educated in matters of eugenics. Biology should be a required study in all high schools, with emphasis upon its eugenic implications. I would here make two suggestions to our educators: First, that instead of compelling all boys and girls to go to school till they are eighteen years of age, I would not permit them to go after they are fourteen unless they do a satisfactory grade of work. Our high schools and colleges are cluttered up with a lot of boys and girls who would be better off if they were at home and at work. Second, that the schools give less time and effort to the subnormal and "underprivileged," and pay more attention to the normal and supernormal. The prime object of our educational system should be training for leadership. The world needs properly trained leaders, and the leaders come from the supernormals.

STERILIZATION AS A EUGENIC REMEDY

Sterilization as a eugenic remedy is perhaps somewhat radical at this time, but after a sufficient education of the public it will no doubt become far more general and effective. More than half of the American states have passed laws compelling or permitting the sterilization of those with the most evident hereditary defects. Under certain limited conditions California, the third state to enact such a law, has, to date, sterilized about ten thousand patients under this law—more than any other state.

The German sterilization law is more comprehensive and applies to such conditions as feeble-mindedness, schizophrenia, Huntington's chorea, hereditary blindness, hereditary deafness, hereditary physical deformity, and severe alcoholism. It is mandatory, and special courts are available for passing judgment in such cases. If German plans along this line are carried out, a superior race will result.

BIRTH CONTROL

The best we can say for the birth-control campaign, as now conducted, is that, eugenically, it is a gesture perhaps in the right direction. It may aid in arousing public interest in eugenics. On the whole, it is probably detrimental to race betterment. The intelligent class of people, who should have more children, avail themselves of the information furnished by the birth-control propagandist, while the unintelligent, the class who should be reached, are too ignorant, indifferent and careless. However, properly conducted birth-control clinics among the very poor should be encouraged.

Among all organisms, both plant and animal, it is true that any characteristic of structure, function or habit which assists in the survival of the species to which that organism belongs persists, while any characteristic which does not so assist either

disappears, or the species to which it belongs disappears.

APPLICATION OF NATURAL SELECTION TO HUMAN ACTIVITIES

As applied to human activities, the doctrine of natural selection means that all those characteristics, whether of structure, function, or activity, which tend to race advancement and ultimate race survival, are good; while all those characteristics which do not so tend are bad. This may be said to be the biologic basis of ethics. All things are right which contribute to race betterment and race survival, and all things are wrong which do not so contribute. This is the yardstick by which every rule of human conduct should be measured. All permanent elements of religion must rest upon this basis. All systems of ethics must conform to it. All living nature, both plant and animal, is filled with instances where individuals sacrifice self, or are sacrificed, for the good of their species. This is the rule we must constantly have in mind in considering the problem of the care of the great mass of incompetents among us: What is the best for the race of the future?

IN CONCLUSION

Wars will continue and they may disrupt the world. We may be overwhelmed by the load of the defective and incompetent among us, and our civilization may go the way of all its predecessors. But "they that shall be of us shall build up the old waste places." Those young men of good heredity who marry the right young women of good heredity may rest assured that their children and their children's children, if they marry wisely, will rise above the wreck and ruin, and build for themselves and their posterity great and happy and heroic lives.

"When young men have vision the dreams of old men come true."

1930 Wilshire Boulevard.

VENEREAL DISEASE CONTROL PROGRAM:
DEPARTMENT OF PUBLIC HEALTH,
STATE OF CALIFORNIA*

By HOWARD MORROW, M.D.
San Francisco

FOREWORD.—The California State Board of Public Health established the first bureau of venereal diseases to be organized within any state health department in the United States. This bureau was established in 1917, and functioned actively for three years until Federal and State funds were withdrawn in 1920. Because of lack of funds, it was necessary to discontinue the bureau work; but it has of late been reestablished, through the use of Social Security funds, and is again actively engaged in the development of a program for venereal disease control in California. It will promote and coördinate activities in local, city and county health departments and endeavor to adjust the State program with that developed by the Fed-

* From the Office of the President, Board of Health of the State of California.

Read before the third general meeting of the California Medical Association, at the sixty-sixth annual session, Del Monte, May 3 to 5, 1937.

eral Government. With the addition of State funds through pending legislation, these programs in local communities will be greatly extended.

OBJECTIVES OF THE BUREAU OF VENEREAL DISEASES OF THE CALIFORNIA STATE BOARD OF HEALTH

The general objectives of the Bureau are :

1. To provide adequate facilities for treatment of venereal diseases.
2. To assist clinics to the end of improving standards of diagnosis and treatment.
3. To distribute drugs, without cost to clinics, meeting required standards, and to private physicians whose patients are unable to pay for the same.
4. To promote epidemiologic investigations into both syphilis and gonorrhea in order that sources may be controlled, contacts investigated, and delinquents returned to treatment.
5. To promote the complete reporting of cases of venereal diseases.
6. To conduct an informative and educational program for the benefit of the general public.
7. To inform the medical profession of new methods in the treatment of venereal diseases as they develop.

ALL PERSONS HAVING VENEREAL DISEASE SHOULD BE TREATED

Of first importance is the provision of treatment for every case of venereal disease in California. All patients who are able to pay shall be cared for by private physicians, as is the custom in every case involving medical care. Facilities for the care of indigent patients are now available in free clinics located, for the most part, in the larger centers of population, and they will be extended to include migratory patients. In such clinics the following services should be available :

(a) The diagnosis and emergency treatment of any patient who applies.

(b) The diagnosis and treatment of any patient who is referred by a private physician, either for continued treatment or for consultative advice and opinion.

(c) The treatment of any patient who is unable to afford private medical care.

All such patients will be investigated and the economic status of each ascertained. All patients who are able to afford private medical care will be referred to private physicians. These requirements are, essentially, those now observed in most clinics throughout the State.

MEDICAL SERVICE SHOULD BE ADEQUATE

Efforts will be made to raise the standards of medical service within the clinics, so as to insure adequate diagnosis and treatment. Clinic record forms are being prepared for distribution in order to improve the standards of record keeping. Every effort will be made to assure continuous treatment of clinic patients. Transients are to be provided with identification cards that will admit them to any clinic coöperating with the State Department. It

is believed that, in so far as possible, physicians should be paid for their services in the clinics. Many clinics throughout the State are paying either part-time or full-time physicians for their services.

EXISTING VENEREAL DISEASE CLINICS

At present venereal disease clinics are being administered by the following general organizations :

(a) Full-time health departments with the health officers in charge, and either full-time or part-time physicians administering treatment.

(b) County hospitals entirely independent of health departments.

(c) County hospitals in which the hospital and public health departments are administered by a single department.

(d) Private charitable institutions.

(e) Medical-school clinics.

These general classes of clinics will continue as at present, but it is proposed to provide closer coöperation between the clinics and health departments in order to develop efficient epidemiologic work. The means by which this can be accomplished will vary from clinic to clinic ; but, in general, the services of local health departments will be available to investigate cases, contacts and sources of infection.

RURAL PROBLEMS

The treatment of indigent patients in rural communities will require special provisions. Funds for treatment of indigent patients in rural communities and, if necessary, for transportation to places where treatment can be obtained will be provided.

DISTRIBUTION OF DRUGS BY THE STATE

The free distribution of drugs, which has been carried on to a limited extent since 1917 by the State Department, will be extended. Present plans call for the distribution of drugs to charitable institutions, clinics, and to private physicians for the treatment of indigent cases. In so far as is possible, such distribution will be conducted through local health officers.

ISOLATION AND HOSPITALIZATION FACILITIES

Facilities for isolation and hospitalization of venereal disease cases are now quite inadequate. Many clinics at the present time are established in connection with hospitals. Such hospitals will be required to accept patients for isolation if help is to be extended to the clinics. Additional isolation facilities must be provided in many districts of the State. This will be done as local communities are educated to the necessity for such facilities and as funds can be raised for the purpose. As an integral part of this provision of isolation facilities, there is included the provision of facilities for pyrotherapy, which method of treatment is coming to play an ever-increasing rôle in the treatment of these diseases.

There are now available a number of diagnostic centers throughout the State in conjunction with medical-school clinics. Plans are going forward to enlarge and extend these services.

EFFORTS TO IMPROVE TREATMENT STANDARDS

The treatment of syphilis is subject to a limited degree of standardization. A special bulletin is being issued by the State Department of Health in which the modern treatment of syphilis is described. Copies of this bulletin are to be disseminated among clinics and physicians of the State. A second bulletin outlining modern trends of treatment of gonorrhea is being prepared. It is hoped that with these efforts, together with wide publicity, the general standard of treatment of venereal diseases throughout the State can be materially raised.

An effort will be made to eliminate the prenatal transmission of syphilis. Publicizing the necessity for blood Wassermanns in every pregnant woman is planned.

ADEQUATE EPIDEMIOLOGIC WORK IMPORTANT

Next to treatment, adequate epidemiologic work is probably most important. By a recent ruling of the State Board of Public Health, the morbidity report cards have been changed. Through publicity, education and appeals to coöperation, as well as legal measures where indicated, physicians will be encouraged to report all cases of venereal diseases. In addition to sending in morbidity report cards on each case, all clinics will be required to send monthly reports to the State Department. Laboratory reports will not be accepted as case reports, but will be used only for checking purposes.

Physicians are required by law to report venereal diseases. In addition, they are to report to health officers any cases lapsing from treatment while still in the infectious stage of the disease. The health officer shall then see that the patient is returned to treatment, enforcing quarantine and isolation in a hospital if necessary. The health officer is also responsible for keeping clinic patients under treatment until rendered non-infectious.

It is desired that every early case of venereal disease shall receive a complete epidemiologic investigation. This will include investigation into the source of infection and all possible contacts. Efforts will be made to bring these contacts in for examination and, if necessary, for treatment. In addition, efforts are to be extended to keep patients under treatment for the required length of time.

STATE BACTERIOLOGIC LABORATORY

The State bacteriologic laboratory will pursue essentially the same course that it has in the past by running tests for all State institutions and certain other private agencies. As in the past, tests will be run on specimens from private patients who are unable to pay for such services, provided these specimens originate in districts not taken care of by local health department laboratories. As in the past, the State bacteriologic laboratory will be available for checking and standardizing of tests run by any laboratory in the State. The plan is not to extend the State bacteriologic laboratory's activities, but to use them, in so far as is possible, to bring up the general standards of laboratory service throughout the State.

EXTENSIVE EDUCATIONAL PROGRAM PLANNED

An extensive informative educational program is being outlined. As indicated above, special bul-

letins are being prepared for physicians. In co-operation with the state and county medical societies, special courses in diagnosis and treatment of venereal diseases are being outlined for presentation to county medical society groups. A number of county medical societies are proceeding with plans of their own in this respect. It is hoped that special courses can be arranged in medical schools for physicians who are interested in obtaining additional information relative to these diseases. In an effort to obtain more definite information concerning the incidence of these infections, surveys will be run from time to time throughout various districts of the State. Questionnaires have already been sent out to several counties.

Literature is being prepared and accumulated for distribution to patients by physicians and clinics. Informative programs for the general public are being prepared. These will include newspaper publicity, lectures, pamphlets, posters, radio addresses, etc. The general public is to be informed particularly concerning the economic costs and benefits from control of these diseases.

In conclusion, it may be stated that the constituted public health authorities of California have in mind a venereal disease program that will aid, in fullest measure, the eradication of venereal disease, but along lines that will not make for confusion or low-standard results through officious meddling with the work of licensed physicians in private practice.

THE EXTENSIVE SIDE-ACTIONS OF BARBITALS AND THEIR TREATMENT*

By P. J. HANZLIK, M.D.
San Francisco

DISCUSSION by C. H. Thienes, M.D., Los Angeles;
C. D. Leake, Ph.D., San Francisco; Fred B. Moor, M.D.,
Los Angeles.

THE object of this paper is to draw attention to actions of barbitals which are oftentimes overlooked in the enthusiastic reception of some highly exploited use, such as the intravenous for analgesia or anesthesia. The actions referred to are the undesired side-actions, some of which are unavoidable in the ordinary uses of barbitals. They shed a light on the irregularities in actions and the physiologic disturbances met with in the use of these drugs.

Since 1929, I have been in the habit of demonstrating to medical students three graphic records which illustrate depression and paralysis of peripheral neuromuscular elements in the autonomic system caused by amytal. They are presented here in Figures 1, 2, and 3, which illustrate depression of the circulation, vagal ganglia, and intestines, respectively. The results illustrated in Figures 1 and 2 agree in all essential respects with recent reports of Koppányi and coworkers,¹ and are to be regarded as confirmatory. The same holds true

* From the Department of Pharmacology, Stanford University School of Medicine, San Francisco.

Fig. 1.—Amytal intravenously in a cat. Depressant effects on blood pressure, pulse rate and vagus ganglia are shown; pilocarpin and cholin, effective before and after amytal; collapse required artificial respiration.

Fig. 2.—Amytal intraperitoneally in a cat. Depressant effects on blood pressure, pulse rate and vagus ganglia are shown; cholin and pilocarpin effective before and after amytal, epinephrin after amytal; artificial respiration for the depression.

Fig. 3.—Amytal on excised intestine of a rabbit. Weakened reactions to pilocarpin, epinephrin and especially barium, as stimulants for autonomic nerves and muscles are shown.

for the results in Figure 3, which confirm the work of others. These confirmations clinch the evidence experimentally and dispose of some uncertainties about the nature of the side-actions.

CIRCULATORY AND VAGAL GANGLIONIC DEPRESSION

The legends on Figures 1 and 2 are self-explanatory as to the occurrence of events in two cats receiving injections of sodium amytal in so-called anesthetic dosage—one intravenously, the other intraperitoneally. Briefly recapitulated, the phenomena are as follows: depressor or collapse action (fall of blood pressure); paralysis of vagus control of the heart without loss of function in the peripheral receptive mechanism (ineffective vagus stimulation; fall of blood pressure and bradycardia from cholin and pilocarpin); absence of central and peripheral vasomotor paralysis (recovery of blood pressure, and pressor action of epinephrin, positive); cardiac depression suggested by bradycardia or tachycardia, with constant loss of vagus control; reflex cardiac slowing improbable (ineffective peripheral vagus stimulation). Presumably, direct cardiac depression is the cause of the circulatory collapse. A justifiable

conclusion is ganglionic paralysis or synaptic block in the cardiac vagi, an action of the amytal paralleled commonly by such poisons as nicotine and lobelin, and sometimes by cholin. This paralytic action has been further analyzed and conclusively demonstrated pharmacodynamically by Koppányi, Dille, and Linegar.¹ It does not require intravenous injection of a barbitol.

The ganglionic paralysis blocks the transmission of both efferent and afferent impulses in the cardiac vagi, and in case blockage extends to other branches of the vagi, and parasympathetic nerves in general, this action of barbitals interferes with visceral reflexes, some of which are protective, such as vomiting and coughing. On the other hand, the ganglionic paralysis, together with the central depression of a barbitol, would make an effective combination for controlling asthmatic attacks of reflex origin.

INTESTINAL DEPRESSION

All the functional elements in a strip of excised rabbit intestine are included in the depression, the muscles perhaps more than the nerves (Figure 3). Muscular depression is shown by a progressive decrease in tone and rhythmic activity, and in re-

action to barium. The autonomic nerves reacted satisfactorily to pilocarpin and epinephrin after poisoning with amytal in low (1:50,000) concentrations, as compared with unpoisoned intestines (not shown here). But after high concentrations (1:8000), the reactions to the same poisons rapidly declined. The concentrations of amytal used for demonstrating these depressant actions were higher than those attainable in the same tissues after oral administration of amytal. However, the moderate depressions of the low concentrations indicate effects of anesthetic doses of amytal given intravenously, and those of higher concentrations of repeated and toxic injections. They are confirmatory of depressant effects described by Gruber² for a number of barbitals in a considerable range of concentrations, and those of Quigley, Barlow, and Himmelsbach,³ using the intact gastro-intestinal tract.

For sake of completeness, the following list of side-actions is recorded: gastro-intestinal flaccidity and reduced peristalsis, decreased intestinal absorption of dextrose, decreased consumption of sugar by skeletal muscles, decreased urine secretion, alarming restlessness, delirium or stupor, paresis of the tongue, cyanosis and asphyxia, skin rashes, arsenic-like paralysis of capillaries, pulmonary congestion and edema, mucoid degeneration of the brain;⁴ depression of the spinal cord and reflexes, emphasized recently again by Porter and Allamon;⁵ blood-destruction and anemia with intravenous anesthetic doses of evipal, a much-exploited barbitat at the present time;⁶ increased blood sedimentation and reduced cell volume with slow return to normal after a number of barbitals and evipal;⁷ very marked reduction of urine output in nephritis;⁸ cardiac irregularities after barbitat;⁹ persistent depression or paralysis of vasomotor reflexes (aorta and carotid sinus) and centers with marked respiratory depression after evipal;¹⁰ precipitation of barbitals in the blood stream with intravenous activation of reflexes from the trunk, aorta, and carotid sinus, resulting in circulatory and respiratory disturbances;¹¹ extensive avascularity of central nervous tissue with reduced blood supply to the brain, muscles, and skin after dial and amytal;¹² damage of cerebral blood vessels and parenchyma after continued daily doses of barbitat;¹³ fatty degeneration of liver, kidneys, heart and lungs after nosta;¹⁴ predisposition to intercurrent disease in barbitat habitués.¹⁵ Use of barbitals in obstetrical practice is in a controversial state; more and better studies of their actions are needed. Placenta is not a barrier to barbitals, as they are readily demonstrated in the fetus, narcotized babies are not infrequent, and continued use may result in abortion.¹⁶ Dodek's¹⁷ clinical studies of uterine contractions indicate that amytal by mouth does not retard labor, but Rawlings¹⁸ states that nembutal may, and Gruber¹⁹ has reported depression of excised strips. This list is not intended to be exhaustive, but is sufficiently complete to leave no doubt of the complications which may attend the use of barbitals.

Many of the reported side-actions occur with doses of anesthetic range, some with toxic doses,

such as capillary paralysis, edema, and nerve and parenchymatous degenerations. While most of the actions have been demonstrated in animals, there is every reason to believe they can occur in humans. They should be given careful consideration in connection with clinical uses, especially the intravenous. It should not be forgotten that man is generally more susceptible to hypnotic drugs than are animals, and therefore reacts to smaller doses.

Collectively, these actions emphasize the fact that the barbitals cause widespread depression or paralysis of living tissues in varying degree. In other words, they cause general protoplasmic poisoning, and are not as selective in their actions as is sometimes claimed. It follows that the use of barbitals, as aids in systemic or local anesthesia, is fraught with certain dangers and that there is no such thing as a nontoxic sedative or anesthetic which may be used with impunity. Some of the side-actions might easily obscure or confuse a diagnosis, and affect a patient's recovery from a disease in which the barbitat was exhibited merely as a symptomatic or palliative measure. Conceivably, some of the side-actions might be desired or even useful, such as ganglionic depression in controlling reflex excitability, vomiting, asthmatic attacks, etc. On the whole, however, they are probably always objectionable in connection with the ordinary uses of barbitals. They should always be kept in mind in relation to the general condition of a patient. The high order of efficiency of some, such as evipal, is apparently related to their paralytic potentialities.

TREATMENT

The minor side-actions do not necessarily require treatment. The major phenomena approaching or resulting in collapse necessitate attention. The general depressant effects of the barbitals call for measures used in the treatment of collapse. Stopping of the medication is first in order. Removal of the barbitat, when swallowed, by gastric lavage with warm potassium permanganate (1:1000) should be attempted. Alkalies should not be used, as they promote solution and absorption. Charcoal, four tablespoonsful for an adult, is given after gavage and not removed. Apply external heat; raise the head to avert bronchopneumonia; catheterize, if necessary, and save urine for barbitat test. Dextrose solution, 5 per cent, or ammonium chlorid, 1 per cent, in physiologic salt solution may be given gastrically, hypodermically, rectally, or intravenously; this promotes diuresis and excretion of barbitals. For circulatory and respiratory depression, caffeine 0.5 gram, strychnin 1 milligram, or digitan 1 cubic centimeter hypodermically; tyramin 50 milligrams or neosynephrin 50 milligrams, hypodermically or intramuscularly, in preference to epinephrin, which is too fleeting in action, and to ephedrin, which depresses the heart; carbon dioxid-oxygen inhalation. The new antidotes, picrotoxin and metrazol, together, as powerful central stimulants, are being tried clinically with some success;²⁰ picrotoxin intravenously, in single doses of 10 milligrams up to a total of about 160 milligrams, and metrazol

intravenously, in single doses of 400 milligrams up to a total of about 2500 milligrams, in twenty-four to forty-eight hours, both drugs to be used cautiously. Cautious use of physostigmin, 0.5 to 2 milligrams, should promote restoration of vagal, gastro-intestinal and muscular functions. Intravenously injected, barbitals are not retrievable, but the various systemic, resuscitative, and excretory measures should be used vigorously. Cerebrospinal drainage may be tried to relieve pressure and to remove barbital when coma is present.

CONCLUSIONS

Barbitals are capable of producing widespread depression and paralysis of living tissues. In other words, they cause general protoplasmic poisoning, and are not particularly selective in their actions. Many of these actions are to be regarded as undesired side-actions accompanying the use of ordinary doses, others are the result of continued and extratherapeutic or toxic doses. Attention should be given to the side-actions, and caution exercised in the clinical use of barbitals. Treatment of the major depression and toxic phenomena is outlined.

DISCUSSION

C. H. THIENES, M. D. (Department of Pharmacology, University of Southern California, Los Angeles).—Professor Hanzlik's article should be especially important to surgeons and anesthetists, for his summary of the literature on the side actions of the barbituric acid derivatives is remarkably complete. I wish to add, however, one more item to the list, namely, the tremors and clonic convulsions frequently seen in evipal anesthesia, but not referred to in the literature that has come to my attention. In experimental animals, such tremors, closely simulating the shivering due to a cold environment, are produced by amytal, pentobarbital and other barbiturates. In the human, as well as in animals, increasing the dose abolishes the tremor, but such dosage increase is often hazardous.

There is no agreement among surgeons and anesthetists as to the values and dangers of the preanesthetic use of compounds of this class. For example, many urologists have abandoned the use of barbiturates preceding spinal anesthesia, while the majority of gynecologists insist on such premedication. There is some experimental basis for the use of barbiturates as premedication for inhalation anesthesia, especially ethylene and nitrous oxid, and for procain or cocain. Pontocain and nupercain are gaining popularity, but interest in the possible value of barbiturate premedication for these anesthetics is almost wholly lacking.

Sound clinical evidence for the safety and value of barbiturate medication preliminary to spinal anesthesia is greatly needed. Parallel studies will have to be made in large clinics, with and without premedication, using similar types of case in ample numbers, before a choice of preanesthetic procedure can be established with confidence.

✽

C. D. LEAKE, Ph. D. (University of California Medical School, San Francisco).—With the increasing use of barbitals, and with the increasing commercial pressure behind the attempted clinical introduction of new ones, Professor Hanzlik's warning regarding their unappreciated side-actions is most timely. While the characteristic effect of the barbitals is to depress the central nervous system, physicians must remember that, in applying this fact to the relief of insomnia, they are also bound to depress other tissues of their patients. The barbitals are not selectively depressant to the central nervous system as is commonly believed. Professor Hanzlik has clearly indicated the wisdom of considering all phases of the action of any drug in applying such action clinically.

Much is being made commercially, in the rapid recovery from central depression, of such new barbitals as "pento-

barbital," or "nembutal," and "evipal." There is strong likelihood that some of the undesired side-actions mentioned by Professor Hanzlik may greatly outlast the central depressant effect. Dr. Mary Montgomery, in our surgical laboratory, has clearly shown how the salivary and gastric secretion may be greatly depressed for several days after recovery from an "amytal" narcosis (*Proc. Soc. Exper. Biol. Med.*, 32:1287, 1935). This observation affords further evidence in support of Professor Hanzlik's thesis.

✻

FRED B. MOOR, M.D. (312 North Boyle Avenue, Los Angeles).—The autonomic nervous control of the heart lends itself well to a pharmacodynamic demonstration such as Doctor Hanzlik has so clearly presented. Utilizing this mechanism, the author has shown that the barbiturates depress the autonomic ganglia, both parasympathetic and sympathetic, in a manner resembling nicotine. There is associated with this a direct depression of cardiac muscle. Koppanyi and his associates have demonstrated similar depression of the nerve supply of the heart with several other members of the barbital group.

Again, in the isolated intestine, muscle and sympathetic and parasympathetic innervation are all depressed. Probably of more significance is the fact that Gruber and others were able to produce the same depression of the intestine in the intact animal with dosages of the barbitals which fall within the range of human anesthesia. We may assume, therefore, that definite depression of the visceral and nervous elements of the cardiac and gastro-intestinal mechanisms occurs with the intravenous injection of the barbital derivatives in the human.

Fortunately, the use of the longer-acting members of the barbital group, such as sodium amytal and pentobarbital sodium, has waned. The popularity of the shorter-acting ones, such as evipal and pentothal, seems to be growing. Some anesthetists manifest considerable enthusiasm for the latter in spite of occasional serious reactions. They are convenient for various minor surgical procedures, and are usually pleasant for patients. In view of reported pathologic effects, the widespread use of even these shorter-acting barbitals does not seem desirable, at least not until they have been given more study. Once injected they are beyond recall, and are not susceptible to the same control as inhalation anesthetics.

The intravenous injection of the barbiturates may be life-saving in poisoning by strychnin and the local anesthetics. In the case of the latter, however, smaller prophylactic oral dosage should precede the local anesthetic.

LEAD ENCEPHALITIS

PRECIPITATED BY ACUTE INFECTION

By RALPH E. NETZLEY, M.D.
Pasadena

DISCUSSION by Hartzell H. Ray, M.D., San Mateo; Phillip E. Rothman, M.D., Los Angeles; E. J. Lamb, M.D., Santa Barbara.

THERE is a striking tendency for children with lead poisoning to develop an encephalitis which has a poor prognosis. Because of its relatively frequent occurrence, the preventive aspect of the problem should be greatly stressed.

It has been observed that children may ingest small amounts of lead over a prolonged period of time without manifestation of symptoms. Intoxication following the ingestion of lead appears to be dependent on a number of factors. Of primary importance is the amount of lead ingested, and the period of time over which it is taken into the body. The absorption of small amounts of lead by all persons seems to be of a normal occurrence, and is said to be unaccompanied by danger.¹ An

increase in the amount of lead ingested, or the continuation of absorption over a long period of time associated with storage in bones, gives rise to potential danger. There is observed considerable individual variation in tolerance to this metal. Some children, after the ingestion of moderate amounts, rapidly develop encephalitis. Others are capable of tolerating quite large amounts with minimal development of symptoms, but, however, with the deposition of abnormal amounts of lead in the bones.² Under certain circumstances, such as the occurrence of acute infection, the chemistry of the body may be changed in such a way as to cause the mobilization of the lead deposited in the bones in apparently inert form, and thereafter develop an acute intoxication. Lead is carried in the blood stream presumably as the phosphate, and is deposited in various organs, especially the bones, brain, liver, and pancreas. Lead deposited in the brain will cause central nervous symptoms. The severity of symptoms will vary with the quantity and rapidity of deposit. These symptoms of encephalitis may be the first indications of lead poisoning precipitated by an acute infection.

REPORT OF CASES

Four cases of lead encephalitis studied at the Pasadena Hospital were initiated by such infections as otitis media, mastoiditis, tonsillitis, and pertussis. None of these children, according to accurate histories, showed significant signs or symptoms of lead poisoning prior to the acute onset of the above mentioned infections. During the course of these infections, three of the four children developed violent convulsions, vomiting—frequently of the projectile type, threatening respiratory failure—and symptoms of cerebral edema. The fourth child only developed tremors, occasional vomiting, and gastro-intestinal disturbances. These children showed characteristic changes in the appearance of the red blood cells, excess amount of lead in the urine, lead lines at the ends of the diaphysis by x-ray, and spinal fluid under increased pressure.

Three of these children are living, two of whom have no apparent symptoms of lead poisoning. The third child, originally treated for otitis media, now has an ataxic gait, shows behavior changes, and has marked mental deterioration. The fourth child, originally having pertussis, died after one week of violent convulsions and symptoms of marked cerebral edema. Autopsy showed relatively large quantities of lead in most of the organs of the body, especially the brain tissue. This child died at the age of nine months.

The source of lead in two of the children was undetermined. In the other two children lead was ingested from play-pen and crib.

DIAGNOSIS

A diagnosis of lead poisoning can be made in children in the early stages of intoxication by the correlation of the history, physical signs, and laboratory data in conjunction with x-ray findings. The clinical picture is the usual one seen in lead poisoning—vomiting, abdominal pain, anemia, central nervous system symptoms such as irritability, ataxic gait, stupor, twitching or convulsions, peripheral nerve lesions, and sometimes behavior changes. Lead encephalitis must be distinguished from other types of diseases with cerebral involvement, notably various forms of encephalitis and meningitis. It is the opinion of McKhann and others that the cerebral manifestations are evidences only of the cerebral edema, and not pathogenic of lead intoxication.

BLOOD PICTURE

The blood picture varies according to the amount of lead assimilated and the amount of lead circulating in the blood in a given period of time. The usual blood picture is a moderate, secondary anemia with basophilic stippling of the red cells. Lead, phosphorus, and bichlorid of mercury are at times the cause of a severe anemia, but the only poison which gives a characteristic change in the appearance of the red blood cells is lead, which produces a striking heavy basophilic stippling of the erythrocytes. The anemia of lead poisoning is usually very chronic in contrast to such violent poisons as phosphorus or bichlorid of mercury.

Stippled red blood cells are found in pernicious anemia, lead poisoning, and malaria. They are less constant and less numerous in the leukemias and in the cachexias referable to septic infections, syphilis, carcinomatosis, and in the final stage of tuberculosis. The largest granules are found in pernicious anemia and in cases of lead poisoning.

SPINAL FLUID

The cerebral spinal fluid is usually clear, and escapes under increased pressure—often as high as 700 millimeters of water pressure. Cells are somewhat increased, from 60 to 100, mostly lymphocytes. Protein is definitely increased quantitatively up to 150 to 200 milligrams. The sugar is normal to high, relatively and absolutely, and the chlorids are normal (Lyttle).

X-RAY FINDINGS

Roentgenograms may show the bones at the ends of the diaphysis to be quite dense. These findings have been described in the literature as signs of lead poisoning.^{3,4,5} This change in the bones has proved to be one of the most constant signs of lead poisoning in children, and has led to the discovery of numerous cases with minimal symptoms or with unusual clinical manifestations. Heavy lines in the ends of long bones are not peculiar to lead poisoning, as the ingestion of phosphorus and other substances may produce similar lines.⁶ Occasionally, in the normally growing child there may be a zone of increased density at the metaphyseal margins of the long bones, owing to a heavy deposit of calcium. These lines should not be confused with the lines observed in lead poisoning, which are of greater density. Narrow lines, of sufficient density to be confused with a lead line, may be found at the ends of long bones in healing rickets, and in infants with vitamin A deficiency.

LABORATORY FINDINGS

Further confirmation of the presence of lead in the cerebrospinal fluid may be obtained by spectroscopic examination.⁷

Examination of urine and stools by a competent technician, for lead will confirm the diagnosis of lead poisoning. However, the demonstration of lead in the excreta of children, by chemical examination, is not conclusive evidence alone of lead intoxication.⁸ Children with lead poisoning excrete much larger amounts of the metal than do

normal children, so that quantitative determination of lead in the excreta, properly controlled, may be accepted as satisfactory evidence of lead poisoning.

TREATMENT

Lead in the body is absorbed, transported, deposited, and excreted much as is calcium. Therefore, in general, factors which influence calcium metabolism might be expected to have an influence on lead. These observations have been made by Aub and his coworkers.⁹ Lead deposited in the organs of the body may induce the symptoms referable to the various organs or systems, while lead deposited in the bones is in an inert form. This treatment for lead poisoning involves measures to remove the lead from circulation and deposit the metal in the bones. Calcium salts or phosphates¹⁰ are administered to diminish the solubility of lead in the blood. The milder cases of lead intoxication may show improvement if the ingestion of lead is prohibited, and if the child remains free from infection and acidosis. Efforts of deleading the bones have resulted in the recurrence of cerebral symptoms. Therefore, allowing spontaneous elimination of the metal is probably more satisfactory treatment. Besides the administration of calcium intravenously, normal salt solution and intravenous glucose may be given to relieve acidosis. Intravenous injections of magnesium sulphate to relieve cerebral edema may be useful, but are only temporary measures. Intracranial pressure caused by cerebral edema probably accounts for the permanent cerebral injury that is so common among children who survive the acute encephalitic stage.

SUMMARY

1. Lead is stored in the bones of the body in an inert form.
2. This lead may be released and cause an acute intoxication by means of the changes in body chemistry, caused by an acute infection.
3. Basophilic stippling of the red cells, increased amounts of lead in the urine, lead lines in the x-ray of the long bones in conjunction with the usual physical signs of plumbism, make the diagnosis.
4. The treatment is directed at replacing the lead in the bones in its original inert form.
5. Possibly unrecognized plumbism in children explains many convulsions of undetermined etiology.

DISCUSSION

HARTZELL H. RAY, M.D. (23 Second Avenue, San Mateo).—In young children the diagnosis of lead encephalitis is often missed because this clinical entity is not thought of. A child who is irritable, cries a great deal, has a slight change in personality, and who may have some bowel disturbance, should be a suspect of this disease.

The pediatrician has the greatest responsibility, also the greatest opportunity, in this disease to practice good preventive medicine. Advice to mothers to get beds that are stained instead of painted; the avoidance of lead-painted toys, and the discouragement of buying lead-containing colored crayons. Occasionally, where plumbing is old one may want to investigate such things as the matter of lead pipes and the amounts of lead in the drinking water. One may find in certain houses that lead pipe has been used from the main into the house, and may or may not be a source of trouble.

During a recent epidemic of lead encephalitis it was reported that lead-containing battery boxes were used for fuel, which brings out another interesting source for lead absorption. The pediatrician can advise mothers about a great many of the common playthings and objects, which may be a source of lead and cause trouble if sufficient amounts of lead are ingested by the children.

22

PHILLIP E. ROTHMAN, M.D. (3875 Wilshire Boulevard, Los Angeles).—The early demonstration that the metabolism of lead simulates that of calcium has been misinterpreted in its application to the therapy of lead poisoning. Shelling has pointed out that the administration of calcium salts, other than the phosphate, for the purpose of storing or "driving" the lead into the bones, where it remains in an innocuous state, may actually result in an accentuation of symptoms if the ratio of calcium to phosphorus is abnormally increased. Since defective ossification may occur from a diet which renders the calcium level high and the phosphorus low, or vice versa, superior calcification and likewise lead storage demand the maintenance of a definite ratio between calcium and phosphorus. Adequate amounts of phosphate are necessary to enable the lead to be deposited as the insoluble lead phosphate. The results, experimentally and in human beings, have been more satisfactory with phosphate therapy than with any other form.

The use of vitamin D therapy in lead poisoning is particularly dangerous, since it not only increases the concentration of calcium and phosphorus in the blood, but also that of circulating lead. It may be used cautiously when the diet is not excessive in calcium and only in conjunction with three grams daily of disodium acid phosphate. Shelling has called attention to the interesting observation of the seasonal incidence of acute lead poisoning. The majority of cases occur during the summer months, when the sun's rays emit an abundance of ultraviolet. This apparently increases the toxicity of the ingested lead in the same way that results from the oral use of viosterol.

E. J. LAMB, M.D. (1515 State Street, Santa Barbara). Doctor Netzley's paper should bring to the pediatricist's attention the possibility of lead poisoning as a cause of convulsions of unexplained origin.

With the present flood-tide of biochemical literature on hypoglycemia, hypocalcemia, etc., as a causative factor in convulsions of childhood, one is apt to neglect inorganic chemical poisoning as a cause of convulsions.

My personal experience with lead encephalitis is very limited—too limited, perhaps, to enter the discussion of this excellent paper.

I have treated only one case, a male of four years of age, who became hospitalized at a contagious hospital with chickenpox. During his sojourn at the hospital his toys were limited to those articles which could be washed in a solution of lysol. Consequently, this child was continually playing with little inanimate soldiers and horses made out of lead. With desquamating macules and pustules it is readily believed that he absorbed through his denuded skin an appreciable amount of lead. Preceding the lethargy of encephalitis, this patient complained of severe abdominal cramps, unaccompanied by any gastrointestinal upset, evidently lead colic.

Unfortunately, the only laboratory test to confirm a diagnosis of plumbism was the basophilic stippling of the red-blood cells.

Whether the child's encephalitis was a complication of chickenpox, or a symptom of plumbism, is a matter of conjecture.

This child at present, two years later, shows a definite mental retardation and poor muscular coordination.

Years ago lead water-pipes were a source of lead poisoning. Today lead toys must be considered as a possible source.

CLINICAL ADRENAL INSUFFICIENCY

By ALFRED C. REED, M.D.
San Francisco

DISCUSSION by Hamilton H. Anderson, M.D., San Francisco; Roy E. Thomas, M.D., Los Angeles.

THE clinician sees, not infrequently, patients who complain of asthenia, anorexia, easy tiring, palpitation, languor, variable abdominal pains, often unexplained nausea, vomiting and diarrhea, with no evident reason apparent on physical examination. Various functional symptoms are present. The systolic blood pressure is below normal. The basal metabolism is little, if any, depressed. Careful search for psychogenic factors is unrewarded. The organic structure shows no constant abnormalities, and the diagnosis of neurasthenia often seems inevitable and equally unsatisfactory.

In a group of such patients, chiefly young women, we have found some who showed lowered blood sugar, decreased blood sodium chlorid, and a striking lack of response to ordinary tonics, forced feeding, abdominal support, and a tonic regimen. Many of these are intolerant of thyroid extract, and show no improvement with various pituitary preparations. Some show remarkable improvement when large amounts of sodium chlorid are added to the diet, and especially when this is combined with reduction in dietary potassium. The administration of adrenal cortical extract is most striking in its results and more lasting in its effects than any other measure. When cortical extract is used, dietary and other measures become of adjuvant or supplementary value only.

It seems logical to expect that adrenal deficiency may exist in all degrees short of the picture of

Addison's disease, and that such deficiency may follow other causes than organic destruction of cortical substance. The characteristic disturbances in blood chemistry obviously will appear in various degrees also. The success of substitution therapy is a factor in correct diagnosis. Maximal treatment includes a course of injections of cortical extract, high salt intake in diet, and the administration of ephedrin by mouth. The latter two alone are poor substitutes for cortical extract, but may be valuable as adjuvants.

CLIMATIC RELATIONS

The question arises as to the relation of adrenal depression to hot climate. Excessive perspiration tends to deplete the blood sodium chlorid. Monotony of warm temperature tends to lower the blood pressure. When external conditions interfere with heat loss, the way is paved for the clinical syndrome of sunstroke. Cramer¹ has made a suggestive study of this condition, using in animals injections of beta-tetra hydronaphthylamin which gives prolonged sympathetic stimulation with overactivity of the thyro-adrenal apparatus. The increased heat production, combined with decreased heat loss (high environmental temperature), produces what he calls "sympathetic fever." The degree of this fever depends chiefly on the environmental temperature and cooling capacity. He found, postmortem, the same pathologic changes as in hyperpyrexial heat stroke in man. There was also a corresponding similarity in symptoms. Cramer explains the situation as being due to the action of an extrinsic factor (*i. e.*, insufficient cooling) on an organism which is under the influence of excessive stimulation of the thyro-adrenal apparatus.

Under conditions of monotonous hot climate, long-continued overstimulation of the adrenals may also be replaced by insufficient stimulation or exhaustion. This, combined with enervating infections and habits, easily becomes a major factor in the development of disturbances in the autonomic nervous system and of so-called tropical neurasthenia. There is need for careful study of adrenal function in the tropics, with the possibility that the proper use of dietary salt, ephedrin and adrenal cortex extract may prove of unsuspected therapeutic value.

De Langen and Lichtenstein² discuss in detail what they call "essential hypotension" in the tropics. They list the principal symptoms as headache, dizziness, anxiety, palpitation and precordial pain and extreme fatigue. They also note abdominal pain, nausea, vomiting, and diarrhea. Apparently, without direct evidence, they ascribe the condition to climatic atony of vessel walls. They find commonly a decrease in blood sodium chlorid and blood sugar. Certainly, adrenal insufficiency comes seriously into account, and further study is greatly needed from this point of view.

BLOOD CHEMISTRY

Grollman,³ in his complete and excellent book on the adrenals, summarizes the known changes in blood chemistry in adrenal insufficiency. He

surveys experimental work up to date on animals, noting that Marshall and Davis⁴ in 1916 observed in adrenalectomized cats a rise in non-protein nitrogen, especially in the urea. The conclusion was that normal renal function depends on the integrity of the adrenals or on a product of their secretion. Grollman notes the abundant confirmation of these findings by later writers. He states that rise in non-protein nitrogen is one of the earliest manifestations of adrenal insufficiency, appearing before such symptoms as weakness and anorexia. Death may occur from adrenal insufficiency with a non-protein nitrogen reading in the blood of only twice the normal figure, indicating that death is not due merely to this increase, since much higher levels can occur without death, as after ureteral ligature, for example.

In dogs, Grollman found a consistent and progressive increase in the blood of non-protein nitrogen, cholesterol and potassium, with a corresponding decrease in sodium chlorid and dextrose. The pH of the blood tended to decrease, with greater rapidity toward the end.

Zwemer and Sullivan⁵ attempted to find a criterion for measurement of the level of activity of the adrenal cortex. Using cats, they found that adrenalectomy was followed by an early loss of sodium, which was reflected in lowered CO₂ capacity with an increase in potassium and non-protein nitrogen. Before death there was also a decrease in blood sugar and chlorid with higher figures for phosphorus and magnesium. They found no important changes in the calcium. They describe the clinical syndrome as seeming to consist of disturbed metabolism of salt and water, with loss of water and depletion of blood chlorid and sodium, together with an increase of blood potassium. Injection of cortical extract into adrenalectomized animals reversed the changes of adrenal insufficiency, and favorably affected observable symptoms. They suggest that the cortex produces a secretion which enables body cells to metabolize salt and water.

In a later paper, Zwemer⁶ reviews these findings, noting that all of the body symptoms indicate changes in body fluids, and concentration of the blood with increase of blood solids, and dehydration. The loss of water takes place chiefly through the kidneys and probably also by reason of the diarrhea so common in early stages. It is further increased by vomiting. Zwemer cautions against drastic relief of constipation in late adrenal deficiency. He suggests that the rise in potassium may be due to its withdrawal from the tissues. Apparently in the plasma, potassium cannot replace sodium without a fatal result. Sodium chlorid gave a definite extension of the survival period in adrenalectomized cats.

Rise in blood potassium has been reported frequently in experimental adrenal deficiency and in the crises of Addison's disease. As noted above, Zwemer and Sullivan⁵ found that injection of cortical extract lowered the high blood potassium level. Zwemer and Truszkowski⁷ state that increased blood potassium might arise from hemolysis of red cells, or as a result of repeated bleeding.⁸

In experimental work on cats, these authors eliminated these two possible errors, and reached the conclusion that "an important function of the adrenal cortex is the regulation of potassium metabolism, and that the various known symptoms of cortico-adrenal insufficiency may be explained in terms of a disturbance of cortico-adrenal-potassium interrelations." They further state that "depletion of sodium may be ascribed to the diuresis due to high potassium" (referring to Blum, Aubel, and Levy.⁹) Low blood sugar has been observed after injection of potassium (referring to Kylin and Engel.¹⁰) Muscular weakness has long been known to be associated with high blood potassium. . . . Dehydration of the blood, often reported in adrenal insufficiency, may be considered a consequence of diuresis and stasis. Finally, the lesions found in the kidney in potassium poisoning are of the same type as those in adrenal insufficiency." They suggest that in Addison's disease elimination of dietary potassium may be more important than to add sodium chlorid. Truszkowski and Zwemer¹¹ have recently prepared a new method for determination of potassium in 0.2 cubic centimeter of blood taken from the ear. Camp and Higgins¹² believe that most of the results produced by epinephrin are really due to potassium. Crabtree and Longwell¹³ have shown that in rats a diet rich in sodium chlorid was accompanied by a large increase in liver glycogen.

TREATMENT

When a condition of adrenal deficiency has been seriously suspected or diagnosed, the first consideration in treatment should be the hypodermic administration of cortical extract. We have given one cubic centimeter daily of cortical extract¹⁴ for ten consecutive days. Supplementary to this, sodium chlorid should be greatly increased in the diet. Usually 8 to 16 grams (two to four teaspoonfuls) can be taken daily as an addition to food. Benefit may be derived from administration of ephedrin sulphate orally (0.015 to 0.040 gram) two or three times daily, in place of cortical extract or as an adjuvant to it. In more serious cases it may be desirable to eliminate from the diet, or to decrease, those foods having a relatively high potassium content. The commoner foods rich in potassium are listed as follows:

Apple	Cocoa
Apricot	Chocolate
Banana	Meat extract
Dates	Mustard
Figs	Caviar
Olives	Kidney and Lima beans
Peaches	Sweet and white potatoes
Prunes	Spinach
Raisins	Dried peas
Peanuts	Green cabbage
Coconut	Beets
Almonds	

Failure to secure disappearance of symptoms indicates incorrect diagnosis, and complete success of treatment is of strong confirmatory diagnostic value.

Several condensed illustrative case reports are appended.

SUMMARY

1. Subclinical Addison's disease, or various stages of adrenal insufficiency, are seen clinically.

2. Such cases do not always exhibit all of the symptoms of adrenal insufficiency, so that response to treatment becomes of diagnostic value.

3. Adrenal dysfunction may play a significant rôle in tropical neurasthenia and in hyperpyrexial heat stroke (sunstroke).

4. In adrenal insufficiency, subjective symptoms are associated with characteristic changes in blood chemistry, which are described.

5. The relation of potassium to adrenal function, while not finally evaluated, is very suggestive, and gives therapeutic indications of possible value.

6. Treatment is outlined, using cortical extract, sodium chlorid, ephedrin, and low potassium dietary.

REPORT OF CASES

CASE 1.—Mrs. I. S. Aet. 42. For fifteen years the outstanding complaints have been weakness, easy tiring, and exhaustion, which are more intense in the early morning and tend to improve toward evening. Since acute appendicitis with drainage at the age of fifteen, she has had frequent periods of pain in the right lower quadrant, ascribed to adhesions. She has three children. Constipation, with frequent periods of diarrhea, has always been present. Various minor complaints have received treatment.

Examination showed an asthenic undernourished woman, with weak spine and feet, and ocular muscle imbalance. She said she had always been "double-jointed." The skin was unusually dry and thick, with some patches of squamous eczema. There was tenderness in the right lower quadrant. The blood pressure average was 100/70, often registering at 90 to 94 systolic.

X-rays of gastro-intestinal tract, teeth, sinuses, and spine were negative. Basal metabolic rate averaged minus 5. Repeated stool examinations showed no parasites. Blood, urine, and Wassermann reaction were negative.

Diagnosis.—Adrenal and probably pituitary deficiency.

Course.—Extensive use of ordinary tonics and combinations of thyroid and pituitary extracts gave, at the most, transient improvement. Addition of 12 grams of salt to the diet daily gave definite improvement, but soon interfered with appetite and digestion. A course of adrenal cortical extract, one cubic centimeter daily hypodermically for ten days, gave a complete and dramatic restoration to normal health, which has now lasted for six months. Small doses of ephedrin have been continued. All eye symptoms have disappeared, and her strength and energy are at their best in many years. The blood pressure averages 110 to 116 systolic.

CASE 2.—Miss B. D. Aet. 20. The patient has for four years suffered from increasing palpitation and tachycardia, with much emotional instability. At times she has been free of symptoms. Weakness, easy tiring, and inability to exercise have been prominent. At times she has had severe headaches. Severe anorexia and occasional nausea are present. She slept poorly. Dysmenorrhea has been severe. Lately she has lost nine pounds in weight. She has had many infections, chiefly repeated colds, otitis media, and sinusitis. The appendix was removed at age of twelve. She had used tobacco to excess.

Examination showed a systolic blood pressure averaging between 82 and 94. The blood and urine were normal. Basal metabolic rate was 16 plus.

Diagnosis.—Adrenal insufficiency.

Various upper respiratory infections.

Course.—Addition of extra salt in diet gave only slight improvement. One cubic centimeter of eschatin hypodermically daily for ten days resulted in a rise of blood pressure to an average of 108 to 112. She gained in weight, appetite became normal, and other symptoms disappeared.

CASE 3.—Mrs. E. R. Aet. 31. The patient complained of exhaustion, easy tiring, and languor. Exertion caused palpitation and faintness. She has had more or less of such symptoms for many years. She was underweight, showed much vasomotor instability, and frequent attacks of diarrhea, often with nausea. The systolic blood pressure was recorded between 92 and 106. Abdominal pain was often present.

X-rays of chest and spine were negative. No abnormality was found in blood, urine, or stools. Wassermann reaction was negative. Blood sugar was 85 milligrams per cent. Blood sodium chlorid was 460 milligrams per cent. Non-protein nitrogen was 25.9 milligrams per cent.

Diagnosis.—Adrenal insufficiency.

Treatment consisted of a full diet with salt added to the amount tolerated by taste. Ten daily injections of one cubic centimeter of eschatin were given hypodermically.

Course.—All symptoms disappeared. Blood pressure rose to a systolic reading of 128.

✓ ✓ ✓

CASE 4.—Mrs. D. C. Aet. 50. Complained of vertigo, easy tiring, weakness, exhaustion, tendency to diarrhea, with some abdominal pain and spells of faintness. Palpitation was frequent. At times physical exertion caused collapse. Vasomotor symptoms have been prominent. Fifteen years ago gall-bladder disease was suspected, but never proved.

The routine laboratory findings were normal. Gastrointestinal x-rays were normal. Stools repeatedly were normal and free of parasites. Blood pressure averaged between 92 and 104 systolic. Excess salt was poorly tolerated in the diet. Ten daily injections of one cubic centimeter of eschatin hypodermically gave marked improvement in appetite and symptoms with return of strength and endurance.

✓ ✓ ✓

CASE 5.—W. H. F. Male. Aet. 47. The present illness began fifteen months ago, when he began a year's residence in Honolulu. An amebic dysentery required repeated courses of treatment through most of the year, and has now been cured. He has lost energy, tires easily and is oppressed by lassitude, both physical and mental. His bowels tend to looseness, especially in the mornings. He suffered from vertigo and dyspnea on exertion, and required two pillows at night. Palpitation was troublesome.

The history had nothing else of significance.

Examination showed an average blood pressure of 100 systolic in a thin, wiry man, weighing 122 pounds. Gastric fractional analysis was normal. Blood count, urine, and stools were normal and free of parasites. B. M. R. gave a reading of minus 4.3 per cent. Gastro-intestinal x-rays showed no evidence of organic lesion. Blood sugar was 87 milligram per cent. Blood sodium chlorid was 462 milligram per cent.

Diagnosis.—Hypo-adrenia following cured amebic dysentery.

Course.—General tonics, with intestinal astringents, and a smooth diet, gave transient slight improvement. Complete disappearance of symptoms followed a course of eschatin, one cubic centimeter hypodermically daily for ten days.

DISCUSSION

HAMILTON H. ANDERSON, M. D. (350 Post Street, San Francisco).—The clinical diagnosis of adrenal insufficiency of a mild degree, or of frank Addison's disease, is very difficult indeed. Abnormal changes in blood-chemistry findings are the best objective criteria, but often, in early cases, such variations are not significantly marked. In those instances where the functional disturbances suggest adrenal insufficiency, a most useful diagnostic aid is substitution therapy with adrenal cortical extract, sodium chlorid and dextrose. Doctor Reed reviews the chemical changes that have been found experimentally in adrenalectomized animals. We must remember, however, that the classical laboratory picture of this severe derangement is seldom seen clinically. Because of this fact, one must be suspicious of adrenal insufficiency in any patient presenting the symptoms enumerated by the author.

In reviewing the cases reported by Doctor Reed one is especially impressed with the consistently low systolic blood pressure in every instance before specific substitution therapy was instituted. In the majority, substantial increases in the systolic pressure were obtained which paralleled symptomatic relief. However, it is interesting to note that the subjective improvement may continue after the blood pressure has returned to approximately the pretreatment level. This observation has also been made in a similar group of patients who received benzedrin therapy.

While it has not been possible to transfer directly to the clinic the laboratory findings on adrenalectomized animals, it is fortunate, indeed, that such work has led to a better understanding of the physiologic and chemical disturbances accompanying adrenal insufficiency in man.

✱

ROY E. THOMAS, M. D. (1136 West Sixth Street, Los Angeles).—Probably half of the patients seen by the internist suffer from no organic disease, and a very considerable percentage of this group complain of the syndrome described by Doctor Reed in this paper, with the stress laid upon one or the other of the symptoms named—fatigue, palpitation, and abdominal distress leading the list. Most of these patients have been tagged as cases of neurasthenia or thyroid insufficiency. Most of them have low blood pressure. As Doctor Reed says, only a few have low basal metabolism. Some without an abnormally low basal rate feel better while taking thyroid; others are unable to take thyroid without phenobarbital or other mild sedative. Without estimation of the blood chlorids, I have tried ephedrin in some of these cases, with temporary benefit. Possibly the addition of sodium chlorid in enteric, coated tablets, such as are used in the treatment of lobar pneumonia, would be better tolerated than salt in bulk or in capsules.

Doctor Reed may have hit upon a valuable addition to our therapeutic armamentarium. Only a larger series of cases, followed for a longer period of time, will establish its real value. I hope we may have a follow-up of these cases, with the addition of others, and records of the blood chlorids and blood sugar after treatment as well as before. Such a follow-up will be of great interest.

MEDICAL ASPECTS OF THE BUSINESS CYCLE*

By EMIL BOGEN, M.D.
Olive View

DISCUSSION by A. B. Cooke, M.D., Los Angeles; Chauncey D. Leake, Ph.D., San Francisco; Clarence G. Toland, M.D., Los Angeles.

THE belief that economic depressions and crises are accompanied by an increase in sickness and death, and especially by an increase in the incidence and mortality from pulmonary tuberculosis, is widespread.¹ A distinct note of astonishment is expressed in many recent publications at the continued decline of the general death rates, and particularly that from tuberculosis, after more than six years of economic depression; and special credit for this state of affairs has been claimed for a number of public health and social agencies. Despite the positive manner in which such statements are phrased, convincing evidence of their validity has not yet been adduced.

ECONOMIC DEPRESSIONS

A depression is such a definite phenomenon in the course of modern economic history, and has recurred so frequently in the past century, that one might expect that its salient characteristics would be readily understood. There is an abundance of reliable information available for investigation. Many of the essential facts were unearthed in the monumental study, "Special Aspects of the Business Cycle" by Dorothy Thomas, more than a decade ago,² and a better understanding of their significance would lead to a more intelligent and sympathetic attitude to the occurrence of periods of business depression.

The term "depression" is generally used to represent a condition that is almost universally hated and condemned. The most devout prayers were uttered, and the most strenuous efforts exerted for the early end of the recent economic situation. To the average man "depression" is a term of opprobrium, and all unliked characteristics are attributed to it without any attempt to confirm their appropriateness. Thus, analogies are freely made between the conditions of business depressions and wars, famines, plagues, and other calamities.

The essential characteristics of a business depression, a glutted market, business stagnation and widespread unemployment, are just the reverse of the conditions that exist during wartime and other calamitous situations. The removal of a large part of the population from productive labor in time of war, the acute shortage of commodities in famines and droughts, and the disabling and destruction of available workers by plagues and other catastrophes, all lead to scarcity, high prices and profiteering, and increased demand for labor. More than one business depression, indeed, has been terminated by such a calamity.

Commercial prosperity is by no means synonymous with the real well-being of the entire com-

Chart 1.—The Death Rate and the Business Cycle.

munity. The disaster to the machinery of the economic organization which a depression represents may, in fact, have repercussions in other lines of human activity that are highly to be desired. That certain individuals may suffer as a result of business depression is, of course, impossible to gainsay; but all available information indicates that the health of the people as a whole, and especially their lives, are better conserved in times of depressions than in periods of prosperity.

The Index of American Business Activity from 1790 to the Present Day, published by the Cleveland Trust Company,³ is one of the longest and best known measures of the changes in business conditions in this country. Rises in this curve represent periods of generally expressed economic prosperity and business booms and expansion, while the dips below the average value correspond to panics, crises, declines and depressions in business, which are reflected in the descriptive language of history and the public press. Although there are many other indices of business activity which might be used, which vary in absolute values, the location of the rises and falls practically correspond, and there is very little difference of opinion as to just when the periods of prosperity and of depression in American business occurred.

GENERAL MORTALITY RATES

The easiest and most accurate information obtainable about any population group is the death rate. There are many factors affecting this, but the influence of a single important agent, such as war, an epidemic, or other catastrophe, is so sharp-cut and definite that depressions, if they had any marked effect on the general health, could well be expected to manifest this through some change in the death rate. Thus, the rise in the death rate in practically all countries during war, the

* Read before the meeting of the Southern California Medical Association, October 31, 1936.

PHTHISIS AND PROSPERITY

Chart 2.—Phthisis and Prosperity.

increased death rate with each influenza epidemic, and the increased death rate accompanying famines, droughts or floods in Europe and Asia, are prompt and unmistakable.

In the United States the death rates for the expanding registration area are available since 1900.⁴ When these are compared with such an index of business conditions as that described above, the fatal cost of business prosperity becomes evident, and the life-saving value of a cessation of commercial activity is revealed. Casual inspection of the crude figures shows that the sharpest drops in the mortality rates followed the beginning of economic declines, while the actual rises, as well as the cessation of the usual trend to lower rates, accompanied periods of business booms.

Refined statistical analysis merely reinforces this conclusion. Both the classical product moment coefficient of correlation of Pearson, and the simpler coefficient of concomitant variation of King appear positive and equal to many times their own probable error. Not only in this country, but in England and Wales, and wherever such data is available in modern industrialized civilized communities, not only for the recent depression, but for each of the commercial cycles of the past century, the general death rate goes down, and not up, in times of depression.⁵ A short depression is

accompanied by a brief decrease in the death rate, while a long depression is accompanied by a prolonged decrease, excluding the possibility of a delayed reverse effect.

TUBERCULOSIS DEATH RATES

Occasionally it is suggested that people live too well and eat too much in times of prosperity, and the reduction in the diet and resumption of harder living conditions may be responsible for the decrease in the death rate observed. Such moralizing, however, is refuted by a closer examination in the death rates from different causes. Clinical experience, for example, has shown that undernutrition is closely associated with the appearance and progression of tuberculosis, and that the death rate from this condition can be appreciably reduced by an increase in the diet. The spectacular increase in the tuberculosis mortality rates during the war demonstrate this effect; but it must be remembered that every index of business, production and employment shows that this was a period of high prosperity, just the reverse of the conditions of economic depressions we are discussing.

The tuberculosis death rate is available for the large American cities of New York, Boston, and Philadelphia for more than 120 years.⁶ Analysis of this curve, covering nearly the entire life of our in-

Chart 3.—Diabetes and the Business Cycle.

dustrial civilization, as compared with the curve of business activity for the same time, shows unmistakably that tuberculosis increases in times of prosperity and decreases in times of depression. The coefficient of correlation between the two series is plus 0.42 with a probable error of 0.05, evidencing the real significance of this relationship. To satisfy the Job's comforters who still insist that the ill effect, although absent in the same year as the depression, is sure to appear in the following years, it is interesting to note that no matter whether we lag the curve by one, two, three, four, or even five years, we are unable to obtain any evidence that such a catastrophe as has been predicted will occur.

CAUSATIVE FACTORS

It has been suggested that the increased use of alcohol and other forms of dissipation during times of prosperity may account for some of the increased mortality rate noted. Increase in traffic and personal contacts, with consequent greater opportunities for exposure to infection, have also been mentioned. The greater nervous strain of boom times, the more active physical and mental exertions then required, and the disposition to let down and rest during depressions are also given as possible causes. It has also been speculated that, as tuberculous individuals might be the first to be let out of employment when business declines, and the last to be reemployed during the boom following, the compulsory rest so inflicted may naturally go first to the very individuals who need it most.⁷

Further study indicates, however, that it is not only the high tension of economic prosperity that exacts its toll of victims of Mammon, but that the indices of commercial prosperity in terms of the stock market, rising profits and prices, and expanding industry are actually inversely related to the true physical well-being of the masses of

Chart 4.—Meat consumption and the Business Cycle.

the population. "Good times" from the point of view of the business man and the classical economist is by no means the "time of plenty" for the people. Again, let us recall that war, drought, famine, and plague are historically associated with underproduction, high prices and labor shortage, while bumper harvests, peaceful industrial development and general good health lead to excess supplies, low prices, and glutting the labor market. In plain English, despite the almost universal popular belief to the contrary, people eat more in times of depressions and, therefore, are healthier, and eat less in times of commercial prosperity, and therefore die of tuberculosis and other diseases of undernutrition.

DIABETES AND DIET

Corroboration of this finding may be sought in the data regarding diabetes, a disease traditionally associated with overeating. During the war-time prosperity and postwar food shortage in the central and eastern European countries, the diminution in the incidence of diabetes was repeatedly remarked. In this country the death rate from diabetes, which has been increasing since 1900, shows fluctuations from this general trend which are quite different from those discussed above in the general death rate, and that from tuberculosis. Diabetes seems to decrease in periods of prosperity and increase in times of business depression. This again strongly suggests that actually people eat more during depression years and less during times of commercial prosperity. It is obvious that we may look to the statistics of food production and consumption in various years to see whether this is really the case.

ACTUAL FOOD CONSUMPTION

The per capita meat consumption in the United States, as given in the World's Almanac⁸ for the past quarter of a century, shows unmistakable con-

firmation of the conclusion based upon the vital statistics. Although there has been a general downward trend in the per capita consumption of meat in this country for a long time, fluctuations from this trend reflect those of business activity. During prosperity, meat consumption tends to decline; during depressions it tends to rise.

The index number of the purchasing power of wages of union workers as measured in terms of food is available for the past two decades. Here also we find that the food value of union wages has run inversely with the death rate and with the indices of prosperity. The nutrition of wage-earners would naturally be better during depressions when their wages, although lower in absolute figures, have greater purchasing power, in terms of food, than during business prosperity, when wages, although inflated, are less than their previous equivalent in food value. How the unemployed and their families are fed is a subject of wide ramifications, in which previous savings, relatives and neighbors, private charities, and governmental agencies all play a part.

MISINTERPRETED FINDINGS

Attempts to show that the unemployed and their families, or any other part of the population, have really suffered poorer health during the depression have been uniformly unsuccessful. In those families who have recently become poor there may be more sickness, or more increase in sickness, than in those who have been on the relief rolls before the depression began,⁹ but this does not mean that the failing finances led to sickness, but rather that some intercurrent illness in the family led many to apply for aid who would, if in good health, have weathered the financial storms unaided. Sickness is always an important cause of poverty, in good times and in bad. Reports of undernutrition in children during depression years usually emanate from sources where no objective records are available of the amount of undernutrition existing in similar groups during years of prosperity, and numerous controlled studies have shown that the health of school children during the depression was better, rather than worse, than in previous prosperous years.¹⁰

CONCLUSION

In view of these facts, there seems to be no good reason why social workers and writers who should be in a position to ascertain the real facts, should continue to growl a direful undertone of morbid prediction and dire forebodings to deepen the gloom of a populace already distressed by severe economic and social disasters. This does not mean that funds and efforts on behalf of public health and social service may with impunity be lessened or withheld. As prosperity returns, and prices are again raised out of proportion to the purchasing power of the masses, malnutrition and disease subsequent to it may be expected, but should not be blamed on the preceding depression. It does seem, however, that plans should be so conceived that energies expended in the direction of the improved health of the population are directed, not as emergency measures, to tide us over

a temporary depression, but rather as preparation for the real dangers to health and life that lurk, not in the shadows of the depression, but in the blaze and heat of the coming economic revivals.

DISCUSSION

A. B. COOKE, M. D. (2007 Wilshire Boulevard, Los Angeles).—Doctor Bogen's paper is a novel and striking presentation of a much misunderstood subject. It is also convincing. The popular and often voiced belief that economic depressions are always attended by increased morbidity and mortality, is clearly refuted.

Since health and longevity are considered humanity's supreme blessings, a logical corollary might be that depressions are far from unmixed evils. Such a pronouncement would probably not be enthusiastically received by any considerable proportion of the general public; but it certainly has its points.

War and pestilence, too, as factors in preventing overpopulation might be defended. Modern civilization has become so complex that no one is able to comprehend it in its entirety, or to unravel the meaning of its many tangles.

Much of the larger scheme of things will doubtless always remain obscure. It may be that depressions and wars and epidemics do serve beneficent purposes in the long run. *Quien sabe?*

This is a universe of law and order. It is not rational to conclude that human life and human affairs alone are chaotic—that chance and destiny are synonymous terms.

⌘

CHAUNCEY D. LEAKE, Ph. D. (University of California Medical School, San Francisco).—It is refreshing to find that some enlightened physicians are beginning to interpret the influence of economic factors on public health in a manner compatible with reasonable judgment on existing data. It is quite the fashion at present to drag a health factor into any sort of economic situation, from advertising to the "farm chermurgic." It is high time that physicians asserted themselves as competent judges in regard to the influence of economic factors on public health. Doctor Bogen deserves congratulation for the skill by which he has shown that business prosperity is by no means identical with mass prosperity, and that it is mass prosperity which really determines whether or not adequate nutritional needs are obtained by the mass of the people.

⌘

CLARENCE G. TOLAND, M. D. (1930 Wilshire Boulevard, Los Angeles).—Doctor Bogen has presented some startling and apparently paradoxical facts. The efforts of all who are thinking of the people's welfare have been di-

rected toward the prevention of cyclic depressions, and the maintenance of the periods of so-called prosperity.

Yet we have been given very good evidence to show that, physically, we are better off during depressions; therefore, our chief suffering has been mental and psychic. One need hardly cite the aptness of Goldsmith's oft-quoted lines:

"Ill fares the land, to hastening ills a prey,
Where wealth accumulates and men decay."

Doctor Bogen's facts would suggest that this is a very definite physical decay.

To us, as physicians, it should give strong reasons for resenting what Doctor Bogen so well called the "direful undertone of morbid prediction" of so many social workers. They constantly and repeatedly have referred to the suffering and ill health of the poor during the depression as a very potent reason for radically changing the status of organized medicine. We shall all be interested in their answer to this gauntlet which Doctor Bogen has so effectively hurled into the ring.

PERIDURAL ANESTHESIA*

By IDA HEISSIG, M.D.
Pasadena

DISCUSSION by Charles F. McCuskey, M.D., Los Angeles; Paul M. Wood, M.D., New York City; John G. Dunlop, M.D., Los Angeles.

THIS form of regional anesthesia, due to its simplicity of performance and the satisfactory relaxation it provides, bids well to compete with subarachnoid block in the same type and well-selected cases.

HISTORY

The injection of the epidural space was started by Cathelin about 1901, when he injected a one per cent solution of cocain into dogs and obtained good anesthesia. His attempts at caudal anesthesia in the human, however, resulted in failure for many years. The publication of his works led the French surgeons to inject the sacral nerves for the relief of pain in chronic nervous diseases, and the Germans to use anesthetic agents for surgical anesthesia. Hirsch, in 1906, describes the technique and gives the results in epidural injections. Laewen, in 1910, apparently was the first to perform surgical operations on the perineum, rectum, and female genitalia under what he called "extradural anesthesia." German and French surgeons gradually increased the use of this method, but confined their technique to the injection through the sacral hiatus. The first to conceive a different method of injecting anesthetic solutions, that is, into the epidural space of the lumbar region, was a young Spanish surgeon, Fidiel Pagès. His technique and results in abdominal anesthesia were published in 1921, in the *Spanish Review of Surgery*, without, however, receiving further notice. In this country caudal epidural anesthesia, used in a few clinics for genito-urinary, gynecologic and rectal operations, preceded by many years its application to abdominal surgery. Edw. Brenner, in 1924, laments the slow adoption of this method by our surgeons, and attributes the hesitation to confusion with spinal anesthesia and its hazards.

* Read before the Anesthesiology Section of the California Medical Association at the sixty-fifth annual session, Coronado, May 25 to 28, 1936.

Neely, in 1927, presents his results in epidural anesthesia for operations, having obtained anesthesia by the injection of the caudal canal, and gaining his level —?— by the use of large quantities of solution and the Trendelenburg position. It remained for A. M. Dogliotti, Italian surgeon, to bring epidural anesthesia to the front. It is assumed that he did not know of Pages' work, as no mention is made of the Spaniard in any of his writings, though the methods are similar. Since his first report of a series of cases in 1931, his segmental block anesthesia has become routine in certain clinics in Germany and South America. Alberto Gutierrez of Buenos Aires and A. L. Soresi of this country both noted, in 1932, the disappearance of fluid from the end of the spinal needle, due to the negative pressure within the epidural space, and made use of this fact in their technique, which was further developed by C. B. Odom of New Orleans.

DEFINITION

Peridural anesthesia is the injection of an anesthetic solution into the space immediately outside and adjacent to the dura mater of the spinal cord. The results are a complete and relatively long muscular relaxation of the body segment supplied by the group of spinal nerves bathed by the solution. The number of spinal and sympathetic nerves blocked will depend upon the site of injection, and the amount of anesthetic solution used.

ANATOMY

In order to understand this type of regional anesthesia, let us review briefly the anatomy involved. The peridural or epidural space is more or less potential and surrounds the dura on all sides within the spinal canal. It varies in size among individuals with the general bony structure, and within the body with the natural anatomical swellings of the spinal cord. From the foramen magnum to the seventh cervical vertebra the peridural space is only potential, then it gradually decreases till a depth of three-fourths centimeter is reached between the fourth and eighth dorsal vertebrae, when it again narrows due to the lumbar enlargement of the cord. In the sacral region the peridural space surrounds the dural sac on all sides and reaches its greatest dimensions. The space, therefore, is deepest where the spinal cord and its roots are smallest, that is, in the upper dorsal and lower lumbar and sacral region. It extends the full length of the spinal canal, from the foramen magnum where the dura, its medial wall, is firmly attached to the periosteum, down to the sacral hiatus, and is filled with loose areolar tissue, many blood vessels and semi-liquid fat. When lightly distended, it holds about 160 cubic centimeters of fluid, one-fifth of this being in the sacral region. Solution injected into the epidural space follows the spinal nerves laterally for many centimeters, through the intervertebral foramen to the paravertebral spaces and tissues. This has frequently been demonstrated on the cadaver, and in the living by the use of solutions opaque to x-ray.

TECHNIQUE

The patient is preferably placed in a lateral recumbent position, with his back well arched, knees and head close together, shoulders and hips in the same plane. In this position, collapse, though usually due to psychic causes at this stage, is entirely prevented, and the comfortable position aids materially in the patient's coöperativeness; if necessary or desired the patient may, however, be placed in a sitting position, though it must be remembered that the solution, due to gravity, will spread mainly caudad. The anesthetic solution will flow both toward the head and the sacrum if the patient is in a horizontal position, and its flow during and after an injection will be little affected by the anatomical curvatures of the spinal column. It is advisable to have the patient lying on the same side as the incision to be made, allowing a longer contact of the nerve trunks with the anesthetic solution.

The skin is prepared with ether and tincture of iodine or whatever antiseptic is generally used, and the patient is draped as for a spinal puncture. A skin wheal is made with novocain in the center of the proper interspace. A midline puncture is best, as no blood vessels will be encountered and the posterior triangular peridural space is entered through its apex. A short, beveled spinal needle, gauge No. 20, is introduced at right angles to the plane of the back through the supra and interspinous ligaments. This spinal needle has a saline-filled glass connecting tube (as used to connect rubber tubing for intravenous infusions) attached to its hub, and is gently advanced until it pierces the ligamentum subflavum. A distinct snap is felt, and the fluid within the glass tube can be seen to move inwardly as much as one centimeter, due to the negative pressure within the epidural space. This is the positive sign to stop the advancement of the needle, and that its tip is in the proper place. Should the space be only potential in the individual, or the dura be accidentally punctured by too much force exerted on the needle, the fluid within the glass tube will be pushed outwardly by the flow of spinal fluid. The same will also happen should a blood vessel have been punctured. In either case the needle must be withdrawn a millimeter or so until the flow stops, then the procedure may be continued, or a new puncture made in another interspace. The needle is held steady with the left hand after its tip has entered the epidural space, while the glass adapter is carefully replaced by a 10 cubic centimeter Luer filled with anesthetic solution which is slowly injected. It will be noted that the solution enters the epidural space and without the slightest resistance. Five minutes are allowed to elapse before any further injection is made of the remaining anesthetic agent. This interval of time is necessary to make certain there is no intradural anesthesia as manifested by motor paralysis of the lower extremities, or sensitivity to novocain shown by collapse symptoms. If either occurs, the administration is, of course, discontinued. In the case of the former the operation can proceed under spinal anesthesia, the dose, 10 cubic centimeters, being well within same limits,

while the latter is avoided by first aspirating, thus preventing the intravenous injection.

Gutierrez and Odom usually select the second lumbar interspace for the puncture, using 35 to 50 cubic centimeters of 2 per cent freshly prepared novocain or pantocain solution, with or without adrenalin. The height of anesthesia is obtained by the amount of solution used and the position of the patient immediately after injection. Thus, 35 cubic centimeters of novocain is sufficient with slight Fowler position for lower extremities and lower abdominal surgery; 50 cubic centimeters and Trendelenburg position for upper abdominal and chest work. Odom now prefers to omit adrenalin from his solutions, as he found a number of patients showing sensitivity to this drug. His anesthetics last one hour with novocain solution alone; one and one-half hours to two hours with novocain plus pantocain. It is best to allow the patient to wait fifteen to twenty minutes after completion of the injection, either turned on his back with head raised or lowered to increase the spread of the solution over the desired area, or turned on his side, thereby increasing the intensity of the anesthesia for unilateral operation. This period of waiting is absolutely essential for the diffusion of the anesthetic solution, and the penetration of nerve sheaths and trunks.

Dogliotti, on the other hand, attaches a syringe filled with saline to the spinal needle and produces a steady pressure on the plunger with his thumb while the needle is advancing. Great resistance is felt while going through the spinal ligaments, and the sudden release of this resistance (allowing the free injection of the saline) is used as the indication that the epidural space has been reached. He varies the site of injection and the amount of solution used with the operation to be performed. His injections are made in the following interspaces:

Lower limbs, pelvis and its contents or	
inguinal region.....	L. 3 or 4 plus caudal
Abdomen, below the umbilicus.....	L. 1 or 2
Upper abdomen.....	D. 8—L. 1
Thorax and upper limbs.....	D. 4—10
Neck	C. 4—5

Solutions including 15 to 25 minims epinephrin per patient are:

Novocain		Nupercain	
Per Cent	Cubic Centimeters	Per Cent	Cubic Centimeters
1.00.....	80-100	0.10.....	80
1.50.....	45-60	0.15.....	45
2.00.....	30-35	0.20.....	30

The injections of the cervical regions are done with extreme care and gentleness, and small amounts of the solutions are used. He has performed all types of operations, with the exception of face and skull, under peridural anesthesia, and is now concentrating his peridural anesthesia work for the upper extremities and neck. He prefers four or five separate doses of 10 cubic centimeters each, letting a short time elapse between each injection, to obtain more localized intense anesthesia, and uses larger quantities of solution or the

more potent nupercain for extensive and bilateral surgery.

It is not to be forgotten that adequate premedication in doses suited to each individual patient is essential for the success of any anesthesia and especially local or regional nerve block. The preceding night a sedative is given to assure the patient proper rest. The following morning, to prevent toxic reactions of novocain and epinephrin, a barbiturate is administered one hour before; morphin and hyoscin one-half hour before surgery to relieve the psychic strain. This will produce a drowsy, but coöperative patient.

COMMENT

The patient while on the table requires certain attentions and needs to be carefully watched. His body should be made as comfortable as possible with pillows or by flexion of the extremities, and this can be done without interfering with the surgical exposure necessary. Discomfort of the patient under any local anesthesia is frequently due to this cause rather than inadequate nerve-blocking. Nausea occurring in a small group of patients can be treated by inhalations of oxygen-carbon dioxid, but many will go to sleep and remain so throughout the operation. Pulse and respiration will be found unaffected. The blood pressure will, in some individuals, fall 20 to 30 millimeters, being due to the anesthetization of the sympathetics, and the amount of the drop will depend on the extent of the anesthetized area and the number of sympathetics involved. This blood pressure drop requires no treatment, and will correct itself as soon as the anesthetic wears off.

A certain number of patients will always be found who are emotionally unstable and who misinterpret their sensations of touch and pressure, insisting they are having pain. A light gas anesthesia to produce unconsciousness will be found sufficient, as the relaxation due to the peridural is adequate for the surgery. On the other hand, severe trauma to the peritoneum by retractors in a small incision, and rough pulling on the viscera, will be resented by the patient as in any other type of local block. The surgeon must coöperate by gentleness in handling of the human tissues so often forgotten when the patient is deeply under an inhalation anesthetic.

Gutierrez, in his series of three thousand cases, reports failure in less than one per cent, and two fatalities for which he does not hold the anesthetic responsible, but attributes them to advanced age and severe myocardial damage. Odom has 6 per cent of incomplete anesthetics and one severe reaction due to hypersensitiveness to novocain or adrenalin, but no deaths in three hundred cases. Dogliotti, who had one serious reaction in three hundred cases, supplements 10 per cent of his cases with light gas anesthesia. Hess, following Dogliotti's technique, finds 50 per cent of his patients complaining of pain during the operation, with one per cent complete failures. This writer's percentages of complaints are out of proportion to all others, and undoubtedly due to lack of, or

insufficient premedication, as their use is not mentioned in his work. Gutierrez, above all others, has shown that difficulties and failures can be eliminated through greater experience with this method.

ADVANTAGES AND DISADVANTAGES

Peridural anesthesia has all of the disadvantages of any local or regional block, which are:

Greater time consumed in administration.
Unsuitable for excitable patients.

Idiosyncrasies to drugs used which are rare.

These disadvantages are far outweighed by the many and definite advantages, which are:

From the standpoint of the surgeon:

Muscles are well relaxed.

Abdomen is quiet, because there are no exaggerated movements of the diaphragm to push out the intestines.

Intestines are collapsed as in spinal.

No interruption of the surgery by vomiting of the patient.

No postoperative sequelae of any kind.

From the standpoint of the patient:

No discomforts due to the anesthetic, as nausea and vomiting, cough, and possible bronchial pneumonia.

No inability to void, no headache or backache.

No inability to move extremities.

In general:

No interference with respiration, though the chest wall is anesthetized.

Collapse is greatly reduced in frequency and severity.

There are no toxic effects on any viscera.

No possibilities of meningeal irritation.

No possibility of the anesthetic solution diffusing to the bulbar and cerebral centers.

No sphincter paralysis.

IN CONCLUSION

Peridural anesthesia is particularly suited for the aged, debilitated, anemic, and patients with hypo- or hypertensions, myocardial and renal impairment, as well as those with upper respiratory infections. It has been successfully used for all types of operations below the chin in over five thousand cases. The technique, as practiced by Gutierrez and Odom, using the visible negative pressure sign and the second lumbar interspace for the injection of the anesthetic solution, is unquestionably the most simple, safe, and certain in obtaining satisfactory anesthetic results, and can easily be acquired by any anesthetist interested in regional anesthesia.

415 Anita Drive.

DISCUSSION

CHARLES F. MCCUSKEY, M. D. (3435 Amesbury Road, Los Angeles).—The chief indication for using peridural anesthesia for lower abdominal work is the freedom from postanesthetic sequelae, which we occasionally see following the use of spinal anesthesia. It must be kept in mind that it requires a very slight error in technique to change a

peridural anesthetic to a spinal anesthetic. For this reason the importance of developing a careful technique during the injection cannot be overemphasized. For the first one hundred cases injected by any individual, I think it would increase the factor of safety if the patients upon whom it is used were limited to those that we would consider good risks for spinal anesthesia.

I would like to congratulate Doctor Heissig on the excellent presentation of this subject, and urge her to continue the use of peridural anesthesia until several of her staff have become proficient with this form of injection.

✽

PAUL M. WOOD, M.D. (131 Riverside Drive, New York City).—Doctor Heissig has very thoroughly reviewed the available literature on peridural anesthesia, and I agree with the findings concerning the relative safety of this regional form. In cases where the dura has been penetrated, I have personally observed patients who apparently did not have true spinal anesthesia as suggested by Doctor Heissig and others of withdrawing the needle slightly.

However, I have also observed two cases where peridural anesthesia was attempted, and where there was no question but that some spinal anesthesia was induced, possibly by leakage into the subarachnoid space from sudden injection pressure into the peridural space.

The greatest disadvantage in my practice is the length of time required for securing this form of anesthesia. A technical maneuver, which has aided me, is the use of a three-way stopcock between the needle and syringe. The No. 10 or No. 20 syringe is filled with the fluid to be injected. A glass "filter adapter" (No. 21 Becton Dickinson), which holds a little less than one-half cubic centimeter of fluid, is placed in the upright position. The stopcock is adjusted so that the fluid to be injected into the peridural space is forced into the glass adapter. The stopcock is then set, and with the entire apparatus balanced in the hand the needle is advanced through the tissues and ligaments. The moment the peridural space is entered, the fluid quickly disappears from the little glass adapter. Without any further manipulation the lever is set in such a position that the fluid in the syringe may be immediately injected. This has tended to eliminate puncturing of the dura during the manipulation of attaching the syringe.

I am convinced that this form of anesthesia has a definite place in the armamentarium of professional anesthesia, and provides efficient and relatively safe anesthesia in selected cases.

✽

JOHN G. DUNLOP, M.D. (111 North Normandie Avenue, Los Angeles).—The value of peridural anesthesia and its ultimate place in the repertoire of the anesthetist is yet to be determined. The administration is more difficult, and requires a greater exactness than for a spinal anesthesia; and as yet few anesthetists in America have had sufficient experience with the method to warrant a just evaluation of its merits. In certain clinics in Europe and South America it has apparently proved satisfactory, and those persons in this country who are in a position to do so should be encouraged to perfect the technique and determine for themselves its value.

Except for patients evidently suffering from hyperthyroidism, adrenalin, I think, should not be omitted from the anesthetic solution. By decreasing the rate of absorption, it decreases the toxicity, and also prolongs the anesthesia. Because an occasional patient is apparently hypersensitive to the drug, however it is probably wise to limit the amount used. For years, in our sacral anesthetics, which are really low peridural anesthetics, we have been adding 6 minims of 1-1000 adrenalin to 100 cubic centimeters of one per cent novocain solution, with no severe untoward reactions attributable to the adrenalin. A similar restriction would probably be wise with peridural anesthetic solutions.

Fifty cubic centimeters of 2 per cent novocain solution contain 1,000 milligrams of novocain, and this amount injected into the highly vascular peridural space is capable of producing rather acute novocain intoxication. A slow administration, plus the judicious addition of adrenalin to the anesthetic solution, is therefore indicated.

THE LURE OF MEDICAL HISTORY†

THE WHITMAN CENTENNIAL: THE LATE DR. MARCUS WHITMAN*

By H. M. F. BEHNEMAN, M.D.
San Francisco

ONE hundred years ago this month, what was probably the first American home on the Pacific Coast was established. On the banks of the Walla Walla River, in eastern Washington, Dr. Marcus Whitman and his wife, Narcissa Prentiss Whitman, ended their long wedding journey and began housekeeping in a crude log cabin. The location of their home was known by the Indians as Wailatpu, or the "Place of Rye Grass," and it was the favorite resort of the Cayuse and Walla Walla Indians.

THE CENTENNIAL MEMORIAL OF JANUARY, 1936

In commemoration of the importance of this event, a public celebration, or centennial memorial, was held last August in Walla Walla, Washington. This was a three-day succession of events depicting the life and work of these noble pioneers of the Northwest. The first day was devoted to the interests of medicine, under the direction of the American Medical Association, when in the beautiful open amphitheater on the campus of Whitman College there were inspiring exercises. A large number of the residents of that part of our Northwest country are direct descendants of those who came in covered wagons, and with that hereditary, inbred spirit of the pioneer, they opened their hearts and their homes to all who came to do honor to the famous country doctor. Each day there was a huge parade, and each night a well-trained, spirited production, by three thousand actors, depicting the Northwest territory from the arrival of Doctor Whitman to the present. The citizenry turned out en masse in the costumes of the covered-wagon days, and each of the ten thousand visitors realized before he left that the preparation of this event had for two long years been entered into with shoulders to the wheel, as it was in the westward crossing. For many months the State of Washington, through the newspapers, ran a popular contest, so that each county in Washington was represented by a direct descendant of a covered-wagon pioneer, chosen through her popularity with the people of her county.

On Medical Day, addresses were given by Dr. Frederick C. Waite, Dean of Western Reserve University Medical School; Dr. S. B. Penrose, President Emeritus of Whitman College; and by the presidents of the Washington and Oregon

†A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of CALIFORNIA AND WESTERN MEDICINE. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

*Presented before the San Francisco County Medical Society, January 12, 1937.

State Medical Societies, as well as a trustee of the American Medical Association; and the address to the laity was entitled "A Century of Progress in Medicine."

PROFESSIONAL TRAINING OF MARCUS WHITMAN

Marcus Whitman came to the Northwest as a young man, and met a tragic death a few years later, having been born in 1802 in a New York village now known as Rushville, named after Dr. Benjamin Rush. In the veins of his parents was the blood of fearless, decisive, migrating pioneers. When Doctor Whitman was eight years old, his father died and he was sent to live with his uncle in Comington, Massachusetts. When he was thirteen, he moved to Plainfield and became a pupil in the well-known private academy of Dr. Moses Hallock, from which emanated some of America's most noted men. When he was ready to enter college at eighteen, he wanted to become a clergyman; but lack of funds prevented this, so for a period of five years he worked in the tannery and shoe shop of his stepfather and in the sawmills of his uncle. At that period, entrance to the ministry demanded four years of college education and three years in a school of theology. The study of medicine, however, could be begun in one's own home town, under the local doctor, and from then on pursued jointly with other duties.

FAIRFIELD MEDICAL SCHOOL

Fortunately for Marcus Whitman, the town's only physician, Dr. Ira Bryant, was a skillful doctor and a man of high integrity, and in 1825, with two years of study under Doctor Bryant behind him, Whitman was ready to enter the study of medicine, there being at that time eight medical schools in New England, three in New York State, and only four more in all of the United States. Whitman entered in October as a student in the Fairfield Medical School, known also as the College of Physicians and Surgeons of the Western District of New York. The school then had five professors, one hundred and thirty students, and one hundred trustees!

This medical college, however, had one distinction. It was the only school in America where human dissection could be carried on legally. The cost of this medical education is very interesting. The session lasted four months, from October 1 to February 1. At that time the students paid each individual professor; he "bought tickets" of them. In this year of 1825, the five tickets cost \$54; the dormitory room cost 30 cents a week; board was \$1 a week; and firewood cost \$1.25 for the entire session. In addition, there was expense for books, candles, and laundry, so that the total cost for the entire session was about \$100. That may seem small to us now, but it took Marcus Whitman two years to save it. After just one session at this school, Whitman was admitted to his County Medical Society upon examination and received his diploma on May 9, 1826.

After practicing for a while in New York State and Pennsylvania, he moved to Canada; but being of an ambitious and searching nature, he wanted further formal education. Accordingly he reentered Fairfield Medical School in 1831. His new teacher of surgery was John Delamater, who in forty years of teaching held nine professorships in as many different schools, and who, with Oliver Wendell Holmes, reestablished the decadent Dartmouth Medical School and took part in founding the Cleveland Medical College, now the Western Reserve University School of Medicine. So on January 29, 1832, Marcus Whitman received the M. D. degree, a thoroughly educated physician for his time, and soon after, as a country doctor, began a residence of three years in Steuben County, New York. There was no other doctor within a radius of sixteen miles, so he had a varied experience.

MEDICAL PRACTICE ONE HUNDRED YEARS AGO: FEES RECEIVED

There were then no specialists, no consultations, no office hours, and the young physician responded to calls regardless of weather, location, or time of day. The only transportation was on horseback, and the busy doctor needed more than one such transport. In fact, a doctor's success was sometimes measured by the number of horses he maintained, and a new force was given to the old expression, "one-horse," a deprecating term long applied in various ways. Naturally, he had to furnish medicines to his patients, crude drugs ground by himself, as there were no apothecaries. All surgery was done in sick folks' homes; and as there was to be no anesthesia for another fourteen years, speed was the index of surgical skill: a good surgeon amputated an arm in three minutes and a leg in six! There was no antisepsis; and instruments once used were wiped off and ready for the next victim. It was to be fifty years before bacteria were discovered. The doctor's fees were of interest: a house visit within three miles was 25 cents, and for each mile thereafter an additional $6\frac{1}{4}$ cents was allowed. If the same patient had a second call the same day, it was half the fee of the first one! Thus the doctor could not be accused of running up a bill. Medicines were extra and averaged $6\frac{1}{4}$ cents each. The office call netted the doctor $12\frac{1}{2}$ cents. The surgeon, too, was not on the road to wealth: Twelve and one-half cents was charged for tooth extraction; fractures were rated from \$2 to \$5, and a charge of \$5 was made for lower-arm amputations, and \$20 for the upper leg. Obstetrical deliveries were from \$1.50 to \$3, dependent upon the duration of labor.

The doctor in those days never spoke of his "income"—it was what he "put on the books": a very successful country doctor averaged from \$75 to \$150 per month. His cash income was very little; he received a great deal in merchandise, and more in services of various kinds. (I have some account books to show you later where even the bar claimed \$12 used credit.)

CHOLERA EPIDEMIC OF 1832

The year 1832 was a period of tortuous practice for the American doctor, more than any year in the country's history. The terrifying cholera spread over the Erie Canal and up the Mississippi like a prairie fire. In this epidemic Whitman saw and learned much.

WHITMAN'S MISSIONARY EXPLORATION

And then came into his daily routine an event which changed not only his life, but the lives of countless to come, as well as the geography of the United States. Whitman, in his heart, never lost the desire he had cherished to become a minister. Out of a clear sky in 1835, the famous clergyman, Rev. Samuel Parker, persuaded him to be his companion in a missionary exploration to the Northwest. Here Whitman saw his opportunity to combine the two greatest fields of service to humanity, the ministry and medicine.

So, in March, 1835, he bade farewell to the sad people of his district, for he was not just their doctor; he was their friend and counselor. Picking his best horse, with eyes toward the unknown western wilderness, he started alone for St. Louis, seven hundred miles away, which he reached early in April. There the Rev. Parker met him, and from there they went by boat on the Missouri River to Liberty, Missouri, the starting point of many caravans to the West and Southwest. And so, in the middle of May, these two brave hearts with sixty men, comprising the caravan of the American Fur Company, pushed westward. I need not comment upon the ruggedness of these sixty travelers. Unfortunately, the Rev. Mr. Parker was a bit inconvenienced by the hardships of travel and was poor at concealing it. He soon became an object of contempt and the target of rotten eggs. Moreover, the whole outfit felt like birds of a color traveling together, and thus Whitman was as mistakenly labeled as Parker. This animosity grew until there was much talk of murdering the pair. Fortune, however, decreed otherwise and saved them in the form of dreaded cholera. Where the Platte River joins the Missouri, one of the caravans succumbed to the disease. They were two hundred miles from any town; they had three choices—desertion, death, or the despised doctor.

Fontanelle, the brave caravan leader, sent for Whitman and reported three cases of cholera. Must they turn back? Must they all die? Then they learned to know Marcus Whitman. He had seen cholera; he had the drugs with him that would stop early cases; so, as a result, only three members of the caravan died. Overnight the doctor was the leader among men; his place was so high that his friend the minister basked safely in Whitman's shadow, ignored and harmless.

So the eleven-day stop ended, and the caravan headed once again into the wilderness of the land of the setting sun. For fifty fatiguing days under the burning rays of summer sun, they plodded on, across eight hundred miles of roadless, treeless plain and prairie. The only unscheduled daytime

stops were those to kill an animal to furnish fat with which to grease the creaking, whining wheels. The wagons were abandoned at Fort Laramie, now Wyoming, and their contents transferred to the backs of pack animals. From then on, as the strength of a chain in its weakest link, the speed of the caravan was the pace of the slowest man or animal.

ON THE CONTINENTAL DIVIDE

But after many narrow escapes from Battles with roving Indians, the caravan reached the summit of the Continental Divide, and on August 10, 1835, Marcus Whitman gazed westward, the first graduate of an American medical school to stand on the western side of the Rockies, the pioneer of all the thousands of us who have administered to the millions residing in this great empire in the past century.

Two days later another historic event took place. The caravan came to the crossing of the Green River, where about two thousand Indians and two hundred white trappers were gathered. Among them was James Bridger, noted American guide and scout. He was suffering and annoyed at the presence of a large iron arrowhead he had carried for over three years just under one scapula. Whitman removed it for him and also one from another trapper. Can you for a moment visualize the historic setting—was there ever any amphitheater containing over two thousand Indians and whites wherein one physician's future standing with his fellow man was more at stake? The gratitude of the two men was unlimited, and the astonishment of the Indians beyond our comprehension. Thus resulted a lasting friendship with Jim Bridger and a firm reputation as a surgeon in the entire Northwest empire. The Indian chiefs sent runners clear to the Columbia River to tell of the coming of the great white medicine man.

THE MISSIONARY PROJECT

And now another important episode took place. After a long conference it was decided that the Reverend Parker should continue West and Whitman should turn back and go East for more missionaries. It took him until November to reach St. Louis, and in the opposite direction Parker had reached the Columbia River in August. Whitman had great difficulty in finding recruits, but in February, 1836, he persuaded the Rev. Henry H. Spalding to join with him. Before starting, however, he made the trip back East to claim Narcissa Prentiss as his bride—a lovely, cultured, educated young woman, courageous beyond words, zealous to carry the word of God to the Indians, and deeply in love with Marcus Whitman.

So the Whitmans and Spaldings joined the caravan of 1836. These two women were the first white women to cross the Rocky Mountains, and the party arrived in the Columbia River valley late in September. There Dr. and Mrs. Whitman established a station on the banks of the Walla Walla River, while the Spaldings went one hundred and twenty miles farther on to the Snake River valley, now in Idaho.

THE POST AT FORT WALLA WALLA,
WASHINGTON

Here at Fort Walla Walla, which became a very important post, Whitman and his good wife fulfilled all the strenuous duties of missionary, doctor, agriculturist, and historian, for eleven years. Their lives were of hardship, particularly for a gentlewoman of the sheltered eastern home life she had known; but she was equal to it. While Whitman performed his medicine and surgery, teaching of agriculture and many other pursuits, Mrs. Whitman taught the Indian women to cook, to sew, and to speak our language; before long she had a large school of Indian women and children, eager to learn the things she had to teach them. Both of the Whitmans worked arduously to convert the Indians to the white man's religion.

In 1838 the second missionary party arrived, containing nine white people, including the Rev. Cushing Eells. The mission and trading post grew far beyond their expectations. Meanwhile great happiness had come for the Whitmans in the form of a baby daughter, born March 14, 1837, perhaps the first white child born west of the Rockies. Blonde like her mother, she was worshiped by the Indians.

We come near the end of the tale now, and fortune appears to desert the Whitmans, finally giving place to bloodshed and tragedy. The first blow to the faithful pair came late in 1839. With her father busy in the fields and her mother teaching school, the little two and one-half year old child wandered alone to the forbidden banks of the Walla Walla River and tumbled in. Her body was found by the heartbroken Indians and returned to the grief-stricken parents. The shadow of trouble grew larger. In a few months, Whitman heard the mission board in the East was about to abandon this mission. Also, now at its height was public discussion as to whether the United States or Great Britain should buy Oregon Territory. It was then under the administration of both countries.

WHITMAN'S CONFERENCE WITH PRESIDENT
TYLER

So, once again, early in 1842, Whitman made the long trek to the East. There, through his eloquence and sincerity of purpose, he convinced the Board the mission should remain. Achieving this, he then went to Washington. A leader among men with the blood of migrators coursing in his veins, he appeared before President Tyler and part of his cabinet in an historic session. He urged Secretary of State Daniel Webster, members of Congress, and the President, to purchase, without further hesitation, this Northwest empire. They listened and were impressed with his tales of wealth in very useful land, with a large river running to the Pacific Ocean—the mighty Columbia. As we know, Congress did not hesitate very long.

OREGON TERRITORY

The rest of that year Whitman spent in zealous enlistment of settlers for the new land, and in

1843 he led to Oregon the first of never-ending caravans, a body of eight hundred people. By 1847 the whites in the new Oregon Territory had increased to over three thousand. His mission was surrounded by settlers and the ever-present Cayuse and Walla Walla Indians. But, unknowingly, the end was near. Distrust and unrest among the Indian tribes increased with the tide of white settlers in the middle forties. The Indians referred to Whitman as the good doctor and regarded Mrs. Whitman as an angel of mercy, but felt more and more terrified at the thought of being driven from the home of their fathers. One Indian was the leader in this movement, by name of Tam-a-has, and his wily associate, Joe Lewis, kept firing the furnace of hatred. They told their tribes Whitman was the man who brought the whites to steal their land. Then, at a crucial moment Fate was most unkind, for the first epidemic of measles broke out at the mission and spread rapidly among the Indians and whites. Naturally, Whitman was unable to control it, although he worked day and night to save those he could. The many deaths left but one path to follow in the mind of the Indian—revenge upon the medicine man.

THE MASSACRE

The befriended reds soon reverted to the centuries of barbarism in their veins. On a cold November night in 1847, there was a knock on the mission door. Whitman was weak from fatigue and worry, and asleep. Narcissa Whitman opened the shutter; two familiar faces, Lewis and Tam-a-has, dourly looked at her, demanding to see the doctor for medicine for their squaws. With fear in her heart she locked the door and called her husband. He, too, was suspicious of trouble, but did not feel it was so close at hand. She begged him not to see them, but he pointed out they were far outnumbered and it would be better to be friendly, saying: "God's will shall soon be known."

He arose and locked the door behind him into the inner part of the house, went to the outer entrance and welcomed the two Indians. They demanded medicine for their squaws and that was all. Whitman talked a few moments to them, relieved that they did not want him to go to their tents. The two pairs of treacherous eyes followed him. As the young martyr bent over his bag, the swift, sure stroke of a tomahawk deep into his skull ended a noble life.

Pandemonium broke loose as the house was being surrounded while the two Indians were talking to Whitman. A shot through the open window brought down Mrs. Whitman with a bullet under her arm and in her cheek; she lived for some hours. One by one, fourteen white lives were taken during the remainder of the night. Fifty loyal Indians and whites were wounded in an effort to stop the massacre. All the remaining whites were held hostages for a month, and then sold at a high price to Governor Ogden in Umatilla. Thus ended Waiilatpu Mission, but thus began monuments to its memory.

WHITMAN COLLEGE

Indian wars continued for twelve years, and then in 1859 the Rev. Cushing Eells returned to the scene of the massacre. He resolved to devote the rest of his life to honoring Dr. and Mrs. Whitman, and the monument he erected was Whitman College, for seventy-five years a worthy tribute to the Whitman's, a coeducational college of high character and large enrollment, in Walla Walla, Washington.

In the pictures frequently shown, you may see the grave of Marcus Whitman, a marble shaft pointing high into the sky, arising on a peaceful hillside in the rolling green hills of eastern Washington. There are tablets to his memory in the three places where he practiced in New York, and the State of Washington has a county named after him.

IN CONCLUSION

All these commemorate a capable physician, a true pioneer, a fearless American of sterling integrity. But, as I look back and realize the multitude of grateful people who came from four states to honor Whitman on medical day, it appears to be more than just a tribute to Whitman. It was also a tribute to the ideals of American medicine, for they gathered to hear all about what we are doing and hope to do in the practice of medicine. In the amphitheater in the shadow of the Whitman Memorial Building, it was heartening to know that these people left the routine of busy lives, some of them for a week, to travel many miles to honor and revere a noble character in American medicine. It brought to mind words spoken two thousand years ago by Cicero: "Memory is the treasury . . . of all things. The life of the dead is placed in the memory of the living."

CLINICAL NOTES AND CASE REPORTS

AN EFFICIENT BACK BRACE

By HUBERT R. ARNOLD, M.D.
San Francisco

NCESSITY frequently compels one to devise ways and means which would not otherwise materialize.

Several years ago I was unfortunate enough to develop a destructive lesion of my fifth dorsal vertebra, with extension into the fourth and sixth vertebral bodies. After a prolonged period of bed rest, x-ray and other appropriate therapy, I became ambulatory and was confronted with the problem of immobilizing my upper dorsal spine. Since my general health was otherwise excellent, I was, naturally, anxious to be fitted with an appliance which would give the proper degree of fixation, but at the same time afford sufficient freedom of motion so I could get back to practice. The Taylor brace soon proved awkward and in-

Fig. 1.—Front view of brace not in use.

efficient, as it was apparent through one's clothes. The perineal straps were uncomfortable. It did not give proper support, and one had the general feeling of being the support instead of being supported. If you have never worn one of these contrivances you will not appreciate what I am saying; besides, there is a multiplicity of straps and buckles, and the breast straps are worthless. It is uncomfortable, particularly when one is sitting down, and in spite of the perineal straps, it hikes upward in this position.

Then I was fitted with a crutch brace. The lower part of this brace was made identical to the brace which I have devised and shall describe in detail below. The crutch was a constant annoyance and discomfort under the arms and, besides, the brace did not give the proper support to my upper back. I was in constant fear, also, of a crutch paralysis from the pressure in the axillae. This brace, indeed, did not give the proper freedom of the arms, and it was impossible to let one's arms hang down by the sides of the body; the arms were always out at an angle and the shoulders somewhat pushed up. A friend remarked to me one day that I looked tough. After a busy day I frequently felt that I was.

A light plaster jacket would give good support, but this is not practical for permanent wear and, besides, it would not give the desired freedom for one who is actively engaged in work.

Fig. 2.—Front view of brace in use.

Fig. 3.—Side view of brace in use.

Fig. 4.—Back view of brace in use.

I presume there have been numerous other back braces and devices for back support, but in general, from what I have seen of such appliances, they are no commentary to the mechanical ingenuity of the orthopedic surgeons, being mostly inefficient, awkward, and uncomfortable for the patient.

The chief difficulty with all back braces is this: They hang on one's back and depend for support on the straps fastened here and there to pull the thorax backward. The principle of the brace I have designed is to support the back by pressure on the upper anterior chest, just below the clavicles. When the lower part of the spinal column is encased in a pelvic girdle (to be described below) at the level of the sacrum, and the lumbar and dorsal spines lie flat against the two upright steel supports (one on either side of the spine), and the upper thorax is partially encircled by a spring band which snugly fits the body and clears the axillae and ends anteriorly in a circular enlargement (padded) just beneath the clavicles, then flexion of the spine is impossible. The entire dorsal spine is supported by pressure anteriorly below the clavicles. Side motion is prevented by a steel upright on each side.

The construction of this brace is simple. A pelvic girdle is made of plaster. While the plaster is still wet it is cut off and immediately reshaped. A model is made from this. Then a steel band (formed of sheet steel) is made to fit the model. This band is about one and a half inches wide and of proper thickness. Anteriorly it is curved somewhat upward. This encircles the pelvis just below the iliac crests, and sufficient space is left anteriorly to enable one to put it on with ease. Then the two spinal uprights are riveted to this base. Their length depends on the patient to be fitted. The side uprights are then put in place, reaching within about two inches of the axillae. The top band is made of duralumin and the ends are flanged out and perforated so a pad can be sewed on. These padded ends press on the chest just

below the clavicles. Sufficient clearance must be left under the axillae. It is neither necessary nor desirable to pad this band, except the ends where they press under the clavicles. A pattern is cut out of paper, and this duralumin band is fashioned from this. It is then riveted to the four uprights.

The four uprights are covered with a soft leather, and a pelvic girdle is made with heavy but pliable leather. It is a good plan to perforate this girdle for ventilation. Just two straps are necessary to hold this brace in place. These buckle across the lower abdomen.

Reference to the photographs will show at a glance the construction of this brace and how it looks when worn. I am the model in this instance. A front, back, and side view are shown, and one photograph is the brace not in use.

This brace is simple in construction, light, gives satisfactory immobilization of the back, reasonably inexpensive, and quite comfortable to wear.*

450 Sutter Street.

* This brace was worked out in the 1117 Market Street shop of C. H. Hittenberger Company, San Francisco.

I am indebted to Mr. Hittenberger personally for the unselfish giving of his time and material, as well as for many helpful suggestions.—H. R. A.

We should endeavor to get ideas from those who conceived or created them, thus bringing directly to bear upon our lives their wisdom and conceptions of beauty. Not content with the distorted impressions of second-hand report, we should let creative men speak directly to us. How can this be done? By coming to know their lives and their works—the books they wrote, the truths they established, the principles of ordered society they laid down, the songs they composed, the pictures and statues they made, and the cathedrals they built. They quicken us to our best; they are the great teachers of the race.

What you know and can do differs from what you used to know and do. No man's skill remains the same year after year. You gain and lose. You are probably now better able than formerly to earn your living—provided you can get a job—but, one may guess, less fresh in algebra. From past training and experience you carry along what you review, use, are interested in.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

CONSTIPATION IN CHILDREN

I. ETIOLOGY

E. EARL MOODY, M. D. (3780 Wilshire Boulevard, Los Angeles).—Constipation has been defined as that condition in which food taken eight hours after defecation is not passed in forty hours. This may be caused by certain conditions in which the passage of the feces through some part of the colon is delayed, though the act of defecation may be normal. Deficient motor activity of the colon, diminished reflex activity and inhibition may be registered as contributing to this type of constipation. Again, the fecal matter may pass properly through the colon, but the final evacuation may be inadequately performed. Laziness, fear of pain due to such condition as anal fissure and hemorrhoids, and failure to obey the impulse of defecation are illustrations.

The medical training of the profession and of the laity has been such that we are led to believe that there should be a daily evacuation of the bowel. This idea has done much to make the human race "defecation conscious." This consciousness perhaps has done much to contribute to the causes of constipation, because interference with normal processes too frequently results, in order to insure daily evacuation. Perhaps this idea has played too much importance in the treatment of disease. With a daily bowel movement in illness, we see some tangible result of our treatment which assures us that we are making certain of at least one life process, even though this is brought about by the use of drastic irritants. Perhaps it is not medical heresy to allow the acutely ill patient, sick with pneumonia or other severe infection, to go several days during the acute stage without a bowel movement. If this is heresy, certainly no one can deny that the energy and strength expended in the daily struggle with the bedpan and the effects of purging would be conserved to fight the disease.

The Newly Born.—If we modify the above definition of constipation somewhat, we can readily see that the newly born might present such malformations that would make bowel movements impossible. An atresia can occur anywhere along the gastro-intestinal tract. Those of us who see many newborn are astounded at the relative frequency of such malformations. These are seen most frequently in the esophagus, the anus, rectum, and, less frequently, in other parts of the intestinal tract. If sufficient amount of meconium is not passed, or its absence is noted, or the stools fail to go through the transitional stage to the milk stool, investigation will probably reveal some such malformation.

Some newly born infants may be so weak that they do not possess the muscular power to bring about sufficient peristalsis and the proper emptying of the lower bowel. This is most often seen in small prematures and other congenitally weak infants.

While we are discussing this problem in the newborn, let us mention, in passing, the nefarious practice that some physicians still follow of prescribing castor oil routinely for all newborn. This practice has no anatomic, physiologic, or pharmacologic basis. It cannot be condemned too strongly. It belongs in the dark age of medicine. This is the entering wedge to the cathartic cause of constipation.

Other Abnormal Causes.—There are certain diseases or abnormal conditions which can cause constipation. Pyloric stenosis, severe pylorospasm, intussusception, and other types of intestinal obstruction which prevent the normal passage of the intestinal contents naturally prevent fecal evacuation or reduce the amount. The constipation associated with appendicitis, peritonitis, pneumonia, and other severe infections need only be mentioned in passing. Lead poisoning and Hirschsprung's disease, both rarely seen, cause very severe and obstinate constipation. The general muscular atony seen in rickets, cretinism, and other constitutional conditions is associated with an atony of the intestines, and constipation usually results. Other findings in these abnormal conditions readily make the diagnosis certain, and the cause of the constipation, if present, is obvious.

The Breast-Fed Infant.—Constipation is rarely seen in the breast-fed infant. This is probably due to the presence of a relatively large amount of sugar which is easily fermented in the bowel. This produces an acid state which stimulates peristalsis. These infants may so thoroughly utilize all the food eaten that there is little residue left. A major reason for this is that in mother's milk there is a relatively small amount of protein and fat, as compared with cow's milk. It is these substances that contribute mostly to residue. It is common to see a breast-fed infant have a stool which is soft, of normal odor and color, and well-digested, only every two or three days and yet be perfectly comfortable. One is loath to call this state constipation. If too much attention is given this condition and enemas or cathartics started, constipation then will surely be fastened upon the child. If left alone, or accessory foods added, nature will produce a normal natural habit of bowel evacuation, especially if some effort to train the child is employed. Of course, there may be present in the breast-fed infant sufficient atony in somatic and intestinal muscles that, in spite of sufficient

food, proper training, and the addition of accessory foods, constipation remains a major problem.

One of the first indications that a breast-fed infant is not getting enough to eat is to see the daily three or four normal stools formerly had, reduced not only in number, but in quantity. Naturally, this condition is the result of reduced residue. The weight gain also slows or remains at a standstill. The addition of other food, sufficient to meet the caloric needs of the child, is all that is necessary to correct the condition.

Not infrequently small infants are seen whose anal sphincter is so spastic or the opening so small that there is difficulty in the small infant developing sufficient *vis a tergo* to overcome this added impediment to bowel evacuation. An examination with the little finger, and a careful daily stretching of the sphincter, will prove and overcome this condition.

The Artificially Fed Infant.—Constipation is much more commonly seen in the artificially fed infant. This is quite natural when we consider that we are dealing with a physical and chemical composition in cow's milk quite different from that in "mother's milk." There are other factors that must be considered, for we will see two children of the same age and weight being fed the same formula, one having three or four loose stools daily, while the other has a hard, constipated stool. The difference must, of course, be attributed to anatomic, physiologic, and autonomic differences in the two children. However, the fat, protein, mineral, and carbohydrate differences are largely responsible for the usual increased evidence of constipation in the bottle-fed infant. The casein (protein), fat, and calcium content of calf's food is several times that of mother's milk, while the sugar content is less. This makes for increased bulk. The residue forms pasty, heavy stools, often composed of insoluble calcium and magnesium, fatty acid soaps, which are passed only with great difficulty. A reasonably soft residue leads to an easy evacuation. The relative insufficiency of an easily fermentable carbohydrate found so freely in mother's milk fails to bring about an acid condition of the lower intestines which favors peristalsis. Also the increased amount of protein tends to neutralize the laxative effect of the fermented carbohydrate. The reaction of the constipated stool in the artificially fed infant is usually alkaline, and this tends to inhibit peristalsis.

This natural tendency in the infant fed on cow's milk makes the introduction of habit-forming enemas and cathartics easy. A knowledge of the basic principles of artificial feeding, permitting of the proper modification of this calf's food, will in most cases correct this constipation tendency, and thus prevent the frequent use of the habit-forming enemas and cathartics.

Older Children.—In older children we see the results due to early bad or inadequate training of bowel evacuation. If proper attention is given the infant when a few months of age, much of the difficulty encountered in later childhood would be avoided. At this early period the mother should place the child on the pot after the insertion of

any inert instrument such as a catheter, thermometer, soap-pencil, or gluten suppository, at a regular time daily. The infant soon learns that whenever the pot is offered, a bowel movement is expected. This, regularly carried on into the runabout period, and the going to the toilet regularly without hurry during the school-age period, other things being equal, will prevent constipation.

The position at stool in the small child may be important enough to mention here. Too often the small child is placed on a toilet seat not fitted to his size, and ability to assume the natural position of defecation is thwarted. The correct position is the squatting one. Here the thighs are pressed on the abdomen, and the "accessory" muscles of defecation are thus brought into play. This position should be assumed as the small infant is held over the pot on the mother's lap. The small pot on the floor best serves this purpose for the older child. The average toilet seat is not comfortable nor in any way adapted to the small child. These seats and large pots too often also compress the nates together, thus increasing the force necessary to bring about the defecation.

In school-age children, the regular visit to the toilet is too often omitted, or, if followed, the child is in a hurry and does not take sufficient time because of the rush for school. The child arises so late that no time is allowed to obey the impulse which comes from regular training. This impulse is thus throttled, morning after morning, and often again through the day, because of the urge of play or stress of other activities. Thus, the rectal reflexes pass, the fecal contents accumulate in the rectum and sigmoid, which eventually become permanently relaxed and the contractility is impaired. Thus, fragmentary defecation results, much feces being left in the lower bowel to further distend and relax. When this is the usual routine, constipation becomes a fixed condition because of the permanent damage done to the tone and reflex action of the bowel.

Again, the child may refuse to move the bowel because of a spirit of negativism. He does not wish to be bothered and taken from his play, which interests him more. When placed on the stool, he simply refuses to make the effort and actually inhibits the movement. Of course, this practice, long continued, will bring the same results as that in which the child does not take sufficient time to obey the rectal impulse. It takes very wise handling of the child to eliminate this negativistic cause of constipation.

Another common fault at stool in older children is the presence of toys and reading material. This interferes with the voluntary part of the act that is necessary to bring about successful defecation. Children should be trained to concentrate on the act and have it over with quickly.

Atony of the Bowel.—Atony of the bowel may appear in an older child as the result of such conditions as severe anemia, a long illness, or nervous exhaustion. These conditions so sap the vitality of the child that general atony, including the bowels, occurs, and the child is left with insufficient power to move the bowels adequately. It is inter-

esting to see the neurotic child who is suffering with chronic exhaustion enter into play or other activities with great energy, only to be so fatigued and exhausted that when brought to stool he is physically unable to make the effort to move the bowels.

Lack of exercise may also be a factor in some children who do not have the opportunity to be much out of doors. This may often be in conjunction with faulty diet in that too much candy, sweets, meat, milk, and other foods which leave little residue, are given. There is a relative absence of cellulose containing foods, as fruits, vegetables, and cereals, which robs the bowel of that mechanical irritation necessary for good bowel evacuation. Often there is an insufficient intake of water, so that the bowel content becomes excessively dry because fluid content is absorbed to supply cellular needs.

Constipation is seen frequently in the child who has a poor appetite. So little food is taken, especially vegetable and fruits, that no residue is left in the bowel to stimulate peristalsis. Such a condition results in malnutrition, atony, and possibly nervous exhaustion, so that these factors also contribute to the problem and the vicious circle is started.

Enema and Cathartic Habit.—How frequently do we see mothers who feel that a weekly or biweekly cathartic or enema is necessary, whether the child needs it or not, in order to clean out the bowel. Each dose of cathartic or enema which disturbs the usual rhythm is usually followed by a day or two when no bowel movement occurs. This, continued long enough, produces atony and stasis, which requires more and more drastic cathartics and more enemas. There is deficient excitability of the mucous membrane due to the inflammation set up by the action of the cathartic chemical or the stretching action of the enema. Again, we see infants whose feeding is faulty, who receive milk of magnesia or other mild laxative daily in the formula in order to insure a daily bowel movement. If this is continued for long, more drastic cathartics must be employed to give the desired daily movement.

Cold and other infections are common in young children. Some parents and some physicians still cling to the exploded idea that such infections can be cured or adequately treated by purging the child. When one considers that colds are due to an infection either by virus or bacteria, the implantation of which is local, it stands to reason that such purging can have but little effect upon the cold and can but help to fasten the cathartic habit upon the child. Cathartics and enemas should be used at rare intervals in children. When necessary the drastics should be avoided.

Spastic Colon.—In some children we see a contracted colon, which is due to an autonomic imbalance. Here the stools are small and pencil- or ribbon-like in character. There may be small, round scybala, the stool resembling rabbit or goat feces. This spasticity may be seen in children presenting a neuropathic constitution. Peristalsis is lost to spasmodic contraction or there may be in-

action. This is brought on by such conditions as lead-poisoning, pain, as that caused by anal fissure or abdominal conditions, or irritation in the bowel, as that due to excessive roughage when bran, agar, and such substances are used in excess. Allergic sensitiveness also frequently causes such a spastic colon when specific substances are eaten by the child. The history of allergy and the relief of symptoms in the child, which comes when the offending article is removed from the environment, make the cause of this type of constipation certain.

* * *

II. DIAGNOSIS

HELEN B. PRYOR, M. D. (Stanford University Medical School).—Constipation may be considered a purely functional disorder in 85 to 90 per cent of cases. Consequently, the type of child most often seen with this complaint should be scrutinized.

In a study of factors involved in the hunger strike, so frequently encountered by pediatricians, it was discovered that most of the hunger strikers were also constipated.

Anthropometric measurements were done on one hundred such children and compared with an equal number of other children of the same age and sex. The measurements included, in addition to data, as age, sex, height and weight, diameters as follows: bi-acromial, lateral chest, bi-iliac, antero-posterior. Girths measured included circumferences of neck, chest at nipple line, upper arm at middle of biceps, calf at greatest girth. These measurements, when compared by age-sex groups, demonstrated that the children who were constipated, and habitually did not eat, were of linear-type body build, and had small and delicate bony frameworks when compared with the control group.

Certain anatomic and physiologic characteristics of linear-type people, as described by Thompson, Bean, and others, should be remembered in connection with constipated children.

Owing to the small thoracic outlet, the liver is low-lying, with a vertical inclination, and keeps mainly to the right side. For the same reason the stomach is low-lying, often below the umbilicus, vertical, and lying strictly to the left side; although, on lying down, it may rise somewhat and the pylorus may move to the right. The stomach is commonly J-shaped—the “fish-hook stomach”—and the important point to note here is that the lowest part of the stomach lies some considerable distance below the pylorus, so that the stomach is under the necessity of emptying itself against gravity. The stomach is markedly atonic, and this, together with the position of the pylorus, just mentioned, makes complete emptying a matter of some difficulty, and one which is often imperfectly performed.

Professor Bean has found that in this type the small intestine is unusually short, while the large intestine is very long. Because of the shortness of the absorptive small intestine, the food does not take so long to pass through it as in the other type, and, therefore, assimilation of nutriment is not so good. On this account, together with the

poor circulatory conditions, the general nutrition of these people is below par; they are thin, their musculature is poor, and their trophic functions are anything but vigorous.

This linear-type child often exhibits vasomotor instability characterized by easy blushing, cold extremities, rapid pulse, breathlessness on slight exertion; speech is usually rapid and sometimes stammering. Mentally, such a child is bright, often precocious; but he changes restlessly from one occupation to another, showing fatigue rapidly and lack of concentration.

A nervous, high-strung child, who is often habitually constipated, is usually anemic, and has a very poor appetite, which constitute a vicious circle. The high-strung child of nervous parents, is often an only child, who is the object of too much undivided solicitude. He develops into the neurotic type of hunger-striker as a result of all the concentration upon his nutrition and elimination.

Since regularity of habits is so important in elimination, we sometimes expect to find constipation a complaint of the willful, spoiled child, who is permitted to be erratic about the performance of his duties.

The causes of constipation due to food include insufficient carbohydrates and insufficient total solids, while insufficient fluid intake results in hard, dry stools. Bottle-fed babies during their early months do not normally have the two to three large stools daily that the breast-fed babies have, but this does not constitute a constipated condition.

A high-fat diet is constipating because it causes stools containing a high proportion of soaps difficult to evacuate. A high-starch diet may be mechanically constipating, because it does not sufficiently stimulate the intestinal glands and the liver, thus slowing down peristalsis.

An anal fissure, or small erosion, should be considered in diagnosing the cause of constipation. In such a case the pain produced by attempted evacuation is enough to cause a spasm of the sphincter ani and retention of feces. Unexpelled fecal matter is returned from the rectum to the sigmoid, producing stasis and dilatation.

Einhorn described constipation as due to retarded peristalsis, to enterospasm, or to abnormality of other organs. The degree of irritability of the bowel wall differs in different types of children. The linear type is more susceptible to spastic constipation.

Spasmodic contraction of the bowels may involve the small intestine, but the colon is chiefly concerned—the contraction being limited to a small segment. Forced feeding and overfeeding, in a conscientious effort to produce gain in body weight, irritates the intestinal tract.

Hertz described the reverse peristaltic wave in the large intestine, which mixes the contents of the transverse and ascending colon and returns accumulations to the cecum. The fluid is absorbed here. If there is too much roughage in the diet, masses of dry, undigestible residue are expelled

with great difficulty. This may cause spastic contraction of the bowel wall with an aggravation of the constipation.

In atonic constipation the cecum is most frequently involved, but sometimes the sigmoid also becomes atonic and dilated because of stasis. The muscular coats of the bowel wall become stretched and lose their power of elasticity, finally allowing dilatation.

Imperfect integration of the nervous system, following illness, interferes with nervous impulses essential to normal action and may affect either the upper or lower bowel.

* * *

III. TREATMENT AND PROGRESS

WILLIAM ANTHONY REILLY, M. D. (University of California Medical School, San Francisco).—The treatment of this common complaint includes training, diet, exercise, and drugs—placed in that order of importance. Training and establishment of a good routine is a great help in establishing the habit of a regular bowel motion, especially in a young child or infant. The emptying of the lower bowel can usually be made a habit in an infant under one year of age as well as taking a nap or having hours for meals. The mother should preferably watch for the usual hour of movement in a child, even only three months old. If the hour is regular, this will prove to be relatively simple. Sitting the child on a small receptacle placed on her lap for five or ten minutes, and gently massaging the lower abdomen in clock-wise direction, will frequently establish the habit. If more than one movement occurs at reasonable hours, the same procedure can be carried out. It is well to explain, even to the infant, with some simple word the purpose of the procedure; often the infant later on imitates this word and the mother can "catch the child in time." With children older than three or six months the same routine should be instituted. If a child reaches one year of age without any set time for a movement, the mother should put the child on a small receptacle, chair, or special toilet seat for the purpose, and try thus to establish a regular hour. Some children prefer to use an adult toilet; others may want to climb onto the seat; a few prefer only to be taken to the room, a few want to go there by themselves.

Permitted indulgence in such idiosyncrasies will often reward the mother with less washing of diapers, etc. If an adult toilet is used, a small infant seat should be procured; one can easily be made from a smooth board and padding the edge. To start a motion it is harmless to insert gluten or cocoa butter suppositories; or even hand-made pure soap suppositories; greased glass rod, oiled paper cone, or even the cotted-greased little finger. This is often done for the first week or two of training; such usage is gradually lessened, the interval increased, and it is then possible to discontinue it and a regular movement time often will have been started. In older children it is very important that they take a regular time for defecation; this is doubly true if the impulse occurs

during play. Probably many constipated older children would be thus relieved; mothers should call them from play at the expected time. Continued failure to heed their impulse probably often results in colonic atony.

Diet is the second item of importance. It, as well as the other items mentioned in the first paragraph, should be quite closely integrated. Breast milk is usually more conducive to bowel motions than artificial feedings. With a breast feeder, pure prune juice or orange juice as a supplement will often relieve infrequent movements; extra water also helps to soften the motions. The mother should realize that a nursing can go twenty-four hours without a movement as long as there is no discomfort from colic, distention, etc. Toxic absorption is so rare, and the evil of laxatives, enemas, etc., so common, that it is well to explain these facts thoroughly to the worried mother. I have seen a breast-fed baby go seven to eight days without a motion, still act well and, finally, pass a soft motion. Nurslings often strain in passing hard feces which, in excoriating rectal mucosa, are streaked with bright red blood. Extra fluid to soften the feces, perhaps a suppository or a syringe-load of mineral oil, will do likewise.

Artificially fed babies are more likely to have trouble with their feces—hard and infrequent motions, gas pains, or restlessness. Of course, 10 per cent, or even 15 per cent, carbohydrate should be added to the formula in the form of more of the added sugar or substituted by other sugars. (Table sugar is pure, good, and often laxative). Malt extracts are fine—the old malt soup extract should be used more often; honey or molasses, one to two drams to a feeding, often help. The finest available dextrin and maltose products often must be changed. After the addition of solid food to the diet, this extra residue, if not too great, often improves this complaint. Finely chopped meat or vegetables does help when they are started in the infant's diet. Fruit is well known for its laxative effect. A one and one-half to two-year-old child still having strained smooth food may have relief from constipation by gradually offering unstrained items, plenty of unstrained fruit, whole-grained cereals, even two or three tablespoons of bran at a meal, as muffins, bread, or cereal. This increased roughage may prove to be the desired solution. The amount of roughage, of course, can be overdone and aggravates constipation. Do not forget that weight-for-weight milk leaves more bulk for feces than most other foods. Thus, too much milk in some youngsters can acutely aggravate this problem. In older children the same above facts hold true. Fermented milks often help them, also generous helpings of honey, or molasses (even the raw varieties of cereals may relieve milder complaints).

The need for exercise is quite obvious and very beneficial. General types—running, jumping, wrestling, riding bicycles, etc., are, of course, helpful in "toning up" all muscles, and this includes those of the colon. Occasionally it is necessary to locally exercise abdominal muscles. Passive exercise by kneading, rotatory clockwise movements,,

etc., all are also helpful. Special active exercise for the abdominal wall—as flexing trunk, stiff leg-raising in recumbency—will be needed in indicated instances.

Purposely, drugs for constipation will be very sketchily mentioned. They should only be used to relieve in acute cases needing immediate relief or for the cases not responding to other procedures. Suppositories are relatively harmless, should be used as are enemas—before a medication by mouth—since the difficulty usually is an inability to empty the large bowel and not to move the small bowel. Gluten or cocoa butter are usually harmless, but slower in action than the more irritating but safe and rapid-acting soap or glycerin sticks. Suppositories often help to train an infant. Enemas are helpful to relieve an acute complaint; or more often for chronic instances or impacted feces. Often in infants, three or four syringefuls (one ounce each) will be followed by a movement. Usually a teaspoonful of salt to a pint of tepid water is the mixture. One or two ounces of mineral oil or olive oil often lubricate hard feces, so that the infant stops laboring and easily expels previously hard feces. In children over a year, more volume of and pressure by the enema may be needed. Do not be afraid to use an enema bag with the small pencil-sized greased tip; it will not hurt or stretch the sphincter any more than a suppository will. Several quarts to a gallon may be necessary; two to three feet of hydrostatic pressure are sufficient; let it run in by pint fractions, having the child seated on a basin or pan and hold this amount for two or three minutes, if possible, before expulsion. Impacted feces are best handled by one to three quarts enema of oil once or twice daily or alternating with soap-suds water, until softening allows of digital removal of feces. In this instance, milk of magnesia, aromatic fluid extract of cascara, A. B. S. C. pills, or compound cathartic pills, may be temporarily used.

Mineral oil, or milk of magnesia (for an infant, drams one or two at night, or ounces one-half to one for older children); agar for older children in one- or two-dram doses on their food once or twice daily, are the more reliable and harmless drugs. They are best used temporarily in acute conditions; or may be used more often in untractable cases. Senna, aloes, rhubarb, should be avoided if drugs have to be used continuously. If drugs must be used, they should gradually be dropped as training, diet, and exercise become effective.

One must always bear in mind that the more severe and untractable cases should have possibly careful physical, fecal, rectal, proctoscopic, and roentgen examination. Anatomic anomalies may exist and several of them should be borne in mind because they can be alleviated surgically. Among these are Hirschsprung's idiopathic megacolon and rectal mucosal valves. The former is revealed by the tremendously large abdomen, large infrequent stools, x-ray, and spinal anesthesia tests; the latter by the proctoscope. Anal stenosis causes ribbon-like stools. Proctoscopic and digit will expose rectal fissure, easily relieved by silver nitrate stick cautery. Other frequent anatomic causes are

weak abdominal muscles following poliomyelitis or rickets, etc.; colonic muscle atony from frequent enemas, etc.; colonic spasm in nervous children.

Prognosis.—In general, the average constipation in infants is mild, shortlived, and may be expected to respond to therapy and disappear quite completely in about two or three months. Naturally, older children constipated since early infancy are slower to improve. The greater the degree of constipation, usually the longer the time and the more difficult to attain good results. Nervous, high-strung children with overwrought mothers and family do not usually respond readily to treatment. Often, though, apparently more difficult cases will respond quite quickly and with quite permanent results. The more desirable results are attained by full coöperation of mother and patient. Often an assuring talk to the mother, that milder degrees of constipation will not hurt the child or that what she calls constipation is not really so serious, will favorably alter the outlook.

Signs of Active Rheumatic Fever.—Massell and Jones base their remarks on a study of 178 patients with active rheumatic fever. In 163 of these cases an analysis has been made of the routine laboratory tests and a comparison made of the leukocyte count and erythrocyte sedimentation rate in respect to their value as tests for active rheumatic fever. Also the clinical manifestations have been analyzed in seventy-three patients with clinical evidence of rheumatic fever, and the relation of laboratory tests to the clinical signs has been determined. The leukocyte count and corrected sedimentation index are helpful and often essential for the determination of low-grade rheumatic fever. In the majority of instances, after the clinical manifestations of the disease subsided, one or both of these tests continued at an elevated level for from several weeks to many months. As tests for low-grade rheumatic fever, the corrected sedimentation index and leukocyte count are of about equal value. In view of the large percentage of error in the technique of the leukocyte count and the necessity for repeated counts, the corrected sedimentation index is more valuable as a single, isolated test. One or both tests may be normal in the presence of clinical signs of rheumatic fever. Corrected sedimentation index determinations are of no significance in the evaluation of active rheumatic fever if performed within two or three weeks after an infection of the upper part of the respiratory tract or tonsillectomy. Neither the leukocyte count nor the corrected sedimentation index is a specific rheumatic fever test, but must be interpreted with regard to other considerations. In rheumatic fever subjects, repeatedly elevated leukocyte counts and rapid corrected sedimentation indexes should be considered indicative of subclinical rheumatic fever in the absence of any other cause for their abnormality.—*New England Journal of Medicine*.

Let's See.—Activities of the National Society for the Prevention of Blindness, Inc., 50 West Fiftieth Street, New York City, during the past year were more widespread than at any time since the organized campaign for conservation of vision was started in 1908, it is pointed out in the annual report of the Society, entitled "Let's See!" made public by Lewis H. Carris, Managing Director.

"Men and women in every walk of life throughout the United States are now participating in the movement to safeguard eyesight," Mr. Carris commented. "The project which has grown into such proportions began originally as an effort of a New York State committee to cut down the amount of babies' sore eyes at birth; this modest beginning has grown into a national organization engaged in combating blindness or impairment of vision of any sort and at every age of life.

"The underlying cause of blindness, whether it be the result of disease or accident, is usually ignorance. Our work, therefore, is concentrated largely on pointing the way. We try to keep abreast of the scientific advances in medical and pedagogical knowledge and to inform the public in popular language of such advances and how they may be applied practically in preventing blindness and in saving sight."

Among the items of information in the report are the following: 350,000 copies of the Society's publications were distributed in 1936; the motion-picture film, "Preventing Blindness and Saving Sight," was viewed by 90,000 persons; 120 displays and exhibits were provided for medical, educational and welfare conventions, and for county fairs; and staff members of the Society visited eighty-eight cities in twenty-seven states, in connection with services to local communities.

Realizing the fundamental importance of the medical profession, the Society maintains the closest relationship with ophthalmologists and public health physicians, as well as with general practitioners. The Society also maintains close relationship with schools and teacher-training institutions; and it coöperates with nurses, safety engineers, illumination experts, governmental and private health agencies, and various civic groups.

The Society's income in 1936 was \$122,000, and its expenditures amounted to \$142,000, necessitating the use of \$20,000 from the reserve fund. Financial support is received through voluntary contributions from approximately twenty thousand members and donors in all parts of the country.

"The unspoken plea of blind babies, 'Let us see,' inspired the founding of our National Society for the Prevention of Blindness," says William Fellowes Morgan, its president, in a preface which explains the title of the report. "At that time, 28 per cent of the children in schools for the blind in the United States were there because of 'babies' sore eyes' (ophthalmia neonatorum). Public information, followed by public action, has resulted in a 75 per cent reduction—a remarkable achievement."

Should Men Be Declared Old?—Lately there has been a tendency to declare men old by legislation, forgetting, of course, as someone once said (we forget who): "Nobody grows old by living a number of years. People grow old by deserting their ideals. Youth is not a time of life; it is a state of mind."

Benjamin Franklin at the age of sixty-nine presided over the Constitutional Convention of Pennsylvania. He was also elected one of the committee to frame the Declaration of Independence and was one of its signers. When seventy years old he was sent to France as one of the three commissioners seeking food, money, arms, and military alliance with that country. And he met with signal success. In 1781, at the age of seventy-five, he was appointed a member of the commission to negotiate a treaty of peace with England. Not satisfied with this, four times after reaching seventy-nine he was elected president of the Commonwealth of Pennsylvania.

Another great statesman, Benjamin Disraeli, entered his second premiership of England at the age of seventy. Old as he was supposed to be, it was due to his political acumen that England, in 1875, obtained a half-ownership in the Suez Canal, and that Queen Victoria in the following year was crowned Empress of India.

In 1887 Giuseppe Verdi produced his opera, "Otello." He was then seventy-four years old. In 1893, when eighty years of age, he produced his next subject, "Falstaff." This was his last and greatest opera.

Thomas Edison lived to be eighty-four. His inventions numbered over a thousand. He labored incessantly despite the handicap of almost total deafness. One of his last achievements just before his death was a process for manufacturing rubber from goldenrod.

And so it goes. Were space available we could mention many others whose greatest accomplishments were produced as they sat in the light of the setting sun.—*Milwaukee Medical Times*.

CALIFORNIA MEDICAL ASSOCIATION EXECUTIVE COMMITTEE

Minutes of a Special Meeting

1. A special meeting of the Executive Committee of the Council of the California Medical Association was held in the Association offices in San Francisco on Sunday, April 11, 1937.

2. The meeting was called to order by the chairman, Karl L. Schaupp, with the following quorum present: Karl L. Schaupp, E. M. Pallette, Howard Morrow, Morton R. Gibbons, W. W. Roblee, George H. Kress, and Secretary F. C. Warnshuis.

3. **Waiver.**—All members present signed a waiver of required notice of meeting.

4. **Committee of Five.**—Discussion was had upon the report of the Committee of Five, the conference with the Board of Health, and the requests of Dr. J. B. Sharp, Director of Projects of the WPA.

William W. Roblee, supported by M. R. Gibbons, presented the following resolution:

Resolved, That the Secretary be directed to advise the State Board of Health that the California Medical Association

is in agreement with the Board of Health's plan and procedure regarding the preparation and publication of the report of the Committee of Five as outlined in the letter of Dr. James B. Sharp to Professor Paul A. Dodd, dated March 22, 1937, in which regulations for publication of statistical survey and research materials were transmitted.

The Secretary was instructed to request the State Board of Health to submit its suggestions and recommendations as to the publication and disposal of the report of the Committee of Five.

Upon receipt of this communication the officers of the Association are to call and hold a meeting with the Committee of Five and complete the details for the publication of the final report.

This resolution was adopted without a dissenting vote. Meeting adjourned.

KARL L. SCHAUPP, *Chairman.*
F. C. WARNSHUIS, *Secretary.*

COMMITTEE ON PUBLIC POLICY AND COUNCIL OF THE CALIFORNIA MEDICAL ASSOCIATION

Minutes of a Joint Conference

1. At the request of the Committee on Public Policy and Legislation a joint conference was held with the Council in the offices of the Association in San Francisco on April 11, 1937. This meeting was in the form of an advisory conference for the reason that the emergency did not permit giving the notice required by the by-laws for a special meeting of the Council.

2. The conference was presided over by Morton R. Gibbons, with the following present: Morton R. Gibbons, E. M. Pallette, Howard Morrow, William W. Roblee, George H. Kress, Henry Rogers, Calvert Emmons, Karl L. Schaupp, W. H. Kiger, O. D. Hamlin, Carl Howson, H. J. Ullmann, A. E. Anderson, T. Henshaw Kelly, J. B. Harris, F. C. Warnshuis.

By invitation: Honorable P. J. McMurray, Honorable Melvin Cronin; Doctors F. R. Makinson, W. E. Mitchell, Rodney Yoell, and Mr. Howard Hassard.

3. T. Henshaw Kelly presented an outline of a proposed reply to an article that appeared in a national magazine.

After a general discussion it was the advice of the conference that the proposed reply should not be sent in or over the name of the California Medical Association.

4. J. B. Harris, Chairman of the Committee on Public Policy and Legislation, presented an extended report on the legislative situation, the tremendous pressure that was being brought by several influential groups for health insurance legislation, amendments that were being submitted and the concentrated effort that was being made to pass Assembly Bill 1283. Doctor Harris suggested certain amendments to safeguard the interests of the public and the medical profession. Advice was requested.

Statements were made by Honorables P. J. McMurray and Melvin Cronin and Doctors T. Henshaw Kelly and Rodney Yoell.

The entire question and related factors were discussed at length by all present. The Chairman called upon Doctors W. E. Mitchell and F. R. Makinson for further discussion.

5. On motion of George H. Kress, supported by Henry J. Ullmann, the following resolution was adopted unanimously:

Resolved, That this conference go on record as being in favor of the commission form of supervision in a

* All articles listed under the caption, "This Month's Topics," have been written and sent to the Editor by the Association Secretary, Dr. Frederick C. Warnshuis.

proposed medical service law, such as "S. B. 605" or "A. B. 1283"; and be it further

Resolved, That the Committee on Public Policy and Legislation feel free to consult with a special committee composed of the President, President-Elect, the Speaker of the House, and the Chairman of the Council, in any emergencies that may arise in these matters, and on changes or modifications in the proposed health insurance.

6. The conference adjourned at 1:30 p. m.

MORTON R. GIBBONS, *Chairman*.
F. C. WARNSHUIS, *Secretary*.

LOS ANGELES SOCIETY BULLETIN

For some time watch has been kept on other bulletins and journals, state and nation, for commendatory comments upon the Los Angeles County Medical Association's Bulletin which several weeks ago came out in new size and typographical make-up. Its form, make-up, and contents is believed to be so meritorious that it was hoped that others would be moved to take notice and express approbation. It was intended that these comments could be quoted as a text for this item in congratulating one of our constituent county units. Alas, thus far they have been conspicuous by their absence.

It was some thirty years ago that we first assumed charge of publishing a county bulletin—one of the first in the country. Since then there has been noted a gradual growing list of county bulletins. Some continue in their original style and contents. Others have acquired new and more pleasing form and make-up. Some embrace the opportunities that confront them, while others are merely program copy, clippings, and "ads" of good and unwarranted copy. Some are issued under a printing syndicate, the copy being the same in all except for the local program and an occasional report. The syndicate makes the profit that the county foregoes because local men decline to assume the duties and give a bit of time to editorial and business management. Some societies cause their bulletin to yield an annual profit of from a couple hundred to several thousand dollars. Last year the Los Angeles bulletin yielded a net profit of over \$7,000—an income that helps defray laudable activities that could not otherwise be undertaken, and members profit therefrom.

It is suggested that other units in this country benefit from the initiative and policies exemplified by the Los Angeles bulletin. With one or two exceptions, every bulletin can be made more pleasing in appearance and more interesting and achieving in its contents matter. And that's that.

To our Los Angeles County Association there is extended earnest words of congratulations and commendation. Pride is taken in their initiative and in the able editorial and business management that is manifest in each issue. A real service is being rendered to the members, and community respect and recognition is being demonstrated. Congratulations again, more power to you, and keep on being a pacemaker for other bulletins.

A VALLEY TREK

On March 16, Councilor Axel Anderson and the State Secretary visited the Merced County Society at noon. There was a goodly luncheon attendance during which there was a question and answer conference. Following the luncheon, Councilor Anderson and the State Secretary discussed several of the major activities of the Association and legislative problems that are confronting the Association. It is always inspiring to meet these members, who are alert to the interests of their community and the rendering of adequate and competent medical care. The Merced Society earnestly and unitedly conform to the policies of their state organization and commendably discharge their component unit obligations.

Following the Merced meeting the trek was continued to Fresno, where at 4 p. m. an informal discussion was had with a number of members of that society. At six o'clock the trek was resumed, with the destiny Hanford, Kings County. Here, at 7:30 o'clock, fourteen members gathered around a delicious dinner. Kings County has a membership of eighteen. Situated in a rich valley section, thirty-four miles from the main highway, these members are quite distant from medical centers. In consequence, difficulties have been experienced in arranging varied

scientific programs and it has been necessary to rely upon their members to a large extent. Councilor Anderson advanced some very constructive suggestions. There then followed a two-hour discussion of organizational policies and local application. Here again it was most gratifying to mingle with a group of members who are diligently striving to maintain the purposes of organization. The night was spent in Fresno, and an early start was made for Sacramento.

On Wednesday evening the Sacramento Society for Medical Improvement held its sixty-ninth annual banquet. As usual, the Banquet Committee had for weeks been rehearsing its after-dinner program that has always been an outstanding feature of these annual celebrations. Chairman Scatena and the Board of Directors, in respect and in honor of Dr. Charles B. Jones, whose sudden death, and funeral on the day of the annual banquet, canceled the "stunt program" and dedicated the annual dinner in memory of Doctor Jones. Some eighty-five members gathered at the Sutter Club. Following a most appetizing dinner, the Doctors Quartet rendered several selections. Doctors can sing. Informal remarks were made by Doctors Wallerius (president) and Scatena and Councilor Schoff. State Secretary Warnshuis substituted his original remarks as guest speaker because of the altered program, and made a response under the general subject of "The Sidewalks of Medicine." President Wallerius then adjourned the banquet in honor of and in respect to Doctor Jones. There followed an enjoyable hour of informal renewal of friendship with the members of this, the oldest, constituent unit of the State Association. Then to bed, but not to sleep because of the riotous doings in corridors and rooms that seems to be a common occurrence in the Capital hotels during legislative sessions with groups and interests seeking to gain legislative favors or exerting pressure influence upon legislators. Hotel managers would do well, if they expect to hold patronage, to direct such celebrants to night clubs. Early morning breakfast, and the old car was pointed toward headquarters and a desk of four days of accumulated mail.

BOARD OF MEDICAL EXAMINERS

The 1936 annual report of this Board contains some interesting facts. A detailed report is given upon the exposure and prosecution of the so-called Pacific Coast abortion ring. The Board and other authorities merit every praise for their efficient efforts in bringing into court this gang of racketeers.

During 1936 the Board issued 590 certificates to practice. Rights to practice were restored to two licentiates. In the written examinations, nineteen applicants failed to gain passing grades. Of eight drugless practitioners, three failed. The majority of failures were among graduates outside of California, foreign medical schools. The California Board is to be congratulated upon the care taken in conducting these examinations, which record is not duplicated by many boards of other states.

In connection with this it should be noted that members of the faculty and students of certain Canadian schools filed protesting petitions with the present legislature because foreign-school graduates desiring to apply for a California license are compelled under law to spend a fourth year in an approved American College. The petition sought to obtain an exception for Canadian graduates. This would be class legislation, hence illegal. Dr. William R. Molony, President of the Board, has well stated: "I am of the opinion that there is ample opportunity in American medical schools for the needs of American people, and we should not worry over the problems of those who choose to take their medical studies in foreign countries."

Reciprocity licenses were granted to 166 applicants, New York and Illinois having the largest number. Sixty-four California licentiates sought endorsement to practice in other states.

During the year thirty-four licentiates were listed for hearings on charges involving unprofessional conduct. Of these, eleven had their licenses revoked; one suspended; fourteen on probation; two dismissed; six, action is still pending. In spite of repeated warnings, there are those who feel that they are exempt from the governing laws. Narcotic law violators head the list. Physicians are ad-

vised to observe the letter as well as the spirit of the law if they are desirous of escaping prosecutions for infractions.

During the year, 229 licentiates died in California or elsewhere.

The total income in fees and tax was \$56,475.87 and disbursements, \$54,134.26. It is pertinent to comment that this is a penurious budget, limited as it is by the Legislature, for the protection of the health welfare of the public. Here is a state board, created solely in the interests of the people, compelled to function with a minimum amount of funds. This budget should be triple in its present amount. The State nor the people do not contribute one penny of these funds; the total is derived from fees paid by applicants to practice. The least that should be asked from tax-derived funds is that the State should match these fees with a like appropriation and give this board \$112,000 for operating expenses.

We are proud of our Board of Medical Examiners, its members, secretary, and administrative officers. We appreciate the reputation they have gained in this country and the efficient manner in which the Board functions. Its ten medical members give generously of their time and ability, unremunerated except for a per diem pittance, for the purpose of maintaining high educational standards among those who engage in medical practice. The public is the beneficiary of these services rendered by these Board members. Our members' thanks and gratitude are tendered to this Board.

ASSOCIATION ENDOWMENT FUND

In several past issues, discussion was had of an Association Endowment Fund. Its legal set-up, purposes, and forms for bequests were described. Pointed suggestions were made that members financially capable, make contributions to this fund. To date not a single nibble, comment, or subscription contribution has been received.

More emphatic suggestions are, apparently, in order.

Purpose.—To create a permanent fund, the principal to remain intact in perpetuity. The interest earnings of the fund to be used to finance expanding Association activities such as postgraduate conferences, public-health education through a speakers' bureau, health institutes, medical museum, and historical records and public relations and legislation.

Contributions.—To establish such a fund that should eventually amount to \$500,000 or more, contributions are solicited from members as well as lay persons. Any amount from \$100 to \$10,000 will be gratefully acknowledged. Brother, how much will you contribute? Having sent in your contributions, it is suggested that you cause that lay friend of yours to send in his contribution. Will you do your part? Thanks.

SIXTY-SIXTH ANNUAL MEETING

This issue will reach our members' desks shortly after our sixty-sixth annual session has ended in Del Monte. The forms went to press the first of May.

Following each annual session it requires about one month to transcribe the minutes and prepare copy for the printer. In consequence, the July issue will contain the record of our 1937 session. A terse summary will be compiled for the June issue in order that the members may gain an early insight of the highlights that characterized the Del Monte session.

HOSPITAL SERVICE

During last year 8,646,885 persons were admitted to hospitals in the United States. Likewise, 831,500 babies were born in hospitals. There are available 1,096,721 hospital beds.

In California 70.4 of available beds were occupied. In this State there are forty church-controlled hospitals with 4,558 beds. Fraternal organizations own three hospitals with 346 beds. Nonprofit organizations operate sixty-six hospitals with 5,563 beds. There are 226 hospitals with 27,054 beds in California, and these admitted 490,575 patients during the year. The average daily census was 19,056. Technicians to the number of 418 were employed by 183 hospitals.

Two hundred and ninety-two radiological technicians were employed by 182 hospitals, and 222 dietitians were employed by 145 hospitals. There were enrolled 2,694 student nurses in 145 hospitals.

Deaths reported by 261 hospitals totaled 23,814. Hospitals which refused registration were 72 with 2,391 beds.

Thirty-four approved hospitals had 435 interns, of whom 389 received a salary that averaged \$29.19 monthly.

These are some of the figures found in the *Journal of the American Medical Association* hospital number of March 27.

MEMBERS ARE BOUND BY THEIR SOCIETY CONSTITUTIONS AND BY-LAWS

The Supreme Court of the State of Washington has handed down some very pertinent declarations related to obligations of members set forth in the constitutions and by-laws of the organizations in which they hold membership.

Furthermore, the constitution, charter, and by-laws of the medical society constituted a contract between the members of the society enforceable in the courts if not immoral or contrary to public policy or the law of the land. The two physicians, as members of the medical society, were required to obey the by-laws of the society or subject themselves to the penalty of suspension or expulsion from the society, and it is not material how selfish or unselfish the objects of the medical society may be. That the medical society had the right to adopt the by-law with respect to contract practice cannot be questioned. Whether such by-law was just, reasonable or wise is a question of policy which concerns only the medical society and its members. The society, in the enforcement of its by-laws for the direct purpose of benefit to itself and to its members, is not answerable for damage incidentally resulting to a third person. So long as membership in the medical society continues, the member can be compelled under his contract with the society to obey its laws, rules and regulations, or suffer the penalty of fine, suspension or expulsion.

The enforcement of a by-law such as the one here involved, continued the Court, does not amount to unlawful coercion. *Seymour Ruff & Sons, Inc. vs. Bricklayers', etc., Union*, 163 Md. 687, 164 A. 752.

An association, in pursuing its legitimate objects, has the right to coerce a member by fine, suspension or expulsion, and the association will not, nor will its members, be liable in damages to those who may be directly or indirectly injured by such efforts. So long as a member remains in the association, he is subject to the coercive effect of a penalty exacted for breach of a by-law of the association. If he does not desire to abide by the obligations of his contract of membership, he may abandon his membership. No rights of the plaintiffs in this case, who were nonmembers, were invaded by the medical society when it established its code of ethics and insisted on compliance therewith through threat of expulsion of an offending member, and the enforcement of solidarity by threat of expulsion of the two physicians created no cause of action for the incidental damage resulting to the plaintiffs.

These opinions should clarify a much discussed section of by-laws governing membership. They clearly declare that members must abide by the conditions that govern membership.

AMERICAN MEDICAL ASSOCIATION

The annual session of our national organization will be held in Atlantic City the week of June 6. Members are advised to consult the issue of the *Journal of the American Medical Association* which contains the official program.

It is quite important that hotel reservations be obtained in advance by writing to the chairman of the Committee on Hotels, Convention Bureau, Atlantic City.

CHAIRMAN OF BOARD OF TRUSTEES AND THE SECRETARY OF THE AMERICAN MEDICAL ASSOCIATION VISIT SAN FRANCISCO

On April 13 Dr. Rock Sleyster, Chairman of the Board of Trustees, and Dr. Olin West, Secretary and General Manager of the American Medical Association, made a visit to San Francisco. The purpose of their visit was to survey the auditorium and hotel facilities of the city in order to report thereon when the invitation to hold the

1938 American Medical Association meeting in San Francisco is considered at the Atlantic City meeting this June.

These national officials were met in Oakland on arrival of their train by Doctors Reinle, Dukes, Makinson and the State Secretary, and welcome greetings were extended. The trip was then made across the Bay Bridge, and the day was spent inspecting auditoriums and hotels.

In the evening an informal dinner was tendered to the distinguished visitors. Present were officers and members of adjacent county societies. President-Elect Howard Morrow presided and he, together with Dr. T. Henshaw Kelly, President of the San Francisco County Society, H. Gordon MacLean, President of the Alameda County Society, Morton R. Gibbons, Chairman of the Council, J. C. Geiger, Director of Health, extended cordial fraternal greetings. Responses were made by Doctors Sleyster and West.

For fully an hour Doctor West commanded the intense attention of all as he imparted comment and observations upon present trends in social and legislative circles of state and national bodies and society. His plea was for courageous and sound thinking and action on the part of all members of the profession. The need for concerted unity of action for the future good of the public and the profession was emphasized. Individualistic and independent group pronouncements that were unauthorized, unofficial and at variance with adopted policies of organized medicine, was declared to be subversive to the ideals, objectives and progress of medical science, practice and service.

The following morning was spent in a further inspection tour, and at noon the members in Oakland tendered a luncheon at the Claremont, attended by thirty members, and presided over by President MacLean. Doctor West discussed some of the problems of medicine and public health.

These visitors gained a partial insight as to conditions in California and promised, at some future time, to make a more extended visit.

C. M. A. DEPARTMENT OF PUBLIC RELATIONS†

Things Well Worth Thinking About

Organize a Medical Service Bureau as a part of your county society. This bureau to aid your patients in determining their ability to pay for medical service and to advise them how to budget these expenses.

Organize a Speakers' Bureau and provide opportunity to gain experience in effective public speaking. Los Angeles County is conducting a most commendable as well as successful Speakers' Bureau. We need better and more public speakers.

Plan joint meetings with your county dental, health and bar organizations. Better understandings will result.

How about another summer picnic or field day? And make it a day for inter-county fraternization.

How about checking up on the social service work of your local and county hospitals for the purpose of ascertaining whether they are functioning efficiently and effectively.

Let the people of your county learn about the total amount of free and charity work done by your members a year. As a rule this amount exceeds the total charity contributions in your county but the people are not aware of this fact. Publicity is indicated.

If these suggestions are initiated and sustained in your county, your society will experience meetings made more valuable by an aroused interested membership. Someone has to pitch the first ball. Why not you?

†The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. Charles A. Dukes of Oakland is the chairman, and Dr. F. C. Warnshuis is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. F. C. Warnshuis, Room 2004, Four Fifty Sutter Street, San Francisco.

An Evasion Racket

Courts have decreed that corporations cannot practice medicine or contract to supply medical service. This ruling has terminated attempts on the part of certain compensation insurance companies from openly employing medical men on a monthly salary basis to render medical care to the employees of firms covered by their insurance coverage.

Reports now are on hand that these certain insurance companies have resorted to a new undercover form of law evasion. This evasion is operated in the following manner. The company engages usually a young surgeon on a monthly salary basis. Instructions are given him to rent ample quarters, engage nurses, a stenographer to make out records and reports, purchase physiotherapy equipment, etc. Firms covered by this company are instructed to send injured employees to this hired agent surgeon. The surgeon is instructed to bill the company on the first of the month for all services rendered at compensation fee schedule rates. By the 5th or the 10th the surgeon receives a check but he is instructed not to cash this check. In a day or so a company representative calls and picks up this check. He gives the surgeon, cash or draft to pay rent, monthly pay roll and office overhead and surgeon's monthly salary. This later transaction is, of course, under cover and the surgeon can claim he is doing compensation work under fixed approved fee rates.

The scheme is illegal, evasion of laws, contract practice and insurance company corporate practice. The surgeon makes himself liable to revocation of his license and the insurance company to illegal corporate practice penalties.

The matter has been called to the attention of the Compensation Commission, the Insurance Department and the Board of Medical Examiners. Steps will be taken to end this racket. Members are requested to send in information that they may have so that it may be turned over to investigators. Such reports will be held in confidence and the informant will not become involved. Members should aid in terminating this corporate racket.

Consideration is being given to the amending of the compensation laws along lines recently enacted in New York. Right now you are asked to aid in presenting evidence and facts.

Foreign Graduates

Los Angeles, Calif., March 22, 1937.

William D. Cutter, M. D.,
Secretary, Council on Medical Education,
535 North Dearborn Street,
Chicago, Illinois.

Dear Doctor Cutter:

I have a copy of your letter to Dr. Warnshuis in regard to foreign graduates who desire a California license. I am sure that no one will disagree with you in your estimate of Canadian standards and standards of Class A Canadian Medical Schools. California along with the American Medical Association and many other states sees the danger in permitting graduates of low grade schools, located in foreign countries, to enter the practice of medicine without some additional evidence of education and training. Therefore, the law was so amended and the house of delegates passed a resolution to the effect of requiring these additional credits.

In order that the law be not declared unconstitutional, it must be all inclusive and not have a provision therein exempting one foreign country from the provisions of the act.

If it were legal for the Board to pass upon the individual, it would be very easy to enforce standards, but as you know this would be class legislation and clearly unconstitutional.

I am of the opinion that there is ample opportunity in the American Medical Schools for the needs of the American people and we should not be worrying over the problems of those who choose to take their medical studies in foreign countries.

Very respectfully yours,

WILLIAM R. MOLONY, M. D.

Compulsory Health Insurance

Massachusetts and Pennsylvania legislatures have under consideration bills proposing compulsory health insurance. The following excerpt presents some figures for Pennsylvania:

What Compulsory Health Insurance under House Bill No. 622 Will Cost in Pennsylvania

"Estimating Pennsylvania as producing 16.4 per cent of the national industrial pay roll, according to 1929 figures, the contributions would be as follows:

The State's contribution to be a tax equivalent to 1½ per cent of total payrolls throughout the State.....	\$ 70,739,760
Employers' contribution by payroll tax, 1½ to 3½ per cent (added to cost of production)	126,581,760
Employees' contribution by pay-envelope deduction, 1 to 3 per cent.....	85,637,520

A total annual sickness tax of.....\$282,959,040

"Allowing against the Pennsylvania figures of 1929 a reduction of 30 per cent as representing the accepted reduction in the present pay roll over 1929, we have:

The State's contribution to be a tax equivalent to 1½ per cent of total payrolls.....	\$ 50,035,440
Employers' contribution by payroll tax, 1½ to 3½ per cent of total (added to cost of production)	89,533,344
Employees' contribution by pay-envelope deduction, 1 to 3 per cent.....	60,572,880

A total annual sickness tax in Pennsylvania of\$200,141,664

COMPONENT COUNTY MEDICAL SOCIETIES

LASSEN-PLUMAS-MODOC COUNTIES

A meeting of the Lassen-Plumas-Modoc Medical Society was held at Westwood on March 26, following a dinner at the home of Dr. F. J. Davis, Sr.

Case discussions were held by the various members, and the winter's experiences discussed. It was decided that the past winter produced a bewildering variety of ear, nose, throat and respiratory ailments, and that it would be profitable to find an outside speaker on this subject for our next meeting.

Dr. W. C. Batson of Greenville was welcomed as one of our new members. F. J. DAVIS, JR., *Secretary*.

✽

SAN JOAQUIN COUNTY

The regular meeting of the San Joaquin County Medical Society, held in the Medico-Dental clubrooms on April 1 at 8:45 p. m., President J. F. Blinn in the chair, was preceded by the customary dinner meeting, held at the Hotel Wolf Roof Garden. Fourteen members were present. Doctors H. S. Chapman and A. K. Merchant presented the paper at the dinner meeting.

A letter from the California Medical Association was read concerning the Intercoast Hospitalization Insurance Company.

Doctor Trick was accepted from the floor, on his application, to transfer from the Los Angeles County Medical Society.

The application of Dr. A. K. Merchant was read and referred to the Admissions Committee.

Mr. Thorpe of the Intercoast Hospitalization Insurance Company asked that an Advisory Committee be appointed to advise the Intercoast Hospitalization Insurance Company in this locality. He also told of the number of policies that he had sold, and told of the prospective buyers. Dr. Dewey Powell made a motion, seconded by Doctor Van Meter, that the appointing of an advisory committee be referred to the Board of Directors and that the Board of Directors be given full authority to act. The motion was carried.

A vote was taken on the motion made at the March meeting concerning the request of the California Medical Association for a change in the by-laws in the San Joaquin County Medical Society, that the sections in the local by-laws on the discipline of members be stricken out and the sections of the California Medical Association substituted. The motion carried.

Doctor Van Meter questioned the members as to whether they wished to have the May meeting put off until after the session of the California Medical Association at Del Monte. Dr. C. V. Thompson made a motion, seconded by Doctor Collis, that the next meeting be held on its regular meeting date. The motion carried.

On the invitation of the Lodi members, Doctor Broadus made a motion, seconded by Doctor Van Meter, that the June meeting of the Society be held in Lodi and that the Lodi members provide the paper and the entertainment. The motion carried.

Doctor Van Meter made a motion, seconded by Doctor Collis, that the resolution of the Tuberculosis Association relative to bovine tuberculosis be accepted and that copies be mailed to the members of the Legislature from this district. The motion carried.

Doctor Broadus reported on the progress of the Post-graduate Committee, and stated that he had a very fine program in the making for the next meeting.

The program was opened by Doctor Garrison, who read a paper on *Protamin Insulin* and its use. This was illustrated by lantern slides. Doctor Templeton of Oakland read a paper on *Malignant and Premalignant Lesions of the Skin*. This was profusely illustrated with lantern slides of the lesions and of the microscopic pictures.

There being no further business to come before the Society, the meeting was adjourned at 10:25 o'clock and refreshments served. G. H. ROHRBACHER, *Secretary*.

✽

SAN LUIS OBISPO COUNTY

The regular monthly meeting of the San Luis Obispo County Medical Society was held at the County Hospital in San Luis Obispo, March 20. Dinner was served to those present by the hospital staff.

An interesting program was presented by Doctors Harold Brunn, Joseph Dillon, E. L. Brown, H. Brodie Stephens, and Esther Rosencrantz of San Francisco.

Doctor Rosencrantz showed films of unusual cases of *Pulmonary Tuberculosis*, stressing especially military tuberculosis. She also showed a few cases of pneumoconiosis.

Doctor Brunn gave an interesting talk on *Lung Abscesses*, stressing their treatment, and illustrated the same with x-ray films.

Dr. E. L. Brown gave a talk on *Empyema and the Treatment of Empyema*, illustrated by means of slides and films.

Dr. Joseph Dillon spoke on *Bronchiectasis*, illustrated with x-ray films.

Dr. H. Brodie Stephens gave a paper on *Intrathoracic Tumors*, and illustrated his paper with slides.

During the forenoon of the same day a surgical clinic was held at the County Hospital, at which a number of surgical procedures for chest diseases was carried out.

E. D. ANDERSON, *Secretary*.

✽

SHASTA COUNTY

The last meeting of the Shasta County Medical Society was held in the Hotel Redding, at Redding, on March 8.

After a delicious luncheon, the Principal of the Cottonwood Grammar School presented the problem of infectious skin diseases in his school. He wished that the County Health Officer would go to the outlying districts and treat these skin diseases or allow the so-called Public Health Nurse to diagnose and treat. He was informed by the Society members that (1) the so-called Public Health Nurse is not licensed to diagnose or treat diseases; (2) that the county budget would not permit the authorization of a licensed doctor to go to outlying districts and treat these cases; (3) that the principal of a school in which such infectious children were in attendance should send those children home until they were returned with a note from a physician stating that they are free of an infectious disease; (4) if these infected children are of an indigent household, they should get a permit from their county supervisor and be treated in the clinic at the Shasta County Hospital.

A film was shown by a Libby, McNeil & Libby detail man concerning homogenized foods for babies and convalescents. Several films were then screened. The first was a film of the D. & G. Company, on the *Anatomy of the Male Genito-Urinary Tract*. The second was a D. & G. film on *Nephropexy*.

The matter of a delegate to the State Medical Association meeting at Del Monte was brought up. Dr. Henry L. White was elected delegate and Dr. Leslie J. Seeley was elected alternate.

The matter of the next meeting was then discussed. The secretary was instructed to contact a speaker for the next meeting.

Those present were: Doctors Olberg, Hansen, Kay, Saylor, Kay, Dozier, Trelstead, and Seeley. The guests were: Dr. M. J. Murphy, Mr. Eaton, Mr. Falkner.

The next meeting will be held at the Hotel Redding on Saturday evening, April 10, and the Society will be addressed by Dr. Dudley Smith, Clinical Professor of Proctology, University of California Medical School.

LESLIE J. SEELEY, *Secretary*.

TULARE COUNTY

The February meeting of the Tulare County Medical Society was held at Motley's Café, Visalia, on the 28th. Dr. R. C. Hill, President, presided.

Those in attendance were: Doctors P. D. Miller, Falk, Zeller, Weiss, Parkinson, Beck, Hubbard, Wenn, A. Miller, Cronmiller, Matthias, Betts, Zumwalt, Ginsburg, Rosson, Guido, McClure, Preston, Brigham, and Hellbaum.

Doctor Hill introduced Dr. Milton J. Hubbard, Chief of the Medical Division, United States Army Hospital at Sawtelle, as guest speaker of the evening.

Doctor Hubbard gave two papers—one on *Liver Abscess* and a second on *Experience with Protamin Zinc Insulin*.

A stated meeting of the Tulare County Medical Society was held at Motley's Café, Visalia, on Sunday, April 4, at 6:30 p. m. Dinner preceded the meeting.

In the absence of our president, Vice President Austin Miller called the meeting to order.

In attendance were: Doctors Fillmore, Bond, Guido, Watke, Matthias, C. A. Ambrose, from Visalia; Seiberth, Betts, Weiss, A. Miller, McClure, Campbell, Tourtellott, Kohn, Zumwalt, Brigham, P. Miller, Hellbaum, Rosson, Ginsburg and Frank Chamlee, of Hanford.

Guest speakers of the evening were: Dr. Frank E. McCullough and Dr. Philip J. Lipsett, both of Oakland. Doctor McCullough presented the first paper, *Injection Treatment of Hemorrhoids*. The paper was illustrated with a series of lantern slides to show the technique employed. The paper was of a practical nature, and was thoroughly enjoyed by those present.

The second paper of the evening was by Doctor Lipsett, who discussed *The Newer Conceptions of Menstrual Disorders*. The paper brought forth a great many questions, which were ably answered by Doctor Lipsett. Lantern slides were used to amplify the talk.

The regular business was transacted by the secretary, and the meeting was adjourned at 9:30 o'clock.

KARL F. WEISS, *Secretary*.

VENTURA COUNTY

The regular monthly meeting of the Ventura County Medical Society was held at the Saticoy Country Club on Tuesday, March 9.

Members present were: Doctors Rey, Cruden, Little Armitstead, Welsh, Hendricks, Yoakum, Neilsen, Strong, Mosher, D. G. Clark, W. S. Clark, Gronhoyd, L. P. Smolt, C. A. Smolt, Shore, Coffey, Bardill, Barker, and Morrison.

Guests present were: Doctors Voorsanger, Moore, Witten, Walker, Wells, Arnold, and Coulter. Mrs. Coulter, Mr. Higbee, and twelve public health nurses were also present.

Doctor Voorsanger spoke about the prevention of tuberculosis, and also outlined treatment for active cases. Discussion was opened by Dr. Charles Smolt. Doctor Little asked if there was any method available to enforce isolation against the patient's wishes. Mr. Higbee stated that in a case of a minor he could be isolated by getting an order through the juvenile court.

Dr. D. G. Clark made a motion that this Society endorse the skin-testing campaign among school children which is sponsored by the local Tuberculosis Association. Doctor Gronhoyd seconded the motion, and it was unanimously carried.

Doctor Shore was called away and no further action was taken in regard to an ethical advertising campaign.

A. A. MORRISON, *Secretary*.

CHANGES IN MEMBERSHIP

New Members (79)

Alameda County.—L. I. Oppenheimer.

Contra Costa County.—Harry E. Peters.

Kern County.—Max D. Hendricks.

Lassen-Plumas-Modoc County.—Wilbur C. Batson.

Los Angeles County.—Howard H. Allen, Kenneth W. Blake, Elena Boder, Clifton H. Briggs, Joseph Brill, William Edward Brown, Alonzo B. Cass, Charles R. Castlen, Robert F. Collins, Walter H. Drane, John Paul Ewing, Louis K. Guggenheim, Joseph Jellen, Arnold Henry Kegel, Russell W. Lyster, Allen I. Mann, Abraham Metzner, George Nador, Charles C. P. Prince, John F. Renshaw, Charles F. Row, Werner Salomon, Robert L. Sands, I. E. Sauber, Victor E. Stark, Walter L. Stilson, Solomon Strouse, Clinton H. Thienes, Emmett LeRoy Schield, Hobart P. Shattuck, Walter T. Sheets, H. Dale Wheeler, William G. Winter, Robert G. Wirth.

Mendocino-Lake County.—M. Clemens Beil.

Napa County.—Kristine B. Johnstone.

Orange County.—J. B. Price, Arthur Donaldson.

Riverside County.—Everett J. Garrison, Iner Sheld Ritchie.

San Bernardino County.—Theophilus Fleming Ford, Thomas F. Judefind, Norris B. Lawrence, Claude A. Macdonald, William A. Richardson.

San Diego County.—Russell T. Bothe, W. R. Herbert, Wilton M. Lewis, J. T. Lipe, G. L. McClintock, Dayrel D. Smith, Erwin L. Young.

San Francisco County.—Charles Wentworth Barnett, Clarence B. Cowan, Gerald Francis Doyle, Delbert Wilfred Hand, George J. Heppner, John E. Kistler, Louis C. Nuyens, Wilfred Larch Olsen, Andrew Benton Stockton, John R. Upton.

San Joaquin County.—K. M. Hidy, Edgar Shepard Leavenworth, William G. Patton, Oliver Riggle, Thornton C. Russell, Paul R. Shumaker.

San Luis Obispo County.—Thomas Ruffin Pratt, Edward Charles Sherman, Jr.

Santa Clara County.—Ben L. Bryant, E. D. Kilbourne, Karl F. Pelka, Ruth Tangier Smith.

Yuba-Sutter County.—Romayne B. Whitney.

Transferred (8)

A. D. Butterfield, from San Diego County to San Bernardino County.

Clarence E. Dixon, from San Bernardino County to Los Angeles County.

G. A. Frost, from Lassen-Plumas-Modoc County to Butte County.

W. E. Macpherson, from San Bernardino County to Los Angeles County.

William A. Rowell, from Contra Costa County to Shasta County.

Francis B. Sheldon, from San Joaquin County to Orange County.

T. K. Trick, from Los Angeles County to San Joaquin County.

Thomas A. Wong, from San Francisco County to Los Angeles County.

Resigned (6)

Coleman A. Block, from San Francisco County.

Elmina F. Cook, from Los Angeles County.

Paul F. Guernsey, from Los Angeles County.

Clelia D. Mosher, from Santa Clara County.

R. Esmond Smith, from Los Angeles County.

Oscar Tobrinier, from San Francisco County.

In Memoriam

Beck, John Edwin. Died at Tulare, April 9, 1937, age 64. Graduate of the College of Physicians and Surgeons of San Francisco, 1905. Licensed in California the same year. Doctor Beck was a member of the Tulare County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✦

Downs, Alfred Jonathan. Died at Los Angeles, March 12, 1937, age 60. Graduate of the Jefferson Medical College of Philadelphia, 1901. Licensed in California in 1902. Doctor Downs was a member of the Los Angeles County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

✦

Eddy, Irving Herbert. Died at Glendale, March 8, 1937, age 59. Graduate of the University of Illinois College of Medicine, Chicago, 1903. Licensed in California in 1930. Doctor Eddy was a member of the Los Angeles County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

✦

Jones, Charles Breckenfeld. Died at Sacramento, March 14, 1937, age 57. Graduate of the University of California Medical School, San Francisco, 1906, and licensed in California the same year. Doctor Jones was a member of the Sacramento Society for Medical Improvement, the California Medical Association, and a Fellow of the American Medical Association.

✦

Mabee, Melbourne. Died at Santa Ana, March 23, 1937, age 60. Graduate of Northwestern University Medical School, Chicago, 1911. Licensed in California in 1930. Doctor Mabee was a member of the Orange County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✦

Martin, James J. Died at Long Beach, March 23, 1937, age 71. Graduate of Eclectic Medical College, Cincinnati, 1898. Licensed in California in 1922. Doctor Martin was a member of the Los Angeles County Medical Association, the California Medical Association, and the American Medical Association.

✦

Pruett, John Floyd. Died at San Francisco, March 17, 1937, age 51. Graduate of Stanford University School of Medicine, San Francisco, 1914, and licensed in California the same year. Doctor Pruett was a member of the San Francisco County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✦

Smith, Harlan Lewis. Died at Sacramento, March 12, 1937, age 34. Graduate of Northwestern University Medical School, Chicago, 1931, and licensed in California the same year. Doctor Smith was a member of the Sacramento Society for Medical Improvement, the California Medical Association, and a Fellow of the American Medical Association.

✦

Solomon, Jacobus C. Died at Los Angeles, March 15, 1937, age 78. Graduate of the National University of Arts and Sciences Medical Department, St. Louis, 1893. Licensed in California in 1894. Doctor Solomon was a member of the Los Angeles County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

OBITUARY

Reginald Knight Smith
1869-1937

Reginald Knight Smith died at his home April 18, 1937. He practiced until the 14th—for several days having suffered intermittent distress from coronary occlusion—days and nights when he would lie down to ease the pain, and then with undiminished readiness respond to the hospital call.

He was born in Newberg, Alabama, September 22, 1869, was graduated from the College of Physicians and Surgeons of Baltimore in 1892, served as surgeon in the United States Navy where he achieved the grade of lieutenant-commander during the Spanish-American War, and practiced obstetrics exclusively and continuously in San Francisco since 1905. He was our first exclusively obstetrical specialist. His early experience was in the Emanuel Sisterhood Polyclinic and the Fruit and Flower Mission, then in the Mount Zion obstetrical clinic, where he became chief in 1910. He was instructor in obstetrics in Cooper Medical College during the year 1908-1909, was president of the San Francisco County Medical Society in 1919 and of the California Academy of Medicine in 1934, and was a member of the Pacific Coast Society of Obstetrics and Gynecology and of various nonmedical organizations. He received no formal instruction in obstetrics other than the meager requirements of one of the less prominent medical schools, he did not publish, rarely spoke in society meetings, did not seek or receive recognition in international or national societies—in fact, he was to known to few (a far-scattered and discerning few) outside the broad locale of his practice.

But how he was known here! He was not without honor save away from his own land. For sheer volume of work it would be hard to find his equal. About 15,000 to 20,000 persons came to light by his personal aid. Two corporations of interest and profit to the local medical profession weathered through exceedingly rough seas to snug harbor under his forceful and generous leadership; two or three hospitals benefited largely from his efforts; for many years the business of the San Francisco County Medical Society drew heavily on his time and energy. And for quality, his professional work brought him early and always held, unsought but well-earned, the unquestioned title of dean of northern California obstetricians.

But work was not all that made him well known. In fact, it was much less important than character and personality. And here the pen falters. No words will quite match the feeling of us who knew "R. K." or evoke his true likeness for others. Professional ethics, courtesy, loyalty, generosity—the common book virtues? These and others would seem colorless terms to the many who have felt his helping hand, a hand deftly concealed, often escaping recognition from the one it served. Interest in the economic and other general relations of the profession to the public? Oh yes, he was tolerant, even helpful to certain schemes for bringing better medicine to more people; but we think of him as the doer rather than the schemer; we see the clinic patient whom he hastily carried in his arms to hospital;

we hear the never-failing ring of welcome in his voice to the long procession of free and near-free patients in clinics and in his office. Sense of duty, seriousness, even sternness were present, but not for exhibition; they were for principles rather than persons, and the rare individual who incurred his animosity abundantly merited it. And equanimity. That was in perfect measure and of unique variety. It could instantly settle the nerves of a fearful, suffering woman or stiffen the courage of an inexperienced doctor. Without levity, anecdote, or even mirth, it was decidedly gay. The vacationless doctor spent his whole life on one grand lark. Tall, upright carriage, firm gait, happy timbre of voice, big pink carnation, a newly bought and soon-to-be read volume of fine literature under the arm—these gave the air of being off for a jolly good time. Trouble seemed merely to raise the carnation a little higher on his breast. Or when trouble came in the operating room—one of those moments which usually calls for wiping the surgeon's brow, or sometimes (let us blush) a burst of profanity—his humming of "Swanee River" would merely become a little more sprightly. The gay equanimity endured—"I've got a through ticket," were his cheerily spoken words at the end—and will endure in the happy memory of our "R. K."

EUGENE S. KILGORE, M. D.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION†

News Letter

Dear Auxiliary Members:

You will be very happy to know that in the recent McReynolds *Hygeia* subscription contest the Western States division of twelve states, under the direction of Mrs. Mark Glaser, won a very high percentage. Arizona carried off the \$50 prize in Group 1 for auxiliaries with a membership not exceeding fifty members. The winning chairman is Mrs. Charles Swackhamer of Superior, Arizona, who represented Pinal County.

In the twelve counties in the entire United States given highest honorable mention, six of these counties, or 50 per cent, are in Mrs. Glaser's division, and Marin County, in California, has the distinction of being in that group.

Mrs. Glaser has done remarkable work, and we all feel very proud and honored by her achievement. We feel she richly deserves the success that has come to her, and we all tender her our hearty congratulations.

MRS. ROBERT M. FURLONG, *Chairman of Publicity.*

Component Auxiliaries

Alameda County

On March 19 the Woman's Auxiliary to the Alameda Medical Association held their annual bridge tea at the Hotel Leamington in Oakland. The spacious clubroom was beautifully decorated with spring blossoms. Two hundred and fifty members and guests gathered for the occasion, and were greeted by our president, Mrs. Clarence Page, and Mrs. Harold Trimble, Chairman of Arrangements.

During the afternoon a radio was raffled and candy sold at the tables. Over \$200 was made for the Students' Loan Fund of Stanford and California universities, which the Auxiliary is sustaining.

Before the close of the afternoon a brief business meeting was held. Mrs. Page thanked Mrs. Trimble and her committee for their work in making the party a success. The

†As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Robert M. Furlong, Chairman of the Publicity and Publications Committee, Linden Lane, San Rafael. Brief reports of county auxiliary meetings will be welcomed by Mrs. Furlong and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue for Woman's Auxiliary notes.

Nominating Committee for the ensuing year was announced, namely, Mesdames Hobart, Rogers, Charles Peters, D. E. Jeffry, and John Ewer.

Tea was then served, and the party adjourned after a most enjoyable and successful afternoon.

✽

Los Angeles County

The Woman's Auxiliary to the Los Angeles County Medical Association honored its new advisers at the regular luncheon meeting at the County Medical Building on Tuesday, March 23. These advisers are Doctors John P. Nuttall, E. Eric Larsen, and E. Vincent Askey.

Current Problems in Medical Legislation was the subject of an address by Dr. Edmund T. Remmen of Glendale, member of the Board of Directors of the Public Health League.

Mrs. E. M. Lazard, President of the Los Angeles League of Women Voters, discussed *Better Schools in Los Angeles for Handicapped Children*.

✽

Marin County

The Woman's Auxiliary to the Marin County Medical Society met in conjunction with the Marin County Public Health League on Thursday evening, March 25, at a dinner meeting at the Marin Golf and Country Club.

The combined groups were addressed by Dr. Glenn Cushman of San Francisco on pending medical legislation. Following Dr. Cushman's address, Dr. F. O. Butler, medical director of the State Home at Sonoma, was introduced by Mrs. H. O. Hund, President of the Woman's Auxiliary, who had secured Doctor Butler as their speaker of the evening. His subject was *The Exceptional Child*, and he gave a very interesting discussion of conditions in the institution.

Plans are now being made for a card party to be given by the Auxiliary on Friday, April 23, at the Improvement Club in San Rafael. Mrs. Robert M. Furlong is in charge of arrangements.

Our February meeting was held in the form of a luncheon at the Meadow Club. We had as special guests, Mrs. Andrew J. Thornton and Mrs. Willard Newman, both of San Diego. Twenty-seven of our thirty-two members were present and, although it was a rainy day, it was a most enjoyable one. A musical program was presented by Mr. Clinton Lewis and his octet from the Marin Junior College.

BURDELLA M. ROBERTSON,
County Chairman of Publicity.

✽

Sacramento County

The regular meeting of the Sacramento Auxiliary met on February 16 at the home of Mrs. Charles Van Geldren. Mrs. Knell gave a report on our Sacramento Hospital Circulating Library. The Sacramento postmaster is granting us all the new unclaimed magazines, which gives us the latest ones for the patients.

Our state president, Mrs. Thornton, and her secretary, Mrs. Newman, were our guests and gave most interesting talks on their visits to the various auxiliaries.

Our president, Mrs. Brown, thanked all who worked on the Red Cross drive.

Refreshments were served by our hostesses.

✽ ✽ ✽

The regular meeting of the Sacramento Auxiliary met on March 18 at the home of Mrs. Anthony Boscoe.

Reports were given by the outgoing officers.

New officers elected were: Mrs. William J. Van Den Berg, president; Mrs. Norris R. Jones, first vice-president; Mrs. Frank McDonald, second vice-president; Mrs. Dave Dozier, recording secretary; Mrs. Heldwig Johnson, corresponding secretary; Mrs. F. N. Scatena, treasurer; Mrs. Frank Knell, Mrs. Richard Scofield, Mrs. James Yovt, and Mrs. Orrin Cook, directors.

After an interesting reading by Mrs. A. Howe, we were served refreshments by our hostess.

MRS. JOHN D. LAWSON, *Corresponding Secretary.*

Santa Barbara County

The members of the Woman's Auxiliary to the Santa Barbara County Medical Society gathered at luncheon Monday, March 15, at the home of Mrs. W. H. Johnston, 205 East Islay Street, to hear a talk on *Cancer Control* by Dr. Henry J. Ullmann, a member of the Cancer Committee of the California Medical Association. Doctor Ullmann pointed out that tuberculosis, which used to rank first as a cause of mortality in the United States thirty years ago, now ranks sixth. The enormous decrease in the proportion of deaths caused by this disease is due to the splendid educational campaign carried on against it. The place of deaths from cancer in the list has changed from sixth to second in the same period of time. In other words, cancer is increasing, and a vigorous campaign is needed to educate the public to fight this much misunderstood disease intelligently. Cancer is curable, and practically all cancer has a curable stage. According to the statistics gathered at the Massachusetts "Cured Cancer Clinic," thirty thousand persons could be cured annually of this disease in the United States. Cancer cannot be stamped out as can an infectious disease, such as tuberculosis or diphtheria, but many persons can be cured of it if education can remove the fear which has, and is still, keeping them from seeking treatment early. The New York City Cancer Committee has put on an extensive and well-planned campaign. Their emblem is a shining silver sword painted upon a black background above the red slogan, "Fight Cancer with Knowledge." Free advertising space has been given them by many magazines, outdoor advertising firms, trolley, subway, and railway systems. This committee publishes a *Quarterly Review*, which describes their education campaign.

Following Doctor Ullmann's talk, Doris White read the essay which won her the first prize of \$20 in the High School class in the contest recently sponsored by the Auxiliary. In it she pointed out the immense benefits to the human race brought about through immunization against such diseases as smallpox, rabies, and diphtheria.

Mme. Marie Jankay then delighted the group with her rendition of two piano numbers—*Le Coucou* by Daquin, and *Invitation to the Dance* by Weber-Taussig.

At the business meeting which followed, a nominating committee, consisting of Mesdames Harold Schwalenburg (chairman), John Van Paing, C. T. Roome, Horace Pierce, and H. E. Henderson, was appointed.

Mrs. C. Z. Nicholas, *Hygeia* chairman, reported on a very extensive campaign which had netted the Auxiliary twenty-four new subscriptions and eleven renewals. She read a letter from the national *Hygeia* chairman, congratulating her for her efforts.

As it was a very rainy day, only sixteen members were in attendance.

MRS. H. E. HENDERSON.

*Santa Clara County*

The regular meeting of the Woman's Auxiliary to the Santa Clara County Medical Association was held at the St. Claire Hotel on April 5 at luncheon, thirty-one members being present.

Dr. R. S. Kneeshaw, president of the County Medical Association, was guest speaker. His subject was *Medical Legislative Problems*.

Mrs. John Hunt Shephard, convention chairman, discussed convention plans, and named those who are to serve on committees.

It was voted to present a scholarship to the Y. W. C. A. for the girls summer camp at Big Basin. Last year 146 girls enjoyed a two weeks' vacation, seventy-one of which were scholarship recipients.

The officers for next year were voted upon and will be announced at Del Monte in May.

MRS. DANIEL BILKER,
Press and Publicity Chairman.

Tuberculosis in Young Adults.—Lloyd and Macpherson stress the fact that about four out of every five young adults suffering from pulmonary tuberculosis who have been in contact with a known case of infection develop the disease within five years of exposure to the last known

contact. This demonstrates the value of continuing the observation of contacts for at least five years after they were known to be last exposed. There is a history of household infection in 82 per cent of the contact cases. History of exposure to tuberculous fathers is almost twice as frequent as history of exposure to tuberculous mothers. In about half of the contact cases, spread of infection is not obviously due to transmission of the disease from parent to offspring, but in many cases infection is apparently introduced into the household by a brother or sister. About 60 per cent of the young adults who develop pulmonary tuberculosis are unaware of any contact with the infection. In noncontact cases the toxemic type of onset is more common than the nontoxemic (70 versus 28 per cent). If all classes of contact cases are taken together, the toxemic and nontoxemic types of onset occur in about equal proportions. It appears, however, that, if there is an interval of more than five years between the last known exposure to infection and the onset of the disease, the onset is more likely to be of the nontoxemic type.—*British Medical Journal*.

Automobile Trailer Sanitation.—As trailers multiply on our roads, new sanitary problems arise to disturb our health officials. Foremost are the provision of safe milk and water and the sanitary disposal of human waste.¹ With reasonable care in choice, safe water is readily available along the highways in many states; similarly the obtaining of safe milk, while slightly more difficult offers no great hazard to the careful purchaser. The chief source of concern is the unsafe or insanitary disposal of human excreta by trailer travelers. Many trailers now provide a small toilet compartment in which excreta may be deposited in cans containing chemical solutions reputed to render the waste innocuous. What to do with the material in the cans is the problem of present concern. No extensive or satisfactory sanitary provisions have been made for the disposal of these wastes and the cleansing of the cans. Serious consideration, it is believed, must now be given to providing roadside facilities for the sanitary disposal of human waste from auto trailers. State or county departments of health may construct disposal systems near roads frequented by auto trailers, the location of which can be made known by appropriate road signs. Recognition has been recently accorded the problem by the city and county of San Francisco,² which has prepared a sanitary code suggested for their citizens when using such conveyances for traveling. According to this code, all trailers should be equipped with an air-tight container of not less than five gallons capacity for the storage of garbage. This container may be emptied only in places approved and so designated by the health authorities of a particular locality. If the trailer is equipped with running water and a flush toilet, an adequate sewage tank should be provided underneath the trailer for the collection and storage of such waste. The tank should be emptied only into sewer connections or by other approved methods of disposal provided by the community. When equipped with water tanks for household use, the tanks must be inspected by an approved health authority at intervals of six months with reference to the potability of the water. Furthermore, water for filling the tanks should be drawn only from certified sources. The code also imposes regulations concerned with parking, food supply, ventilation, cleanliness, and screening. The use of pasteurized milk exclusively is recommended, and trailer travelers are warned concerning the need for securing medical attention if illness arises. The desirability of vaccination of children against smallpox and their inoculation against diphtheria is stressed. Even if no further increase in the number of individuals traveling and living in automobile trailers should occur, it is definitely incumbent on local health authorities to enact and enforce suitable legislation covering the health problems raised by this migratory population.—*Journal A. M. A.*

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, Atlantic City, New Jersey, June 7-11. Olin West, M. D., 535 North Dearborn Street, Chicago, Secretary.

California Medical Association, Del Monte, May 3-6. F. C. Warnshuis, M. D., 450 Sutter Street, San Francisco, Secretary.

American Heart Association, Atlantic City, New Jersey, June 7-8.

American Surgical Association, New York, June 3-5. Charles G. Mixter, M. D., 319 Longwood Avenue, Boston, Secretary.

State Medical Association of Texas, Fort Worth, May 10-13. Holman Taylor, M. D., 1404 West El Paso Street, Fort Worth, Secretary.

Medical Broadcasts*

The American Medical Association and the National Broadcasting Company are presenting the second series of dramatized health broadcasts, under the title, "Your Health." The first broadcast in the new series, the thirty-second dramatized cooperative broadcast under the title "Your Health," was given October 13, 1936. The theme for 1936-1937 differs slightly from the topic in the first series, which was "Medical Emergencies and How They Are Met." The new series is built around the central idea that "one hundred thousand American physicians in great cities and tiny villages, who are members of the American Medical Association and of county and state medical societies, stand ready, day and night, to serve the American people in sickness and in health."

The program will be on the Blue network

The time of the broadcast is Tuesday afternoon, one o'clock, Pacific time.

The topics are announced monthly in advance in *Hygeia*, the health magazine, and three weeks in advance in each issue of the *Journal of the American Medical Association*.

San Francisco County Medical Society

A radio broadcast program for the San Francisco County Medical Society for the month of May is as follows:

Tuesday, May 4—KYA, 6 p. m.

Tuesday, May 11—KYA, 6 p. m.

Tuesday, May 18—KYA, 6 p. m.

Tuesday, May 25—KYA, 6 p. m.

Los Angeles County Medical Association

The radio broadcast program for the Los Angeles County Medical Association for the month of May is as follows:

Saturday, May 1—KFI, 9:15 a. m., The Road to Health.

Saturday, May 1—KFAC, 10:15 a. m., Your Doctor and You.

Thursday, May 6—KECA, 10:45 a. m., The Road to Health.

Saturday, May 8—KFI, 9:15 a. m., The Road to Health.

Saturday, May 8—KFAC, 10:15 a. m., Your Doctor and You.

Thursday, May 13—KECA, 10:45 a. m., The Road to Health.

Saturday, May 15—KFI, 9:15 a. m., The Road to Health.

Saturday, May 15—KFAC, 10:15 a. m., Your Doctor and You.

Thursday, May 20—KECA, 10:45 a. m., The Road to Health.

Saturday, May 22—KFI, 9:15 a. m., The Road to Health.

Saturday, May 22—KFAC, 10:15 a. m., Your Doctor and You.

Thursday, May 27—KECA, 10:45 a. m., The Road to Health.

Saturday, May 29—KFI, 9:15 a. m., The Road to Health.

Saturday, May 29—KFAC, 10:15 a. m., Your Doctor and You.

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to CALIFORNIA AND WESTERN MEDICINE, 450 Sutter Street, San Francisco, for inclusion in this column.

American Association for the Study of Goiter.—The annual meeting of the American Association for the Study of Goiter will be held in Detroit, Michigan, June 14-16, with headquarters at the Book-Cadillac Hotel. Copies of the tentative program may be secured by request to W. Blair Mosser, M. D., Corresponding Secretary, Kane, Pennsylvania.

Better Knowledge of Cesarean Section Needed.—Maternal mortality in the United States is still unduly high and the incidence of cesarean delivery has not lowered this rate, despite its increase and apparent popularity. This is stated by Dr. F. W. Lynch, professor of obstetrics and gynecology in the University of California Medical School, who contends that because of reasons for which the public itself is largely responsible, cesarean section is being performed far too frequently "in the face of indications which experience has shown entail an unjustifiably high maternal mortality."

Doctor Lynch holds that such deliveries should be limited to cases in which valid reasons for their use exists. Many such operations are performed "on demand of the patient," or "for economic reasons," whereas, in a number of these cases another type of delivery should be employed, he said.

Mortality from surgical intervention is becoming less and less in other gynecologic cases, he said. "The increase in cesarean mortality has been initiated by both the laity and the profession."

Doctor Lynch gave a number of maternal mortality figures embraced in the histories of 524,117 women taken over a period of years, and the part that cesarean delivery played in this mortality. His findings are published in the current issue of *Surgery, Gynecology and Obstetrics*, and were presented at the annual meeting of the American College of Surgeons in Philadelphia.

Milbank Memorial Fund.—The Milbank Memorial Fund, 40 Wall Street, New York, gave \$321,518.13 in 1936 for projects and grants-in-aid in the fields of public health, medicine, population, education, and social welfare, according to the annual report of the Fund, published today. This brings to a total of \$11,067,517.07 its appropriations for philanthropic purposes during the thirty-two years since its establishment in 1905 by Mrs. Elizabeth Milbank Anderson. Of this amount, approximately \$3,500,000 was given in the period of 1930-1936.

In a foreword to the report, Albert G. Milbank, President of the Fund, points out that during this depression period "it has become evident that the conception of public health must not be restricted to its former limits, but must broaden out beyond the scope of preventive medicine to advance further and further into the field of social protection in the largest sense of the word. The successful application of corrective and preventive public health activities frequently rests upon the concurrent solution of many other problems, for example, poor housing, nutrition, population trends and their influences on the future economic and social life of the country—which formerly did not seem to have any close or intimate connection with public health. There is no single avenue of approach by which the goal of health and happiness for all of the people can be gained. Rather, its achievement will depend upon the concerted attack of the workers in many fields of social endeavor—medicine, public health, welfare and relief, education, and research."

In 1936, the Fund assisted organizations in all of these fields, although its principal contributions, both in financial support and technical assistance, were made in the field of public health. . . .

Health Section of Los Angeles City Schools.—In the belief that correction of recurring defects is not sufficient and that health education is the most important function of a school health department, the Health Service Section of the Los Angeles City Schools, under the direction of Dr. Sven Lokrantz, has established a Health Education Unit.

This unit has as its purpose the education of school children, parents, teachers, and general public in health matters. The methods used are: lectures to Parent-Teachers Association and student groups, the use of health materials in curricula, the showing of health films and slides in schools, bulletins to teachers and parents, and radio talks to the public.

Specifically, the department is issuing to teachers and all those interested in public health matters, a mimeographed bimonthly publication called "Health News." Beginning Thursday, April 29, and continuing Thursday thereafter, a ten-minute radio health lecture will be given over KECA at 6:15 p.m. These broadcasts will be given by physicians in the health department and by other physicians interested in public-health matters. These lectures are to be passed on by the Los Angeles County Medical Association.

Last Rites for Dr. R. K. Smith.—The San Francisco *Call-Bulletin* of April 20, 1937, printed the following item:

Funeral services were held today for Dr. Reginald Knight Smith, dean of San Francisco obstetricians.

During his thirty-two years of practice in San Francisco, Doctor Smith attained eminence as a child specialist and obstetrician.

Doctor Smith is survived by his widow, Mrs. Alice Scott Smith; two children, Irving M. S. Smith and Miss Betty Knight Smith, and a brother, Dr. Wallace Smith of San Francisco.

Following the services at Grace Cathedral, interment was at Cypress Lawn.

Honorary pallbearers were: Drs. Herbert C. Moffitt, Wallace I. Terry, Arthur L. Bloomfield, Ernest S. DuBray, R. Langley Porter, Thomas H. O'Connor, John H. Graves, Walter B. Coffey, Harry E. Alderson, Howard C. Naffziger, Loren R. Chandler, Ludwig Emge, Frank W. Lynch, Harold Brunn, William C. Voorsanger, William P. Lucas, Irving S. Ingber, Guy S. Millberry, Karl L. Schaupt, Henry A. Stephenson, Paul E. Hoffman, Stanley Mentzer, T. Henshaw Kelly, Cavins D. Hart, Captain H. B. Price, John Francis Neylan, and Mr. Hartley F. Peart.

Statement on American Medicine.—A survey of the present status of American medical practice, which some might regard as exceedingly frank, has just been released locally by the American Foundation of New York through the University of California Medical School and other sources. The survey was intended to get to the bottom of the problem of making adequate medical care available to the large part of the population that now fails to get it.

All of the information obtained in the survey was gathered and submitted by the doctors themselves, most of them having twenty or more years' experience. The Foundation merely asked the doctors for a statement of existing facts and from these it made up a report graphically presenting the picture of American medicine as it functions at the present time. No conclusions or recommendations are contained in the report, as it was intended as a plain statement of fact and nothing more.

Arguments both for and against the establishment of a Department of Public Health in the United States Government, with its own Cabinet member, and such issues as "Is there too much surgery?" "Is there too much specialization?" and "Is the Family Doctor passing?" feature the report. Some doctors hold that there are too many poor and too few good specialists, and many hospitals have expensive and unnecessary "frills." One group contends that everyone should be compelled to save some money for medical care.

The Foundation Committee directing the survey contains such personages as Curtis Bok (chairman), Thomas W. Lamont, Robert A. Millikan, Roscoe Pound, Mrs. Ogden Reid, Mrs. F. A. Vanderlip, and John G. Winant.

Concerning Examination of Eyes of School Children. The following resolution was adopted by the Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association in February, 1937:

WHEREAS, The eyes and the sight of the school child are of the most vital importance for satisfactory school work, and their preservation for future health and efficiency depends upon their wise conservation during childhood; and

WHEREAS, The school has a grave responsibility for the conservation of eyesight among school children; and

WHEREAS, School administrators in many parts of the United States are frequently besieged with demands for admission into their school systems of eye examinations and eye-glass prescriptions by practitioners other than qualified doctors of medicine; and

WHEREAS, The eye, as an organ of vital necessity, requires careful conservation and deserves treatment only at the hands of trained and competent persons; and

WHEREAS, Teachers and nurses properly may and often do make rough tests of visual acuity in the classroom, but diagnosis of diseases of the eye and of disturbances of vision requires more extensive examination and often involves treatment other than the mere fitting of glasses; and

WHEREAS, Even the fitting of glasses often requires the paralysis of accommodation through the use of drugs popularly known as "drops"; now, therefore, be it

Resolved, That it is the sense of the Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association, in meeting assembled at New Orleans, February 23, 1937, that the safety of the eyes of school children, the adequate diagnosis of disease and the correct fitting of glasses require examination of children's eyes (beyond rough visual tests performed by teachers or nurses) by a licensed doctor of medicine and, upon his recommendation, by a medical specialist in diseases of the eye, properly known as an oculist or ophthalmologist.

Experimental Tunnel at Mount Weather, Virginia.—A research tunnel, or adit, for testing purposes has been established by the United States Bureau of Mines, Department of the Interior, on the Government Reservation at Mount Weather, Virginia, under a cooperative arrangement with the Weather Bureau and the Department of Agriculture. This site was selected as being the most desirable among many considered because it is on Government-owned land and because the prevailing rock is especially suitable for conducting drilling tests.

The object of the research at Mount Weather is to increase the knowledge of the details of the various steps in metal mining and to improve the underground working conditions affecting the health of miners. Similar work for coal mines is being done by the Bureau of Mines at its experimental coal mine at Bruceton, Pennsylvania, near Pittsburgh, where especial emphasis is placed on the study of prevention of coal-dust explosions.

The problems on the current program at Mount Weather include technical investigations of rock drilling; tests to establish the comparative efficiencies of rock drill bits fabricated from different steel alloys and from carbon steel; studies of the formation and prevention of dust caused by blasting, rock drilling, loading of mine cars and underground transportation; research in blasting, including the depth and method of placing drill holes for the best results in breaking ground; gases formed by different kinds of explosives after blasting; ventilation of underground mine openings; and other related subjects.

The project is an activity of the Mining Division of the Bureau, and the operations are in direct charge of Wing G. Agnew, as resident engineer. Normally, work is confined to the day shift by a small force of regular workmen. Occasional assistance in clearing the grounds and surfacing roadways has been given by members of the Civilian Conservation Corps from the near-by camp at Front Royal. When tests are being conducted at the tunnel, specialists from the several divisions of the Bureau of Mines cooperate in a common endeavor to solve the particular problem under investigation.

Upon the completion of a series of tests, the results will be published by the Bureau of Mines and will be available to all those who may be interested.

Quarantine Order, Dogs and Cats: Long Beach.

An investigation having been made as required in Chapter 369, Statutes of 1913, of the State of California, and rabies having been found to exist among dogs living within the city of Long Beach, the California State Board of Public Health hereby declares a quarantine against all dogs and cats within those city boundaries of Long Beach as described in the charter of the city of Long Beach amended as of 1933.

Quarantine under this Act means the strict confinement, upon the private premises of the owners under restraint by leash or closed cage or paddock, of all dogs and cats within the above described area.

It shall be the duty of all peace officers, the City Veterinarian and all deputies of the City Health Officer, as well as the City Health Officer, to enforce the provisions of this order within the above quarantined area.

The City Health Officer, or other properly constituted officials, may make inspection or examination and enter upon all private premises for the enforcement of this quarantine.

Any owner, or other person in possession of any animal being held or maintained in violation of this quarantine, shall be subject to arrest on the charge of committing a misdemeanor.

Southern California Medical Association.—This Association held its ninety-sixth semi-annual meeting on April 9 and 10 at the Hotel Del Coronado, Coronado, under the direction of its Committee on Arrangements: Doctors L. H. Redelings, Ray C. Loundsberry, Robert E. Austin, Mrs. C. O. Tanner (Women's Entertainment), and officers—Doctors Merrill W. Hollingsworth, President, Santa Ana; LeRoy Sherry, First Vice-President, Pasadena; C. L. Emmons, Second Vice-President, Ontario; Robert W. Langley, Acting Secretary, Los Angeles.

The program follows:

FRIDAY AFTERNOON SESSION

Contact Eczema—Joseph Weinberger, M. D., San Diego. Discussion by Hiram Newton, M. D., San Diego, and H. P. Jacobson, M. D., Los Angeles.

The Treatment of Acute Cholecystitis—H. P. Totten, M. D., Los Angeles. Discussion by Chester Tanner, M. D., San Diego, and J. Norman O'Neill, M. D., Los Angeles.

The Facts About Radium and X-Ray Therapy—George S. Sharp, M. D., Pasadena. Discussion by C. Hiram Weaver, M. D., Los Angeles, and Douglas R. MacColl, M. D., Los Angeles.

Experimentally Induced Variations in Plasma CO₂ Combining Power—Noel F. Shambaugh, M. D., Los Angeles. Discussion by Dr. Henry Borsook, California Institute of Technology, Pasadena.

FRIDAY EVENING SESSION

In Memory of David Ghrist—Elmert Belt, M. D., Los Angeles.

Methods of Directing the Urine Above the Level of the Bladder—Hugh Cabot, M. D., Section on Urology, Mayo Clinic, Rochester.

SATURDAY MORNING SESSION

Osteomyelitis in the Newborn—Russell T. Bothe, M. D., San Diego. Discussion by William W. Belford, M. D., San Diego, and Joseph J. O'Hara, M. D., San Diego.

The Practical Application of Skin Tests in Dermatology—William H. Goeckerman, M. D., Los Angeles. Discussion by Dr. L. F. X. Wilhelm, Los Angeles, and Dr. Philip K. Allen, San Diego.

Typhus Fever in San Diego County—Arthur A. Marlow, M. D., San Diego. Discussion by Dr. E. Minton Fetter, San Diego.

The Cancer Problem in the United States Navy—Lieutenant Commander O. B. Spalding (MC), United States Navy. Discussion by Albert Soiland, M. D., Los Angeles, and Albert E. McEvers, M. D., Los Angeles.

SATURDAY AFTERNOON SESSION

A Résumé of Protozoan Infestation in Southern California as Shown by Records in a Large General Hospital,

Over the Latest Decades—John V. Barrow, M. D., Los Angeles. Discussion by William C. Boeck, M. D., Los Angeles, and Fred B. Clarke, M. D., Long Beach.

An Estimate of Mapharsen in Early Syphilis—Commander R. P. Parson (MC), United States Navy. Discussion by Samuel Ayres, M. D., Los Angeles, and Julius R. Scholtz, M. D., Los Angeles.

Heat Production and Heat Loss in Chills and Fever—Eugene F. DuBois, M. D., Professor of Medicine at Cornell Medical College, and Medical Director of the Russell Sage Institute, New York City.

The Board of Governors for 1936-1937 includes: Doctors F. M. Pottenger, Egerton Crispin, Joseph King, Charles T. Sturgeon, Raymond G. Taylor, Carl R. Howson, all of Los Angeles; Rexwald Brown, Santa Barbara; Joseph K. Swindt, Pomona; Paul E. Simmonds, Riverside; Fred B. Clarke, Long Beach.

The Councilors are: Doctors Bon O. Adams, Riverside; H. Douglas Eaton, Los Angeles; Franklin Nuzum, Santa Barbara; Robert W. Langley, ex officio; and David Ghrist, ex officio.

Clinical Problems in Syphilis Control Today.—John H. Stokes, Philadelphia (*Journal of the American Medical Association*, March 6, 1937), brings out the fact that the League of Nations investigation brought to the dignity of statistical demonstration the fact that clinics, widely regarded as the chief instruments for the control of syphilis, are so inefficiently run the world over that 20 per cent of their early syphilis material has not received even the minimum of darkfield examination and serologic testing required by the past two decades of knowledge of the disease. Two adequate systems for the treatment of early syphilis can now be issued in black and white for public health and voluntary agents, including private physicians' reference and use: the British-Danish intermittent and the American continuous alternating. Of the two the Coöperative Clinical Group and the United States Public Health Service believe they have proved the alternating continuous treatment to be the better. With new detection machinery in full movement, an enormous influx of seropositive latency is to be expected and must be evaluated and treated. Hospital, and outpatient and practitioner "pick ups" require (1) adequate complete physical examination, not mere listening through the shirt and tapping the knees; (2) with a negative physical examination the beginning of treatment, not by the first arsenical "shot" one can reach, but with bismuth subsalicylate weekly, while one gains the patient's confidence and a spinal-fluid examination. For two reasons the author would place the syphilitic woman first rather than fourth among the modern problems of syphilis. Infectious early syphilis of a woman's genital tract is the *terra incognita* of the public health aspect of the disease. The relatively more benign and inconspicuous course of the whole infection, which Warthin rated as in her almost a disease in a different animal species, fills the terrain with the unexpected and unpredictable and makes epidemiologic and therapeutic certainties rare indeed. As soon as possible after the recognition of prenatal syphilis, especially of the tardive type, the spinal fluid should be examined in order to forestall the onset of grave neurosyphilis by fever therapy, precisely as one does in acquired syphilis. Few rules will thwart more tragic consequences. Of the therapy of neurosyphilis, Ravaut, who brought asymptomatic neurosyphilis to light, died ten years too soon. He suggested, and would probably have shown, that a great deal of neurosyphilis recovers of itself; that even the parietic formula is compatible with a long, effective and healthy life. It is clearly proved that asymptomatic neurosyphilis tends to be withheld from symptomatic expression or cured by a prolongation plus some form of intensification of standard treatment for the disease. The incidence of asymptomatic neurosyphilis is reduced practically to zero by sufficiently intensive treatment begun early in the disease. Injections of chemotherapeutic agents are merely mediated by the hand and head. Effective treatment for syphilis may indeed be mechanized to a certain perfection by knowledge. But the uprooting of the disease from its hold on humanity is done by the eye, the voice, the understanding and sympathetic spirit, without which all the much gathering of knowledge is but the unliving dust.

New Development in Study of Spinal Disease Virus. Difference in the severity of outbreaks of poliomyelitis, an inflammation of the spinal cord, in different regions may be accounted for by a qualitative difference between different strains of the virus causing this disease.

This conclusion was pointed to by recent experiments carried on at the Hooper Foundation for Medical Research of the University of California. Results of the experiments were reported in *Science* magazine by B. F. Howitt, associate in research medicine at the University.

According to the *Science* article, the mildness of outbreaks in some sections as compared with the severity of outbreaks in other localities may be explained by regional differences in the strains of virus. This difference may be explained not only by a variance in infectiousness or potency of the virus, but also in the tendency to build up immunity.

Undoubtedly, says the author, the high immunity of certain communities accounts for the comparatively low number of cases recorded. Yet sudden outbreaks of poliomyelitis do occur which are accompanied by high mortality. Howitt believes that these attacks may be accounted for by the sudden introduction into such regions of a virus of different quality from that to which the population is ordinarily exposed combined with high infectiousness.

Therefore, in judging the results of serum therapy, some account must be taken of the possible differences of virulence in the virus of different regions. Populations ordinarily exposed to a mild strain of virus to which they have built up a high immunity may not be able to resist one of high potency. Thus they would not respond as well to serum from those immune to the milder strain.

Virus for the experiments was obtained from a fatal case during the outbreak in Sacramento in 1934. This was compared with another strain obtained from the New York City Health Department, and with others on hand, notably one obtained from a fatal case in San Francisco.

1937 Graduate Fortnight: New York Academy of Medicine.—For the Annual Graduate Fortnight of the New York Academy of Medicine a subject of outstanding importance in the practice of medicine and surgery is selected and is presented from as many angles as possible. It offers to the profession a résumé of the present knowledge of the subject so that the practitioner may be so informed.

The Tenth Annual Graduate Fortnight will be held November 1 to 12, and will be devoted to a consideration of medical and surgical disorders of the urinary tract. The subject will include Bright's disease, arterial hypertension, and infections, tumors, calculi and obstructions of the urinary tract, and will exclude venereal disease, diseases of the genitalia, and gynecology.

Twenty important hospitals of the city will present coordinated morning and afternoon clinics and clinical demonstrations. At the evening meetings, prominent clinicians of New York and many of the other leading medical centers of this country who are recognized authorities in their special fields will discuss the several aspects of the general subject.

A comprehensive exhibit of books, pathologic and research material, diagnosis, treatment and prevention whenever possible, clinical and laboratory diagnostic methods, x-rays, action of drugs and other therapeutic measures. Demonstrations will be held at regular intervals.

Some of the features to be presented at the meetings, in the clinics and in the exhibit will be:

- Physiology of the kidney.
- Tests for kidney function.
- Edema and its treatment.
- Uremia and pathology of kidney function.
- Pathology of nephritis.
- Clinical aspects of nephritis including glomerular, focal, embolic and acute interstitial nephritis.
- Nature of hypertension.
- Clinical aspects of hypertension, including malignant hypertension.
- Evaluation of the surgical treatment of hypertension.
- The nephroses.
- Vascular and renal complications of pregnancy.
- The relation of psychogenic factors of hypertension.

Pathogenesis and treatment of renal infections.

Renal and perirenal infections.

Tuberculosis of the kidney.

Calculus disease. The formation of stones.

Clinical aspects of calculus disease.

Hydronephrosis and pyonephrosis.

Bright's disease in children.

Common urologic diseases in children.

Radiotherapy of tumors of the urinary tract.

Tumors of the kidney and ureter.

Tumors of the urinary bladder.

Pathologic physiology of bladder-neck obstructions.

Transurethral resection of bladder-neck obstructions.

Surgical treatment of obstructions at the neck of the bladder.

The medical profession is invited to attend.

A complete program and registration blank may be secured by addressing Dr. Mahlon Ashford, The New York Academy of Medicine, 2 East 103rd Street, New York City.

Bacillus May Be Either Harmless or Villainous.—A "Dr. Jekyll and Mr. Hyde" in the tiny world of microscopic bacteria has been detected by Dr. Francis E. Clark, bacteriologist in the United States Department of Agriculture's division of soil microbiology.

As a villain the bacillus most recently was identified as *Bacillus siamensis*, a pathogenic or virulent form recovered from various pathologic sources, including contaminated human blood.

In a more common rôle it has long been known as *Bacillus cereus*—one of the most common and harmless of all soil bacteria—inhabiting the air and soil in countless millions. Other bacteriologists have noted the similarity in appearance but, because one is virulent and the other harmless, concluded there was a difference.

Before coming to the Department of Agriculture, Doctor Clark was a bacteriologist in the Colorado General Hospital. In a routine examination of a blood sample, he found the virulent *B. siamensis*. He cultured the tiny, spore-forming microbe.

After isolating *B. siamensis*, Doctor Clark cultured it for twenty-four hours on glucose broth. An injection of one cubic centimeter under the skull killed a guinea pig within a few hours. Subcultured over a longer period, the bacilli gradually lost virulence. At the end of a month it required four cubic centimeters to kill a guinea pig. After three months even this amount was not fatal.

When Doctor Clark transferred his work to the Department of Agriculture, he showed the results of his study to N. R. Smith, senior bacteriologist, who immediately noticed the striking similarity between the *B. siamensis* and *B. cereus*. Subsequent culture tests showed them to be identical.

A virulence test of *B. cereus* first bore out the common opinion of bacteriologists that the bacillus does not cause disease. However, when it was subcultured rapidly on blood agar for a few generations, the surface growth after twenty-four hours was virulent enough to kill a guinea pig overnight.

Thus, under culture, the "non-virulent" bacilli became virulent. In the same manner the virulent form lost its virulence in a typical "Dr. Jekyll and Mr. Hyde" manner.

Two significant results are seen. In the first place, medical pathologists may save time and trouble by comparing any apparently new virulent and spore-forming bacillus with *B. cereus*. In the second place, it is a step forward in avoiding a too arbitrary "break down" of bacilli into virulent and non-virulent fields, a subject with which bacteriologists have made little progress in the past.

There is small probability of any human illness from such border-line pathogens, says Doctor Clark, and they usually do not attack such laboratory animals as the guinea pig unless injected artificially in large doses. However, it is entirely possible that they may cause natural epidemics in the lower forms of animal life. An example is the identification of the *B. Cereus*—*B. siamensis* group submitted to Doctor Clark by workers in the Bureau of Entomology and Plant Quarantine. The bacilli were responsible for a highly fatal epidemic septicemia of army worms which were being used in laboratory experiments.

LETTERS

Concerning reprint of "San Francisco Chronicle" article on a Proposed Medical Service Law: Additional information and correction concerning the same.*

LEO H. SHAPIRO
Attorney at Law

San Francisco, California,
April 22, 1937.

California and Western Medicine
Room 2004, 450 Sutter Street
San Francisco California
Attention Frederick C. Warnshuis
Gentlemen:

In your issue of March, 1937, on page 212 thereof, you have published an article under the title, "Bill (Williams) Not Health Insurance," by Chester Rowell. This article purports to be a copy of an article as published by Chester Rowell in the *San Francisco Chronicle* on September 17, 1936.

The portion of the article which is particularly objectionable to me is the statement that the bill which is described in the article was drafted by me on behalf of Credit Unions. For your information, Mr. Rowell, in subsequent articles in the *San Francisco Chronicle*, after receiving the true facts in connection with the statements previously published by him, editorially retracted any statements in connection with such bill as applicable to me.

For your information, I had nothing whatever to do with the preparation of any medical or health bill. Credit Unions are interested in securing proper and adequate health insurance, to be strictly supervised and to be rendered according to the best standards of the medical profession. They are not interested in rackets of any kind or nature, and they want to see physicians duly and adequately paid, without any deductions for any promotional propositions.

I would, therefore, appreciate the correction or retraction of the article as published by you, and I would suggest that you contact Mr. Rowell in order to confirm the statements which I have made herein.

Appreciating your prompt response, I am
68 Post Street.

Yours truly,
(Signed) LEO SHAPIRO.

Concerning syphilis: A letter from a United States Fleet medical officer.

UNITED STATES FLEET
U. S. S. PENNSYLVANIA, FLAGSHIP
San Pedro, California,
March 30, 1937.

J. P. Nuttall, M. D.
President, Los Angeles County Medical Association.
Dear Doctor:

The disease syphilis is acquired by the men of the Navy during periods of leave and liberty ashore. Approximately 10 per cent of our crews have this disease. The major part of the United States Fleet bases for most of the year on two ports of Southern California, Los Angeles and San Diego. A very large proportion of new admissions for syphilis are acquired in the State of California. For this reason the renewal of interest in the control of syphilis being taken in California brings to us a ray of hope. For many years the Navy has brought early diagnosis, early segregation of the infectious and early treatment to bear upon this disease within the confines of its own environment. The increasing evidence that similar activity is now contemplated on a state-wide and perhaps a nation-wide basis is heartening indeed.

Statements which have appeared recently in the Bulletin of the Los Angeles County Medical Association relate to the pressing need for greater activity by all physicians and public health activities. Such an attack upon this disease will succeed in reducing its incidence in the population. It is most gratifying to see that the leadership of your influential society is being brought to bear upon this problem.

The 65,000 men of the Fleet, whose medical care devolves upon naval surgeons, are protected by prophylactics to only

a small degree. They, therefore, must place their hope for effective action against the physicians in the civil community.

We hope that the effort now being made in the Legislature of the State of California to write into the statutes a strong and effective legal basis for better control of syphilis will be successful. We hope that as leaders of medical action in the metropolitan center of Los Angeles your society will realize that we follow your activities in this campaign with the greatest interest. We in the Fleet stand ready to cooperate to the fullest extent with any laws or regulations civilian authority may enact to lessen the incidence of this widespread and active destroyer of human life and health.

Sincerely and hopefully yours,

(Signed) GEORGE F. COTTLE,
Captain, (M. C.) United States Navy,
Fleet Medical Officer.

Concerning California's indigent transient problem.

LOS ANGELES CHAMBER OF COMMERCE
LOS ANGELES, CALIFORNIA

April 15, 1937.

Dear Dr. Kress:

Reference is made to my letter of March 22. The fact that you have not heard from me sooner does not mean that we are not deeply interested in the indigent transient problem in California, and its solution.

Apparently, from the opinion rendered by the Attorney-General's office, there is no doubt that the entrance of those who are sick and liable to become a burden upon the community can be stopped. Indeed, the decision seems to me to go much further and recognize the right of the state to keep out those who may become a public charge on the state and county.

The Chamber has a special committee studying this whole problem. This committee would be very glad to go into this phase of the matter and, if you find time, I would very much appreciate it if you would meet with the group.

Very truly yours,

LOS ANGELES CHAMBER OF COMMERCE,
Arthur G. Arnoll,
Secretary and General Manager.

Concerning State Medical Board's interpretation of emergency medical care.

The item below, with the notation by the editor of the publication, is taken from the *Yuba City Independent-Farmer*:

Editor's Note.—The following letter from Dr. Charles B. Pinkham, Secretary-Treasurer of the Board of Medical Examiners of the State of California, is discussed in full in the editorial columns of today's *Independent-Farmer*.

San Francisco, California,
March 20, 1937.

Re Medical Practice Act.
Editor, *Independent-Farmer*
Yuba City, Sutter County, California

Dear Sir:

Permit me to correct your misrepresentation of the Medical Practice Act, as expressed in the editorial printed in the *Yuba City, California, Independent-Farmer*, March 2, 1937. Therein you claim that such procedure as applying iodine to a skinned knee or using methol or aspirin tablets for a cold, or removing a cinder from an eye, constitutes a violation of the Medical Practice Act.

May we call your attention to Section 22 of said Act, reading in part as follows:

"Nothing in this Act shall be construed to prohibit service in case of emergency or the domestic administration of family remedies."

Hence, your suggestion that a "school employee is in danger of arrest if he or she applies iodine to a scratch or puts a protective bit of gauze on a skinned knee" is a misstatement of fact.

The situation which occasioned your editorial arose because a public health school nurse was reported to have taken it upon herself to diagnose a skin disease and prescribe a remedy therefor. This is strictly prohibited under

* This letter from Attorney Shapiro is printed for the information of all concerned.—Editor.

Section 17 of the Medical Practice Act, copy of which please find enclosed. If such procedure should be permitted to laymen, including public-school nurses, not thoroughly trained in medicine, diagnosis, etc., it must be conceded that the avenue will be opened to serious epidemics, etc. Either of these groups could easily make an error in diagnosing a case of smallpox as one of scabies or some similar condition. By so doing, the case of smallpox would no doubt infect a large number of individuals, causing an epidemic.

The Board of Medical Examiners has had complaints from many sections of the State of California that public-school nurses diagnose physical conditions of school children, thereafter recommending treatment and often prescribing remedies. This is not conducive to the best interest either of the individual or the community. Instances have been reported where a case of diphtheria has been diagnosed as an ordinary sore throat and a gargle prescribed.

Trusting that you will correct the misinformation in the editorial above referred to, believe me

Very truly yours,

C. B. PINKHAM, M. D.,
Secretary-Treasurer.

The following excerpts from the Medical Practice Act were enclosed with the letter:

"Sec. 17. Any person who shall practice or attempt to practice, or who advertises or holds himself out as practicing, any system or mode or treating the sick or afflicted in this state, or who shall diagnose, treat, operate for, or prescribe for any ailment, blemish, deformity, disease, disfigurement, disorder, injury or other mental or physical condition of any person, without having at the time of so doing a valid unrevoked certificate as provided in this Act, or who shall in any sign or in any advertisement use the word 'doctor,' the letters or prefix 'Dr.,' the letters 'M. D.,' or any other term or letters indicating or implying that he is a doctor, physician and surgeon, physician, surgeon or practitioner, under the terms of this or any other act, or that he is entitled to practice hereunder, or under any other law, or who shall in any sign or any advertisement or otherwise use the word 'chiroprapist,' 'foot specialist,' or any other term or terms, or letters indicating or implying that he is a chiroprapist, or that he practices or holds himself out as practicing chiroprapy or foot correction, as defined in Section 8 of this Act, without having at the time of so doing, a valid unrevoked certificate as provided for in this Act, shall be guilty of a misdemeanor and upon conviction thereof shall be punished as designated in this Act; provided that nothing contained in this section shall be construed to prohibit the manufacture, the recommendation, or sale of either corrective shoes or of appliances for human feet." (Amended statutes 1915, page 184; statutes 1917, page 93; statutes 1929, page 435; statutes 1933, chap. 499, p. 1275.)

Concerning number of signatures for an Initiative Basic Science Law.

STATE OF CALIFORNIA
DEPARTMENT OF STATE
SACRAMENTO

March 18, 1937.

To the Editor:—Further with reference to our reply to your letter of the 9th, and replying to your letter of the 16th, concerning number of signatures necessary to qualify an Initiative measure to be submitted to the electors.

The figure of 186,378 is correct. That number will qualify any Initiative during the present year, or in the year 1938, to be submitted to the electors at the general election in November, 1938.

The total is determined by multiplying the total number of votes cast for all candidates for governor at the last preceding general election, at which a governor was elected, by 8 per cent, as provided in Section 1, Article IV, of the Constitution of California. At the November, 1934, general election the candidates for governor received 2,329,722 votes, 8 per cent of which is 186,378.

Very truly yours,

FRANK C. JORDAN,
Secretary of State.
By Charles J. Hagerty, Deputy.

Concerning syphilis legislation.*

CALIFORNIA MEDICAL ASSOCIATION

April 12, 1937.

To Presidents and Secretaries of County Societies:

Gentlemen:

By direction of the Council, your attention is called to the following statements. The members of your county society are requested to be accordingly governed when giving consideration to any local plans relating to a venereal disease program.

1. At the request of Surgeon-General Thomas Parran, United States Public Health Service, the Council on January 16, 1937, adopted the following motion:

WHEREAS, The federal, state and local public health agencies have authorized and are putting into operation carefully prepared plans for a campaign for the prevention and treatment of syphilis and gonorrhea; and

WHEREAS, The utilization of federal funds in this work necessitates centralization of state procedures in and through the California State Board of Health; now, therefore, be it

Resolved, By the Council of the California Medical Association, that it is in full sympathy with all rational and practical efforts to solve the problem of syphilis and gonorrhea; and be it further

Resolved, That this Council suggests that all groups and citizens who wish to cooperate in this work, do so in conjunction with the State Board of Health.

2. On February 7 the Council adopted the following resolution:

Resolved, That the Legislative Committee be instructed by the Council to support legislation for the control of venereal disease that is satisfactory in the judgment of the committee and that is also supported by the State Board of Health.

3. These resolutions were published in CALIFORNIA AND WESTERN MEDICINE, page 121 of the February issue, and page 190 of the March issue, and county secretaries were requested to impart this action to members.

4. Because of certain communications that are being addressed to county societies and members, the Council again requests that no official action be taken by your society or members until the nature of the indicated action is transmitted to your society after having been formulated by the Council or House of Delegates.

The Board of Health has given careful consideration to Assembly Bill 2790, and is of the opinion that it is necessary for the control of venereal diseases. The Board of Health and the Council of the California Medical Association do not endorse and do not deem that Assembly Bill 1089 is necessary.

The Board of Health has passed a resolution approving the policy that "As far as control measures are concerned, they must be carried out through official agencies—by the State and local health departments. We do not believe that we should be handicapped in framing rules and regulations by having the same written into the law. It will be necessary for the Board to promulgate certain regulations which can be changed from time to time as the occasion demands, and we would be very glad to discuss some of the features in Assembly Bill 1089 with regard to placing them in the regulations. On legal subjects we must be guided by the Advice of the Attorney-General."

The Council requests county societies and members to be governed by the foregoing statements.

F. C. WARNSHUIS, M. D.,
Secretary.

Concerning price advertising (Ward M. Whitten vs. California State Board of Optometry).

DEPARTMENT OF PROFESSIONAL AND VOCATIONAL
STANDARDS

BOARD OF MEDICAL EXAMINERS
STATE OF CALIFORNIA

MARCH 30, 1937.

To the Editor:—Supplementing our recent correspondence relative to price advertising, thought you would be interested in the enclosed copy of a California Supreme Court decision filed March 16, 1937, which upholds the right of the California State Board of Optometry to hear

* See also, in regard to Assembly Bill 2790, items on pages 294 and 348.

charges against one of their licentiates, Ward M. Whitten, who advertised "for sale complete glasses containing single vision lenses and including frames and examination for seven and 50/100 (\$7.50) dollars," but "refused to sell" the same for that price "to persons answering that advertisement."

Another most vital point in this decision is that boards such as the Optometry, Medical, and others, have the right to hold hearings and revoke licenses.

We believe this important decision is worthy of publication in CALIFORNIA AND WESTERN MEDICINE.

Very truly yours,

C. B. PINKHAM, M. D.,
Secretary-Treasurer.

IN THE SUPREME COURT OF THE STATE OF
CALIFORNIA

In Bank

FILED March 16, 1937

B. GRANT TAYLOR, Clerk

By J.

S. F. Deputy

WARD M. WHITTEN,
Plaintiff and Respondent,

vs.

CALIFORNIA STATE BOARD OF OPTOMETRY,
Defendant and Appellant.

This case was transferred to this court after decision by the District Court of Appeal, Second Appellate District, Division Two, in order that we might give further consideration to the propriety of the issuance of the writ of prohibition to restrain the respondent board from taking further action in proceedings to revoke the license of Ward M. Whitten for the making of untrue statements in his advertisement in violation of the Optometry Law (Stats. 1913, p. 1097). The action was commenced in the superior court and the peremptory writ of prohibition was ordered to issue. The Board prosecutes this appeal therefrom.

The office of the writ of prohibition is limited by the constitution to the restraint of a threatened exercise of judicial power in excess of jurisdiction and it does not lie to an officer or board exercising purely ministerial functions. (*Cameron vs. Kenfield*, 57 Cal. 550; *Baines vs. Zemansky*, 176 Cal. 369; *Santini vs. Justice's Court*, 218 Cal. 671). The Optometry Law provides for a State Board of Examiners in Optometry having statewide jurisdiction over the practice of optometry. Hence the case comes squarely within the rule, recently reiterated in the case of *Standard Oil Company of California vs. State Board of Equalization*, 92 Cal., December 7, that, in the absence of a constitutional grant of judicial power a state board cannot exercise judicial functions and the legislature is powerless to confer such power upon it. Hence the writ of prohibition is inappropriate. The fact that the Optometry Law fails to provide a method of review, perhaps by trial de novo in the superior court, is a matter for the consideration of the legislature.

The cases of *Millsap vs. Alderson*, 63 Cal. App. 518, and *Crisso vs. Board of Medical Examiners*, 95 Cal. App. 385, can no longer be considered as establishing that the legislature cannot confer upon the person deprived of a license or privilege the right to have his cause heard by way of a statutory review or trial de novo before the superior or municipal court. The distinction between the absence of authority in the legislature to enlarge or decrease the superior court's jurisdiction and its power to create or diminish rights, which, in effect, creates new or limits old causes of action, is well drawn in *Spreckels vs. Hawaiian Com. Company*, 177 Cal. 377, 381. See also *Wright vs. Superior Court*, 139 Cal. 469, and *Reclamation District vs. Superior Court*, 171 Cal. 672, 681.

However, it is suggested that the line of cases exemplified by *Suckow vs. Alderson*, 182 Cal. 247, and *State Board of Chiropractic Examiners vs. Superior Court*, 201 Cal. 108, should govern the instant case rather than *Standard Oil Company of California vs. State Board of Equalization*, supra. We are unable to find any substantial difference between the functions exercised. While it is true that in the authorities mentioned it is held that the writ of certiorari would lie to review the wrongful revocation of a license of a physician and surgeon on the theory that the medical board was exercising a quasi judicial func-

tion, we think that the sounder conclusion, in view of changing and increasing governmental activities, is that such boards are actually engaged in enforcing administrative determinations. Agencies engaged in making administrative determinations, unlike courts, have the power and the facilities to investigate and initiate action and, more or less informally, find the facts which under the law justify a course of action. They cannot and do not declare the law but perform the sole duty of ascertainment. (*Dominguez Land Corporation vs. Daugherty*, 196 Cal. 468, 483.) Under this theory the order of statewide agencies such as the Board of Optometry would not be subject to review in response to the writ of certiorari, but their discretion could be confined within legal limits either by the procedure heretofore suggested or by the use of the writ of mandamus.

Aside from the fact that the writ of prohibition will not lie, for the reasons already stated, we are of the opinion that the petitioner is not at this time entitled to any relief upon the showing made. He is accused of making untruthful statements, in this, that he advertised "for sale complete glasses containing single vision lenses and including frames and examination for seven and 50/100 (\$7.50) dollars," but "refused to sell" the same for that price "to persons answering that advertisement." No evidence was taken, this proceeding having been instituted before the time set for hearing. We can appreciate that under certain testimony it might be proven that the advertisement was not an untruthful statement, whereas, under other circumstances, it would be demonstrated to be untruthful and intentionally drawn to mislead. Certainly untruthful advertising should be held to constitute an untruthful statement. Under such circumstances the respondent board should be permitted to proceed.

Accordingly the judgment is reversed and the peremptory writ of prohibition is discharged.

THOMPSON, J.

We concur:

Decision unanimous.

MEDICAL JURISPRUDENCE†

By HARTLEY F. PEART, ESQ.
San Francisco

The Doctrine of Res Ipsa Loquitur (The Thing Speaks For Itself) as Applied to Malpractice Cases

Last month, in discussing the case of *Ales vs. Ryan*, the doctrine of *res ipsa loquitur* was mentioned, but discussion of the doctrine was deferred until this issue.

Ordinarily when a plaintiff commences action for damages arising out of an injury inflicted by the defendant to his person or property, it is necessary for the plaintiff to prove not only that the injury occurred and that he was damaged thereby, but that the injury occurred as the direct result of a negligent act or omission by the defendant. Once in a while, however, an injury is caused in such a manner that the plaintiff, in the nature of things, cannot prove the defendant negligent as conveniently or as easily as the defendant, if, in fact not negligent, can prove the absence of negligence. In such situations the law helps out the plaintiff by invoking a doctrine known as *res ipsa loquitur*, or "the thing speaks for itself." When this doctrine is applied, the jury is entitled to infer from the fact that the injury occurred that it was caused by the negligence of the defendant. Practically speaking, in such cases it is up to the defendant to convince the jury that he was not negligent, while in ordinary cases the burden is upon the plaintiff to convince the jury that the defendant was negligent.

Before a court will instruct a jury that "the thing speaks for itself" it is necessary for each of the following factors to appear:

1. The instrumentality causing the accident must be under the exclusive control of the defendant and the injury must be caused by some act or omission incident to that control;

† Editor's Note.—This department of CALIFORNIA AND WESTERN MEDICINE, containing copy submitted by Hartley F. Peart, Esq., will contain excerpts from and syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

2. The accident must be of such nature that it ordinarily would not have occurred but for the defendant's negligence;

3. The accident must have occurred without any voluntary action or participation by the party injured; and

4. Information as to the cause of the accident must be more accessible to the defendant than to the plaintiff.

The case most often used to illustrate *res ipsa loquitur* is an English one where a barrel fell from the second story of a warehouse upon a person walking below. In that case the necessary factors were present, *i. e.*, (1) the defendant (owner of the warehouse) had exclusive control of the barrel which caused the accident; (2) ordinarily a barrel does not fall from a building unless it is negligently handled; (3) the pedestrian did not participate in any way in the barrel's fall; and (4) the precise cause of the barrel's fall could more readily be ascertained by the defendant than the plaintiff.

As expert evidence is *ordinarily* required to prove malpractice actions, it follows that *ordinarily* the *res ipsa loquitur* doctrine is inapplicable in such cases. In *Nicholas vs. Jacobson*, 113 Cal. App. 382, it is said:

Ordinarily, negligence on the part of a physician or surgeon must be proved by expert evidence, and when the matter in issue is one within the knowledge of experts only, and is not within the common knowledge of laymen, the expert evidence is conclusive. Hence, when the expert evidence fails to show negligence on the part of the physician or surgeon, and there is no evidence of an independent act or omission within the common knowledge of laymen, there is no ground upon which the jury may base an inference of negligence, and in such a case a nonsuit is proper.

Now and then a case arises involving an allegation of negligence in professional practice, which is said by the Court to be of such a nature that expert or opinion evidence is not necessary to prove negligence. In these cases, even though a professional act or omission is involved, the courts have applied the doctrine of *res ipsa loquitur*. An early example of this type of case is the one where an x-ray machine, attached to a wall in a dentist's office, fell, striking a patient who was sitting in the dentist's chair. The patient suffered a broken nose and other injuries to her face. In that case the Court held that it was only necessary for the patient to prove the machine fell and what injuries were sustained in order to entitle her to recover against the dentist. This case bears quite a resemblance to the early English barrel case mentioned above. However, some of the more recent decisions applying "the thing speaks for itself" doctrine against physicians and other professional persons seem to be far removed from the original judicial conception of the meaning of *res ipsa loquitur*.

In *Armstrong vs. Wallace*, 8 Cal. App. (2d) 429, the District Court of Appeal applied the *res ipsa loquitur* doctrine in a sponge case. The surrounding circumstances disclosed that no sponge count was made by anyone and that the operating surgeon did not bother to ascertain if one had been made.

In the case which we discussed last month, *Ales vs. Ryan*, 93 Cal. Dec. 28, the California Supreme Court held that *res ipsa loquitur* was properly applicable in a sponge case where the surrounding circumstances disclosed that a sponge count was made but, through the mistake of the nurses the operating surgeon was misinformed with respect to the count. It further appeared in *Ales vs. Ryan* that the surgeon testified that he made an independent search for sponges after the count had been reported to him. This case represents a clear extension of the *res ipsa loquitur* doctrine to an entirely new class of cases. When one considers that one of the conditions which must be present before *res ipsa loquitur* is applicable, is "exclusive control of the defendant" over the instrumentality causing the accident, and when one considers that the operating surgeon does not have exclusive control over the sponges used in an operation, it is clear that *res ipsa loquitur* now apparently means much more than it has in the past.

One cannot venture to prophesy future decisions of courts upon this or any other subject, but, unless great caution is used by the courts in applying the doctrine of *res ipsa loquitur* to cases involving professional acts, it seems clear that a grave injustice will be done the members of the medical profession. Professional acts rarely are of such a nature that juries can draw upon "common knowledge" to determine the presence or absence of negligence.

SPECIAL ARTICLES

PROPOSED PUBLIC HEALTH LAWS*

For the information of readers who may be interested, the following excerpts from the "Senate Weekly History" and the "Assembly Weekly History," of dates of April 16, 1937, and showing the status of certain measures in one or both of the legislative houses, are here given.

I. SENATE BILLS

5—Crittenden, January 18. To Committee on Constitutional Amendment.

Proposed amendment to Article XI of the Constitution, by adding Section 21 thereto, relative to hospitals maintained by cities, counties, or cities and counties.

January 18—Introduced. To printer.

January 19—From printer.

April 1—From committee, with recommendation: Do not pass. Reported correctly engrossed.

121—Williams, January 14. To Committee on Insurance.

An Act to amend Section 100 of, and to add Section 122 to, the Insurance Code, and to add Chapter 14 to Part 2 of Division 2 of said code, providing for the regulation of insurance against the need for medical and hospital services, defining such services, providing standard provisions for such insurance maintenance of reserves for the protection of insureds under such insurance providing for the licensing of persons entering into such contracts and rendering such services and providing penalties for the violation thereof.

January 14—Read first time. To printer.

January 15—From printer. To committee.

605—McGovern, January 21. To Committee on Public Health and Quarantine.

An Act to add Chapter 11B to Part 2 of Division 2 of the Insurance Code, authorizing the creation, organization and government, and providing for the regulation of public associations to be known as medical service associations, defining medical service contracts, providing standard provisions for such contracts, providing for the deposit of security by medical service associations, providing for certificates of authority for associations entering into medical service contracts, and rendering through members medical services and providing for the powers and liabilities of medical service associations.

January 21—Read first time. To printer.

March 1—From printer. To committee.

March 31—From committee, with recommendation: Be amended, and re-referred to committee.

April 1—Read second time. Amended. To print, and re-referred to committee.

II. ASSEMBLY BILLS

51—Heisinger, January 5. To Committee on County Government.

An Act to amend Section 4223 of the Political Code, relating to admission of county hospitals.

January 1—Read first time. To printer.

January 11—From printer. To committee.

684—Daley, January 18. To Committee on Public Health and Quarantine.

An Act to amend Section 5.190 of the School Code, relating to health and development certificates.

January 18—Read first time. To printer.

March 1—From printer. To committee.

1089—Beene, Cottrell, Boyle, Morgan, Turner, Welsh, Patterson, Cronin, Robertson, Dawson, Maloney, Clark, Peek, McMurray, and Hunt, January 20. To Committee on Medical and Dental Laws.

An Act to provide for the control, prevention, and cure of venereal diseases; providing for the establishment of a State Bureau of Venereal Diseases under the direction of the State Board of Health and defining its powers and duties; and providing for the granting of State financial aid for the control, prevention, and care of venereal diseases, and making an appropriation therefor.

January 20—Read first time. To printer.

January 21—From printer. To committee. Withdrawn from committee. Re-referred to Committee on Public Health and Quarantine.

March 15—From committee without recommendation, as amended.

March 16—Read second time. Amended. To printer.

March 17—From printer. To engrossment.

March 18—Reported correctly engrossed. Re-referred to Committee on Public Health and Quarantine.

April 6—From committee without recommendation, as amended. Read second time. Amended. To printer.

* See also editorial comments in this issue on page 294.

April 7—From printer. To reëngrossment. Reported correctly reëngrossed. Re-referred to Committee on Public Health and Quarantine.

April 16—From committee, with recommendation: Do pass as amended.

1132—Cronin, January 20. To Committee on Hospitals and Asylums.

An Act for the regulation and control of corporations organized for the purpose of operating nonprofit hospital service plans, and of hospitals rendering services under any such hospital service plans.

January 20—Read first time. To printer.

March 1—From printer. To committee.

March 22—From committee, with recommendation: Do pass as amended.

March 23—Read second time. Amended. To printer.

March 29—Read third time, passed, title approved. To Senate.

March 30—In Senate. Read first time, and referred to Committee on Insurance.

1196—Turner, January 20. To Committee on Government Efficiency and Economy.

An Act to amend Section 4223 of the Political Code, relating to county, city, or city and county hospitals.

January 20—Read first time. To printer.

March 1—From printer. To committee.

1262—Cronin, January 20. To Committee on Government Efficiency and Economy.

An Act to amend Section 372 of the Political Code, relating to the State Board of Public Health.

January 20—Read first time. To printer.

March 1—From printer. To committee.

March 10—From committee, with recommendation: Do pass.

March 11—Read second time. To engrossment.

March 12—Reported correctly engrossed. Read third time, passed, title approved. To Senate.

March 15—In Senate. Read first time, and referred to Committee on Public Health and Quarantine.

March 17—From committee, with recommendation: Do pass.

March 18—Read second time.

March 31—Read third time, passed, title approved. To Assembly.

March 31—In Assembly. To enrollment.

April 5—Reported correctly enrolled. To Governor at 3 p. m.

April 15—Approved by Governor. Chapter 49.

1283—Welsh, January 20. To Committee on Insurance.

An Act to amend Section 100 of, and to add Section 122 to, the Insurance Code, and to add Chapter 14 to Part 2 of Division 2 of said code, providing for the regulation of insurance against the need for medical and hospital services, defining such services, providing standard provisions for such insurance, maintenance of reserves for the protection of insureds under such insurance providing for the licensing of persons entering into such contracts and rendering such services and providing penalties for the violation thereof.

January 20—Read first time. To printer.

March 1—From printer. To committee.

March 26—From committee without recommendation, as amended.

March 29—Read second time. Amended. To printer.

March 30—From printer. To engrossment. Reported correctly engrossed. Re-referred to Committee on Insurance.

April 9—From committee without recommendation, as amended.

April 10—Read second time. Amended. To printer.

April 12—From printer. To reëngrossment. Reported correctly reëngrossed. Re-referred to Committee on Insurance.

1472—Pelletier, January 21. To Committee on Medical and Dental Laws.

An Act to regulate the practice of naturopathy; to create and appoint a self-sustaining Board of Naturopathic Examiners; to prescribe their tenure of office, powers, duties, compensation, etc.; to require and regulate the issuance of licenses to practice; to establish and collect fees for the examination of applicants and for the issuance and renewal of licenses; to define naturopathy; to define and qualify naturopathic colleges; to provide for the taking of examinations by qualified applicants; to segregate naturopaths from the State Medical Act; to provide for the assessment and collection of penalties for the violation of this Act; and to provide for the handling, custody, and disbursement of all funds collected under this Act.

January 21—Read first time. To printer.

March 1—From printer. To committee.

April 13—From committee without recommendation, as amended.

April 14—Read second time. Amended. To printer.

April 15—From printer. To engrossment.

April 16—Reported correctly engrossed.

1491—Cronin, McMurray, and Boyle, January 21. To Committee on Medical and Dental Laws.

An Act to add Chapter 11B to Part 2 of Division 2 of the Insurance Code, authorizing the creation, organization and government, and providing for the regulation of public associations to be known as medical service associations, defining medical service contracts, providing standard provisions for such contracts, providing for the deposit of security by medical service associations, providing for certificates of authority for associations entering into medical service contracts, and rendering through members medical services and providing for the powers and liabilities of medical service associations.

January 21—Read first time. To printer.

March 1—From printer. To committee.

March 30—From committee without recommendation, as amended.

March 31—Read second time. Amended. To printer.

April 1—From printer. To engrossment.

April 2—Reported correctly engrossed. Re-referred to Committee on Insurance.

April 16—From committee without recommendation, as amended.

1880—Clark, January 22. To Committee on Education.

An Act to amend Section 5,190 of the School Code, relating to health and development certificates.

January 22—Read first time. To printer.

March 1—From printer. To committee.

March 23—From committee, with recommendation: Do pass.

March 24—Read second time. To engrossment.

March 25—Reported correctly engrossed.

April 7—Read third time, passed, title approved. To Senate.

April 8—In Senate. Read first time, and referred to Committee on Public Health and Quarantine.

2790—Burns, Hugh M., March 8. To Committee on Public Health and Quarantine.*

An Act relating to the care and control of venereal diseases, granting other and further powers in relation thereto to the State Board of Public Health and its subordinate agencies, authorizing the acceptance of Federal Social Security funds and making an appropriation therefor.

March 8—Read first time. To printer.

March 9—From printer. To Committee.

April 16—From committee, with recommendation: Do pass as amended.

HOSPITAL CONVENTION AT LOS ANGELES

Association of Western Hospitals, Association of California Hospitals, and Western Catholic Hospital Association

The hospitals of eleven western states have just finished a most successful convention in Los Angeles (April 12-15). Over two thousand delegates registered and attended the sessions at the Biltmore Hotel which featured a number of new innovations and departures from past policies. Instead of the usual convention with a competing three-ring circus and a consequently over-crowded program, the program committee chose to very thoroughly develop and discuss six major topics.

The first session started Monday afternoon considering the subject, "The Manifold Obligations of Hospitals to the Public." Dr. Benjamin W. Black, Medical Director of the Alameda County Institutions, gave the opening address and in his characteristic manner ably handled the subject, starting the program off with the proper enthusiasm and momentum. He emphasized that although hospitals do have manifold obligations, the primary obligation of hospitals is patient welfare and that all other obligations are subsidiary thereto. He stressed among others, the obligation of leadership in public health, teaching, and in public education. His address was ably discussed by George B. Mangold, Ph.D., University of Southern California, Dr. John Wilson, Los Angeles County General Hospital, Mr. Frank Van Dyk, Executive Director Associated Hospital Service, New York City, Dr. Louis B. Boonshaft, Director, Los Angeles County Relief Association, Mr. W. C. Cran-

* See also items on pages 294 and 345.

dall, Director, Scripps Memorial Hospital, La Jolla, California.

On Tuesday morning, the convention was addressed by Mr. Howard Burrell, Attorney, Los Angeles, on "Legislation and Hospitals." Handling this in a proper neutral attitude, Mr. Burrell crystallized the attention on the various types of legislation confronting hospitals at the present time. He went further than actual legal code and discussed court decisions which have become equally as important as legislation. His address was discussed by Mr. Thomas F. Clark, Executive Secretary, Association Western Hospitals, Mr. Clifford Mack, Superintendent, Livermore Sanitarium, Mr. William P. Butler, Manager, San Jose Hospital, Dr. H. H. Johnson, Superintendent, St. Luke's Hospital, San Francisco, C. Rufus Rorem, Ph.D., Representative, American Hospital Association. This session proved to be not only a study of the history of legislation but a guide for future legislative policies for hospitals.

Tuesday afternoon, the convention was addressed by Mr. Frank Van Dyk, Executive Director, Associated Hospital Service of New York, C. Rufus Rorem, Ph.D., Director, Committee on Hospital Service of the American Hospital Association, the subject being "Group Hospitalization." Both Dr. Rorem and Mr. Van Dyk proved to be competent authorities on this problem—Dr. Rorem from his long study of this problem under the American Hospital Association and Mr. Van Dyk in light of his experience as Director of the largest Hospital Service Plan in the United States, now numbering nearly three hundred and fifty thousand members. Both of these speakers emphasized the public service of this plan of budgeting sickness costs—particularly pointing out that Group Hospitalization is primarily a solution of the patient's economic problem and only incidentally beneficial to the hospitals. These addresses were ably discussed by Mr. R. D. Brisbane, Superintendent, Sutter Hospital, Sacramento, Dr. B. C. MacLean, President, American College of Hospital Administrators, Mr. Philo Nelson, Executive Director, Insurance Association of Approved Hospitals, Oakland, Mr. A. G. Saxe, Superintendent, Mt. Zion Hospital, San Francisco, Mr. Roland Maxwell, Attorney, President Methodist Hospital Association, Los Angeles, Mr. R. E. Heerman, Superintendent, California Hospital, lead this discussion hour and emphasized that in Southern California the hospitals themselves were anxious and ready to proceed, some twenty-seven hospitals having already signed qualifying papers and were held up by the necessity of legislation now under consideration at Sacramento enabling their Association to proceed.

On Wednesday morning, Dr. Claude W. Munger, President, American Hospital Association, addressed the convention on the subject "The Interest of the Patient Is Paramount." He stressed the responsibility of the hospitals for providing scientific progress to assure safety and proper sanitation facilities—but beyond these, which he considered minimums in hospital care, he stressed the necessity for considering the new psychologic aspects of the care of patients. He emphasized the necessity of further study in psychiatrics—the training in this subject of nurses, doctors, and the public. He predicted that far greater use of this modality can be expected and that the benefits will be surprisingly beneficial. He placed particular attention on the science of dietetics and predicted further development in this line. Under the leadership of Dr. B. C. MacLean, Superintendent of Memorial Hospital, Rochester, New York, Dr. Munger's address was ably discussed by Rev. Joseph S. O'Connell, Ph.D., Assistant Director of Catholic Hospitals and Division of Health in the Archdiocese of New York; Dr. Alan Benner, Superintendent, San Mateo Community Hospital, San Mateo; Miss Alice Henninger, Superintendent, Huntington Memorial Hospital, Pasadena; Dr. Malcolm T. MacEachern, American College of Surgeons; Miss Reeve Hinyon, Dietitian, California Hospital, Los Angeles.

Wednesday afternoon the session was opened by Dr. B. C. MacLean, who addressed the convention on the subject "The Growth, Causes and Cures of Malpractice Suits." Doctor MacLean very ably presented the problem and through the use of lantern slides gave interesting statistics supporting his discussion. His address was a very capable presentation of a serious hospital problem. Following Doctor MacLean's address, the convention staged one of its

interesting innovations, namely, a mock trial of a malpractice suit. This session proved to be highly interesting and entertaining as well as instructive on this grievous problem. The case of *McGillacudy vs. Lying Down Memorial Hospital* will long be remembered by the many delegates who packed the assembly room and willingly remained forty-five minutes beyond the prescribed hour of adjournment. The trial was conducted realistically under the leadership of Roland Maxwell as Judge, William Rains as Prosecuting Attorney, and Raymond G. Stanbury as Defense Attorney. Many common errors and mistakes were dramatized and searchingly driven home by examination and cross-examination. The law on the subject was very interestingly presented by Judge Maxwell in his charge to the jury. The verdict was in favor of the plaintiff.

At 8:30 on Wednesday evening, the delegates assembled at the Biltmore Rendezvous for their annual banquet. A very high spiritual note was introduced into the convention by Professor Ordway Tead, Columbia University, who addressed the banquet guests on the subject "Can We Have Faith in the Future?"

On Thursday morning, delegates of the convention listened to an address by Dr. Ordway Tead, Lecturer on Personnel Administration, Columbia University, on the subject "Employee Welfare in the Broader Sense." Doctor Tead emphasized the necessity of promulgating in the employee group itself the high motives of hospital service. He drove home the necessity of studying administration itself as scientifically as doctors do the practice of medicine. He candidly discussed the problem of labor unrest which for the first time has reached out and affected hospitals. He urged that administrators approach this problem with an open mind and do the job constructively rather than obstructively. In the discussion which followed later, under the leadership of Mr. William P. Butler, a very spirited attack was made upon this problem. Mr. H. S. Barnes, Superintendent, Latter Day Saints Hospital, Salt Lake City, Utah; Dr. W. S. Mortensen, Medical Director, Santa Monica Hospital, Santa Monica, Calif.; Dr. Basil C. MacLean, Strong Memorial Hospital, New York; Mr. R. G. Walker, Assistant Superintendent, California Hospital, Los Angeles, and Dr. Malcolm T. MacEachern, gave varying and personal viewpoints on this challenging subject—differences of opinion were expressed and the delegates were highly interested.

In addition to these general assemblies, sectional programs of exceptional merit were provided by Auxiliary and Volunteer services—cancer clinics, dietitians, hospital pharmacists, trustees, medical social workers, public hospital administrators, and record librarians. Capacity audiences attended all of these sessions and were highly pleased with the programs presented. The consensus of opinion of the delegates, assembling in greater number than ever before, is that this was the most interesting and successful convention ever held on the Pacific Coast.

THE PACIFIC COAST ABORTION RING*†

The Pacific Coast abortion ring has been smashed. The curtain has been rung down on a "racket" as inconceivable in its intimate details as any tale not excepting those found in the Arabian Nights.

This illegal operation project was conceived by Reginald L. Rankin, whose egotism was so self-inspiring that he believed he was "above the law." Said he, "We fear no trouble, for we have the best legal advice." A native of Oregon, former woodsman, timber cruiser, etc., he came to California some twenty-five years ago. The knowledge gained as a "timber cruiser" was put to good use when a

* From the annual report for 1936, Board of Medical Examiners of the State of California, Charles B. Pinkham, M. D., Secretary-Treasurer.

† The Board of Medical Examiners of the State of California has as members: William R. Molony, Sr., President, Los Angeles; Clark L. Abbott, Vice-President, Oakland; Charles B. Pinkham, Secretary-Treasurer, San Francisco; Harry V. Brown, Glendale; Fred R. DeLappe, Modesto; Frederick W. Didier, Wheatland; Percival Dolman, San Francisco; William H. Geistweit, Jr., San Diego; Charles E. Schoff, Sacramento; George Thomason, Los Angeles, Legal Counsel—Attorney General U. S. Webb, San Francisco. Investigation Department—Thomas P. Hunter, Special Agent, San Francisco; Albert Carter, Special Agent, Los Angeles; John Ronan, Assistant Special Agent, Los Angeles.

short time after his arrival in California he handled some disputed tax matters involving some land in San Diego County. Early in 1913 he became well known in Sacramento, where he married. His success in the San Diego affair led him to overestimate his ability.

When late in 1933 he started his meteoric career as promoter of the Pacific Coast abortion ring (which ended in October, 1936, with a state prison sentence) his business card announced him to be a "Tax Factor, Evaluation Engineer and Expert on Income Tax Matters," with offices in the Walter P. Storey Building, 610 South Broadway, Los Angeles. He boasted he was too smart to be caught by law enforcement officers. His false claims of political influence and that the Board of Medical Examiners approved his scheme led some thirty or more individuals to join with him in operating a gigantic illegal operation ring which involved the states of California, Oregon and Washington.

Comment on the Pacific Coast racket appeared in the *Allied Council News*, Denver, Colorado, March 29, 1935, under the heading "The Alleged Abortion Racket—The California Ring—An alleged abortion ring which threatens to become nationwide in scope, is now operating on a chain store basis in the major cities in California. . . . An investigation, the results of which have just been made public, reveals that this syndicate, it is said, employs attractive women to solicit trade, especially among high school girls, soliciting them for illegal operations. The syndicate pays \$10 commission for every case referred. The standard price for abortions is \$50. The investigation is being conducted by Charles B. Pinkham, Secretary of the California State Board of Medical Examiners. . . ."

In this organization were:

1. A crew of salaried abortionists consisting of both physicians and surgeons licensed in California and unlicensed operators;
2. A staff of salaried solicitors for state-wide distribution of the business cards of the ring;
3. Offices in San Francisco, Oakland, San Jose, Los Angeles, Hollywood, Long Beach, San Diego, Portland, Oregon, and Seattle, Washington;
4. Private hospitals or "nursing homes" for cases that developed complications;
5. A fleet of airplanes with landing fields both in Oregon and on an isolated ranch hidden in the mountain regions of a Northern California county. The latter was the only level piece of property for miles around. It was purchased ostensibly as a "dude ranch." However, its asserted function was to provide either a "hideout" for any of the operators of the "racket" who might become involved in a police investigation or to provide a "haven" for any operated case that might go "bad."

The keystone of the racket was the Medical Acceptance Corporation. Its main office was in the Signal Oil Building (Room 205), Los Angeles, in close proximity to the office of Dr. George E. Watts, convicted in connection with the Pacific Coast abortion ring. An office of this finance organization was located in every major Pacific Coast city, always in the same building where the abortion syndicate maintained an illegal operation office.

The Seattle office of the Medical Acceptance Corporation, 1904 Third Avenue, Suite 314 (Securities Building), opened on or about October 10, 1935, and W. W. Macfarlane was appointed resident manager. However, he said he resigned about December 19, 1935, when he learned of the type of organization and the work they were doing. The Seattle office, about February, 1936, was moved to the Shafer Building, Seattle, in close proximity to the office of Dr. W. Norman Powers, also convicted in connection with the Pacific Coast abortion racket, whose California medical license was revoked March 11, 1936.

A business card which came to the Board of Medical Examiners during our investigation read, "Medical Acceptance Corporation, 1916 Broadway, Oakland, California, J. M. Lotta, Mgr., Phone HOliday 5771." Another business card received about the same time read, "The American National Detective System, J. M. Lotta, Mgr., Tapscott Building, 1916 Broadway, Oakland. . . ." At this same address Dr. James Beggs (also convicted), assertedly operated one of the offices of the Pacific Coast abortion ring.

The San Francisco office of the Medical Acceptance Corporation was in Rooms 519-520 Elkan Gunst Building, Geary and Powell Streets, San Francisco. In the same building, Room 617, was the office of Dr. James Beggs, and (after Beggs's removal to Oakland), later occupied by Dr. Jesse C. Ross, both convicted in connection with the Pacific Coast abortion ring.

This finance organization furnished unwed mothers with funds to pay for operations performed by doctors on the pay roll of the "syndicate." This racket reversed the old adage, "Let not your right hand know what your left hand doeth." The promoters of the Pacific Coast abortion racket, through its Medical Acceptance Corporation, lent money at usurious rates to its victim in one office, then sent her to another office in the same building where said loan was taken as payment for an asserted illegal operation. R. L. Rankin, president of the Medical Acceptance Corporation, was quoted as saying, "We turn our money over every ninety days."

Whenever a woman sought treatment at any of the offices of the Rankin-Watts abortion syndicate, she was required to write her name on the first line and sign the affidavit at the bottom of a "Case Record," which read as follows:

I, being first duly sworn, depose and say that I voluntarily applied to Dr. for treatment on the above date; that my condition demanded immediate attention; that there was nothing of a criminal [sic] or unprofessional nature in the treatment given me; and that I have read the above, and am fully aware of its contents and that the same is true.

(Signed)

Subscribed and sworn to before me this day of, 19

Notary Public for California.

My commission expires, 19

Reports relate that Dr. George E. Watts acted as notary in signing and sealing these affidavits. It is obvious that these were to be used as an alibi should a case go "bad" and any member of the Rankin-Watts abortion ring be charged with performing an illegal operation.

Police reported when, on June 6, 1936, they raided the offices of the Medical Acceptance Corporation, they found about 70 per cent of the "paper" for loans made were for patients of Dr. George E. Watts, seeking relief from pregnancy.

In many instances such an operation was unnecessary because no pregnancy existed. However, that made no difference to the racketeers. Advertisements were inserted in metropolitan daily papers offering pregnancy tests by examination of urine. The abortion syndicate offices claimed to diagnose accurately pregnancy by such an examination. Their procedure assertedly was pure "hokum," because, according to one familiar with the racket, regardless of whether the specimen submitted for examination was from a female or male, a diagnosis of pregnancy was always made.

How intriguing has been the story of this abortion syndicate, as it was gradually unfolded during three years' investigation by the California Board of Medical Examiners, constantly endeavoring through its secretary to discover some clue on which concerted action could be taken to "round up" the entire outfit at one fell stroke.

Betrayal of the trust placed by the Board of Medical Examiners in certain members of its investigation department was indicated early in our study of the various angles of this case. Confidential information both as to conversation and correspondence mysteriously found its way to the leaders of this racket. These "leaks" regarding the progress of our investigation indicated a traitor in our employ. The secretary of the board had his suspicions as to the guilty party. A special meeting of the board was called and employment of a Special Investigator to investigate the board's *Investigation Department*, was authorized. His service began in 1935. Only three people knew his identity, i. e., President Dr. William R. Molony, Secretary Pinkham and a man of unimpeachable integrity who recommended this undercover man. Reports soon warranted the board's ousting our guilty investigator. He was later indicted by the grand jury in San Francisco, as well as Los Angeles, convicted on five counts of the indictment and sentenced to ten to twenty-five years in the penitentiary.

Meanwhile Rankin believed because he had influenced an investigator of the Board of Medical Examiners to turn traitor to his employers and to become his traveling companion, as well as the "front" man in his nefarious deals, that his racket was firmly entrenched. Our investigation disclosed that R. L. Rankin and William Byrne, Investigator for the California Board of Medical Examiners, on October 8, 1935, arrived in Seattle, Washington, via plane. Both registered in the Olympic Hotel at the same hour, 4:13 p. m., occupied adjoining rooms (935 and 937) and checked out at the same time (October 11, 1935, at 11 a.m.). A conversation was held in the Seattle office of the Pacific Coast abortion chain, during which (according to report) it was agreed one of the doctors should drive Byrne to Olympia to try and interest Mr. Harry Huse, Director of Licenses, State of Washington, in the racket. That Byrne did call on the date mentioned was verified by Mr. Huse in a letter to Secretary Pinkham of the California Board.

On Byrne's return to Seattle he reported to Rankin that Mr. Huse was not interested. This assertedly depressed Rankin, who expressed the hope that he might interest Mr. Huse in his subsidiary organization, *i. e.*, the Medical Acceptance Corporation.

While at the Olympic Hotel, Seattle, Rankin telephoned to Los Angeles, California, to one of his associates, Joseph Shinn, secretary-treasurer of the Medical Acceptance Corporation, an asserted director of a Santa Monica bank, in reference to a case said to have been operated on by Dr. Harry Houston in the Long Beach office of the syndicate, which had "gone bad." This patient was then under treatment in the Los Angeles County Hospital. Rankin assertedly requested Shinn to arrange a "pay off" to avoid trouble. Byrne is quoted as having told Rankin he should not have given this instruction to Shinn, as he (Byrne) had the case "fixed." The victim in this case was mentioned as a witness in the Los Angeles trial of the abortion syndicate principal and was quoted as having verified this "pay off."

Rankin called, in November, 1934, on Secretary Pinkham in the San Francisco office of the Board of Medical Examiners and among other statements said he handled all the income tax matters for the abortionists in various Pacific Coast cities, among them being Dr. George E. Watts of Portland, Oregon, who, desirous of opening a practice in California, had requested Rankin to make such a purchase. When told he and his associates would be prosecuted, he boasted he had no fear because of his asserted "influence."

Investigation reports indicated that the procedure used by the leaders of the abortion racket in negotiating the purchase of a "business" was as follows: First, Promoter Rankin would call and make an offer to purchase the business. He would be followed by an investigator for the Board of Medical Examiners, since dismissed, convicted and sentenced to San Quentin Prison. The latter, without intimating that he had knowledge of the visit of the "promoter," would announce he was aware of the character of the business engaged in and threaten arrest if the individual continued same. A few days later the "promoter" would make his second call, renewing his offer to purchase. He would boast of his political influence and as a demonstration thereof would promise to have an investigator of the Board of Medical Examiners call the next day. A sale invariably followed. One Long Beach prospect refused to sell, arguing, "Why should I sell to these racketeers? I have as much right to perform abortions as they." As a result of this refusal a fake arrest of the office nurse was staged. She assertedly was virtually kidnapped as she left her employer's home, thrown into an automobile and whisked away to some unknown "hide out."

Rankin's first purchase of a practice in California was that of an old time practitioner in the Arcade Building, Los Angeles. About April, 1934, Rankin brought Dr. George E. Watts from Portland, Oregon to take over this practice. After a few operations had been performed in the Arcade Building, this practice was moved to Room 210, Signal Oil Building, 811 West Seventh Street, Los Angeles. Dr. Watts, although a non-resident of this state, had been licensed in California in 1899 by the then existing easy process prescribed by law, *i. e.*, by filing his medical college diploma and a fee of \$5.

Soon after Dr. Watts arrived in Los Angeles the California Board of Medical Examiners received a note postmarked Portland, Oregon, relating that Dr. Watts, for-

merly of Portland, had located in the Signal Oil Building, Los Angeles, and proposed to "open up a chain of abortion offices in Washington, California and Oregon." We thereupon started an investigation of his past practice. Reports indicated he had practiced for many years in Portland, Oregon, sharing with a Dr. J. W. Morrow an office at 212 Oregonian Building, Portland, Oregon. His practice assertedly had consisted of abortions and, although he had been called before the Oregon Board of Medical Examiners on several occasions, he had escaped punishment because of the difficulty to get the evidence required under the Oregon law.

On or about February 2, 1935, R. L. Rankin registered at the St. Francis Hotel, San Francisco. In response to his telephoned request, two individuals known to the Board of Medical Examiners came to his room. Negotiations were opened for the purchase of the property at 2240 Van Ness Avenue, San Francisco, then said to be owned by a resident of Vallejo. These premises had been occupied previously by Harley H. Heddens, erstwhile civil engineer abortionist, convicted by the Board of Medical Examiners in Bakersfield in 1926. On October 18, 1936, following his plea of guilty of manslaughter, Heddens was sentenced to San Quentin Prison by Los Angeles Superior Judge Joseph Vickers for a term of three to fifteen years. In passing sentence Judge Vickers stigmatized the defendants (Heddens, his wife and an assistant) as "the worst illegal operation ring ever to come before the court." "This is a sordid case," he said. "There is no way of telling how many women suffered at the Heddens' clinic. Heddens, an electrical engineer, knowing nothing whatever about the science of medicine, deliberately took the lives of these women into his hands. It is clear by the excellent work of the police and the district attorney in this case that you (the defendants) have performed one hundred or more illegal operations. Not only did you perform these illegal acts, but you did it in the most crude manner possible and without an iota of medical skill."

As a sequel to Rankin's conversation with these "two known individuals" at the St. Francis Hotel, San Francisco, a check for \$250 was passed by Rankin as down payment on the property at 2240 Van Ness Avenue, San Francisco, and the title thereafter (as well as the Heddens' telephone number), was transferred to the Rankins.

Paul de Gaston, erstwhile photographer, who about 1934 held the photograph concession in one of San Francisco's well-known department stores, succeeded Heddens at 2240 Van Ness Avenue. A jury in a Los Angeles superior court assertedly twice disagreed in 1935 as to his guilt following trial on an illegal operation charge. The discredited investigator for the Board of Medical Examiners was said to have had a hand in tampering with witnesses for the prosecution in this case.* De Gaston was one of those indicted and testified for the prosecution in the Los Angeles trials of the Pacific Coast abortion ring.

In the meantime the Rankin-Watts syndicate opened an office in the Kress Building, Long Beach, and Dr. James Beggs was placed in charge. This office was later moved to the Ocean Center Building with Dr. Harry L. Houston in charge because Dr. James Beggs had been sent to take charge of the San Francisco office in the Elkan Gunst Building.

The practice of another Los Angeles physician was purchased by the Rankin-Watts combination in May, 1935. The statements of this second physician indicate "strong arm" methods were employed by the party or parties interested in making the purchase. Among these was an asserted threat to "bump off" this doctor if he refused to sell. A similar threat assertedly was made to another Los Angeles doctor whose "practice" was desired by the syndicate. A short time later the doctor referred to was killed in an automobile accident under conditions that aroused suspicions.

Investigators reported that in the bill of sale by which a "business" was purchased in Oakland was a clause that in case of the death of the "seller," the property would immediately be possessed by the purchaser. Shortly thereafter the Oakland doctor, whose "business" had been purchased, died. The authorities threatened to exhume the body, but did not do so.

* Los Angeles *Evening News*, October 9, 1936.

About this time Rankin purchased the offices operated by Dr. Jesse C. Ross at 6331 Hollywood Boulevard. Then, according to investigation reports, followed in rapid succession the purchase or opening of offices in several other Pacific Coast cities, *i. e.*, Tapscott Building and 3849 Grove Street, Oakland; Dr. Frank Hart, Josiah Green Building, Seattle (June, 1935); Dr. William Norman Powers, Bratlin Building, Seattle (July, 1935); E. B. Fromm (sanipractor), 515 Arcade Building, Seattle; Room 407 Commonwealth Building, San Diego; Elkan Gunst Building, San Francisco, and 899 Jackson Street, San Jose.

Early in our investigation we learned that a licensed chiropractor named L. J. Giubbini had been practicing in San Jose since his departure from San Francisco, where he had been watched by our investigation department because of reports received in February, 1931, of the irregularities of the practice he conducted in his office in the Liberty Bank Building, San Francisco. In June, 1931, our former investigator, J. W. Davidson (deceased), reported that with a member of the San Jose Police Department he had called on Giubbini, Rooms 502-3 First National Bank Building, San Jose, and warned him that the character of his business was known and if continued he would be arrested. Although Giubbini moved from the First National Bank Building to 265 South Eleventh Street, and later to 899 Jackson Street, San Jose, the warning apparently was not heeded, judging from the following incident uncovered after we had started our investigation of the Pacific Coast abortion ring. This information was sent to Secretary Pinkham by the distracted father of the deceased. Those who have daughters may well shudder at the gruesome tragedy and pray it may never strike home.

Pathos involved every line of what proved to be the death note of a fear-stricken daughter written November 24, 1932, to her devoted father. The heartbreaking sermon in that letter strikes to the very heart of fond parents and law abiding citizens. Said she:

Dear Papa—I want you to know this in case anything happens to me—Tomorrow I am going to San Jose to the Pacific Bacteriological Laboratory—to a doctor for an illegal peration. . . . If I don't come back please remember I am telling the truth. I don't know the doctor's name, but Marvin Raithel* who works for the Lyne Drug Company there does, as it is through his appointment. . . . You will hear from me in a few days if I am all right. . . .
Much love (Signed) V.

On arriving at the house of death she penned a short note, reading:

Papa—this is the place—change address—899 East Jackson St. Two-story white house—San Jose.

Death closed her career four days later at 899 Jackson Street, San Jose. The death certificate gave the cause of death, "Epileptic (note spelling) Seizures," and was signed Joy V. Simmons, 899 East Jackson Street (San Jose). The "Proof of Death" certificate to an organization in which this poor girl was insured, showed as attending physician a signature purporting to be that of Joy V. Simmons. Underneath was written "Per Dr. L. J. Giubbini, Assistant," 899 Jackson Street, San Jose, Calif. This "Proof of Death" certificate shows it was sworn to before Edward A. Uhl, notary public, San Jose, by Dr. L. J. Giubbini, January 30, 1933.

On November 28, 1932, a grief stricken father from a northern California town wired:
Chief of Police,
San Jose, California.

My daughter, Mrs. A. Dryden, died there today. I have sufficient reason to request that a very strict examination be made into this case to determine the cause of death. . . . Answer.

(Signed).....

That the father of the deceased discussed the matter with the Santa Clara County district attorney is shown by the following letter dated San Jose, January 6, 1933, addressed to him:

This office has investigated quite thoroughly the facts of the case which you discussed with Mr. Fred L. Thomas, District Attorney of this county, and also with Mr. Chesley M. Douglas, Assistant District Attorney, on December 13, 1932. By our investigation we have not been able to obtain sufficient information to warrant action

being taken against either one of the parties against whom you made the complaint. We will, however, continue our investigation and if at any future time we are able to obtain what appears to be sufficient information to warrant complaints being issued, we will advise you further in the matter. If we can be of any further assistance to you do not hesitate to call on us. . . .

(Signed).....

What of the subsequent history of the premises, 899 Jackson Street, San Jose, where the death occurred? In a letter addressed to the Secretary of the Board of Medical Examiners, dated San Jose, October 1, 1936, the following information is given:

San Jose, Calif.,
October 1, 1936.

Mr. C. B. Pinkham,
Sacramento, Calif.

Dear Sir: Your letter a few days ago, in reply will say L. J. Giubbini purchased the property at 899 E. Jackson on August 28, 1932, of Lucy H. Neher later my wife, Mrs. Charles E. Ritter, who died June 8, 1934. Giubbini assumed one mortgage of \$3,000 and one \$1,400, then gave a third mortgage of \$3,700 to Mrs. Neher, then L. J. Giubbini was to pay \$55.00 per mo. on the \$3,700.00 loan, which he did until paid down to \$2,640.00. Then in October, 1935, leased the building to a Mr. Ranken, I believe, but in September, 1932, L. J. Giubbini deeded the property to his father, L. D. Giubbini, at 1734 Lyon Street, San Francisco, Calif., but lived at said place until October, 1934. In November, 1935, he discontinued paying the \$55.00, also was back on the \$3,000 and \$1,400 mortgage, so I was compelled to start action of foreclosure, which I did January, 1935. Thirty days later his father offered to except \$50.00 for deed to me as I held the Neher mortgage which my wife had willed to me, as she had passed on. Then L. J. Giubbini moved to a place owned by his father L. D. Giubbini at Livermore, Calif., known as the Fountain Hospital, No. 24 Tel. Phone. This is all I can give you in regard to L. J. G.

Yours truly,

(Signed) CHAS. E. RITTER,
899 E. Jackson,
San Jose.

The above letter indicates that R. L. Rankin, asserted head of the Pacific Coast abortion ring, took over the premises in October, 1935. A nurse named Violette Pelligrini, said to be a former employee of Giubbini, thereupon continued as nurse-employee of Rankin, who according to court records, placed Dr. Jesse C. Ross in charge. The latter, following conviction by a Los Angeles jury in connection with the Pacific Coast abortion racket, was sentenced to ten to twenty-five years in the state penitentiary at San Quentin. Another nurse named Tieman, employed on the premises, testifying* during the recent Pacific Coast abortion ring trials in Los Angeles, related a most gruesome procedure which she assertedly saw. Her story involved the asserted "cutting up" of a foetus born alive on the premises, 899 Jackson Street, San Jose. Nurse Pelligrini was sentenced to one year in the Los Angeles county jail following her conviction in connection with the Pacific Coast abortion racket.

But I am ahead of my story, so let us pause and learn more about this Joy V. Simmons, whose name was signed to the previously mentioned death certificate of V. D.

The records of the Board of Medical Examiners show he secured a diploma from the Western College of Chiropractic, dated San Francisco, June 20, 1923; that shortly thereafter he was denied admission to the written examination for drugless practitioners under the medical act. He appealed and the board was compelled by action of the San Francisco superior court to grant Simmons a drugless practitioner certificate. According to police records, Simmons thereafter gained a criminal record which culminated in his conviction in Los Angeles of abortion, assertedly performed at 8712 Darrington Avenue, Beverly Hills, on November 30, 1933, and his being sent to San Quentin for a "term prescribed by law." His drugless practitioner license was revoked March 1, 1934.

Our investigation indicated that in November, 1933, one calling himself J. V. Roberts was at 899 Jackson Street, San Jose (keep the address in mind). The San Jose Merchants Association at that time was interested in learning whether J. V. Simmons, 260 North Third Street, San Jose, was the same as J. V. Roberts, 899 Jackson Street,

* Again mentioned on page 15.

* Los Angeles Herald-Express, October 23, 1936.

San Jose. The latter premises had been reported by our investigation department as the headquarters of L. J. Giubbini, licensed chiropractor. That J. V. Roberts and Joy Simmons were one and the same individual was indicated by the death certificate already mentioned.

During the year 1935 the Pacific Coast abortion racket had reached its peak with offices doing a land office business in Seattle, Washington; Portland, Oregon; San Francisco, Oakland, San Jose, Los Angeles, Hollywood, Long Beach and San Diego. Rankin in an asserted dictaphone conversation was "caught" as boasting that one office alone last year (1934) "had handled 1400 cases and the entire organization handled 4400 cases."

Attorney Buron Fitts of Los Angeles, Chief Deputy Chamberlain in the office of District Attorney Earl Warren of Alameda County, Captain of Detectives Charles Dullea and the homicide squad of the San Francisco Police Department had been advised of the magnitude of the racket. The secretary of the Board of Medical Examiners by correspondence and in personal interviews had given complete and detailed information to these enforcement officers. All were waiting for that "break" which eventually would make possible the final clean up of the entire racket. Captain Dullea had detailed two of his best inspectors to "smoke out" the racket, which with headquarters in Los Angeles was rapidly spreading to other states. The "break" came unexpectedly one afternoon when San Francisco Police Inspectors George Engler and Harry Husted were browsing about the Elkan Gunst Building, San Francisco. They casually called at the office of Dr. Jesse C. Ross. While there a young man came in and asked for "Mr. Rankin" and left when told by the nurse that Rankin had not been in. The officers then stepped into the office of the Medical Acceptance Corporation and there saw the same young man. Regarding him with suspicion and convinced he had an intimate acquaintanceship with the personnel of the offices, they suggested he accompany them to headquarters. In his automobile were found hundreds of the "business cards" of the various offices of the abortion syndicate, each bearing the name of the doctor in charge, all bound in packages of about 50 each, perforated so as to be easily torn from the binding. These he said he passed out in drug stores and other places, with directions they be given to any woman seeking relief from pregnancy. On arrival at headquarters this young man gave his name as Marvin Raithel,* drug clerk by vocation, and acknowledged he was a salaried solicitor for the abortion racket. Captain Dullea, with Inspectors Engler and Husted, and assisted by the police department stenographer, took a two-hour statement, in which were revealed the intimate details of the entire organization. Responding to a call from Captain Dullea, the secretary and an investigator for the Board of Medical Examiners joined in quizzing Raithel. Here at last was conclusive evidence by which the long investigated Pacific Coast abortion racket could be smashed. San Francisco District Attorney Brady detailed his assistant, John McMahon, to the case, to whom great credit is due for his persistent and self-sacrificing work. Alameda County Assistant District Attorney Coakley was summoned and the raids commenced. First to the offices in the Elkan Gunst Building, where most important information, card records, etc., were seized and taken to headquarters. The following day Assistant District Attorney McMahon, with Inspectors Engler and Husted, and accompanied by Alameda Assistant District Attorney Coakley, flew to Los Angeles, where with trusted investigators from the office of Los Angeles District Attorney Buron Fitts, offices of the syndicate in Hollywood, Los Angeles and Long Beach were raided. Truckloads of material, records, etc., were confiscated and shipped to San Francisco to remain in custody of the authorities.

A short time thereafter Deputy District Attorney McMahon and Inspector Engler raided the San Diego office of the syndicate. They found Laura Miner in charge of the office with Nedra Arden. Valuable statements were taken and Laura Miner afterward testified for the prosecution in the Los Angeles trials.

Assistant District Attorney McMahon, Captain Charles Dullea, with Inspectors Engler and Husted, worked night and day in segregating the evidence so that no time should

be lost in presenting the details of the Pacific Coast abortion racket to the San Francisco grand jury.

On June 18, 1936, indictments charging violating the provisions of Section 274 and Subdivision 1 of Section 182 of the Penal Code of California were brought by the San Francisco grand jury against the following asserted principals and associates in the Pacific Coast abortion ring: Nedra Arden (nurse), Dr. James Beggs, Beatrice Bole, asserted solicitor; William A. Byrne (former investigator for Medical Board); Grace Cole, receptionist; John A. Creeth, secretary Medical Acceptance Corporation; Paul de Gaston, Josephine Follett, L. J. Giubbini, D. C., Leola Habel (Sarah L. Lee), office nurse; Ruth Hansen, Dr. Harry L. Houston, Gladys Korf, Bessie McCarthy, Zora McEwen, Laura Miner, Dr. E. T. Patee, Violette Pellegrini (Violet Brown), J. C. Perry, San Francisco office Medical Acceptance Corporation; Dr. William Norman Powers, Reginald L. Rankin, Violet Rankin, Marvin Raithel, Dr. Jesse C. Ross, Dr. (A. H.) Valentine St. John, J. O. Shinn, Medical Acceptance Corporation; Dr. F. B. Smith, Viola Warner, Dr. George E. Watts, Lillian Wilson, Mary Wilson. Warrants for their arrest were issued.

Assistant District Attorney McMahon, Captain Charles Dullea with Inspectors George Engler and Harry Husted daily pored over the accumulated evidence.

Seattle police reported the apprehension of L. J. Giubbini and Violette Pellegrini as they disembarked from a steamer on which, assertedly under the name of Dr. and Mrs. Victor Angelo, they had completed a cruise to Alaska. Away went Assistant District Attorney McMahon and Inspector Engler to Seattle, fortified with extradition papers for the return of the fugitives. Although the Seattle authorities had been requested to hold the fugitives until the arrival of the San Francisco authorities, the latter found the "birds had flown" before their arrival. However the trip was not in vain, for while in Seattle they obtained a most valuable signed statement from Paul de Gaston (indicted), who later testified for the prosecution in the Los Angeles trials.

District Attorney Buron Fitts of Los Angeles joined in the chase of those connected with the Pacific Coast abortion ring. He assigned his deputy, Verne Ferguson, to the task of cleaning up this racket. He came to San Francisco with two investigators of the Los Angeles Police Department, made some special investigations, went over the evidence accumulated by the San Francisco authorities. Thereafter on August 27, 1936, the Los Angeles grand jury returned indictments against the following individuals associated in the Pacific Coast abortion racket: Dr. James A. Beggs, Beatrice Bole, William A. Byrne, Grace Cole, John A. Creeth, Dr. Harry Houston, Bessie McCarthy, Grace Moore, Violet Pellegrini, J. C. Perry, Dr. William Norman Powers, Jessie Radcliffe, R. L. Rankin, Dr. Jesse C. Ross, Dr. (E. H.) Valentine St. John, J. O. Shinn, Dr. George E. Watts, Lillian Wilson.

All those indicted either surrendered to the authorities or were apprehended, excepting Beatrice Bole and Dr. Harry Houston, who at last accounts were still fugitives from justice.

Following conferences between the representatives of the district attorneys of San Francisco and Los Angeles it was agreed the trials be held in Los Angeles, the headquarters of the racket. It was also agreed that San Francisco Assistant District Attorney John McMahon was to assist Los Angeles Assistant District Attorney Verne Ferguson in the prosecution of those indicted.

Came the day of trial. Some fourteen indicted individuals, with a battery of five defense attorneys, appeared before one of California's most learned and fearless judges, Honorable Arthur Crum.

An editorial headed "Breaking Up of Criminal Abortion Syndicate," published in the *Bulletin* of the Los Angeles Medical Association, November 6, 1936, stated: "... At the beginning of the trial it appeared that 'jury fixers' were active. In order to keep the jury free from this influence the trial judge, Judge Arthur Crum, ordered the jury locked up during the trial. Later, upon evidence supplied by Mr. Ferguson that there was tampering with witnesses, Judge Crum, with commendable courage, ordered several of the accused held in the county jail during the period of the trial"

* Previously mentioned.

The prosecution required almost one month to present its testimony. The defense had but little to offer. Prosecution testimony sparked with sensational evidence as the prosecution, step by step, unwound the intricate workings of the racket. How the internal revenue income tax experts must have sharpened their pencils after hearing the fabulous revenue derived from the abortion business! Testimony of representatives of certain banks, depositories for the R. L. Rankin Company, the Medical Acceptance Corporation and R. L. Rankin disclosed unbelievable transactions. Representatives of the Western Union Telegraph Company testified they had transported sums of money to Rankin. Assistant District Attorney Verne Ferguson was quoted in the *Los Angeles Herald Express*, October 15, 1936, as stating he would prove that many thousands of the \$1,000,-000 he claims the syndicate made in 1935 was sent to Rankin by wire. Laura Miner was quoted in the *Los Angeles Evening News*, October 15, 1936, as testifying that a year previous William Byrne, one time investigator for the Medical Board, threatened her with arrest if she did not join the syndicate; how she had been placed in charge of the San Diego office on salary; how she had been instructed by Rankin as to the bookkeeping system to be followed in all offices; how and where she remitted revenue to Rankin; how she received weekly salary checks, signed R. L. Rankin, by J. L. Shinn, and how later she assertedly was "strong armed" by Rankin into buying the San Diego office. "She introduced in court six \$1,000 checks she said she had been forced to give to 'the boys' for 'protection'." She said after being coerced into joining the "ring," she was later forced to buy back her own business for \$30,000.

Bernice Tieman, former nurse in the San Jose office of the abortion syndicate and witness for the prosecution, was quoted in the *Los Angeles Examiner*, October 21, 1936, as testifying, "Mr. Rankin told me after the raids on the clinic last June, that they would get rid of me if I turned State's evidence." Paul de Gaston (heretofore mentioned on page 12), a prosecution witness, testified that although he was not licensed to practice medicine anywhere in the United States, he was employed by the ring at a salary of \$750 a month, eventually opening branches for Rankin in Seattle and San Francisco; that he was furnished with licenses, making it appear he was a duly licensed physician; that in San Francisco (2240 Van Ness Avenue), he hung on the wall of his office a framed license for a "Dr. Hoschi." (According to San Francisco Police Department, this was a license in the name of Dr. Jacob F. Hosch, licensed in Oregon, but not in California.) De Gaston testified that he operated under that name and that in Seattle he used the name Dr. T. F. Read to conform with a certificate furnished by Rankin bearing that name. (*Hollywood Citizen News*, October 9, 1936.)

Mrs. Gladys Duckworth, prosecution witness, testified that prior to the trial Rankin and William A. Byrne called on her and worked on her sympathy. "Mrs. Miner said that Rankin and Miss Elsa Timler (Timmer), friend of Byrne, asked her 'not to remember' certain testimony." (*Los Angeles Evening News*, October 9, 1936.) This evidence, as well as similar testimony by Nedra Cordon (also known as Nedra Arden) and Dr. W. Norman Powers, caused Superior Judge Crum to revoke the bail of Byrne and Rankin, who were then ordered into custody of the sheriff during the remainder of the trial. (*Los Angeles Examiner*, October 9, 1936.)

On October 24, 1936, the jury brought in the verdicts as follows: Dr. James Beggs, William A. Byrne, Grace Moore, Reginald R. Rankin, Dr. Jesse C. Ross, J. O. Shinn, Dr. George E. Watts, and Lillian Wilson were found guilty on five counts; Violetta Pellegrini was found guilty on three counts; John Creeth and Dr. (A. H.) Valentine St. John, were found guilty on two counts; and Dr. William Norman Powers, plead guilty to one count.

Thereafter sentences (to run consecutively, not concurrently) were imposed by Superior Judge Crum as follows: Dr. James Beggs, William A. Byrne, Reginald Rankin, Dr. Jesse C. Ross, and Dr. George E. Watts, were sentenced to ten to twenty-five years in the penitentiary. Dr. (A. H.) Valentine St. John was sentenced to state prison for a term of four to ten years. John Creeth and J. O. Shinn were given five years' probation, without requirement that they serve any time in jail. Dr. William Norman Powers, who testified for the prosecution, was

sentenced to state prison, which sentence was suspended and he was put on probation for three years, which includes a condition that he spend six months in the Los Angeles County jail and shall not practice medicine during the period of his probation, but may return to the State of Washington following completion of his jail term. Violet Pellegrini was given probation on condition she serve one year in the Los Angeles County jail. Lillian Wilson and Grace Moore were also given probation, on condition they serve six months in the Los Angeles County jail. Defendants J. C. Perry and Mrs. Jesse Radcliffe were acquitted. According to the *Los Angeles Herald Express*, November 6, 1936, Dr. (A. H.) Valentine St. John, a British born naturalized citizen of Rumania, may be taken from state prison after a year and deported. Beggs, Byrne, Rankin, Ross, St. John, and Watts have filed notice of appeal.

So endeth the Pacific Coast abortion ring—"Up like a rocket and down like a stick." Its doctors dropped with a sickening thud from an income of about \$1,000 per month to the squalid fare of a state prison.

Said the "Bulletin of the Los Angeles Medical Association" in its issue of November 5, 1936, under the heading "Breaking Up of Criminal Abortion Syndicate":

The criminal abortion syndicate which flourished in California during the last few years has been broken. In the Superior Court of Los Angeles County the members of this syndicate have been convicted of criminal conspiracy. This syndicate operated a racket which had no parallel. In its operation there were banded together a group of heartless promoters, doctors, nurses and public officers, who believed themselves above the law and without danger of being attacked. To Dr. Charles B. Pinkham, Secretary of the State Board of Medical Examiners, to the District Attorney of San Francisco County and to Byron Fitts, District Attorney of Los Angeles County, goes credit for the indictments that brought the members of this syndicate to trial. Early in the investigation Mr. Fitts assigned Mr. Verne Ferguson to full time on the case. To Mr. Ferguson and Mr. McMahon (Assistant District Attorney of San Francisco) is due the major credit for the exhaustive investigation which brought so complete a presentation to the jury that convictions were obtainable . . . The citizens of this state and particularly the medical profession, should feel deeply grateful that our law enforcement officers have been alert and have done an excellent bit of work in clearing up what was fast becoming a disgraceful condition—a condition which struck deeply into the finer standards and ideals of our profession.

CALIFORNIA INFANT MORTALITY RATES*

Adjusted for California Residence

Infant mortality rates have long been recognized as a most sensitive index to actual public health conditions within the community. Because of the fact that births and deaths of infants often occur in places other than those constituting the true place of residence of the mother, it has been difficult, in the past, to secure a reliable record of infant mortality in the various communities of California. Through the use of a Works Progress Administration project, adjusted infant mortality rates have been made for the years 1934 and 1935; such adjustments covering the rural districts and the incorporated cities within each county of the State.

In those cities where the county hospital is located within a large center of population, that city's infant mortality rate is conspicuously high because many infants are brought from the rural districts of the county into the city where death occurs. Similarly, in those counties where the county hospital is outside of the incorporated limits of any city, the infant mortality rate for the rural district is excessive.

It should be understood that, in this work, the births in these communities were adjusted for residence and the deaths as well. The adjusted infant mortality rates, therefore, provide a true index to infant mortality in these communities during the two years covered by the project. The rates for the State as a whole are changed slightly due to adjustments caused by residence outside of the State.

* Reprinted from California State Board of Health Bulletin.

The following table provides the crude and adjusted numbers of infant deaths, with rates for 1934 and 1935:

Adjusted Infant Mortality Rates, 1934 and 1935
By California Counties and Cities

**TWENTY-FIFTH ANNIVERSARY OF THE
CHILDREN'S BUREAU, UNITED STATES
DEPARTMENT OF LABOR***

A Quarter Century of Work for Children

By KATHARINE F. LENROOT

Last summer there came to my desk a letter that made me realize not only that the Children's Bureau had come of age some time before, but that those of the staff who, like myself, had been associated with it almost from the beginning, were truly of the "grandmother" class. The letter read in part as follows:

I am writing you to see if I can get some booklets on Infant Care before and after birth.

I recently found an Infant Care book from which I was raised and which was published July, 1914, so that is where I am getting my information to write to you.

The incident led to rummaging in our own attic, the files of the Children's Bureau, for some of the letters that came to Julia C. Lathrop, the Bureau's first chief, in those earliest years. Here is one from a little girl named Kathryn, who wrote to "Uncle Sam" asking him please to "send me a baby brother whenever you have any." In her thoughtful and characteristically human reply, Miss Lathrop wrote:

I wish we had a baby brother to send to such a good home as I am sure he would find in your parents' house,

* Reprinted from "The Child," March, 1937. This issue of the Monthly News Summary of the Children's Bureau presented a frontispiece photo-cut of Grace Abbott, Chief of the Children's Bureau, 1921-1934, giving the following excerpt from one of her addresses:

"If there is any subject endowed with national interest, it is the welfare of the nation's children. The nation's future existence, the intelligent use of its resources, the rôle it will play in world affairs, depend on its children—whether or not they are physically fit and whether or not they are trained in self-control, in respect for the rights of others, and in understanding of their own rights and obligations. That the first responsibility must rest with the nearest government—the State, the county, and the municipality—is the reason why the rôle that the Federal Government must play in the training of children is that of an intelligent and interested coöperator, ready to assist but not to control nor hamper."

but Uncle Sam does not trust us with real babies, but only tells us to try to learn all the ways to keep babies and their older brothers and sisters well and good and happy. This is hard, slow work, and sometimes I feel a little discouraged because it is so slow. Your letter cheers me up and I am glad you wrote, although I am obliged to send this disappointing answer.

When this letter was written, in 1914, as described in another article in this issue, there was no national birth-registration system in the United States. One of the first tasks to which Miss Lathrop set the Children's Bureau, in cooperation with the Bureau of the Census, the General Federation of Women's Clubs, and other agencies, was the development of the United States birth-registration area, which did not cover the entire country until 1933. In twenty-nine years, from 1915 to 1935, the infant mortality rate has been cut almost in half, although the loss of life in the first month of infancy has been reduced very much less, and now constitutes more than one-half the total loss of life in the first year. Very slow progress has been made in reducing the appallingly high death rate among mothers, which early gave Miss Lathrop grave concern. In 1916 she wrote as follows to a mother in Wyoming, who had described the deaths of two mothers and two babies in her own sparsely settled rural community within a year:

Your letter of October 19 came in my absence, and I have just read it with most urgent attention and sympathy. It is not the only letter of that kind which the Bureau has received—it makes very urgent the great question of protecting motherhood. The Bureau is trying to find a plan by which mothers living in remote places can secure the medical and nursing care to which they are certainly entitled. It is an old need, but a new practical question, and it will not be solved until many people can be made to see that a way to provide the required care is possible in every part of our country.

In 1917 Miss Lathrop set forth in her annual report a program for the protection of maternity and infancy, of which the principal features were as follows:

1. Public health nurses who shall be available for instruction and service as are the public school teachers and other public officers;
2. Instruction in schools and universities and through different forms of extension teaching covering the field of hygiene for mothers and children, furnished at such places and times as to meet the needs of persons of varying ages and circumstances;
3. Conference centers at county seats or elsewhere, affording convenient opportunity to secure examination of well children and expert advice as to their best development;
4. Adequate confinement care;
5. Hospital facilities made available and accessible for mothers and children.

From 1922 to 1929 under the Sheppard-Towner Maternity and Infancy Act progress was made in developing public-health nursing, prenatal and child-health conferences, and health-education services throughout the United States. With the termination of the act and consequent withdrawal of Federal aid, just at the onset of the depression, these services were greatly curtailed.

The passage of the Social Security Act, approved August 14, 1935, made possible a vigorous program to safeguard and promote the health of mothers and children through the coöperation of the Federal Government, the states, and the local communities. Summary of state plans submitted this year by the fifty-one states and territories co-operating with the Children's Bureau under the act shows great extension of resources for bringing mothers under early prenatal care, for child-health clinics and conferences, for immunization against communicable disease, and for public health nursing services in the home. In many areas opportunities for post-graduate instruction in obstetrics and pediatrics have been brought to doctors in their own communities.

Evidence is steadily accumulating that a direct and courageous attack must be made on the central problem of providing adequate medical and nursing care at time of delivery, with medical and nursing supervision continuing throughout the antenatal and postnatal periods. Such care would conserve the lives not only of the mothers but also of many thousands of the new-born, and those who die before birth. It can be provided only with the coöperation of Government, practicing physicians, nurses, professional schools, and the mothers and fathers themselves. The

American Committee on Maternal Welfare is coöperating with the Children's Bureau in considering the various steps which will be necessary if motherhood in America is to be given safeguards commensurate with the need and the possibilities of saving life and health.

Care of the mother and the new-born infant is of primary importance, but many and varied are the needs of youth in the period from infancy to maturity. The real basis of progress in safeguarding the health and general welfare of the Nation's children lies in a threefold program: Correction of existing conditions that stand in the way of the child's wholesome development; prevention of such conditions; and above all, general application of knowledge of those conditions that will enable children everywhere to be born, to grow, and to develop according to standards that will give them their fair chance in the world.

Changing conditions of national life, emergencies such as those that occur in periods of depression and widespread unemployment, new discoveries resulting from the advances of science, and the needs of special groups at different times may require emphasis to be placed on one or another of the varied factors contributing to child welfare. However, each factor must be weighed in relation to all the others, for the welfare of the child as a whole is like a fabric woven of many different threads.

Immediate responsibility for the welfare of children lies with their families and their home communities. If there is one fact more than any other that has emerged from all the studies of the Children's Bureau, it is that the primary essential of child welfare is the power to maintain a decent family living standard, and this is dependent upon many factors not within individual control. In other words, the problem of economic security is a vital part of the whole problem of child welfare. Measures tending to promote economic security, such as an adequate wage level, good housing at reasonable cost, unemployment compensation, prevention of accidents and sickness, and care of the incapacitated breadwinner and his family, are basic factors in the well-being of children. They should be accompanied, however, by measures for parental education in methods of child care, and organization of community services for child health, child protection, and the care of children who are dependent, neglected, delinquent, or handicapped in body or mind.

Elsewhere in this issue has been related the progress which has been made in a period of twenty-five years in dealing with problems of child labor, juvenile employment, and the development of community resources for children. In one special type of need—provision for the crippled child and the care of those conditions which may lead to crippling—a definite program of Federal and state coöperation is being carried on under the Social Security Act, with forty-five states and territories developing or extending services to crippled children under its provisions. This first experience in Federal aid to the states for medical care of children should provide a sound foundation of relationships and methods upon which to build services for other types of handicapped children as their need for Federal assistance may be disclosed.

In twenty-five years, in comparison with the problems to be solved and the needs to be met, the work of the Children's Bureau as a broadly conceived center of information and service in all phases of child life has just begun.

By its thirty-fifth birthday the Bureau should be able to report:

1. Reduction of the death rate per 1,000 live births in the first year of life from 56 to 35 or below; in the first month of life from 34 to 24; reduction of the stillbirth rate from 36 to 26 or below.
2. Reduction of the maternal mortality rate per 10,000 live births from 58 to 38 or below.
3. Practical elimination, through immunization, of smallpox and diphtheria, great reduction through more widespread use of measures now available or being developed in the number of deaths of children from whooping cough, measles, scarlet fever, and pneumonia; reduction in congenital syphilis through the syphilis program being stimulated by the United States Public Health Service; definite progress in control of epidemics of infantile paralysis, and in the prevention of crippling conditions resulting from this disease; prevention of and care for injuries to new-born infants.
4. Marked reduction in the number of undernourished children through improved economic conditions and widespread dissemination among the people of knowledge of

ways in which good nutrition may be assured at moderate cost.

5. Elimination of child labor under the age of 16 years and safeguards of employed youth 16 and 17 years of age in industrial and commercial occupations and other occupations where children and their parents are especially subject to commercialized exploitation, through direct Federal legislation, administered in cooperation with State agencies, made possible by completion of the ratification of the child labor amendment.

6. Widespread extension of educational and vocational guidance and junior placement service, built upon elementary and secondary school facilities and facilities for public recreation increasingly adequate to meet the needs of youth in a period of rapidly accelerated economic and social change.

7. Increased availability to rural as well as to urban children of public assistance when the economic ability of the normal breadwinner to provide for his family fails, and of case work, child guidance, recreational, and other community services for the early discovery and remedial treatment of conditions leading to child dependency, neglect, emotional instability, and delinquency.

8. Extension of services to crippled children, to include all physically handicapped children not otherwise able to obtain skilled medical, surgical, nursing, and social care, these programs being closely correlated with a sound program of education and guidance adapted to the needs of each child.

9. Development of comprehensive state-wide and community programs for the care of the mentally deficient, including discovery, diagnosis, special class education, community supervision, and for those who need it, institutional or boarding home care.

10. Changed public attitude toward juvenile delinquency, based upon increasing awareness of the conditions leading to its development and the types of service in community, court, and training school which are essential if children thwarted and handicapped by untoward family and neighborhood conditions from their earliest years are to be given their fair chance in the world.

These are far-flung goals, but they are not beyond the knowledge and the resources which can be made available within the next ten years to those responsible for the health and welfare of American children. To achieve them, there must be assured the earnest cooperation of parents, schools, men's and women's civic organizations, public officials of localities and states, and the resources and leadership of the Federal Government.

As Grace Abbott has often said, what we would do for children this year cannot be postponed until next year, for children do not wait upon convenience. They live and thrive in proportion as we are understanding, loving, and resourceful in their service.

HOSPITAL INSURANCE*

Two months ago the San Francisco County Medical Society invited the Insurance Association of Approved Hospitals (Alameda Plan), to enter San Francisco for the purpose of selling hospital insurance. It has taken two months for the Hospital Conference to approve the Insurance Association of Approved Hospitals plan, but this was done on March 11, 1937, and by the time the "Bulletin" reaches you it is expected that many of the hospitals of San Francisco individually will have signed the contract.

The provisions of the plan as presented to prospective insureds are outlined below:

"In the event of sickness or disability through injury, expense results. Should hospitalization be necessary, a membership in this Association entitles you to the following service in one of the participating hospitals, while it in no way disturbs the relationship between your doctor and yourself. You make your own selection of physician or surgeon and pay him direct for his services.

Service covered by this membership includes:

Board and room—Ward accommodations. (Should a private room be desired, this may be obtained by paying the difference in rate directly to the hospital.)

General nursing care.

Operating-room service, including anesthesia if given by hospital employee.

Material appliances, such as splints, casts, etc.

Dressings.

Physiotherapy treatments.

Drugs and medicines, with the exception of serums, vaccines, spirituous liquors and expensive proprietary drugs.

The Association will indemnify the patient to pay the pathologist for routine clinical laboratory services, i. e., urinalysis, complete blood count, coagulation time, smears.

Indemnify the patient to pay the roentgenologist for the following services:

(a) In cases of accidental bodily injuries, all such services necessarily incident or required, exclusive of therapy, in the opinion of the attending physician, for the registered hospital bed patient.

(b) In cases of bodily illness or disease only when necessary to assist in diagnosis during hospitalization, and expressly excluding all therapy and any diagnostic services which could have been performed prior to admission to the hospital.

Membership covers hospitalization for twenty-one days for any one illness or accident during any twelve-month period.

If traveling, should you suffer an injury or sudden illness necessitating hospitalization, you will be provided with fourteen days' service in any accredited hospital in the United States or Canada.

Hospital service becomes effective:

1. For accidental injury—one day after application has been accepted.

2. For sickness or illness contracted or having its first signs or symptoms more than seven days after application has been accepted.

3. For illness or ailment requiring major or minor operation that is contracted or has its first signs or symptoms more than fifteen days after application has been accepted, except in the case of hernia, tonsillectomy or adenoidectomy which is twelve months after application has been accepted.

Services not provided in this contract are:

Tuberculosis, diagnosed cancer, venereal infection, mental disorders, occupational diseases or injuries covered by law, alcoholism, drug addiction, rest cure, intentional self-inflicted injuries (sane or insane), normal pregnancy, including cesarean section, abortions or services of special nurses.

Applicant must be in good health at time of application for membership and between eighteen and sixty-five years of age, but no medical examination is required. Hospitalization of any member must be upon the written order of a legally qualified doctor of medicine, whose credentials would be recognized by hospitals accredited by the American College of Surgeons.

Dues.—The rate per month shall be 90 cents per member, paid in advance; plus a registration fee of \$1, which must be paid at the time of filing application. Members will receive the same attention and courtesy in the hospital as if they were paying the bills personally.

Service covered by this contract is confined strictly to the care of registered hospital bed patients."

GERMAN MEASLES

Regulations of the California Department of Public Health for the Prevention of German Measles

At a recent meeting, the State Board of Public Health amended Rules 5 and 6 of the state regulations for the prevention and control of German measles. The complete regulations now read as follows:

Rule 1. Notification

Any person in attendance on a case of German measles, or a case suspected of being German measles, shall report the case immediately to the local health authority, who shall in turn report at least weekly, on the prescribed form, to the Director of the State Department of Public Health all cases so reported to him.

NOTE.—The report to the local health authority shall be in writing unless local rules permit notification by telephone.

When no physician is in attendance it shall be the duty of the head of the private house, or the proprietor or keeper

* Reprinted from the "Bulletin" of the San Francisco County Medical Society.

of any hotel, boarding house, lodging house or superintendent of any orphanage or school to report forthwith to the local health officer all the facts relating to the illness and physical condition of any person in any private house, hotel, boarding house, lodging house, orphanage or school under his charge who appears to be affected with any disease presumably communicable, together with name of such person.

Rule 2. Instructions to Household

It shall be the duty of the physician in attendance on any case suspected by him to be German measles to give detailed instructions to the nurse or other person in attendance in regard to precautionary measures for preventing the spread of this disease.

Rule 3. Investigation of Cases

Upon being notified of a case of German measles, the local health authority shall make an inquiry regarding the probable source of infection. If this source of infection is outside his jurisdiction, he shall notify the State Department of Public Health in order that it may inform the health authority (local or state) within whose jurisdiction the infection was probably contracted. The local health officer shall determine that the instructions are understood and observed and, in the event of non-observance, shall take proper legal steps for their enforcement.

Rule 4. Isolation

It shall be the duty of the local health officer to see that cases of German measles are properly isolated, and to define the area within which the patient and his immediate attendants are to be isolated. Without permit from the local health officer, no person shall carry, remove or cause to be carried or removed from any hotel, boarding house, lodging house or other dwelling, any person affected with German measles. Isolation in this disease is defined as that degree of detention necessary to insure non-contact with susceptible persons.

Rule 5. Contacts

When a person affected with German measles is properly isolated, members of the family or household are not subject to any restrictions.

Rule 6. Release from Isolation

The period of isolation shall be until clinical recovery.

Rule 7. Exclusion by School Authorities

It shall be the duty of the principal or other person in charge of any public, private or Sunday school to exclude therefrom any child or other person affected with a disease presumably communicable until such child or other person shall have been seen by the school physician or nurse, or shall have presented a certificate issued by the local health officer, or by the attending physician, and countersigned by the local health officer, stating that such child or other person is not liable to convey a communicable disease.

Rule 8. Disinfection

Concurrent Disinfection.—All discharges from the nose and mouth of the patient shall be immediately disinfected by boiling or shall be burned. Objects which may have been contaminated by the patient shall be disinfected before being removed to any place where they might become possible sources of infection. Clothing and bedding that have been contaminated by the patient, as well as the dishes used by the patient, shall be sterilized by boiling or immersion for twenty minutes in 2 per cent carbolic acid or liquor cresolis compositus.

Terminal disinfection shall consist of thorough cleaning by scrubbing and washing with hot water and soap of material on which and in which bacteria may find favorable conditions for prolonging life and virulence.—*Weekly Bulletin, California Department of Public Health.*

PSITTACOSIS IN CALIFORNIA: 1934-1935

The problem of the administration and control of aviaries has gradually resolved itself into a routine function of this department. The procedure involves three main factors: Registration, release, legband code numbers, and shipment of shell parrakeets.

REGISTRATION

Anyone engaged in selling, trading or bartering shell parrakeets, must obtain a certificate of registration from the State Department of Public Health. Senate Bill No. 516, Chapter 607, 1933, requires an annual fee of \$5 for such a certificate. This fee is payable July 1 of each year in the form of a money order or cashier's check.

According to figures compiled to date there are on record 1,721 aviaries representing approximately 65,255 shell parrakeets. The following table gives the distribution by counties:

Counties	No. of Aviaries	No. of Birds
Alameda	24	1,540*
Contra Costa	5	200*
Fresno	5	338
Glenn	1	30
Humboldt	3	21
Kern	8	121
Kings	1	6
Lake	1	10
Los Angeles	1,378	45,790*
Marin	4	219
Merced	2	11
Monterey	4	112
Napa	7	66
Orange	68	4,452
Riverside	19	1,903
Sacramento	20	645
San Benito	3	30
San Bernardino	35	2,114
San Diego	38	2,374
San Francisco	4	107*
San Joaquin	6	229*
San Mateo	2	70*
Santa Barbara	9	777
Santa Clara	22	458*
Santa Cruz	5	265*
Solano	2	55
Sonoma	9	168
Stanislaus	7	132
Tulare	7	430
Ventura	25	2,557
Yolo	1	25
	1,721	65,255

Some of the counties have been surveyed during this biennium. Such a survey was conducted in Los Angeles County with the assistance of the SERA. A summary of the survey follows:

Summary of Aviary Survey, Los Angeles County, 1934		
Private aviaries	1,145	
Less than 100 shell parrakeets		1,127
100 to 500 shell parrakeets		17
501 to 1,000 shell parrakeets		1
Over 1,000 shell parrakeets		—
Total shell parrakeets in private aviaries in survey	18,442	
Commercial aviaries	233	
Less than 100 shell parrakeets	233	
100 to 500 shell parrakeets		158
501 to 1,000 shell parrakeets		7
Over 1,000 shell parrakeets		1
Total shell parrakeets in commercial aviaries covered in survey	27,348	
Total aviaries surveyed		1,378
Total shell parrakeets in these aviaries	45,790	

As the above figures indicate, the bulk of the industry is concentrated in Los Angeles County with 1,378 aviaries out of a total of 1,721 located there. Only a small percentage of these aviaries has been tested, released and registered for carrying on the business of buying and selling shell parrakeets. A large proportion of the remainder is maintained for pleasure until such time as the owner wishes to dispose of the surplus stock.

RELEASE

Then, the aviary is subject to the regulations passed by the State Board of Public Health in May, 1935, which provide that at least two laboratory tests be made before an aviary may be certified and the birds released for sale.

The first test consists of mature birds—six months of age or over and represents 10 per cent of the entire stock, with not less than ten birds accepted for the test. The second test consists of immature birds—three to five months of age and represents 10 per cent of the entire stock, with not less than ten birds accepted for the test. An aviary may be subject to repeated tests if in the judgment of the State Department of Public Health there is any suspicion concerning the status of the birds.

The following is a tabulation of the laboratory tests done during the period January 1, 1934, to June 30, 1936:

* Surveyed during 1934-1936.

Laboratory Tests of Aviaries

Year	Total No. of Aviaries Tested	No. Positive	No. Negative
1934.....	193	48	145
1935.....	79 (new aviaries)	3	76
	47 (retests*)	1*	46*
1936.....	10 (new aviaries)	...	10
	14 (retests*)	...	14*

In 1934, 24 per cent of the aviaries tested proved positive; in 1935 the percentage dropped to 3.8 per cent and in the first six months of 1936 all the aviaries tested were negative for psittacosis.

When the stock in an aviary is infected with psittacosis as demonstrated by laboratory examination, the birds may either be quarantined or destroyed. Practically all positive aviaries have been destroyed. This undoubtedly reduces the number of sources of infection and might account for the few positives found in 1935. However, other factors may be involved—i. e., the cessation of indiscriminate exchange of breeding stock among aviary owners with a resulting improvement in breeding stocks; the reduction of the number of nestings (mass breeding), the general sanitary conditions improved and the question of being at the low level of the disease cycle.

If the laboratory tests are negative for psittacosis, then the aviary is released. The following table gives the released aviaries by counties:

Released Aviaries by Counties, July 1, 1936

County	No. of Aviaries
Alameda	9
Contra Costa	1
Kings	2
Los Angeles	135
Orange	3
Riverside	2
Sacramento	2
San Bernardino	8
San Diego	1
San Joaquin	1
San Mateo	1
Santa Clara	5
Santa Cruz	2
Stanislaus	1
Tulare	4
Ventura	1
Total	178

LEGBAND CODE NUMBERS

A total of 178 aviaries have been given a release after negative laboratory examinations. These aviaries must band their mature birds with a code number assigned to them by the State Department of Public Health. These code numbers consist of a letter and a number with a star between indicating laboratory release (i. e., A *70). This identification is used to protect the owner when shell parakeets are involved in cases of suspected psittacosis.

SHIPPING

The released registered aviaries are permitted to sell intrastate and interstate properly banded mature birds—eight months of age or over. For interstate shipments the United States Public Health Service requires a certificate issued by the State Department of Public Health. This certificate must be sworn to by the shipper before a notary public.

A tabulation of interstate shipments is presented by months for this biennium:

Interstate Shipments of Shell Parakeets

	1934	1935	1936
January	1,368	1,839	1,839
February	1,303	2,101	2,101
March	2,436	3,030	3,030
April	2,090	2,135	2,135
May	2,104	2,212	2,212
June	1,347	2,098	2,098
July	1,342	...	...
August	162	2,521	...
September	496	3,719	...
October	1,251	4,433	...
November	1,507	6,077	...
December	1,830	7,862	...
Totals	5,245	36,602	13,415

During the first six months of 1936 approximately 3,000 more birds were shipped than during the same period in 1935. This would indicate that control measures have not interfered with the economic phase of a public health problem.

*Retests—Previous tests done in 1934 or 1935. Total aviaries excluding retests 282 and 51 positives. Total birds autopsied 13,219 (1934 to July 1, 1936).

DOCTORS' HOBBY SHOW:
ALAMEDA COUNTY

What does a famous surgeon do with his spare time?

Sharpen his tools and count his surgical sponges?

Not always. Sometimes he ties flies against the day when he can get to the mountain streams to try his skill with the elusive trout.

Sometimes he carves bedsteads for his children, sometimes he haunts second-hand stores in search of old guns, sometimes he paces the sea shores in search of rare shells.

An idea of what doctors do with their spare time was given the general public on Saturday and Sunday, March 27 and 28, at the California College of Arts and Crafts, Broadway at College, in Oakland, when the Doctors' Hobby Show is opened to the general public.

A wide variety of exhibits was presented by the members of the medical fraternity in metropolitan Oakland, exhibits ranging from colored photography of the State of California to oil paintings and sculpture, from hand-tied flies to model airplanes.

Doctors Frank Bowles and E. N. Ewer demonstrated the cunning of their fingers and the extent of their patience in an exhibit of dry flies, all hand-made, some of them copies of standard American and English flies, some of them originals.

In addition to displaying the finished flies, the doctors showed the various steps taken in the construction of a fly tracing the process from the bare hook to the finished fly—not excluding the fish, appropriately stuffed and mounted, that may be caught, with good luck and better management.

Among the large exhibits was a bedroom set of carved wood, the work of Dr. Charles Mell who made it for his daughters and used persons of the nursery rhymes for his subjects. It included a twin bed set, a chest of drawers, a cedar chest and several plaques.

Other featured exhibits included a collection of old guns and pistols presented by Doctors C. A. Wills and Fletcher Taylor; a collection of rare stamps by Doctors Harry and Henning Koford; pipes by Dr. James Campbell; orchids by Dr. Michael Torrano; sea shells by Dr. Frank Baxter; model ships by Dr. F. S. Bascom; model airplanes by Doctor Chesebrough; arrowheads by Dr. L. Michael and archery, aviation and agricultural items by Doctors Warren B. Allen, Francis Shook, J. L. Lohse, and W. E. Mitchell, respectively.

In the art line there were books by Dr. Milton Shutes, Dr. S. H. Babington, and Dr. Frank Makinson, all authors of note; photography by Doctors H. R. Parker, W. W. Cross, G. Splithoff, Wilbur Calkins, Stanley Truman, N. Keeler, and Stanley Davis; painting by Doctors William Strietman, Charles Peters, Mark Emmerson; sculpturing by Dr. William Porter, charcoal drawings by Dr. Leland Taylor, and etchings by Dr. Paul Michael.

A list of the exhibitors follows:

Dramatics: Dr. Robert Glen.
Orchid Culture: Dr. Michael Torrano.
Horticulture: Dr. George Calvin.
Walnut Culture: Dr. John Luis Lohse.
Study of Navajo Indians: Dr. S. H. Babington.
Medical History: Dr. Frank Makinson.
Life of Lincoln: Dr. Milton Shutes.
Guns and Pottery: Dr. C. A. Wills.
Model Ships and Rug Making: Dr. Noble Logan.
Arrowheads: Dr. Luther Michael.
Archery: Doctors Warren Allen, and M. F. Frandy.
Etching, Pen and Ink, Tortise Shell Work: Dr. W. S. Porter.
Stamps: Dr. Henning Koford.
Astronomy: Dr. Kenneth Tattersall.
Photographic Exhibits: Doctors Wilbur Calkins, Stanley Davis, A. W. Henry, C. A. Splithoff, Harry Templeton, Stanley Truman, W. W. Cross, H. R. Parker, and Francis Shook.
Pastels: Dr. W. H. Strietmann.
Charcoal: Dr. Leland Taylor.
Etching: Dr. Paul Michael.
Cabinet Making: Dr. Burton Adams.
Wood Carving: Doctors Forrest Kracaw, Roy Nelson, F. W. Edmonds, Sydney Smith, Roscoe Van Nuys, L. W. Wuesthoff, and Charles Mell.
Fly Making: Doctors E. N. Ewer, and Frank Bowles.
Oil Painting: Dr. Mark Emerson.
Model Airplanes: Doctor Chesebrough.
Pipes: Dr. James Campbell.
Sea Shells: Dr. Frank Baxter.

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. X, No. 5, May, 1912

From Some Editorial Notes:

The Del Monte Meeting.—The annual meeting of the State Society, held at Del Monte on the 16th, 17th, and 18th of last month, was in every way a distinct success. There was such a large amount of business introduced, and some of the reports and resolutions were received so late—most of them not being turned in until the time of the meeting—that it is impossible to include the full and official report of the forty-second annual meeting in this issue of the *Journal*. Some of the business matters brought up will be found to be of great importance to our several county societies; other matters were first referred to committees, and these may perhaps have taken some action by the time the next issue is ready for the press.

Throughout the session there was displayed not only keen interest in all matters pertaining to the affairs of the Society and to the business presented, but also a harmony of feeling and a total lack of bitterness or prejudice that speaks strongly for the continuance of improvement in all parts of the State.

The next meeting will be held at Santa Cruz in April, 1913.

The president is Dr. O. D. Hamlin of Oakland.

The first vice-president is Dr. Saxton Pope of Watsonville.

The second vice-president is Dr. Fred Tebbe of Siskiyou.

The secretary is Dr. Philip Mills Jones of San Francisco. . . .

Doctor Wiley.—Through the lifetime of a generation Dr. Harvey W. Wiley has served as Chief of the Bureau of Chemistry in the Department of Agriculture. His recent resignation has caused the press of the country to unite in a wail of protest at his departure from an office which he filled with such conspicuous success. Doubtless, Doctor Wiley long ago proved himself peculiarly fitted for the difficult position he occupied: his stupendous energy, his untiring patience, his unswerving honesty, combined with his scientific knowledge, make his record one without equal in his department. Doubtless, had it not been for his persistence, the Food and Drugs Act of 1906 would have been as innocuous to the manufacturers of adulterated foodstuffs as previous pure food legislation had been. . . .

Keep It in Your Office.—Ye fortunate mortals who have patients sitting in your reception rooms awaiting their turn, why not put some good reading in said reception room for the improvement of the mind of the waiting person? Why not let him read "Nostrums and Quackery," published by the American Medical Association, price fifty cents, with your name stamped on the outside cover? . . .

Protecting a Gullible Public.—Under this caption the Pasadena *Daily News* has an editorial in its issue for March 22 that is well worth reading. The *News* announces its policy in regard to fake and fraudulent "doctor" advertisements. Here is a newspaper the owner of which does not wish to soil his hands with the dirty money—and such "easy money"—of the quack and the charlatan. . . .

From an Article on "Treatment of Severe Cases of Diabetes" by Emile Schmoll, M. D., San Francisco.—The mystery which has always shrouded the etiology of glyco-

(Continued in Front Advertising Section, Page 15)

† This column strives to mirror the work and aims of colleagues who bore the brunt of Association work some twenty-five years ago. It is hoped that such presentation will be of interest to both old and new members.

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By CHARLES B. PINKHAM, M.D.

Secretary-Treasurer

News

"Attorney-General U. S. Webb today advised Dr. C. B. Pinkham, Secretary-Treasurer of the State Board of Medical Examiners, that cosmetologists are prohibited by law from dropping or spraying liquid preparations in the human eye. Doctor Pinkham requested the opinion after an investigation disclosed that a large number of so-called beauty salons, located in department stores, provided various eye lotions which were used by cosmetologists in treating the patrons' eyes. . . ." (Sacramento *Bee*, March 24, 1937.)

"Governor Frank F. Merriam today appointed Dr. Roy F. Terry, Long Beach, as a member of the State Board of Public Health, succeeding Dr. Gifford L. Sobey, Paso Robles, whose term expired." (Los Angeles *Illustrated Daily News*, March 31, 1937.)

Reappointment of Drs. Edward M. Pallette and George H. Kress, both of Los Angeles, as members of the State Board of Public Health, was announced yesterday by Governor Merriam.

Doctor Pallette, President of the California Medical Association and a surgeon here for thirty-five years, was first appointed by the late Governor Rolph. His new term will expire January 15, 1939.

Doctor Kress, a member of the General Hospital staff here and editor of the California Medical Association journal, was also appointed by Rolph. His term will expire January 15, 1941. (Los Angeles *Examiner*, April 6, 1937.)

J. Walter Clark, D. C., recently addressed to this magazine a communication reading as follows:

In the July to December, 1936, Volume 45, No. 6, edition of your magazine, CALIFORNIA AND WESTERN MEDICINE, under the heading, California State Board of Medical Examiners—Index XI, there appears this notation: "Clark, J. Walter, D. C., guilty of burglary. Probation three years (July, 1936), Adv. p. 22." I wish to state that I am J. Walter Clark, D. C., and that the above notation is incorrect. I was charged with the receiving of stolen goods—not burglary.

There is a vast difference between these two charges, the charge of burglary being much more detrimental to my character and constitutes felony.

I believe you have either been misinformed or it may be a misprint, but I feel I have the right to ask you to make a correction of this statement in the next issue of this same journal. I feel this is only fair to me and my future as well as to you and the authenticity of your magazine.

The particular item to which objection is made was that appearing under the heading "California State Board of Medical Examiners—Index." No objection is made to the news story which was carried in the July, 1936, issue of said magazine. Such news item read as follows:

Dr. J. Walter Clark, South Gate and Huntington Park chiropractor, today was free on three years' probation in connection with the burglarizing of the Los Angeles Drug Company of \$30,000 worth of drug accessories in five months.

This item was quoted as being taken from the Huntington Park *Signal*, May 9, 1936.

Since receipt of Doctor Clark's communication we have sought further information as to the offense of which Doctor Clark was found guilty. The Los Angeles Police Department, under date of April 9, 1937, advises that Walter J. Clark, No. 31707-M11, was arrested by that

Evidence: Admissibility of Roentgenograms for Purposes of Comparison.—The plaintiff's pelvis was fractured when she was struck by an automobile driven by the defendant. She sued the defendant to recover damages and obtained judgment in the trial court. The defendant thereupon appealed to the District Court of Appeal, Third District, California.

The defendant contended that the trial court erred in admitting in evidence, without proper foundation, a roentgenogram of a normal pelvis apparently for the purpose of comparison with a roentgenogram taken of the plaintiff's pelvis. The contention of the defendant was without merit, in the opinion of the District Court of Appeal. The use of skeletons, charts, and diagrams is common in trials to show the normal structure of the human body, and the court of appeal could not perceive why the use of roentgenograms of a normal bone arrangement may not, likewise, be used for illustration and comparison. The roentgenogram offered in evidence was that of the pelvis of a normal woman about the age, size, and figure of the plaintiff and, in the opinion of the court, was properly admitted for the purpose of enabling the witness to explain to the jury a roentgenogram already in evidence. Finding no error, the judgment of the trial court was affirmed. (*DeMartini vs. McDonnell* (Calif.), 58 P. (2d) 170.)—*Journal A. M. A.*

Persons Engaged in Care of Sick in Germany.—The National Health Bureau has issued an official statistical report on the number of persons actively engaged in the medical, nursing and kindred professions as of January 1, 1935. The report includes statistics on all other groups, the members of which derive their livelihood from the care of the sick. In all, 286,948 persons were included within the survey. That a majority were females is due to the fact that by far the largest unit listed comprises members of the nursing profession. The medical profession, as the keystone of all the professional groups covered by the survey, represented 17 per cent of the

foregoing grand total; its members numbered 47,419 persons who are licensed to practice medicine in Germany. There were 44,491 men physicians and 2,928 women physicians. These figures represent an increase in the total number of physicians of 0.3 per cent (144) over 1934. There were 12,088 licensed dental physicians, of whom 785 were women; 10,981 registered pharmacists, including 549 women; 25,737 midwives; 20,298 dentists (dental practitioners without university training), including 2,363 women; 11,922 bone setters, masseurs, and so on, including 5,494 women; 126,008 trained nurses, of whom the vast majority (104,822) were women; 6,869 nurses especially trained to care for infants; 1,240 confinement assistants; 5,581 disinfectors, including 593 women, and finally there were 14,023 heilpraktiker (lay practitioners who by no means are to be considered as physicians, but rather as so many quacks), including 3,359 women. Lumping all these groups together as a unit, the distribution, according to sex, was found to have been 130,520 men and 156,428 women. While the foregoing figures may be regarded as official, they still lack uniformity, as this type of statistical survey is relatively new and not all of the German states have instituted compulsory registration for the members of all these groups.

Only a slight increase took place in the number of regular physicians during 1934. There were 7.2 physicians to each 10,000 of population and 10.1 physicians to each 100 square kilometers of area, or one doctor to each 1,388 inhabitants and to each 9.9 square kilometers of area. The previously mentioned 144 physicians were chiefly women, 127 new women physicians to only seventeen men. From this, one may conclude that the proportion of women physicians will undergo a yet greater increase in the near future, since it is significantly higher among the rising generation as compared with the older generation of physicians. In the year 1933-1934, 15.4 per cent of all persons receiving the license to practice medicine were women (324 women in a total of 2,109 persons licensed); of students who passed the preliminary examination in

medicine (given at the end of the first five semesters of study) 22.1 per cent were women; at the same time 19.8 per cent of all medical students were women. The total number of licenses granted underwent a sharp increase in 1933-1934 (2,109 persons licensed as against 1,280 in 1932-1933). On the other hand, there was but a slight increase in the number of students who passed the preliminary examination (4,943 in 1933-1934 against 4,836 in 1932-1933) and, throughout, the increase in the number of women was considerably greater than the increase in the number of men. Conversely, the total number of medical students declined, although the number of women students declined at a slower rate than that of the men students. The statistics on the distribution of medical students over various semesters show that the high figures for those entering the medical profession will remain about the same for some three years and then will suddenly drop to about one-half their former value. How long the number of new admissions will remain at so low a level cannot be computed beforehand, since the exigencies of the work service and military service are factors conducive to a retrogression in the number of students admitted to the medical schools. On the other hand, the decline in the number of women matriculants is so considerable that it cannot alone be attributed to the work service but may be taken to indicate that fewer women contemplate medicine as a career. Whereas the number of matriculants in medicine amounted in 1933-1934 to 2,866 men and 852 women, corresponding figures for 1934-1935 show only 1,826 men and 338 women or, in terms of percentage of the matriculants in the preceding academic year, only 65 per cent and 39.7 per cent for men and women, respectively. The number of specializing physicians January 1, 1935, showed an increase of 1 per cent over January 1, 1934. The greatest increase was among the internists, whereas the greatest decrease was among the dermatologists and venereologists. The proportion of women is by far the highest among pediatricians

and lowest among surgeons and otorhinolaryngologists. Table 1 shows in detail the distribution of physicians engaged in the specialties.

TABLE 1.—Distribution of Specialists as of Jan. 1, 1935

Specialties	Absolute Number		Number on Jan. 1, 1935 Listed on Jan. 1, 1934	Number Per 100 Physicians	Women Physicians in the Specialties	
	Jan. 1, 1934	Jan. 1, 1935			Absolute Number	Number Per 100 Specialists of Both Sexes in Same Field
Surgery	2,729	2,682	98	5.7	24	0.9
Gynecology and obstetrics	1,757	1,781	101	3.8	99	5.6
Internal medicine	2,795	2,975	106	6.3	89	3.0
Pediatrics	1,128	1,188	105	2.5	328	27.6
Dermatology and venereology	1,813	1,746	96	3.7	68	3.9
Mental and nervous diseases	1,653	1,687	102	3.6	78	4.6
Ophthalmology	1,360	1,344	99	2.8	70	5.2
Otorhinolaryngology	1,476	1,498	101	3.2	15	1.0
Totals	14,711	14,901	101	31.4	771	5.2

It is further estimated that 4 per cent of physicians were in government service and 17 per cent were occupying permanent posts in institutions for the sick. Only one-half of all physicians had selected to exercise their profession in a general, independent, nonspecialized practice. Detailed statistics on the groups lying outside regular medicine are of scant interest with the exception of the figures for the "heilpraktiker." These lay practitioners occupied a more favorable position under the new régime

BILHUBER-KNOLL CORP. 154 OGDEN AVE., JERSEY CITY, N.J.

than that formerly enjoyed by them, a fact mentioned in previous letters. In this survey all unlicensed persons who were professionally engaged in the treatment of the sick were three such heilpraktikers to each ten regular physicians in Germany; the corresponding ratio was 2.6:10 in 1929, 1.5:10 in 1909, 1.1:10 in 1878, and 0.5:10 in 1876. Sixty years ago there were only 670 heilpraktiker (according to the rather incomplete records of those times); today there are 14,023 such practitioners. The increase in the number of heilpraktiker took place at a greater rate than the increase in the number of regular physicians until 1927 and has made yet further advances since that time. In 1935 a decrease is to be noted for the first time, presumably a consequence of the measures instituted for the "purgation" of the ranks of the lay practitioners. The increase in the number of heilpraktiker prior to 1935 is shown in Table 2.

TABLE 2.—Increase in Number of Heilpraktiker Prior to 1935

Year	Number of Heilpraktiker	Number of Women Heilpraktiker	Heilpraktiker Per 10,000 of Population	Heilpraktiker to Each Ten Physicians
1876	670	95	0.16	0.49
1887	1,713	305	0.36	1.08
1898	3,059	766	0.56	1.24
1909	4,468	1,322	0.70	1.46
1927	11,761	2,832	1.86	2.70
1928	12,098	2,803	1.90	2.63
1929	12,413	3,091	1.94	2.61
1930	12,942	3,094	2.01	2.74
1931	14,031	3,372	2.17	2.93
1934	14,266	3,378	2.19	3.02
1935	14,023	3,359	2.13	2.96

The proportion of women is higher among the heilpraktiker than among the physicians or the dental physicians. Before the war the proportion of women heilpraktiker had increased from 14 per cent to 30 per cent;

after the war it remained with great regularity at around 24 per cent—not quite one-fourth of the total. An explanation of the considerable proportion of women lay practitioners may be found in the fact that traditionally many farmers' wives and nurses of one sort or another, including women in holy orders and masseuses, were classed as heilpraktiker.—*American Medical Association's Berlin Correspondent.*

Paternity: Admissibility of Blood-Grouping Tests to Determine Paternity.—The prosecutrix gave birth to an illegitimate baby and the defendant was named as the father. In a prosecution for rape, the defendant asked the trial court to require the prosecutrix and her baby to furnish a few drops of blood for the purpose of having it tested and compared with the blood of the defendant. By this test, the defendant maintained, it might be possible to demonstrate as a scientific fact the impossibility of his paternity. The trial court refused to order the test, and the defendant was convicted of second degree rape. On appeal, the Supreme Court of South Dakota upheld the refusal of the trial court to order the test, holding:

"That it does not sufficiently appear from the record in this case that modern medical science is agreed upon the transmissibility of blood characteristics to such an extent that it can be accepted as an unquestioned scientific fact that, if the blood groupings of the parents are known, the blood group of the offspring can be necessarily determined, or that, if the blood groupings of the mother and child are known, it can be accepted as a positively established scientific fact that the blood group of the father could not have been a certain specific characteristic group." (*State vs. Damm* (S. D.), 252 N. W. 7.)

A rehearing was granted in the case, limited to the ruling of the trial court with respect to the blood test.

Our former opinion, said the Supreme Court on rehearing, seems to have been widely accepted and understood as a holding that the reliability of the blood test was

(Continued from Preceding Page)

not as yet generally established or recognized by the consensus of expert opinion in the particular field of science wherein the matter lies. There was no intention in that opinion to express a conviction one way or the other on the abstract question of the reliability of the test as a matter of science. Our former opinion, continued the court, went no further than to hold that the record itself failed to establish the reliability of the blood test. In view of this misunderstanding of the purport of its former decision, the Supreme Court considered it advisable, on rehearing, to state that, in its opinion, the reliability of the blood test is definitely established as a matter of expert scientific opinion entertained by authorities in the field, and that the time has undoubtedly arrived when the results of such tests, made by competent persons and properly offered in evidence, should be deemed admissible in a court of justice whenever paternity is in issue. The foregoing statement was made because, in the words of the court: "We do not wish any misapprehension as to the views of this court by any possibility to deter other courts from accepting and acting upon a tenet of biological science which we are convinced is now fully ripe for acceptance in medico-legal cases."

All judicial powers, said the court, are vested in the courts, and the judiciary constitutes a separate, distinct, and coördinate department of the government of the sovereign state. The primary function of the judiciary is the administration of justice, and justice can never be rightly administered unless truth is first ascertained as nearly as may be. The citizen holds his citizenship subject to the duty to furnish to the courts, from time to time and within reasonable limits, such assistance as the courts may demand of him in their efforts to ascertain truth in controversies before them. This is just as much a part of the citizen's inescapable duty of supporting his government as is military service in time of war, or any other like obligation. The court could perceive no valid reason why courts of record may not require of any person within their jurisdiction the furnishing of a few drops

of blood for test purposes when so to do will or may materially assist in administering justice in a pending matter. The order for such test should be adequately safeguarded. The order should not issue as a matter of absolute right but in the sound discretion of the court. A trial judge should not be a mere umpire presiding over a game of skill conducted by counsel, and the court could conceive of no valid reason why a trial judge might not of his own motion in a given case, if he thought it likely to be helpful, order the making of a blood test by a competent person and a report thereon under oath subject to cross-examination by both parties. Recapitulating its views, the Court said:

"We think (1) the reliability of the blood test is universally conceded by competent scientific authorities; (2) a trial court of record in this state has inherent power and authority, in its reviewable discretion, to order the taking of blood for such purposes in cases where paternity is an issue and where, in the opinion of the court, the making and reporting of such test will be, or is likely to be, helpful in ascertaining the truth."

Notwithstanding the foregoing views, the Supreme Court felt impelled to hold that the trial court did not err in refusing to make the order requested. The case, the Supreme Court observed, was tried in October, 1931, and the literature on the topic of the scientific reliability of the blood test appeared for the most part subsequent to that date. We are far from willing, the court said, to say that it was error for a trial judge in South Dakota, at the time of the trial of this case, to fail or refuse to take judicial notice of such reliability. If such reliability was not, at the time of the trial of the case, a matter which the trial court was obligated judicially to notice, then it was necessary for the applicant for the order to prove such reliability by proper and satisfactory expert testimony. This he failed to do. Furthermore, there was no adequate showing that if the requested order was granted the defendant could and would have the tests made by a

"PROTECTIVE FOOD DRINK"

Is Indicated

THE DIETETIC VALUES of Cocomalt establish it as a "protective food" in the opinion of many physicians.

For instance, Cocomalt is rich in Calcium and Phosphorus—but more than that Cocomalt also has a rich Vitamin D content which enables the system to utilize the Calcium and Phosphorus. Each glass of Cocomalt in milk provides .33 gram of Calcium, .26 gram of Phosphorus, 81 U.S.P. units of Vitamin D.

Furthermore, each ounce of Cocomalt, the amount used to prepare one cup or glass, contains 5 milligrams of Iron in readily-assimilated form. Thus, three glasses or cups of Cocomalt supply the average normal daily iron requirement.

These important and vital food essentials plus the protein and carbohydrate content signalize the value of Cocomalt for the diet of expectant mothers, undernourished children, elderly people, nursing mothers, convalescents. Cocomalt is easily digested, quickly assimilated.

Cocomalt is Palatable and Inexpensive

Two added virtues that make this "protective food drink" deservedly popular with physicians and patients alike. Of distinctive and appetizing taste, this protective food drink costs little in proportion to its merit. It may be served Hot or Cold as you prescribe.

Cocomalt is sold at drug and grocery stores in ½-lb. and 1-lb. purity sealed cans. Also, for professional use, in 5-lb. cans available at a special price.

competent, capable and experienced person. The judgment of the trial court was consequently affirmed. (*State vs. Damm* (S. D.), 266 N. W. 667.—*Journal A. M. A.*)

A Commission to Study Hospital Lotteries.—The Government of South Australia appointed a royal commission to inquire whether it is desirable to institute lotteries in South Australia for the purpose of raising funds to assist in the finance of hospitals and other charitable institutions. The Commission took evidence in the different states of the commonwealth and had special statistical information about lotteries of Great Britain, Ireland, France, the United States and Canada. The Commission expressed itself in its report as being not unduly influenced by the religious or ethical aspect. It says it would not have felt justified in coming to its conclusion or objecting to the lottery system on the ground of ethical objection, if on other grounds it had been found desirable. There is a real difference in principle between a government on the one hand taxing private betting or other private activities of the people and on the other hand introducing a lottery for the purpose of raising money for one of its essential social services. In the former case the Government takes no part in the promotion of the activities on

For Acidity and Allied Conditions, we suggest ADAMS SPRINGS MINERAL WATER

● **MANY** physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is marked drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

(Continued from Preceding Page)

No Australian government urges people by advertisement to bet on horse races in order that more revenue may be obtained from betting or to go to the pictures so that the amusement tax revenue may be increased, but when there are lotteries the public is definitely encouraged to do so.

The Commission was much impressed in the course of its investigations by what appeared to be the political repercussions of lotteries either conducted by governments or under a government license. The Commission gained the definite impression that lotteries conducted on the lines of those of New South Wales, Queensland, and Tasmania tend to become the masters rather than the servants of the government that "controls" them. The Commission considered that the state of affairs tends to demoralize governments. After full and careful investigation the Commission satisfied itself that the lottery does not and cannot solve the hospital finance problem. Even in Ireland the immense Irish sweep has not relieved the Government or the local authorities of their hospital obligations, and in Western Australia and in Queensland lotteries have not helped the Government to any material extent. The existence of lotteries in four of the six Australian states, and the seeming benefits derived from them, give an impression that a lottery is desirable. After thorough investigation, however, the Commission is satisfied that these benefits are more superficial than real.

It may appear difficult to understand why it is that, with all the revenue that lotteries bring in, the Government or local authorities do not secure corresponding relief. There are several contributing factors to this position: (1) The people of Australia are becoming more and more hospital-minded, which means an increasing demand for accommodation. (2) The existence of a lottery tends to create in the people a demand as of right for a much higher standard of hospital buildings and equipment, and for more hospitals. (3) The practice has been generally to use lottery moneys for capital expenditure and, therefore, the cost of maintenance necessarily

SAILING

SELLING

... to reach your destination
you *must* chart your course.

7 POINT program for DIRECT MAIL SUCCESS

1. *Intelligent plan*
2. *Sound copy*
3. *Attractive design*
4. *Significant illustration*
5. *Good printing*
6. *Correct circulation*
7. *Barry's coöperation*

Special attention given to "Point 7" will insure proper consideration of the other six points. Call our Creative Department when planning your next printing. There's no obligation, of course.

Intelligent direction is what keeps a ship on its course and assures safe arrival at its destination. Never would the captain set sail without a dependable compass and reliable charts.

The creation of a direct mail campaign should never be impulsive and ill-considered. It is futile to proceed until a substantial basic plan has been developed. Decide upon the load that must be carried, then build the vehicle to carry it.

The initial cost of intelligently planned direct mail advertising is no more than "hit or miss" production—and the results explain why so many representative advertisers consistently return to this firm for Planned Printing.

increases. (4) The existence of a lottery tends to decrease the voluntary contributions for hospital and charitable purposes, and this factor is greatly accentuated when there is a rate or tax for hospitals as well. (5) Where charities are associated with lotteries, the charitable institutions set up higher standards. (6) It may be that one of the reasons why lottery moneys are spent in the manner in which they are is that such expenditure provides an excellent advertisement for the lottery. For these reasons the Commission found that the establishment of a lottery will not materially relieve the Government or the local governing authorities of their burdens for hospitals or charities. In fact, because of the higher standard that is built up through the expenditure of lottery moneys as capital the ultimate burden is likely to be increased by the existence of a lottery.

Everywhere, says the report, there is a tendency to increase the prizes, and especially the first prize; and everywhere the lottery is an exploitation of the gullibility of the public and the widespread gambling instinct. In fact, so deep-seated has this legalized form of gambling become that it is doubtful whether any government would dare to introduce legislation to abolish these lotteries. The Commission concluded that a lottery, as a form of hospital finance, provides an unstable method that is demoralizing to the Government, distinctly injurious to traders, and detrimental in the end to the poorer sections of the community, who contribute the bulk of the receipts. If the people who buy lottery tickets can easily afford the money, they can afford to pay their share of the direct taxation necessary to support hospitals. If they cannot afford the money, the state should not take their money. From the establishment of the "golden casket" in Queensland nearly twenty years ago the total receipts amounted to £12,000,000, the prize money amounted to £7,000,000, and the sum paid to hospitals and charities after payment of expenses was £3,000,000. These figures confirm the Commission in its belief that the lottery does not and

If it is desirable to control acidification more accurately, may we suggest the use of Poland Water, because it is extremely pure — chemically and bacteriologically — and it is NEUTRAL.

cannot solve the hospital finance problem, and consequently it was recommended that the practice should not be permitted in South Australia.—*Australian Correspondent.*

The American Social Hygiene Association.—The objectives and methods the Association is working for include:

The provision of adequate professional health and medical services, supplemented as necessary by federal, state, and community facilities; inclusion of syphilis and gonococcal infections as major problems of such services; development of opportunities for graduate physicians to gain practical experience in diagnosing and treating these diseases; establishment of adequate instruction for students being trained for the professions and technical services concerned; and protection of the public from medical quacks and others seeking to exploit the sick and those believing themselves to be infected.

The securing of community environments favorable to family life and the safeguarding of children and adolescents from conditions leading to sex delinquency; study of laws and their practical application; promotion of protective measures advancing standards of public and private morals; the development of recreation for young and old adapted to their increasing leisure time; and direction of all these activities toward relations of men and women conducive to mutual respect, wholesome companionship, marriage, and parenthood.

The promotion of public information, (1) to insure popular understanding and support of social hygiene as an integral part of permanent community activities; (2) to provide particularly for protection of the individual against the diseases syphilis and gonorrhea.

The establishment of correlated educational, religious, and social instruction and training directed toward (1) the general objective of making the family biologically and sociologically effective in securing for each generation good heredity and wise parental care in successful homes; (2) the acquiring of individual knowledge and control

most likely to insure the functioning of sex as a useful influence in personal and family life.

The Association works through:

The membership of the Association, which collectively represents every part of the United States and the experience and judgment of all professional and lay groups. The members constitute a means of securing dependable views and cross sections of public opinion on social hygiene questions. They also provide an essential medium for exchanging, among local and state groups, data and experience with new methods.

The officers and members of other agencies, which include social hygiene activities in their respective programs. The coöperative projects with such organizations serve to promote teamwork, avoid duplication and unnecessary specialization in health and welfare programs, while decreasing the costs of administration and broadening the base of support.

The public information and education facilities of the schools, the church, the press, the radio, the screen, professional and organized groups, lectures and institutes.

Consultation, field work, studies and research, as temporary aids to establish public and voluntary institutions in position to incorporate permanent social hygiene activities in their communities. . . .

The Association may be addressed at 50 West Fiftieth Street, New York City.

Men influence the conduct of others chiefly through personal association and intercourse. There is such a preponderance of good in human nature that association with men ordinarily begets a liking for them. As men come to know each other, each comes to receive from the others the respect and confidence to which he is entitled; his character and his opinions insensibly acquire their due weight and influence. It is not the stranger who says, "Go there," or "Do that," who is obeyed, but it is the old acquaintance who says, "Come with me," or "Let us do thus and so," who is followed.—Elihu Root.

When boils come in crops . . .

STAPHYLOCOCCUS TOXOID

Lederle

SEVERE BOILS—boils that had recurred in crops for several years—patients who had never been free from boils for many months—cases of two years' duration or longer—intractable cases—a series of 28 such cases reported by Dolman (J.A.M.A. 4-1-33) all resulted in cures following a series of progressive injections of Staphylococcus Toxoid.

For the milder, commoner cases of boils and carbuncles and for the related manifestations of staphylococcus infection such as blepharitis and pustular acne, staphylococcus toxoid is also effective.

The antitoxic titer generally developed by the toxoid shows promptly in the blood and is measurable by laboratory procedures.

Staphylococcus Toxoid has been widely used with success abroad, in Canada and throughout this country.

Colfax School for the Tuberculous

Colfax, California

(Altitude 2400 feet)

This institution is for the treatment of medical tuberculosis and of selected cases of extrapulmonary (so-called surgical) tuberculosis.

The Colfax School for the Tuberculous consists of five Hospital Units with beds for patients who come unattended and a Housekeeping Cottage Colony for patients and their families.

The Colfax School for the Tuberculous offers the following advantages:

1. Patients are given individual care by experienced tuberculosis specialists. The patient is treated according to his individual needs.
2. Patients are taught how to secure an arrest of their disease, how to remain well when once the disease is arrested, and how to prevent the spread of the disease.
3. Patients have the advantage of modern laboratory aids to diagnosis and of all modern therapeutic agencies.
4. The climate of Colfax enables the patient to take the cure without discomfort twelve months in the year. We believe climate is secondary to medical supervision and rest, but the fact remains that it is easier to "cure" under good climatic conditions than where these climatic conditions are absent.
5. Colfax is accessible. It is on the main line of the Ogden Route of the Southern Pacific R. R. and has excellent train service. It can be reached by paved highway, being on the Victory Highway, with paved roads all the way to Colfax.

TYPHO-SEROBACTERIN MIXED

THE APPROACH OF HOT WEATHER brings the constant threat of typhoid and paratyphoid fevers. Fortunately, however, the value of immunization against these infections is well established.

Typho-Serobacterin Mixed, being a sensitized bacterin or antigen-antibody combination, possesses distinct advantages over plain bacterial vaccines. It offers a degree of passive immunity during the period of lag or "negative phase" which precedes the develop-

ment of active immunity in the use of plain bacterial vaccines.

Local and general reactions are reduced to a minimum. Further, the combination of antigen and antibody permits the administration of larger doses (i. e., as to bacterial count) and more frequent injections to stimulate maximum immunity response.

Typho-Serobacterin Mixed is supplied in three-syringe and three-vial single-immunization packages and in five-cc. and twenty-cc. vials.

"A supply in the bag; a supply in the office —*always!*"

No physician knows, when he starts his day, what critical situations will confront him. Because this product is essentially an emergency remedy, many physicians make a practice of keeping at hand at all times a supply of Adrenalin Chloride Solution 1:1000 (the Parke-Davis brand of Solution of Epinephrine Hydrochloride U.S.P.).

Medical men and women

throughout the world have been relying on the original Parke-Davis product every hour of the day and night for thirty-five years; and the resources and personnel of the Parke, Davis & Co. laboratories of today are pledged to maintain its unvarying dependability. A request will bring the booklet "Adrenalin in Medicine" by return mail.

EMMENIN

The orally active, oestrogenic placental
extract elaborated by Dr. J. B. Collip, De-
partment of Biochemistry, McGill University.

*(Canadian Medical Association Journal,
February, 1930.)*

IMPORTANT ANNOUNCEMENT . . .

By an improved technique developed in our
laboratories, we have been able to render
Emmenin entirely free from disagreeable
taste and odor. This has been accomplished
without loss of therapeutic activity, and the
potency is ensured by carefully controlled
biological assay.

DETAILS ON REQUEST

Emmenin is biologically assayed and stand-
ardized under direct control of the Depart-
ment of Biochemistry, McGill University.

ROSTER OF COUNTY MEDICAL SOCIETIES, CALIFORNIA MEDICAL ASSOCIATION

(County society secretaries are requested to promptly notify "California and Western Medicine" when changes are indicated in their roster information.)

Alameda County Medical Association
2404 Broadway, Oakland
President, H. Gordon MacLean, 230 Grand Avenue, Oakland.
Secretary, Gertrude Moore, 2404 Broadway, Oakland.
Meeting, *Third Monday, 8:15 p. m., Hunter Hall, Oakland.*

Butte County Medical Society
President, John H. White, 315 Wall Street, Chico.
Secretary, J. O. Chiapella, 131 Broadway, Chico.
Meeting, *Second Thursday.*

Contra Costa County Medical Society
President, Clara H. Spalding, 331 Eighth Street, Richmond.
Secretary, Thomas J. Dozier, 202 G Street, Antioch.
Meeting, *Second Tuesday, 8 p. m.*

Fresno County Medical Society
President, J. M. Frawley, T. W. Patterson Building, Fresno.
Secretary, O. B. Doyle, Bank of America Building, Fresno.
Meeting, *First Tuesday, University-Sequoia Club, Fresno.*

Humboldt County Medical Society
President, Allan R. Watson, 350 E Street, Eureka.
Secretary, Lawrence A. Wing, Fifth and F Streets, Eureka.
Meeting, *First Thursday.*

Imperial County Medical Society
President, Floyd A. Burger, Box 193, El Centro.
Secretary, Merritt C. Canfield, 204 Professional Building, El Centro.
Meeting, *Third Tuesday, 7 p. m., Barbara Worth Hotel, El Centro.*

Kern County Medical Society
President, H. R. McAllister, Professional Building, Taft.
Secretary, C. S. Compton, 428 C Street, Bakersfield.
Meeting, *Third Thursday, 8:30 p. m.*

Kings County Medical Society
President, P. K. Edmunds, Corcoran.
Secretary, William A. Johnstone, Hanford.
Meeting, *Second Monday, 8 p. m., Legion Hall, Hanford.*

Lassen-Plumas-Modoc County Medical Society
President, C. I. Burnett, Susanville.
Secretary, Fred J. Davis, Jr., Westwood.
Meeting, *On Call.*

Los Angeles County Medical Association
1925 Wilshire Boulevard, Los Angeles
President, John P. Nuttall, 203 Professional Building, Santa Monica.
Secretary, E. Vincent Askey, 1925 Wilshire Boulevard, Los Angeles.
Meetings, *First and Third Thursdays, 1925 Wilshire Boulevard, Los Angeles.*

Marin County Medical Society
President, Anne L. Brady, Albert Building, San Rafael.
Secretary, Carl W. Clark, 510 B Street, San Rafael.
Meeting, *Fourth Thursday, 6:30 p. m., Marin Golf and Country Club.*

Mendocino-Lake County Medical Society
President, Thomas P. Hill, Lakeport.
Secretary, Charles A. Craig, Lakeport.
Meeting, *On Call.*

Merced County Medical Society
President, Max Brannon, Merced.
Secretary, Fred O. Lien, Shaffer Building, Merced.
Meeting, *Third Thursday, Hotel Tioga, Merced.*

Monterey County Medical Society
President, Garth Parker, 8 East Alisal Street, Salinas
Secretary, Arthur L. Wessels, Salinas National Bank Building, Salinas.
Meeting, *First Thursday.*

Napa County Medical Society
President, Fred Heegler, Migliavacca Building, Napa.
Secretary, M. M. Booth, Bruck Building, St. Helena.
Meeting, *First Wednesday.*

Orange County Medical Society
President, Waldo S. Wehrly, 620 N. Main St., Santa Ana.
Secretary, Glenn Curtis, 323 So. Pomona Street, Brea.
Meeting, *First Tuesday, 8 p. m., Chapel of the Orange County Hospital, Orange.*

Placer County Medical Society
President, C. E. Lewis, 59 Lincoln Ave., Auburn.
Secretary, Robert A. Peers, Colfax.
Meeting, *At Call of President.*

Riverside County Medical Society
President, H. L. Ratliff, 3616 Main Street, Riverside.
Secretary, Thomas A. Card, 3616 Main Street, Riverside.
Meeting, *Second Monday, 8 p. m., Library, Riverside Community Hospital.*

Sacramento Society for Medical Improvement
President, Raymond M. Wallerius, 312 Physicians Building, Sacramento.
Secretary, Glenn E. Millar, 321 Physicians Building, Sacramento.
Meeting, *Third Tuesday, 8:30 p. m., Auditorium, Sacramento.*

San Benito County Medical Society
President, L. C. Hull, Hollister.
Secretary, L. E. Smith, Hollister.
Meeting, *At Call of President.*

San Bernardino County Medical Society
President, D. C. Mock, 215 Cajon Street, Redlands.
Secretary, A. E. Varden, Medico-Dental Building, San Bernardino.
Meeting, *First Tuesday, 8 p. m., San Bernardino County Charity Hospital.*

San Diego County Medical Society
Fourteenth Floor, Medico-Dental Building, 233 A Street, San Diego
President, S. J. McClendon, 2001 Fourth Street, San Diego.
Secretary, W. H. Newman, Medico-Dental Building, San Diego.
Meeting, *Second Tuesday, El Cortez Hotel.*

San Francisco County Medical Society
2180 Washington Street, San Francisco
President, T. Henshaw Kelly, 490 Post Street, San Francisco.
Secretary, Stanley H. Mentzer, 2180 Washington Street, San Francisco.
Meetings, *Every Tuesday, 8:15 p. m., 2180 Washington Street, San Francisco.*

San Joaquin County Medical Society
President, John S. Blinn, 1101 Medico-Dental Building, Stockton.
Secretary, George H. Rohrbacher, Medico-Dental Building, Stockton.
Meeting, *First Thursday, 8:15 p. m., Medico-Dental Club Rooms, Stockton.*

San Luis Obispo County Medical Society
President, Charles R. Kennedy, Bank of America Building, Paso Robles.
Secretary, E. D. Anderson, 1120 Morro Street, San Luis Obispo.
Meeting, *Third Saturday, 6:30 p. m., Mulholland's Grill, San Luis Obispo.*
(Roster lists continued on advertising page 6)

San Mateo County Medical Society
President, Frank S. Gregory, 736 Main Street, Redwood City.
Secretary, J. Garwood Bridgman, 205 Third Avenue, San Mateo.
Meeting, *Fourth Wednesday, Benjamin Franklin Hotel, San Mateo.*

Santa Barbara County Medical Society
President, Irving Wills, 1421 State Building, Santa Barbara.
Secretary, William H. Eaton, 822 De la Guerra Terrace, Santa Barbara.
Meeting, *Second Monday, Cottage Hospital.*

Santa Clara County Medical Society
President, R. Stanley Kneeshaw, 404 Medico-Dental Building, San Jose.
Secretary, Leslie B. Magoon, Medico-Dental Building, San Jose.
Meeting, *Third Wednesday, 8 p. m., Medico-Dental Building, San Jose.*

Santa Cruz County Medical Society
President, A. N. Nittler, 36½ Pacific Avenue, Santa Cruz.
Secretary, Samuel B. Randall, Farmers and Merchants Bank Building, Santa Cruz.
Meeting, *Second Tuesday, 7:30 p. m., Hotel Rio del Mar, Aptos.*

Shasta County Medical Society
President, Oscar J. Hansen, 318 Yuba Street, Redding.
Secretary, Leslie J. Seeley, 1432 York Street, Redding.
Meeting, *Second Monday.*

Siskiyou County Medical Society
President, E. F. Carlson, Fort Jones.
Secretary, J. B. McGuire, Mt. Shasta City.
Meeting, *Second Sunday.*

Solano County Medical Society
President, H. Brownlie Perkins, 445 Georgia Street, Vallejo.
Secretary, John W. Green, Box 539, Vallejo.
Meeting, *Second Tuesday, 8 p. m., Casa de Vallejo Hotel, Vallejo.*

Sonoma County Medical Society
President, C. B. Andrews, Sonoma.
Secretary, C. M. Carlson, 1055 Fourth Street, Santa Rosa.
Meeting, *Second Thursday.*

Stanislaus County Medical Society
President, Marion C. Collins, Turlock.
Secretary, Edwin F. Hagedorn, Box 834, Modesto.
Meeting, *Second Friday.*

Tehama County Medical Society
President, Donald E. Thompson, Red Bluff.
Secretary, F. J. Bailey, Red Bluff.
Meeting, *At Call of President.*

Tulare County Medical Society
President, J. C. McClure, Lindsay.
Secretary, Karl F. Weiss, Security First National Bank Building, Visalia.
Meeting, *Sunday Evening once a month.*

Ventura County Medical Society
President, F. R. Hendricks, 885 East Main Street, Ventura.
Secretary, A. A. Morrison, 625 Main Street, Santa Paula.
Meeting, *Second Tuesday, Ventura County Country Club.*

Yolo-Colusa-Glenn County Medical Society
President, Stanley E. Coffey, 239 Fourth Street, Orland.
Secretary, Ray E. Nichols, Woodland.
Meeting, *First Tuesday.*

Yuba-Sutter County Medical Society
President, Stanley R. Parkinson, 434 Fourth Street, Marysville.
Secretary, Fred W. Didier, Wheatland.
Meeting, *Second Tuesday.*

BUT THERE'S A BIG DIFFERENCE...

Two teeth may sometimes look so nearly identical that even the dentist is surprised at what the X-ray picture reveals. And likewise, a deficient vitamin product can't always be judged by appearance. It may look, weigh, taste and smell exactly like one fully potent.

Realizing this—and knowing, too, that deficient vitamin products are sold—more and more physicians now protect patients by *writing* prescriptions for Haliver Oil with Viosterol and specifying *Abbott* whenever vitamins A and D are indicated.

Rigid bio-assays and beginning-to-end control of production warrant your complete confidence in Abbott vitamin products. Prescribe Abbott's Haliver Oil with Viosterol

routinely for all who require additional amounts of vitamins A and D. Available at prescription pharmacies everywhere in soft, entirely tasteless, 3-minim capsules in boxes of 25, 50, 100 and 250. Supplied also in 10-cc., 20-cc., and 50-cc. vials with special droppers.

DIARRRHEA

"the commonest ailment of infants in the summer months"

(HOLT AND McINTOSH: HOLT'S DISEASES OF INFANCY AND CHILDHOOD, 1933)

One of the outstanding features of DEXTRI-MALTOSE is that it is almost unanimously preferred as the carbohydrate in the management of infantile diarrhea.

In diarrhea, "The sugar is added gradually, conditions admit, some sugar other than milk sugar or cane sugar being used, preferably dextrose and maltose."—H. E. Small: *Diarrhoea in bottle-fed infants*, J. Maine M. A. 12:152-158, Jan. 1932.

In diarrhea, "Carbohydrates, in the form of can be handled without trouble."—B. B. Jones: *A discussion of some of the commoner types of infantile diarrhea, and the principles of the diets used in their treatment*, Monthly, 66: 411, 1932.

"The most desirable sugar is dextri-maltose because of all the sugars maltose is least apt to cause."—A. I. Blau: *The use of protein milk*, J. Pediatr. 1: 359, April 2, 1932.

Concerning the treatment of diarrhea, "If the weight remains stationary, it is an indication that loss of substance is occurring through the stools, mostly in the form of alkaline salts. To equalize this loss of substance, the diet must be increased, but in such a way as to avoid causing fermentation. This may be done by adding dextri-maltose and preparations of protein to the food, increasing the calories until the infant is taking 160 calories per kilo. of body weight."—H. L. Rainoff: *Nutritional disturbances*, Arch. Pediatr., 41:771 Nos., 1924.

"... Professor Finkelstein in the science of being able to feed the infant with fermented like protein milk, after only one day on the vantage of being able to safely add a carbohydrate like Dextri-Maltose No. 1 or No. 2 to the protein milk within a few days, enables one to gradually bring the infant up to its basal level a short time. When protein milk was used, the result that many children were advised to be of collapse. The suggestion of Toronto, Canada, that Dextri-Maltose be added to protein milk, was of great periods without adding carbohydrate. It is emphasized that regardless of the stools, carbohydrate must be added to avoid collapse."—G. J. Feldstein: *Diarrhea in infants and children*, Arch. Pediatr., 41: 1933.

In cases of malnutrition and indigestion, "The appetite improves rapidly, and the stools soon become normal in appearance. By this I refer to an intelligent person. I have used it in proper proportions to looseness, for I find there is a tendency to looseness."—M. Ludd: *For the treatment of diarrhea*, J. Pediatr., 1: 196, July, 1932.

"After the preliminary short period of starvation, protein milk should be used. ... When dextri-maltose has been sufficiently checked, dextri-maltose may be added and gradually increased until from 4 to 6 tablespoons are being used."—W. L. Denney: *Acute nutritional disturbances of infancy*, Univ. West. Ontario M. J. 2:132-137, April, 1932.

Regarding the treatment of diarrhea, "In our experience, the most satisfactory carbohydrate for routine use is Mead's dextrin-maltose No. 1."—F. R. Taylor: *"Summer Complaints," Southern Med. & Surg.*, pp. 655-559, August, 1927.

In cases of diarrhea, "For the first day or so no sugar should be added to the milk. If the bowel movements improve carbohydrates may be added. This should be the one that is most easily assimilated, so dextri-maltose is the carbohydrate of choice."—W. H. McCaslan: *Summer diarrheas in infants and young children*, J. M. A. Alabama, 1:278-282, Jan., 1932.

There is any tendency to sugar fermentation use a preparation with a high dextrin and relatively low maltose content, as Mead's dextri-maltose.

"If it is desired to feed an unusually large amount of sugar to a baby, it is well to use a maltose-dextrin preparation, as in this way there is less danger of bringing about sugar fermentation than if lactose were used."—L. W. Hill: *Practical Infant Feeding*, W. B. Saunders Co., Phila., 1922, p. 206.

"The young one-third milk, usually skimmed at first, and a half ounce of Dextri-Maltose as the carbohydrate, most easily digested. ... Preparations containing the more maltose are more rapidly absorbed, but on the other hand, are more popular to produce diarrhea. ... Lactose which was very popular at one time, is never used in our work. The consensus of opinion seems to be that milk sugar is often a source of indigestion in normal infants and the primary cause of fermentative dyspepsias in infants during the first year of life."—J. H. Reading, Jr.: *Artificial feeding of infants during the first year of life*, Arch. Pediatr., 47:344-354, June, 1930.

"Protein milk may be continued for several weeks when a gradual transition to a whole milk or evaporated milk formula, which will supply about one and one-half to two ounces of whole milk or every pound of body weight, is reached. This should finally have the addition of dextri-maltose amounting to five to seven per cent."—R. A. Strong: *Summer diarrheas in infancy and early childhood*, Arch. Pediatr., 47:344-354, June, 1930.

"The treatment of diarrhea, 'Dextri-maltose preparations are preferred, for they do not ferment readily, are rapidly absorbed and leave very little for fermentation.'—V. A. Blenkle: *Protein milks in infant feeding*, Arch. Pediatr., 42:743-760, Nov., 1925.

"... I begin to add carbohydrates slowly, by replacing 1/4 ounce Casec every two days with 1/4 ounce of Dextri-Maltose, preferably Dextri-Maltose Number one. As a rule, this is tolerated. When one ounce of Dextri-Maltose is used, the Casec, of course, should be discontinued."—I. W. Reed: *The etiology and treatment of diarrhea*, J. Pediatr., 1: 196, July, 1932.

"When sugar causes diarrhoea one can change the form of it. Mead's Dextri-maltose, in small doses is more quickly absorbed and so superior to castor [cane] sugar. Lactose is expensive and seems not to be better than castor sugar."—H. B. Glendon: *Infant Feeding*, J. Pediatr., 1: 196, July, 1932.

"Milk-sugar, which has been so extensively used in the past, should never be used where there is any digestive disturbance. It is not as easily digested as either cane-sugar (granulated sugar) or dextri-maltose. The latter is the best of all sugars to use, especially if there is any tendency to looseness of the bowels."—A. Brown: *The Nutrition of the Infant*, F. D. Goodchild: *Infant Child; Its Care and Feeding*, F. D. Goodchild Company, Toronto, 1933, p. 120.

For cases of fermentative diarrhea, "... the ideal plan of treatment would be to give a food of organisms thrive on) and high in protein. Calcium caseinate milk accomplishes this purpose. In our series of cases, we found it was necessary to use the casein calcium for from 5-8 days; we then stopped it and added dextri-maltose to the formula."—A. G. DeSanctis and L. V. Pader: *The value of calcium caseinate milk in fermentative diarrhea*, Arch. Pediatr., 47:344-354, June, 1930.

Just as DEXTRI-MALTOSE is a carbohydrate modifier of choice, so is CASEC (calcium caseinate) an accepted protein modifier. Casec is of special value for (1) colic and loose green stools in breast-fed infants, (2) fermentative diarrhea in bottle-fed infants, (3) prematures, (4) marasmus, (5) celiac disease. MEAD JOHNSON & CO., EVANSVILLE, IND., U. S. A.

When requesting samples of Dextri-Maltose, please enclose professional card to cooperate in preventing their reaching unauthorized persons.

COÖPERATE WITH YOUR ADVERTISERS

CALIFORNIA AND WESTERN MEDICINE, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention CALIFORNIA AND WESTERN MEDICINE.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this JOURNAL to members and readers.

A SERVICE AGENCY—FOR READERS

THE JOURNAL of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely free to every member of the California Medical Association. The Coöperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in CALIFORNIA AND WESTERN MEDICINE, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. CALIFORNIA AND WESTERN MEDICINE and the A. M. A. Service Bureau desire to serve you.

COOK COUNTY GRADUATE SCHOOL OF MEDICINE

(In affiliation with **COOK COUNTY HOSPITAL**)

Incorporated not for profit

Announces Continuous Courses

MEDICINE—Informal Course first of every week; Intensive Personal Courses during August.

SURGERY—General Course One, Two, Three and Six Months; Two Weeks Intensive Course Surgical Technique (Operative Surgery with Practice); Clinical Course. Courses available every week.

GYNECOLOGY—Four Weeks Intensive Personal Course starting August 2. Two Weeks Intensive Course starting September 20 and October 18.

FRACTURES AND TRAUMATIC SURGERY—Informal Practical Course; Ten-day Intensive Course starting July 12.

OTOLARYNGOLOGY—Two Weeks Intensive Course starting October 4.

OPHTHALMOLOGY—Two Weeks Intensive Course starting October 18.

UROLOGY—General Course Two Months; Intensive Course Two Weeks; Special Courses.

CYSTOSCOPY—Intensive Course every two weeks (attendance limited).

General, Intensive and Special Courses in all branches of Medicine and Surgery starting every week.

TEACHING FACULTY — ATTENDING STAFF OF COOK COUNTY HOSPITAL

Address: Registrar, 427 South Honore Street, Chicago, Ill.

Announcing the **Coronation Acousticon** FOR THE HARD OF HEARING

Not merely a New Model, but an entirely new conception of the advantages to be gained from a compensating Hearing Aid.

We welcome an opportunity to show the Coronation Acousticon to you and suggest that you allow us to demonstrate at our office the many advantages of the new Acousticon to the deafened patient without obligation. The evidence from the lips of your own patient will, we believe, be conclusive.

and the profession since 1902*

The Summer-Time Use of Mead's Oleum Percomorphum.—During the hot weather, when fat tolerance is lowest, many physicians have found it a successful practice to transfer cod-liver oil patients to Mead's Oleum Percomorphum.

Due to its negligible oil content and its small dosage, this product does not upset the digestion, so that even the most squeamish patient can "stomach" it without protest.

There are at least two facts that strongly indicate the reasonableness of the above suggestion: (1) In prematures, to whom cod-liver oil cannot be given in sufficient dosage without serious digestive upset, Mead's Oleum Percomorphum is the antiricketic agent of choice. (2) In Florida, Arizona and New Mexico, where an unusually high percentage of sunshine prevails at all seasons, Mead's Oleum Percomorphum continues increasingly in demand, as physicians realize that sunshine alone does not always prevent or cure rickets.

Mead Johnson & Company, Evansville, Indiana, invite you to send for samples of Mead's Oleum Percomorphum for clinical use during the summer months to replace cod-liver oil.

If one continues to ply one's mind, growth ensues, even in the years formerly supposed to be marked by stagnation and decay. To foster this growth one must not trust too much to the casual gains of everyday work and experience. One must put forth directed efforts. Merely to maintain one's status is not enough. He who is satisfied to stand still will soon slip backward. To grow one must go on learning. So it has come about that education, formerly thought to be an activity limited to the days of one's youth, is now seen in one form or another to be desirable in all periods of life. Thus, one continues to improve; thus, one keeps young.

Do not spend your days waiting for an angel to deliver realized hopes at your door. Go out and toil for them. There are few forms of hard work more wearying than waiting.

Action Pictures.—E. I. du Pont de Nemours & Company, Wilmington, Delaware, announce they have recently taken a great number of action pictures at various du Pont plants, showing important phases in the manufacture of a number of this company's products. These pictures are now available to you for publication. Below we are submitting a list of the pictures on hand from which you are privileged to make a selection of those subjects in which your readers are interested. The list follows: Plastics, Perfumes, Vitamin D Synthesis, Du Pont Film, Alumina Sulphate, Sulphuric Acid, Handling Raw Bauxite, Neoprene, Synthetic Camphor, Dyes, Gardinol, Technical Laboratory, Jackson Laboratory (Including the Semi-Works), Pest-Control Laboratory.

If those who are interested in pictures on any of the above subjects and will communicate with this office, the Company will be very glad to forward a representative group on the subject, or subjects.

The Use of "Benzedrine Inhaler" in Children.—Scarano and Coppolino (Arch. Pediat., 54:97, Feb., 1937) report on the use of "Benzedrine" (benzyl methyl carbamine, S. K. F.) in vapor phase in one hundred cases of nasal congestion in children. The ages of the group ranged between two months and twelve years, with eleven under one year of age.

In 97 per cent, or all but three cases, "Benzedrine" vapor diminished engorgement, established ventilation and relieved congestion promptly and effectively. With nursing infants this form of therapy was particularly effective.

Discomfort following administration was mild and infrequent, and in no instance severe enough to cause discontinuance of treatment. No systemic reactions such as restlessness or sleeplessness were observed; nor did continued use produce tolerance, atony, or bogginess.

The authors conclude that "Benzedrine Inhaler" therapy is effective and acceptable to the child patient. At the same time it tends to eliminate the pain and discomfort which so often complicate the administration of liquid vasoconstrictors.

HOSPITALS AND SANATORIUMS

National Health Inventory.—The National Health Inventory of the United States Public Health Service, started October 1, 1935, reports in the *Health Officer* for January, 1937 (p. 333), that on October 1, 1936, the work of coding and card-punching data is from 40 to 50 per cent complete. This is much the largest study ever undertaken, covering almost a hundred times as many as the next largest previous study; 867,000 family schedules, representing some 3,000,000 persons, have been returned. Physicians have been asked to confirm diagnoses, and about 555,000 medical report forms were sent to approximately 35,000 doctors and institutions. The responses, with reports, range from 50 to 100 per cent. The study of occupational morbidity and mortality covered industrial sick benefit associations in more than 390 firms and produced 564,000 schedules suitable for analysis. Approximately 40 per cent of the health survey schedules showed no cases of illness. The first tabulations are intended to give (1) the prevalence of each chronic disease, each group, sex and color, (2) the number of persons disabled on the day of enumeration and (3) for a year's period the incidence of illness lasting seven days or longer, together with the number of bed and hospital cases among these illnesses.—*Journal A. M. A.*

Depressions would not come like locusts to vex us if the persons elected to public office were adequately trained in the science and art of government. Jefferson and Hamilton knew the principles underlying their age of agriculture, craft, and small trade. Our complex times can be coped with only by those who command such subjects as economics, law, social and political theory, biology, and logic. A career of the highest merit is now opening to those who have resolved to prepare themselves for governmental service, doing it with such thoroughness as is found among those entering the medical profession. What the country needs above all is voters and office-holders who reason from ascertained premises rather than let themselves be carried to conclusions by fear, favor, or pressure.—Leon J. Richardson.

The Test of Time

We have been making the Baumanometer now for some twenty-one years, which is a long while to devote exclusively to the making of *any* one thing. And in all of that time our work has never deviated from these three principles:

ACCURACY—above all else, the rock upon which the Baumanometer first won the medical profession's confidence.

SIMPLICITY—the "irreducible minimum" number of parts, especially valves or joints to leak air pressure or mercury.

RELIABILITY—to the end that whatever variation is found, you may be sure it is in the patient, and *not* in the instrument.

To-day our most cherished asset is the confidence, and good-will, and respect of doctors and hospitals throughout the world . . . The Baumanometer has stood the test of time.

You don't buy a sphygmomanometer every year, so why not have a genuine Lifetime Baumanometer. First-cost may be a little more, but *through the years* it actually costs less.

Everyone should order his daily life so as to have some leisure, for it is during such parts of the day that many important decisions are made. Then a man has time to think quietly and to do some of the things, like reading, that make for his mental growth. If work tends to get him into a rut, leisure lifts him out again. If work is not carrying him to a proper goal, it is often during leisure that he discovers the fact and directs his course anew.

First United States Pharmacopeia Supplement Delayed.—There has been a slight delay in the issuance of the United States Pharmacopeia Supplement, due to changes in plans for the binding. It was originally proposed that the "First Supplement" would be issued with a stout paper cover and that this would be enclosed in a strong spring-back binder capable of also holding such future supplements as would be issued.

Now, however, to make the "Supplement" less costly it has been decided to offer it without the spring binder, although the binder will still be available for those who desire it. The purpose of the spring binder has been to keep all "Supplements" together and in such form that they may stand on the shelf by the original Pharmacopeia, or be serviceable in the laboratory. With this change in plans the individual Supplement will be bound in a more substantial, but flexible, cover. The proper development of this feature has taken a longer time than was expected.

The Supplement soon to be issued will be known as the "First Supplement to the Pharmacopeia of the United States, Eleventh Decennial Revision." It may not be necessary to issue Supplements annually, but these will be published whenever the number of new interim revision changes justify their publication. The delay in the release of the "First Supplement" will no doubt necessitate an advance in the date when the new standards are to become official.

Orders for the "First U. S. P. XI Supplement" should be sent to The Mack Printing Company, Easton, Pennsylvania, or to any of the regular distributing agencies for the Pharmacopeia. The price will be \$1.

minimizes scarring

A FEATURE OF
ANTI-PYREXOL

This most comfortable, and least troublesome dressing for burns may be depended upon to:

1. Relieve pain promptly.
2. Protect denuded areas.
3. Give antiseptic protection.
4. Combat toxemia.
5. Promote prompt healing.
6. Minimize scarring.

Anti-Pyrexol is available through surgical supply houses and drug jobbers in 2-oz. tubes, 1-lb., 5-lb., 10-lb. tins. For technical information address Mona E. Bettin (M.D.), Pathological Laboratories, Roosevelt Building, Los Angeles, or:

Every Family Should Have a Regular Physician, Doctor Tobey Says in "The Common Health."—"No person should defer engaging or becoming acquainted with a physician until disease is manifest, an accident occurs, or a baby is expected," Dr. James A. Tobey declares in "The Common Health," one of the twenty volumes of the National Health Series prepared under the auspices of the National Health Council, which has just been published.

"Every family should have a competent and reliable medical adviser, who should be visited regularly once a year for a general health examination, and consulted from time to time about health promotion and disease prevention. His services will, of course, be sought in emergencies and when disease occurs. Similarly, the dentist should be visited twice a year.

"Physicians, like others who have valuable services to sell, are worthy of their hire. They have spent long years in preparing for their honorable profession, they have devoted much time as internes with practically no compensation except highly valuable experience, and they have had to build up their practices over long periods. They give their services freely to the poor and afflicted, to clinics, and to the hospitals in the community. They earn and deserve the moderate fees that they charge, and they should be paid promptly and gratefully by their patients."

There is a principle which is a bar against all information, which is proof against all argument and which cannot fail to keep a man in everlasting ignorance. That principle is "condemnation before investigation."—Herbert Spencer.

Few of the talents that heaven sows are ever brought to light.—Leon J. Richardson.

BOOK REVIEWS

Surgical Treatment. By James Peter Warbasse, M. D., F. A. C. S., Special Lecturer in the Long Island Medical College, Formerly Attending Surgeon to the Methodist Episcopal and the Wyckoff Heights Hospitals, Brooklyn, New York; and Calvin Mason Smyth, Jr., B. S., M. D., F. A. C. S., Assistant Professor of Surgery in the University of Pennsylvania, Graduate School of Medicine, Surgeon-in-Chief to the Methodist Episcopal Hospital, Philadelphia, Pennsylvania, and Visiting Surgeon to the Abington Memorial Hospital, Abington, Pennsylvania. Second Edition. Philadelphia and London: W. B. Saunders Company, 1937.

A sound conservative surgical textbook in three volumes which has been revised and brought up to date. While the work is primarily devoted to surgical procedures, it does not neglect the underlying physiologic principles and discusses therapy by drugs, biologics, and radiation. The equipment and preparations for operative treatment are presented in minute detail.

**PHYSICIANS CASUALTY ASSN.
PHYSICIANS HEALTH ASSN.**

400 First National Bank Building

OMAHA NEBRASKA

The work is arranged according to regions, and the anatomy of the regions is described concisely. The descriptions are well illustrated by drawings and diagrams. The technique of surgical procedures is given in detail and well illustrated. In many instances a number of alternative technical methods with the uses and advantages of each are discussed.

The portion dealing with the blood vessels includes a short section on the alternating positive and negative pressure treatment of pregangrenous vascular occlusion. That devoted to the abdomen is complete and very well illustrated.

On the whole it is a splendid text and should be of value especially to the general practitioner.

A Medical Formulary. By E. Quin Thornton, M. D., Emeritus Professor of Therapeutics, Jefferson Medical College. Fourteenth Edition. Pp. 363. Price, \$2.75. Philadelphia: Lea & Febiger.

The first edition of this formulary was printed thirty-eight years ago. The fourteenth edition, revised to date, is now offered. The purpose of this guide is intended to discourage the prescribing of secret and patented preparations that manufacturers foist upon the profession. Physicians are tendered prescription forms that are pharmaceutically and therapeutically potent. They are arranged to meet symptoms and diseases. Their exhibition is clearly indicated.

Physicians will do well to consult this formulary, for it will be most helpful in developing scientific prescribing of drugs.

Medical Urology. By Irvin S. Knoll, B. S., M. D. Pp. 431, illustrated. Price, \$5. St. Louis: C. V. Mosby Company.

This text presents nothing new in urology. It does present to the general practitioner present-day urology principles in a practical understandable manner. It clarifies many details related to diagnosis, pathology and treatment, thus enabling the medical man to better treat the urologic conditions of his patients.

This text, therefore, will be most helpful to the practitioner, for it gives him principles and procedures that

What's Back of Our R Service?

There's a long story back of our R Service—a story of many years of honest, painstaking endeavor. The very nature of the refraction procedure demands the very best of materials to faithfully interpret the ophthalmic prescription, and Riggs R Service has always been dedicated to this end.

You can always depend on Riggs R Service.

California Treasury and to be used by the California State Board of Medical Examiners in enforcing the Medical Practice Act of California; and . . .

* * *

Second Session, April 17, 1912, at 8:40 p. m.—The House of Delegates was called to order by the President at 8:40 p. m. and fifty-four delegates responded to the first roll-call; others came in and were seated subsequently. The President declared a quorum present and the House ready for business.

President.—O. D. Hamlin of Oakland, was nominated by G. P. Reynolds and seconded by Dudley Tait. There being no further nominations, the nominations were declared closed and on motion the Secretary was instructed to cast the ballot of the House. This was done and O. D. Hamlin declared elected president for the ensuing year.

First Vice-President.—Saxton Pope of Watsonville was nominated by G. G. Reinle, and there being no other nominations, on motion the Secretary was instructed to cast the ballot of the House, which was done, and Saxton Pope declared elected.

Secretary.—Philip Mills Jones was nominated by George H. Kress, and there being no other nominations, the Presi-

dent was on motion instructed to cast the ballot of the House, which was done.

* * *

Report of the Reference Committee on Reports and New Business.—This report was first read as a whole and was then taken up section by section. . . .

* * *

9. Eye, Ear, Nose and Throat and Urological Sections. The Committee recommends that such official recognition be granted the Eye, Ear, Nose and Throat Section and that any necessary details in connection therewith be referred to the Council. V. G. Vecki moved to amend by including the Urological Section. Amendment accepted.

Address of the President: The Medical Education Problem, by Thomas W. Huntington, M. D., San Francisco.—It is hardly to be expected that anything original can be advanced bearing upon the general subject of medical education. The work of the Council of Medical Education of the American Medical Association, seconded by the efforts of President Pritchett, Abraham Flexner, Arthur Dean Bevan, and many others, has exhausted the subject from the standpoint of modern ideals. General policies have been finally determined and it remains only to call attention to some of the perplexing details which confront all teachers associated with university medical departments. . . .

Report of the Secretary and Editor.—To the House of Delegates of the Medical Society of the State of California. Gentlemen:

. . . Membership. During the year 1911 twenty-four members died and twenty resigned; the resignations were in nearly every case caused by removal from the State.

TWENTY-FIVE YEARS AGO

(Continued from Page 15)

One member was suspended. The total membership on December 31, 1910, was 2,087; on December 31, 1911, it was 2,118, or an increase of thirty-one, in spite of the loss of forty-four by death and resignation. . . .

The medical defense work of the Society is of great importance, and it is absolutely essential that county societies keep their records and collect their dues in a proper business-like manner. . . .

In regard to our publications, the report of the Council will deal in detail; the editor can only say that the year was passed with rather less than the usual number of complications in spite of the increased size of the *Journal*. To the Publication Committee, to the Advertising Committee and to all those who have given assistance, he wishes to extend his thanks.

Respectfully submitted,
Philip Mills Jones,
Secretary.

Report of the Council.
To the House of Delegates.

. . . Medical Defense. Our medical defense plan has been found to work out most admirably. A very large number of threatened suits have never been brought, probably due to the fact that such threats were promptly turned over to our attorneys, who notified the complaining parties that any suit brought would be fully defended. . . .

Appeal to the Council. Dr. — of Santa Barbara appealed to the Council against the action of the Santa Barbara County Medical Society in suspending him from membership for the period of five years. . . .

Report of the Committee on Cancer.—Your Committee on Cancer was empowered by you to prepare a brochure of about one thousand words dealing with the cancer question in a general way, subject to the approval of the Publication Committee, and, if so approved, one hundred thousand copies were to be printed for public distribution through the members of this society. . . .

Consultation among the members of the Cancer Committee, as well as with the members of the Publication Committee and other of our members, brings the committee before you with the opinion that the time is not quite ripe for presenting the cancer problem to the general public in the form of a published statement. We advise, therefore, that the Cancer Committee be, for the present, discharged.

Is Purer Nitrous Oxide Desirable?

Many of the leading hospitals in California, Washington, Oregon and Arizona answer "yes"—and use Stuart Hi-Pure, the nitrous oxide of 99% plus purity.

These hospitals believe that a nitrous oxide of maximum practical purity is a definite aid to more even anesthesia.

March 16, 1933, the *first* cylinder of Hi-Pure was delivered to a San Francisco hospital. So far as we know, it was then, as it is *now*, the only nitrous oxide of 99% plus purity manufactured in the United States. For complete clinical data, address us at 211 Bay Street, San Francisco.

SEATTLE

PORTLAND

TACOMA

From an Article on "Hypophysis Diseases and Their Diagnosis" by C. M. Cooper, M.B., San Francisco.—Vesalius appears to have been the first to describe this organ, and in his "De Corporis Humani Fabrica," 1553, he calls it the "*glans pituitam encipiens*," under the mistaken idea that this organ secreted the "pituita" or nasal mucus. It is of interest to note here that in the lampreys the pituitary tube which remains during life opens on the dorsal aspect of the head, and, though it does not secrete the nasal mucus, it functions as an external nostril. . . .

Report of Medical Education by W. F. Snow, M.D., Sacramento.—To the President, Thomas W. Huntington.

Dear Sir—As representative from California, I attended the series of conferences held in Chicago February 26 to March 1, 1912, inclusive. These conferences were as follows:

1. Conference of American Medical Association on Medical Education.

(Continued on Next Page)

BUTLER BUILDING

TWENTY-FIVE YEARS AGO

(Continued from Preceding Page)

2. Conference of American Medical Association on Medical Legislation.
3. Conference of American Medical Association on Public Health.
4. Conference of State Medical Examining and Licensing Boards.
5. Annual meeting of Association of American Medical Colleges.

All of these meetings were well planned, full of interest, and well attended.

Medical Education.—The most interesting discussions during the sessions on medical education centered about the subjects of practical examinations for the licensing of medical graduates; and the relation of the medical school to a fifth or hospital year. . . .

Minutes of the Annual Meeting of the California Association for the Study and Prevention of Tuberculosis, April, 1912.—The annual meeting of the California Association for the Study and Prevention of Tuberculosis was held Wednesday, April 17, at the Hotel Del Monte, Del Monte, California.

The meeting was called to order by the president, Dr. George H. Kress of Los Angeles, and the annual report of the Secretary and Treasurer for 1911-1912 was read.

It was moved, seconded, and carried, that the report be accepted and ordered placed on file.

It was moved by Dr. W. Jarvis Barlow, and seconded by Dr. George H. Evans of San Francisco, that the report of the Secretary be published in the *State Journal*, and also that it be given publicity in the lay press. Motion carried. . . .

From an Article on "A Proposed Code of Public Health Regulations for California" by John N. Force, M.D., Berkeley.—In the year 1824 one Stephen Dodd, being pastor of the Congregational Church in East Haven, Connecticut, published a thin little volume wherein was set down the history and vital statistics of his town, between its settlement in 1664 and the year 1800. Those who are inclined to charge our modern congested cities with every crime against public health may read with profit the story of East Haven. . . .

From an Article on "Regulation of Hospitals" by William R. Dorr, M.D., San Francisco.—Just at present two separate and distinct movements are on foot in the hospital field which have been brought forward with the intention of regulating hospitals, and thus putting them in a better condition to serve the public at large.

One of these movements, which took the form of a bill presented at the last legislature, has had a temporary setback inasmuch as, although it passed both branches of said legislature, it failed to be signed by the Governor. This proposed law made it the duty of the State Board of Health to license all hospitals that, after a thorough investigation, were found to be thoroughly sanitary in location and equipment and to revoke said license if all the provisions of the law were not observed. Certainly nothing less than this could be required of hospital authorities. There were, however, other provisions of the bill that might be considered as objectionable and which were probably the reason that it failed to be signed.

The other of these movements is the attempt of this society to classify the different hospitals of this city and to point out to its members the hospitals that come up to certain standards and recommend that those, and only those, be patronized by the members of the Society. . . .

Intelligence is the most potent factor that can be directed against disease.

VITAMIN REQUIREMENTS OF MAN

IV. VITAMIN B₁

• The multiple nature of vitamin B has been definitely established by intensive research within the past decade. Considerable quantitative information is now available concerning the requirements of certain species of animals for the various factors contained in the vitamin B complex. At the present time, however, the anti-neuritic vitamin B₁ is the only one of these factors for which the minimum requirement for man can be postulated.

Beriberi-preventing diets of Chinese coolies and natives of Java have been estimated to contain 200 International units of vitamin B₁ (1). Practical use is made of knowledge such as this in the Philippines, where the Bureau of Science, in a successful effort to combat beriberi, dispenses tikitiki (vitamin B₁ concentrate from rice polishings) containing approximately 200 International units of vitamin B₁ per daily dose.

It is generally agreed that the absolute requirement for this factor may be variable, depending upon such factors as size and caloric intake of the individual. However, equations have been derived which take into consideration some of these variables and are useful in estimating the adult vitamin B₁ requirement (2).

Application of these equations indicate that approximately 225 International units of vitamin B₁ per day are required for the average American adult. The average daily infant requirement has been estimated to be

50 International units, increasing to 200 units at the time of adolescence (1). The League of Nations Technical Commission recommends a daily intake of over 150 International units for pregnant and lactating women (3).

While it may be possible to estimate the daily intake of vitamin B₁ which will prevent clinical beriberi, it is not yet possible to state the minimum amount of the vitamin which, when imposed on an otherwise adequate diet, will promote optimum nutrition. There is increasing belief that some of the vague disorders, noted clinically, may be in reality manifestations of suboptimal vitamin B₁ intake (4).

Today, we have the new concept of nutrition which recommends the intelligent inclusion in the varied dietary regime of foods with known nutritive values—thereby insuring that the individual is not dwelling in “the twilight zone of nutrition”. Thus has arisen the concept of “protective foods”.

Results of formal bio-assay have established many commercially canned foods as valuable sources of vitamin B₁ (5).

Incorporation in the diet of the wide variety of foods—made available throughout the year by commercial canning—will assist in the acquisition of an adequate supply of vitamin B₁, as well as other members of the B complex, essential to human nutrition and usually occurring in nature along with the antineuritic factor (6).

BOARD OF MEDICAL EXAMINERS

(Continued from Text Page 448)

"Charged with practice of 'fake healing' and illegally prescribing medicine, Maria P. Acosta, twenty-four, and Jesus Espinosa, twenty-one, both of 2501 M Street, today were in custody of Bakersfield police. The pair were arrested following investigation by Inspector Bob Knight and Lieutenant George Kerr. Miss Acosta and Espinosa, according to police, informed a Bakersfield woman she was ill because evil spirits had cast a spell over her and that for \$10 they could break the spell. After the initial fee had been paid, it developed that the spell was more complicated than first suspected and an additional \$20 was needed to purchase a 'super-spell buster.' At this stage of the 'cure,' police stepped in to cast a spell of their own over the asserted fake healers." (Bakersfield Californian, April 19, 1937.)

"Definitely abandoning any theory that an illegal operation caused the death of Mrs. Mary Shell, authorities proceeded today with plans to prosecute Mrs. Yanka Zlataroff, her mother, at a hearing next Tuesday before Judge W. H. Dinning in South San Francisco, on charges of performing two other illegal operations. The belief that an illegal operation performed by the mother, a confessed abortionist, might have caused her daughter's death, was given up after Chief of Police Louis Belloni of South San Francisco, who had returned from an investigation trip to Salinas. . . . 'We have no evidence of any abortion having been performed on Mrs. Shell,' he said, 'and if there was, it was performed in Salinas and would not be within our jurisdiction.' Meanwhile Mrs. Zlataroff, who has admitted performing two abortions, returned to her work at a South San Francisco Foundry, apparently unconcerned by the abortion hearing she faces and the fact that she is only at liberty under \$5,000 bond." (Redwood City Tribune, April 15, 1937.)

"Names, addresses and records of more than twenty known or suspected abortionists operating in San Francisco were submitted to Chief Quinn by his Homicide Squad yesterday as the latest sensational offshoot of the graft investigation. The Chief at once notified the commanders of the police districts in which the places are located, with orders for immediate investigation of everyone. . . . In the drive against the sordid and frequently fatal abortion racket, Dr. Charles B. Pinkham, Secretary of the State Board of Medical Examiners, is cooperating with the police. Abortion cases are under jurisdiction of the Homicide Squad, which enters the drive with Captain Arthur Layne in command. . . . The list of known or suspected abortionists was prepared yesterday at Captain of Detectives Charles Dullea's order. As the drive was launched, Doctor Pinkham called on Atherton with a request for whatever evidence the Investigator may have on the abortion racket. Homicide Inspector George Engler, who prepared yesterday's list, cited a number of cases, pending or past, as evidence of the scope of the abortion racket in the city. One of these will come up in Superior Court May 12, to be set for trial. It involves Minerva Geddes, Frances Zoffel, Rudolph Zoffel, and Eland Swindell (a woman) on charges of conspiracy to commit an abortion. . . . The tragic prelude to the case, according to Engler, was the death of Florence Alves, 119 Buckeye Street, Redwood City, following an illegal operation. Engler said that when the abortion death was called to the Homicide Squad's attention, police sent in their own woman investigator. She assertedly called at 1115-1117 McAllister Street, a known abortion 'agency' and made arrangements for an operation through the Swindell woman, who sent the investigator to 431 Ashbury Street. A woman investigator was about to submit to an operation when inspectors broke in by prearrangement. Engler said they made the arrests there and seized crude, unsterilized equipment and instruments. The place, he declared, was supposedly a private residence with a wooden library table serving for

BOARD OF MEDICAL EXAMINERS

(Continued from Page 20)

an operating table. Another recent case involving the McAllister Street address, he continued, was that of Mrs. Martha Kauffman, who died there in 1929. Conflicting medical testimony during a protracted coroner's inquiry, which was reopened last October, failed to prove use of instruments and no charges were brought. In still another case, Ora Davis last Friday, was permitted to change a plea of not guilty of murder to guilty of manslaughter and received three years' probation in Superior Court. The charge involved the death of a woman operated on in her own home on February 18. She died from 'horrible lacerations' en route to a hospital." (San Francisco Examiner, April 11, 1937.)

"Police today searched for Dr. William C. Norman, 55-year-old Glendale, physician, who disappeared late yesterday and is believed to be suffering from a recurrence of amnesia. Doctor Norman is described as weighing 195 pounds, blue-eyed, light-brown hair, and almost bald." (Los Angeles Evening News, April 7, 1937). The records of the Board of Medical Examiners do not show any licensee of this name.

"Charged with illegally prescribing morphin sulphate, Dr. Charles F. Vogel, thirty-two, osteopathic physician, was arrested yesterday at 4905½ Second Avenue. Doctor Vogel had been indicted on charges of violation of the Federal Narcotic Act. He was held under \$2,500 bond." (Los Angeles Illustrated Daily News, April 9, 1937.)

"Levon G. Kassabian, thirty-seven, of 817 West Fifty-eighth Street, today was sentenced to pay a fine of \$150 as a provision of two years' probation, given him by Municipal

Judge James H. Pope on a charge of practicing medicine without a license. Testimony at the trial indicated that Kassabian distributed cards identifying him as a physician, advertised as a doctor and signed prescriptions. . . ." (Los Angeles Evening News, May 5, 1937.)

Investigation reports relate that a warrant was recently issued in the Justice Court of Belvedere Township, Los Angeles, charging Rafael del Castillo Chausal with violation of the Medical Practice Act and bail was set at \$1,500. He was not apprehended. It is said he was convicted last year in Albuquerque, New Mexico, of violation of the Medical Practice Act and assertedly served three months in jail.

Food and Drug Shippers Fined.—Reports of the termination in the Federal Courts of twenty-seven criminal prosecutions were received during March, the Federal Food and Drug Administration reports. Ten of the cases had been brought against shippers of drug products found to vary from the official standards or their own label representations of strength, and patent medicines labeled with extravagant medicinal claims. In the former class were the Standard Chemical Company, Des Moines, Iowa, fined \$10 and costs; George H. Nowland Company, Cincinnati, Ohio, \$40; Endo Products, Inc., New York, N. Y., \$100; S. F. Durst & Company, Philadelphia, Pennsylvania, \$100; Drug Products Company, Inc., Long Island City, New York, \$300; and Sharp & Dohme, Inc., Philadelphia, Pennsylvania, sentence suspended by the court on plea of *nolo contendere*.

Patent medicine manufacturers involved in recent actions, and the offenses for which they were prosecuted, are: Mexican Medicine Company, Inc., Los Angeles, California, "Tabletas Marca Vida," containing compounds of bismuth, calcium, sodium and potassium, carbonates, nitrates, plant

extracts, starch and a laxative, for colic diarrhea, dysentery, indigestion, fevers, liver ailments, cramps, constipation, and for the prevention of scarlet fever, measles, whooping cough and diphtheria, fine \$100; Golden Peacock, Inc., Paris, Tennessee, a mouth wash represented as "highly antiseptic," "A powerful germ killer" and "ten times as strong as ordinary antiseptics," found to be not antiseptic, fine \$100 and costs.

A nominal fine of \$1 with costs was imposed by the Court on the Ferretone Company, Wichita, Kansas, shippers of "Ferretone Eye Lotion," offered for the treatment of eye ailments, and "Ferretone Tonic Tablets," offered for the treatment of various internal diseases and symptoms of disease. The Kraus-Near Chemical Company, Minneapolis, Minnesota, was fined \$50 because of a shipment of "Pep-O Iodized Dairy Minerals," represented as a treatment for diseases of cows.

False Curative Claims

Twenty medicinal preparations were picked up because of false and fraudulent curative claims on their labels. They were: "Akalyne" tablets, containing 3.2 grains of acetophenetidin and 2 grains sodium salicylate, bearing no declaration of the content of acetanilid derivative as required by the Act, and offered for the relief of headaches, neuralgia, rheumatism, menstrual disturbances, and gripe; a shipment of alum sold as a treatment for external hemorrhages and other bleedings from mucous membranes, for leukorrhea, ulcers, and sore throat; "Castrique Worm Powder," consisting entirely of sodium acetate, for worms, poor condition, unhealthy coat, loss of energy, red mange, rickets, and tapeworms in dogs.

"Colac Pile Pills," containing magnesium carbonate and vegetable material such as licorice, and coated with sugar, calcium carbonate and iron oxid, for piles and for strengthening the intestinal tract; "Grandma's Medicinal Herbs," mostly senna, with small amounts of couch grass, saffron, caraway and anise seed, licorice, sassafras, lavender, cinna-

mon and bearberry leaves, for weight control, bad complexion, general health improvement, indigestion, halitosis and b. o.

"Lawrence's Liniment," glycerin, phenol, iodine, 2.8 per cent alcohol and 27 minims chloroform per fluidounce, labeled "Alcohol 5 per cent, Chloroform 20 minims to ounce," for spasmodic croup and pains and soreness in the lungs; a shipment of methyl salicylate (synthetic wintergreen) offered as a treatment for rheumatism, gout, lumbago, and stiffness in the joints; "Munyon's Tona Spaf," a "salvage stock," consisting of iron and phosphorus, arsenic, alcohol, water and flavor, for colds, grippe, influenza, insomnia, anemia, diabetes, acidosis, senility, dyspepsia, exhaustion, indigestion, palpitation, debilitation, tired feeling, malnutrition and blood disorders.

"Needham's Red Clover Extract," a paste of plant materials without demonstrable therapeutic value, offered for the treatment of constipation, pimples, boils, carbuncles, diabetic conditions, internal and external growths, disorders of the stomach and bowels, run-down conditions, inflammation, coughs, lack of appetite, gangrene, ulceration, indigestion, low blood pressure, and poor circulation.

"Nod," tablets containing one and one-half grains phenobarbital and two grains amidopyrin, for "naturally" overcoming sleeplessness, nervousness, restlessness, and for soothing tense nerves, and represented as "safe" despite its amidopyrin content; "Picot Compound Tablets," sodium salicylate, sodium benzoate, potassium nitrate, magnesium carbonate, uva ursi and juniper oil, for pain in the back, loins and lumbar region, rheumatic infections, neurasthenia, dyspepsia, dropsy, Bright's disease, and nephritis.

"Picot Grape-Flavored Salt," sodium bicarbonate, potassium bitartrate, tartaric acid, sugar and saccharin, with no grape flavor, represented as derived from grapes, for rheumatism and to stimulate the stomach; "Prieto Tonic," water, glycerin, 10 per cent alcohol, potassium iodid, sodium benzoate and plant drugs, including cinchona, represented as a "tonic of walnut, Mexican herbs, roots and medicinal extracts used by the Indians for many years," for insomnia,

anemia, poor blood, chronic coughs, boils, pimples, skin diseases, light ulcers, poor appetite, bronchial congestion and herpes.

"Rx 333," aspirin and sodium salicylate, for the prompt relief of pain caused by rheumatism, lumbago, neuralgia, gout, arthritis, sciatica, neuritis, and swollen joints; "Right-O Round Worm Capsules," oil chenopodium, calomel, a plant laxative, sodium bicarbonate and mineral oil, for roundworms and pinworms in pups, dogs, and foxes.

"Simmons Cough Syrup," ammonium chlorid, sugar, vegetable extractives and water, and a trace of chloroform (label stated $3\frac{1}{2}$ minims chloroform to each ounce), for cough of catarrhal origin, whooping cough, influenza, hoarseness, sore throat, asthma, bronchitis, and bronchial affections; "Snipes' Japicura Skin Remedy" containing 17 per cent carbolic acid (the label declared 25 per cent), bearing no "Poison" label as required by the Federal Caustic Poison Act, and offered as a treatment for eczema, tetter, ringworm, rose patch, shingles, poison oak, insect bites, and itch; a shipment of sulphur, offered as a blood purifier in rheumatism and gout, and misbranded, under the Federal Insecticide Act, because of disinfecting and fumigating claims.

"Ter-O-Sul," starch, sodium bisulfate, sodium bicarbonate, sulphur and other inorganic compounds, for body fatigue, weariness, sleeplessness, arthritis, sciatica, neuritis, lumbago, gout, rheumatic ailments, skin disorders, and for reducing weight; "Uriseptin," methenamin, water, glycerin, plant extracts including corn silk, alcohol and salts of sodium, potassium and lithium, offered as a urinary antiseptic, for nephritis, pyelitis, urethritis, cystitis, calculus, rheumatism, gout, pneumonia, bacteriuria, gonorrhea, gleet, and suppurative diseases of the urinary tract.

Other drug products seized were a lot of "Neo-Cultol," represented as a source of *Bacillus acidophilus* but having few such viable bacilli per teaspoonful although at least fifty million microorganisms other than the one specified; nine packages of unsterile surgical bandages, 182 ampoules of pituitary extract below the United States Pharmacopeial

when a full
night's sleep
is important

DURING illness, or before an operation, sleep is particularly necessary; yet fear and worry often rob the patient of needed rest. In such cases the use of a safe and effective sedative is advisable.

Ipral Calcium has been used for more than twelve years as a safe sedative and hypnotic. It induces a sound, restful sleep closely resembling the normal, from which the patient awakens calm and generally refreshed. Ipral is readily absorbed and rapidly eliminated, its effect being chiefly confined to a selective action on the higher cerebral centers. In therapeutic doses no untoward organic or systemic effects have been reported from its use.

Ipral Calcium (calcium ethylisopropylbarbiturate) is supplied in 2-gr. tab-

lets and in powder form for use as a sedative and hypnotic.

Ipral Sodium (sodium ethylisopropylbarbiturate) is supplied in 2-gr. tablets and capsules for hypnotic use and in 4-gr. tablets for preanesthetic medication.

Tablets Ipral-Aminopyrine (2 gr. Ipral, 2.33 gr. Aminopyrine Squibb) provide both analgesic and sedative effects.

Ipral Calcium (Powder) is available in 1-oz. bottles. Tablets Ipral Calcium 2 gr., Tablets Ipral-Aminopyrine 4.33 gr., Tablets Ipral Sodium 2 gr. and 4 gr. and Capsules Ipral Sodium 2 gr. are available in bottles of 100 and 1000.

For literature address Professional Service Department, 745 Fifth Avenue, New York.

CHEMISTS TO THE MEDICAL PROFESSION SINCE 1838

TO THE DOCTOR'S WIFE

It is our conviction that cosmetics should be selected to suit the individual's requirements. We cater exclusively to you, the individual. Our representatives are trained to help you select suitable beauty preparations and to show you how to apply them.

It is only sensible to realize that a truly beautiful skin is first of all a healthy skin and secondly a well-cared-for skin.

Cosmetics serve to enhance your appearance, to present you at your best. In this regard it is well to bear in mind that a natural appearance is by far the most charming.

Carefully selected, and artistically applied, make-up preparations lose their identity as cosmetics and become an indistinguishable part of your personality.

We want it clearly understood that we in no way undertake to treat skin disorders. If you are thus afflicted we had rather that you not use our preparations without the consent of a skin specialist. Our formulary is available to the medical profession.

A card addressed to us will be referred to the manager of the territory in which you reside. It is our pleasure to be at your service.—LUZIER'S, Inc.

standard; 64 cans of impure ether, 28 dozen bottles of below-standard tincture of iodine, and 480 bottles of citrate of magnesia short in volume and not in conformity with the requirements of the United States Pharmacopeia.

More Money for Food, Spent to Better Advantage, Need of Low-Income Family.—"More money for food, and more effective application of present knowledge of food and nutrition to food-selection problems, are necessary if higher levels of nutrition are to be more generally attained by low-income city families," Dr. Hazel K. Stiebeling, senior food economist of the Bureau of Home Economics, United States Department of Agriculture, said recently in an address at the round-table conference on Nutrition and Public Health, held at the New York Academy of Medicine under the auspices of the Milbank Memorial Fund.

Summing up the results of a recent Bureau study on the diets of wage-earners and low-salaried clerical workers in North Atlantic, Southern, and Pacific Coast cities, Doctor Stiebeling said:

"Major differences in the amount and kind of food purchased by city families can be attributed to differences in the level of expense for food. With increasing expenditures for food, there is a marked increase in the total amount of all food purchased. The increases are much more marked in eggs, meats, milk, butter, and the succulent vegetables and fruits than in grain products, potatoes, dried legumes, and fats other than butter. This unequal distribution of the increases in food purchases with increasing expenditure for food results in more food for higher income groups, and in general, food richer in high-quality proteins, in minerals, and in vitamins.

"High expense for food is not necessarily a guarantee of adequate diets. The study showed that at spending levels between \$1.50 and \$4.50 per week per food-cost unit, some families managed to get 'Grade A' diets, some had 'B' diets, and others had 'Grade C' diets. (A food-cost unit is based upon the cost of the food required by a moderately active man.)

"As more money is spent for food, families tend to buy more of the milk, butter, eggs, succulent vegetables, fruits, and other foods which are good sources of the calcium or certain vitamins in which the most frequent shortages were found among the diets studied.

"Of the wage-earner families studied, about 10 per cent of those living in the North and far West, 38 per cent of the Southern white families, and 68 per cent of the negro families spent for food less than \$2 weekly per food-cost unit. About 20 per cent of the families of wage-earners in the North and far West, 6 per cent of the Southern white families, and less than 3 per cent of the negro families studied spent as much as \$4 weekly per food-cost unit.

"About one-fifth of the employed workers' families in the North Atlantic cities, an eighth of the Pacific Coast families in this same population group, 40 per cent of the white workers in the South, and 70 per cent of the colored workers were living on poor, Grade C diets, if the families studied were a typical sample.

"At 1935 price levels, apparently no families had better than C grade diets unless they were spending as much as \$1.25 in the North Atlantic region, or \$1.75 in the South, weekly per food-cost unit. Some families seemed to require as much as \$4 in the North and West, and \$3.50 in the South to secure fair or adequate diets. Average diets costing about \$3 weekly per food-cost unit in the North and West, and about 10 per cent less in the South, were at Grade A level, but less than half the families at this spending level had Grade A diets.

"In the Pacific region, a higher percentage of families at each expenditure level seemed to get good diets, and a lower percentage had poor diets, than in other regions. At every level of food expense, Pacific families bought more vegetables and fruits than did families in the North Atlantic region, about the same amount of eggs and milk, less meats, and a smaller share of their grain products in highly processed forms."

A child will learn three times as fast when he is in tune, as he will when he is dragged to his task.—Locke.

Medical Practice Acts: Administration of Anesthetics by Nurses.—Two practicing physicians, on behalf of themselves and all other physicians, filed a petition for an injunction to restrain the defendant nurse, employed by the defendant hospital, from administering general anesthetics in connection with operations. Such practice, it was contended, constituted a violation of the Medical Practice Act of California. The trial court gave judgment for the defendants, and the plaintiffs appealed to the Supreme Court of California.

The findings, said the Supreme Court, show conclusively that everything that was done by the nurse . . . is done under the immediate direction of the operating surgeon. Such method, said the Court, seems to be the uniform practice. . . . The Court continued:

"There was much testimony as to the recognized practice of permitting nurses to administer anesthetics and hypodermics. One of the plaintiffs' witnesses testified to what seems to be the established and uniformly accepted practice and procedure followed by surgeons and nurses, and that is that it is not diagnosing nor prescribing by the nurses within the meaning of the Medical Practice Act. We are led further to accept this practice and procedure as established when we consider the evidence of the many surgeons who supported the contention of the defendant nurse, and whose qualifications to testify concerning the practice of medicine in this community and elsewhere were established beyond dispute. That such practice is in accord with the generally accepted rule is borne out by the decided cases."

Furthermore, said the Court, aside from the proposition that nurses in the surgery during the preparation for and progress of an operation are not diagnosing or prescribing within the meaning of the Medical Practice Act, it is the legally established rule that they are carrying out the orders of the physicians to whose authority they are subject. The surgeon has the power, and therefore the duty, to direct a nurse in her actions during the operation.

The judgment of the trial court for the defendants was, therefore, affirmed. (*Chalmers-Francis et al. vs. Nelson et al.* (Calif.), 57 P. (2d) 1312.)—*Journal A. M. A.*

When Steers Had Long Horns

THE medicinal value of the glands of internal secretion was not recognized.

But times have changed, as well as cattle. Now, the therapeutic value of certain gland products is definitely established and each year adds to our knowledge in this important field of therapeutics.

To the physician prescribing gland products we urge specification of "Wilson," because it connotes a product made at the source of supply from fresh glands, processed promptly, with the aim of conserving maximum hormone activity, in a laboratory devoted exclusively to the endocrine field.

Medical Societies: Contract Practice in Relation to Professional Ethics.—The plaintiffs, one as its manager, were employed by the Associated Physicians Clinic, operated by two members of the King County Medical Society. This clinic made contracts with business firms of Seattle to furnish necessary medical, surgical, and hospital care to employees of such firms at a stipulated rate per month per capita. In April, 1933, the King County Medical Society organized the King County Medical Service Corporation, described in the record as "identical in its plan and operation with that of the Associated Physicians' Clinic and the other independent clinics." The following August, the medical society adopted an amendment to its by-laws, providing for the censure, suspension or expulsion of a member

"who shall engage in contract practice unless the same shall previously have been authorized by the Board of Trustees of this Society, or who as physician or surgeon shall serve on the staff of or perform work for the patients of, or shall perform work in any institution or group or organization unless such services or work shall previously have been authorized by the Board of Trustees of this Society."

Shortly thereafter the Society, it was alleged, threatened to expel the physicians who operated the Associated Physicians' Clinic unless they abandoned their contract practice. The physicians apparently continued to engage in contract practice, and on March 19, 1934, written charges were filed with the Society against them, charging a violation of the by-law quoted. The two physicians then terminated their contracts with the plaintiffs, who thereupon instituted the present suit against the King County Medical Society, the King County Medical Service Corporation and certain officers, trustees and members thereof, alleging that the defendants had caused a breach of the contract between the Associated Physicians' Clinic and the plaintiffs. The trial court sustained a demurrer interposed by the defendants, on the ground that the complaint failed to state a cause of action, and the plaintiffs appealed to the Supreme Court of Washington.

APPROVED CLINICAL PATHOLOGISTS

American Medical Association Essentials for An Approved Clinical Pathologist

An approved clinical pathologist should be a licensed graduate of medicine. He shall have specialized in clinical pathology, bacteriology, pathology, chemistry, and other allied subjects for at least three years, and he should be reasonably familiar with the manifestations of disease in the body. The director of a clinical laboratory shall be on full time or have definite hours of attendance, devoting the major part of his time to this specialty. A clinical laboratory is an institution organized for the practical application of the fundamental sciences by the use of specialized apparatus, equipment and methods, for the purpose of ascertaining the presence, nature, source, and progress of disease in the human body.

The following Clinical Pathologists directing private laboratories in California are approved by the Council on Medical Education and Hospitals of the American Medical Association:

**Clinical Laboratory of Drs. W. V. Brem, A. H. Zeiler, Roy W. Hammack
and G. D. Maner, 657 So. Westlake Avenue, Los Angeles, California.**

Zera E. Bolin, M.D., 490 Post Street, San Francisco, California. ✶ ✶ ✶

These laboratories use standard methods and are fully equipped to make all clinical examinations of recognized value in: Tissue Pathology, Bacteriology, Hematology, Serology, Bio-Chemistry, Kolmer Wassermanns, Kahn test, Medico-legal, Basal metabolism, Blood chemistry, Hormone Test for Pregnancy, Parasitology, Cardiology, Autogenous vaccines, etc.

Mailing containers sent on request. Special delivery postage insures prompt, accurate service.

An employee, said the Supreme Court, has no right of action against an individual or group of individuals who organize to compete with his employer. The organization of the King County Medical Service Corporation by the King County Medical Society as a competitor of the Associated Physicians' Clinic, therefore, did not create a cause of action against the defendants. Furthermore, the constitution, charter, and by-laws of the medical society constituted a contract between the members of the Society enforceable in the courts if not immoral or contrary to public policy or the law of the land. The two physicians, as members of the medical society, were required to obey the by-laws of the Society or subject themselves to the penalty of suspension or expulsion from the Society, and it is not material how selfish or unselfish the objects of the medical society may be. That the medical society had the right to adopt the by-law with respect to contract practice cannot be questioned. Whether such by-law was just, reasonable or wise, is a question of policy which concerns only the medical society and its members. The Society, in the enforcement of its by-laws for the direct purpose of benefit to itself and to its members, is not answerable for damage incidentally resulting to a third person. So long as membership in the medical society continues, the member can be compelled under his contract with the Society to obey its laws, rules and regulations, or suffer the penalty of fine, suspension or expulsion.

The enforcement of a by-law such as the one here involved, continued the court, does not amount to unlawful coercion. In *Seymour Ruff & Sons, Inc. vs. Bricklayers, etc., Union*, 163 Md. 687, 164 A. 752, it was said:

"The decisions are practically in harmony in holding that it is within the power of labor unions, and it is lawful for them, to instruct or order their members not to accept employment with an individual, or to continue in such person's employment, where the action of a union is justifiable in the sense that it is to promote the welfare of the members of the union. Accordingly, the enforcing of a by-law forbidding members of the union to serve one who has broken a contract with its members does not amount to intimi-

dation. Neither a fine or other disciplinary action under such by-law would be unlawful as to members who voluntarily subject themselves to the provision of such by-law. They are left free to enter the employment of the prescribed employer, although practically they are compelled to choose between the benefits of such employment and membership in the union."

In *Booker & Kinnaird vs. Louisville Board of Fire Underwriters*, 118 Ky. 771, 224 S. W. 451, 21 A. L. R. 531, the Court said:

"In almost every profession and every business there are associations or lodges or boards, organized by persons engaged in particular lines of industry or following certain professions, that have for their sole purpose the protection and promotion of the best interest of the business or profession in which they are engaged. And bodies like these, acting in a collective capacity, may, in a quiet orderly way when their interests demand it, refuse to deal with or have any business relations with any other person or persons they choose, although the effect of such combined action is to boycott the objectionable person. . . ."

An association, in pursuing its legitimate objects, has the right to coerce a member by fine, suspension or expulsion, and the association will not, nor will its members, be liable in damages to those who may be directly or indirectly injured by such efforts. So long as a member remains in the association, he is subject to the coercive effect of a penalty exacted for breach of a by-law of the association. If he does not desire to abide by the obligations of his contract of membership, he may abandon his membership. No rights of the plaintiffs in this case, who were nonmembers, were invaded by the medical society when it established its code of ethics and insisted on compliance therewith through threat of expulsion of an offending member, and the enforcement of solidarity by threat of expulsion of the two physicians created no cause of action for the incidental damage resulting to the plaintiffs.

The judgment of the trial court for the defendants was therefore affirmed. (*Porter et al. vs. King County Medical Society et al.* (Wash.), 58 P. (2d) 367.)—*Journal A. M. A.*

Bequest Forms: Unto the California Medical Association*

FORM OF CLAUSE OF WILL PROVIDING FOR CASH BEQUEST

I hereby give and bequeath unto Trustees Of The California Medical Association, a nonprofit corporation of California, the sum of \$—— to be known as the —— Gift, to be used and expended by said corporation for scientific, educational, or hospital purposes.

* * *

FORM OF CLAUSE OF WILL PROVIDING FOR CASH BEQUEST

I give and bequeath unto Trustees Of The California Medical Association, a nonprofit corporation of California, the sum of \$——, to be held as a fund, to be known as the [here insert name desired] Fund, the principal whereof shall from time to time be invested to the best advantage compatible with safety, and the income whereof shall be used and applied for scientific, educational, or hospital purposes.

* * *

FORM OF CLAUSE OF WILL PROVIDING FOR BEQUEST OF PERSONAL PROPERTY

I give and bequeath unto Trustees Of The California Medical Association, a nonprofit corporation of California [here describe the property], the same, or the proceeds thereof, to be held as a perpetual fund, to be known as the [here insert name desired] Fund, the income whereof shall be used and applied for scientific, educational, or hospital purposes. The said corporation shall have the power to sell said property and to invest and reinvest the proceeds arising from the sale thereof from time to time as it may deem advisable for the purpose of producing as large an income as may be compatible with safety.

For Acidity and Allied Conditions, we suggest ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and manganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is marked drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

A Natural Mineral Water SHOWING MAIN CONSTITUENTS

By PROF. SYDNEY A. TIBBETTS, Berkeley

MANGANESE	1.3 parts per million
IRON	12.5 parts per million

Efficacy of Liver Therapy in Pernicious Anemia.—Sellers investigated objectively the extent of the prolongation of life of persons dying of pernicious anemia since 1926. Despite the wide differences in mortality from pernicious anemia throughout the world an abrupt decline is noted in a group of widely separated representative countries. The trends in mortality in each instance are remarkably alike. An abrupt alteration of the trend of mortality from pernicious anemia occurred in 1927 coincident with the general introduction of liver therapy as specific treatment in this disease. The low level of mortality reached in 1927 and 1928 has in general been well maintained. Reduction in mortality from pernicious anemia has been most marked at young ages but has occurred in all age groups up to 70 years.

When controversy bursts forth, the first one to become silent is assuredly of good family.—Talmud.

The Mattern VERTICAL FLUOROSCOPE

How many times have you felt the need of making Fluoroscopic examinations?

You and your patients can now have the benefits of this valuable instrument.

Typical LOWEST PRICE again emphasizes MATTERN VALUES, more facility for less money.

Write for Bulletins

A Vacation Hazard

● The summer traveler or camper frequently accepts chances of infection by *Endamoeba histolytica*. Unguarded water supplies, food prepared by unknown hands, the unavoidable presence of the housefly—all contribute to the possibility of ingestion of the cysts of this organism.

Throughout the year the physician has many occasions to consider amebiasis in the differen-

tial diagnosis, inasmuch as 5 percent to 10 percent of the population of the United States is infected. The symptoms of amebic infestation are protean and suggestive of a variety of diseases of different etiologies.

Carbarsone, Lilly (p-carbamino phenylarsonic acid), is effective in treatment, is of low toxicity, and is usually successful without supplementary medication. It may be given orally in capsules or tablets, or it may be administered by retention enema. Supplied in 0.25-Gm. pulvules; in 0.05-Gm. and 0.25-Gm. tablets; in boxes of six 2-Gm. vials; and in one-ounce bottles.

NOTE: Because of the late date on which the minutes of the Del Monte annual session were received by the Editor, it was not possible to print this June issue of CALIFORNIA AND WESTERN MEDICINE on schedule time. The minutes being important, it was decided that delay until the July issue would be inadvisable.—G. H. K.

EDITORIALS†

THE SIXTY-SIXTH ANNUAL SESSION DEL MONTE, MAY 2-6, 1937

Del Monte Sessions in 1912 and 1937 Significant for Work Done.—Twenty-five years ago the California Medical Association held its annual session at Del Monte. Founder-Editor Philip Mills Jones' comments on the convention of 1912 apply with force as equally to the session just held, from the 2nd to the 6th of May, as when, a quarter of a century ago, he wrote:

The Del Monte Meeting.—The annual meeting of the State Society, held at Del Monte on the 16th, 17th, and 18th of last month, was in every way a distinct success. There was such a large amount of business introduced. . . . Some of the business matters brought up will be found to be of great importance to our several county societies. . . .

Throughout the session there was displayed not only keen interest in all matters pertaining to the affairs of the Society and to the business presented, but also a harmony of feeling and a total lack of bitterness or prejudice that speaks strongly for the continuance of improvement in all parts of the State.

* * *

Minutes of House of Delegates and Council: Their Importance.—All members of the Association may well take time to scan the proceedings, in outline, of the two important official groups whose function and responsibility are to speak in the name of the California Medical Association on matters of policy and procedure. For, to be indifferent in days such as the present, on how Organized Medicine is trying to solve its problems (in our State, Organized Medicine means the California Medical Association, its component county societies and members) is to invite the thought that physicians so constituted are lacking in what might well be termed their civic responsibilities in medical practice.

The well-established relationships between physicians and patients, which have worked out so successfully in the many past decades, are today being subjected to one assault after another, mostly by theorizing laymen who are usually on good salaries from subsidized "foundations," and who

†Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

ofttimes stop at nothing, in the exploitation of their vagaries through articles in the press, as they repeatedly thrust their ill-digested opinions upon the attention of the public.

Fortunately, the medical profession, with its record of altruistic service and ethical standards surpassed by no other professional or vocational group, is able calmly and with courage to meet such aggressions; in the knowledge that men and women who have consistently given their discoveries, for disease prevention and health conservation, to the world without hope of material profit to themselves, never could be, and are not indifferent to the lot of fellow citizens of humble economic station, to whom disease or injury, at times, may add additional afflictions, and concerning whose care so many irresponsible statements have been made.

If the wide influence of the press in promoting propaganda designed to poison the minds of the public and of lawmakers had not been so abundantly proved in the past, the shoutings and fantasies of these would-be exploiters of radical changes in private medical practice could be passed over as of little or no consequence; yet not, if year after year we are confronted in congressional halls at Washington and legislative chambers at Sacramento with all kinds of ill-natured and theoretic laws which, once enacted, could in most cases result only in more harm than good in matters they would presumably alleviate. This is especially evident since proposed legislation of that sort would in general wreck havoc upon those established methods of practice so long standing the test of time, in accomplishing ends, such as the highest type of medical and surgical service to the largest possible number of human beings, by a group of professional men and women who live up to a code wherein each moves forward to larger service, in proportion to his own individual capacity and worth.

What has been written above may seem to be far afield from a consideration of the minutes of the House of Delegates and Council on transactions at the recent Del Monte annual session; but not so, for it is the exploitation of these so-called needed reforms in medical practice, often placed in the public eye during the last ten years or so by lay romanticists and obsessionists, that has added to Organized Medicine the responsibilities and duties it must meet today.

Wherefore, if you would know somewhat the trend of problems affecting every physician who practices medicine in California, a perusal of the official proceedings at Del Monte will be well worth your time.*

* * *

Items of Special Interest: California Medical Economic Survey; Dues; New Officers; and 1938 Meeting Place.—The House of Delegates, as the supreme legislative body of the California Medical Association, decided two issues, in which many members have had a special interest:

1. *California Medical Economic Survey.*—The California Medical Economic Survey (so-called "Dodd Report"), in accordance with the regulations of the Federal Works Progress Administra-

tion, by instructions from the House of Delegates at Del Monte has been almost entirely dissociated from the California Medical Association, which organization, as "co- or supporting sponsor"—in the last three years, contributed some \$35,000 of its funds to carry on the work—and given over to the California State Board of Health, now according to Federal rules, the "legal sponsor."

2. *Dues.*—The State Society assessment for the coming year was reduced by the House of Delegates from the \$15 schedule, in operation for 1937, to \$10 for the year 1938. This action was taken, not because of the lack of important activities whose causes could be promoted if adequate funds were available, but for the reason that the House of Delegates wished, in the present strenuous times, to make the State Association's financial burden as low as the immediate urgency of its needs would permit.

3. *New Officers.*—In the May issue of CALIFORNIA AND WESTERN MEDICINE comment was made concerning Dr. Edward M. Palette of Los Angeles, who retired as president; Dr. Howard Morrow of San Francisco, who assumed the presidency; and Dr. W. W. Roblee of Riverside, who was honored by election to the office of president-elect.

The elevation of Doctor Roblee to his new position made necessary the selection of a Speaker of the House of Delegates, and Dr. Lowell S. Goin of Los Angeles became the recipient of this honor. Doctor Goin has long been identified with organization work in the Los Angeles County Medical Association, and his friends feel he will make for himself a creditable record in his new responsibilities. Dr. John H. Graves of San Francisco was reelected Vice-Speaker of the House.

Two retiring councilors-at-large received the unanimous approval of the House for continuance in their positions: Dr. Junius B. Harris of Sacramento and Dr. William H. Kiger of Los Angeles, whose long records of efficient service made them, logically, persons to succeed themselves.

For councilor of the third district, Dr. Louis A. Packard of Bakersfield, who in the last several years has done such yeoman service in Kern County in its county hospital fight, was selected. Dr. Karl L. Schaupp of San Francisco, who has been chairman of the Council's Executive Committee, was returned without opposition, and so, also, Dr. Henry S. Rogers, who has been most faithful in maintaining his official contacts with the component county societies comprising the ninth district.

The names of other general officers and members of standing committees will be found in the minutes.†

4. *Next Year's Session in Pasadena.*—The Hotel Huntington, at Pasadena, will be the host of next year's annual session, the date of meeting to be determined later by the Council, after the 1938 place and date of meeting of the American Medical Association are decided by the Board of Trustees of the national organization.

The problem of where the California Medical Association, with its more than 5,600 members,

* For minutes, see pages 410-429.

† See pages 415 and 416.

shall hold its annual session, is becoming an increasingly-difficult one for the officers to solve. The day is past when all members who attend can be housed under one roof, desirable as that arrangement, for convenience to section meetings and promotion of fraternal relations, may be.

The Huntington is one of the largest hotels in California, and since many Los Angeles County members will not take rooms, its spaciousness should be sufficient to house most of the out-of-town colleagues. However, in order to avoid disappointment, those who wish to be certain of accommodations should write as soon as convenient to the hotel management and make their reservations.

CALIFORNIA MEDICAL ECONOMIC SURVEY

Action of the Riverside Annual Session of May, 1934; and the Committee of Five.—CALIFORNIA AND WESTERN MEDICINE, in its issue of November, 1934 (page 344), printed an official notice concerning the California Medical Economic Survey, signed by Paul A. Dodd, Ph.D., who had been appointed Director of the Survey by the California Medical Association Committee of Five (Doctors William R. Molony, chairman; Harry H. Wilson, secretary; Rodney A. Yoell, Robert A. Peers, and Alson R. Kilgore). In that communication, attention of the members of the Association was called to the questionnaires which had been sent to the physicians throughout the State; the replies to which, when properly segregated and compiled, were to furnish material for charts, tables and graphs that would shed light on the economic and other phases of sickness in California, as interpreted by physicians in practice throughout the State.

The Committee of Five came into being through action of the House of Delegates at the sixty-third annual session of the Association held at Riverside, at a memorable session of the House that did not adjourn until 2 a. m. on Thursday, May 3, 1934. (See issue of CALIFORNIA AND WESTERN MEDICINE for June, 1934, page 431, page 445, Resolution No. 4, and page 446, Resolution No. 8.)

* * *

Survey-Director's Original Estimates Were Greatly Exceeded.—Since that time, as regards this medical economic survey, concerning the cost of which the appointed director, on more occasions than one, assured the Council (the body responsible for the carrying out of the instructions of the House of Delegates) that the sum of approximately \$14,000 would be the maximum contribution to be expected from the California Medical Association for its share of the work, "much water has gone over the dam," and many hours have been spent by the Committee of Five and the Council in trying to bring the project to completion. A sad financial experience developed from time to time, through the readjustments of estimates by the Director on the California Medical Association's share, until the total amount of Association funds expended not only equalled the sum of \$14,000, but exceeded the figure of \$35,000! And the end is not yet, for the Association, on

behalf of itself and the Federal Government (which, through the WPA, expended some \$55,000 in giving employment to field agents and workers), feels itself obligated to bring to publication a final report.

* * *

Where Much of the Delay Rested.—A considerable amount of the delay that has arisen since the work was first undertaken may be said to have come about through a wrong orientation by some of the employees of the Association as to their places and authority in the survey. (See editorial in May issue, page 290.) Since the appearance of the comments there made, last month, the 1937 California Medical Association annual session has been held, the Committee of Five, appointed in 1934, submitting its final report and being relieved, by the Del Monte House of Delegates, of further duty.*

* * *

Federal Works Progress Administration Rules Clarified a Muddled Situation.—In accordance with the March 13, 1937 rules of the Works Progress Administration known as "Operating Procedure No. W-11—Regulations for Publication of Statistical, Survey and Research Materials," wherein the legal sponsor (in the case of the California Medical Economic Survey, the California State Board of Health, because it is the State authority through which the federal moneys for the field work were dispensed), is the agency responsible for bringing the report off the press; the cooperating sponsor (in this instance the California Medical Association) having fulfilled its obligations when it provided ways and means for the housing, equipment and direction of the field and other work, and payment for the printing costs of the final report.

* * *

Final Agreement With the Federal Authorities.—In a letter dated May 13, 1937 signed by Regional Coördinator of Statistical Projects James B. Sharp of San Francisco, and addressed to the Chairman of the Coördinating Committee of the Central Statistical Board at Washington, D. C., the allocation of responsibility, as above indicated, is practically outlined.

The California State Board of Health is expediting the completion of the report and every possible effort will be made to forward its publication, in full coöperation with the federal authorities, either before the close of the present fiscal year on June 30, 1937, or within a month thereafter. The Council of the California Medical Association, too, is giving all possible coöperation and has authorized the printing of an adequate number of copies.

It is to be regretted that misunderstandings of function and authority should have crept into this project; these, unfortunately, being of such nature and amount as would give a distorted impression to many persons who (both in and out of the medical profession), not having access to first-hand knowledge of actual facts, would be naturally apt to criticize the California Medical Association for lack of joint action. Of all that, however, more perhaps, on some later occasion.

*See minutes in this issue: Item 25, p. 423; Item 17, p. 427; and Item 4, p. 428.

**STATUS OF PUBLIC HEALTH LEGISLATION:
AS IT WILL BE WHEN THE CALIFORNIA
LEGISLATURE ADJOURNS ON
MAY 28, 1937**

California Legislature's Adjournment.—California's fifty-second legislature convened on Monday, January 4, 1937, and is scheduled to adjourn on Friday, May 28, 1937, although it be necessary to stop the clock pendulums of the legislative chambers one or more days in order to permit the last of the legislative grist to go through this year's law mill.* Commencing in the January number, proposed enactments having public health bearings have been discussed in each issue of CALIFORNIA AND WESTERN MEDICINE, and at the annual session of the Association at Del Monte, Dr. Junius B. Harris of Sacramento (who, in recent years, on behalf of the California Medical Association, and as chairman of its Committee on Public Policy and Legislation, has voluntarily sacrificed no end of time and effort in safeguarding the interests of the public health and medical practice) made a report that was listened to with rapt attention by the delegates present.

* * *

Digest of Report of Committee on Public Policy and Legislation.—Even though, at this writing, it does not tell the complete story of the final days of this year's session of the California Legislature, a digest, because of the valuable information it contains, is worthy of careful reading:

With the opening of the Legislature, our first concern was the personnel of the committees which would consider public health legislation. Both Lieutenant-Governor George J. Hatfield and Speaker of the Assembly, William Moseley Jones, were very coöperative, and as a result the committees appointed are very fair-minded.

To date, 4,185 proposed laws have been introduced—an all-time record for California. We have scanned all of these bills and find over 250 have some reference to the practice of the medical professions and public health legislation. We are concerned with fifty-four committees, which meet from 8:30 in the morning until the wee sma' hours of the following morning, to say nothing of the actual sessions of the Assembly and the Senate, where measures of concern to us pop up for a vote almost every day. Subdivided by groups, we find the following:

Board of Health.—Fifteen bills were introduced relating to the powers of the State Board of Health. Representatives of the department are watching this legislation carefully.

Chiropody.—The chiropodists are sponsoring two bills to regulate misleading advertising. These have passed the Assembly and are now before the Senate.

Chiropractors.—The chiropractors have been on the job in force, as usual, trying to extend their rights through two bills. To date, both of these are buried in committee.

Clinical Laboratories.—The lay laboratories reintroduced their bill, which was passed in 1935, but found unconstitutional. It has passed the Senate and is now before the Assembly.

Code Bills.—During the past two years the California Code Commission has been busy codifying the existing laws relating to the business and professional acts of the State. These are known as the Dental Code, Medical Code, Optometry Code, etc. These bills have passed the Senate and the Assembly, and are now before the Governor for consideration.

Compensation Act.—Several bills were introduced by persons who have sought to amend the Compensation Act. Two of these were the medical and hospital-records bills, requiring records to be exhibited to the patient and any person he authorizes to examine the same. Seven others would give the injured employee free choice of healer (not confined to M. D.'s). To date, none of these bills and nothing vitally concerning the Compensation Act have been passed.

County Hospitals.—One of the hottest fights has been against three bills and a proposed constitutional amendment which would open up county hospitals to so-called "pay patients." These bills have had powerful backing from the Farm Bureau, from labor and from various boards of county supervisors, and it has only been through the united work of the California Medical Association, the Public Health League of California, the Hospital Associations, and the State Dental Associations that they have been held in check. One of them was tabled in committee; two others have failed to muster sufficient votes to emerge from committee, and the constitutional amendment has been sent back to committee.

Expert Testimony.—Senate Bill 446, sponsored by the California Medical Association, has passed the Senate and is now in the Assembly.

Health Insurance.—The toughest battle to date has been on the subject of health insurance. Two bills were introduced early in the session—one in the Senate and one in the Assembly—to set up control of voluntary health service associations in the Department of Insurance. These "companion" bills were sponsored by interested medical and "groups" in Los Angeles and San Francisco. They enlisted the support of the Farm Bureau and large groups of public employees, teachers, etc., who are subscribers to one or the other service. The Farm Bureau has made this one of its major objectives, its representative apparently giving more time to trying to regulate the medical and dental service than to promote strictly farm problems. This subject has been constantly before the Assembly Committee on Insurance since March 26. To meet an apparent demand for legislation enabling voluntary medical service insurance, the California Medical Association sponsored two bills on this subject (Senate Bill 605 and Assembly Bill 1491). Such strong objection was rendered from various sources that Assembly Bill 1491 was amended in many of its provisions, and is now before the Assembly for vote.

On May 10, the supporters of Assembly Bill 1283 (sponsored by the above-named groups) brought it before the Assembly for vote. It received twenty-four favorable votes and forty-six in opposition!

Hospitalization Insurance.—The Association of California Hospitals is sponsoring Assembly Bill 1132, designed to set up machinery for the sale of hospital service on an insurance and nonprofit basis. This has passed the Assembly, and is now before the Senate for vote.

Medical Practice Act.—Thirty-three bills proposing to amend the Medical Practice Act are before the Legislature, only seven of which were sponsored by the Board of Medical Examiners. The remainder are from outsiders who seek to dress up the Act according to their special ideas.

Naturopaths.—Developing unexpected strength, and with a well-financed organization, the naturopaths have carried on a hot campaign to enact Assembly Bill 1472, which is almost identical with the old Proposition 17 which was defeated in 1934 as an initiative. The bill was defeated in the Assembly, 16 to 49.

Optometry.—The optometrists brought up a proposal to amend their Act so as to permit them to treat eyes. When the battle was over, the "treatment" provision had been deleted.

Osteopaths.—The osteopaths have been more active and more determined at this session than ever before. They have combed every bill before the Legislature and, wherever possible, have proposed seemingly harmless amendments to present themselves to the public on the same basis as Doctors of Medicine.

X-Ray.—Assembly Bill 1009, sponsored by the Pacific Roentgen Club, was introduced on January 20, but to date it has not been taken up by committee for hearing.

* Adjourned as of that date, but actually (with clocks stopped), on Sunday, May 30, 1937, 4:15 a. m.

Status of Proposed Laws at the Time of the Legislature's Adjournment

County Hospital Opening.—Assembly Bill 51 (admission to county hospitals), Assembly Bill 1196 (county hospitals), Assembly Bill 1695 (county hospitals), and Senate Constitutional Amendment 5 (county hospitals), all died in committee.

Chiropractors.—Assembly Bill 2731 and Assembly Constitutional Amendment 35, killed in committee.

Clinical Laboratories.—Senate Bill 118 (technologists, technicians, blanket license to laboratories) passed the Senate and the Assembly, and is now before the Governor.

Codes.—All Professional Code Bills are now before the Governor.

Compensation Act.—Bills requiring exhibition of patient's records were killed in committee. All bills permitting injured person free choice of healer (not confined to M. D.'s) were killed in committee.

Expert Testimony.—Senate Bill 446 (expert testimony) passed the Senate and Assembly. Now before the Governor.

Hospitalization Insurance.—Assembly Bill 1132 (non-profit hospitalization) passed the Legislature and is now before the Governor.

Medical Practice Act.—All bills attacking this Act were killed in committee. Senate Bills 781, 782, 783 (State Medical Practice Act), introduced by the Board of Medical Examiners, providing remedies and disciplinary proceeding under Medical Practice Act, have passed the Senate.

Naturopaths.—Assembly Bill 1472 (naturopathy) was killed on floor of the Assembly.

Osteopaths in Schools.—Assembly Bill 684 (school health certificates) and Assembly Bill 1880 (school health certificates) passed the Assembly, but were killed in Senate committees. Repeated attempts to revive them have been stopped.

Venereal Diseases.—Assembly Bill 2790 (venereal diseases) passed the Assembly and Senate. Now before the Governor.

X-Rays.—Assembly Bill 1009 (x-ray) was left in committee files.

A SAMPLE OF SOCIALIZED MEDICINE PROPAGANDA: HONEST AND CLEAR-THINKING PEOPLE CAN DRAW THEIR OWN CONCLUSIONS

A Recent Article in a Lay Publication.—In the May issue of a publication which each month finds a place on some of the news stands appeared, as an opening article, an account of suffering by a man who was treated in a hospital in Los Angeles, which, because of statements made in the article, and its nature, is quite apt to be seized upon, used in portions by propagandists for state medicine, in much the same fashion as the antivivisectionists present their stories of laboratory cruelty to the lower animals. We have taken the pains to look up this particular case and present for our readers some excerpts from the article, which was written by the patient, whose description of his own sufferings, presumably, led a well-known writer to accept the same and volunteer a foreword, these also containing statements quite as startling as those made by his patient-friend or acquaintance. We shall also comment on what the records of the hospital actually show as having been paid by the patient. Readers can then judge for themselves concerning the merit of the statements of the patient, and the justification of the publicist's foreword, as based thereon.

Quotations from the Story as Narrated by the Patient.—First, some quotations from the patient's story:

August of my twenty-third year, 1926, . . . I was working as a "mud-smeller," an oil geologist, in the desert oil fields of the San Joaquin Valley, California. . . .

* * *

. . . Then one night at the bridge table—just as it can happen to anyone—wham! a pain hit me, running from hip to knee down the outside of my left leg. I was no stranger to pain, for eight years before I had smashed my leg and had to have the decayed bone removed by an operation before I made a complete recovery. . . .

* * *

. . . Marje persuaded me to try Christian Science, and to please her I honestly tried to think that what I foolishly thought of as pain was, after all, only "error." . . .

* * *

. . . Finally I gave up, went to bed and called in two physicians. . . . I made an agonizing trip by train to Los Angeles and went into a big hospital there. . . .

* * *

. . . The next day, without consulting me, he [the Los Angeles physician] dragged a bone surgeon into the case. . . .

[Later] . . . We must eliminate, he said, the possibility that I was being poisoned by bad sinuses. . . . Since I have always had some slight sinus trouble, I gave in. I wasn't being poisoned by bad sinuses, but it cost me \$80 for the x-ray of my head and the specialist to prove it.

* * *

. . . As I lay, with the pain beating dreadfully in my hip, I couldn't help contrasting the snail-like slowness of the hospital routine with the hustle and efficiency of the oil industry. Here they had taken a week to make a few tests and x-rays which I felt could surely have been completed in a day, had there been any snap to their organization.

* * *

. . . I remained another week in the hospital and then moved to a bungalow in a court. During my two weeks' stay I had improved, until I could walk without much pain on a pair of crutches. . . .

* * *

. . . Now I wanted to change doctors, but it was too late. They had picked me clean. Though they knew my salary was only a little over \$2,000 a year, they had charged me over \$300 for their first month's services. This together with the \$250 for two weeks in the hospital, x-rays, physiotherapy, \$80 for the nose doctor, and nearly \$40 for internal medicine had made my first month of sickness cost me more than I could save in two years. October's bills were less, for I had only the doctors and my internal medicine to pay. Still, by the time November's bills came I could see the end of my money. Also, I had just been told that, sympathetic as the company felt, my November pay check would have to be my last. They had worked their way through all the money I had in the bank, including \$500 belonging to my wife, three salary checks (over \$500), some oil stock, and even my Petroleum Club membership. It was no great amount—around \$1,500, I believe—but it was all we had, and the doctors certainly were far from charging in proportion to my income, as they always claim to do. . . .

* * *

Excerpts from the Foreword of the Publicist. Let us turn now to the foreword by the publicist:

In a blizzard in February, 1936, ———, who was slowly dying, came to our camp by Lake Michigan. Again and again for ten years he had been given up by small and great surgeons so that he knew his own doom, and the miracle of his still being alive has become drab to him. This snowy day he came with no hope of some new cure to which I

might direct him. Long ago I had failed him there, and my advice came near killing him quickly, not slowly, five years before. Now he wanted to write, in the short time he knew was left him, the biography of his illness that was inexorable as incurable cancer. In an hour of tragi-comic narrative he sketched an epic of human hope never quite downed by suffering or often imminent death. . . . Post-graduate in suffering that he was, he made me ashamed of the superficiality of my own stories of the human death fight. Today he has proved his plan was no day-dream. Now against the stream of the failing of his vital functions he is writing a story that cannot fail to touch the hearts and brains of men and women of good will. It reduces to absurdity solemn inquiries about costs of medical care or arguments about socialized medicine. . . .

* * *

The Real Facts as to What Was Paid.—

Now, what is the truth as to moneys paid by this patient, who was admitted to the hospital on October 18 and discharged November 5, 1926, after a period of eighteen days?

1. The superintendent of the hospital in question states that, according to its financial records, these were the accommodations afforded; and for the same and the service rendered, only the following amounts, as a total, were ever paid by the person so making the complaint:

The patient occupied a private room (not a ward bed, available at a much lesser cost), for which he paid \$8.50 per day for eighteen days, a total of \$153. Additional payments made to the hospital included:

Laboratory examinations.....	\$ 5.50
X-ray examination of pelvis and leg.....	32.00
X-ray of sinuses	15.00
Telegrams and telephone calls.....	3.60
Drugs and prescriptions.....	30.25

Grand total.....\$239.35

2. The physician, who made the diagnosis of chronic and recurrent arthritis and who sent the patient to the hospital, and who himself, or through his assistant, attended him almost daily and visited him some twenty-four times after he left the hospital, states that he did not receive a single penny for the professional services he so rendered!

3. The otolaryngologist, who visited him in the hospital and treated him in his office on some ten different occasions also states that his records show he did not receive a penny for his professional services!

4. The orthopedic surgeon's records are not available, but probably, in view of the above, it would be fair to assume that the patient, not having paid the other two physicians, most likely failed to pay the orthopedic surgeon as well.

Contrast, now, the patient's outcry as to the fees he lets his readers think he paid with these actual facts of what, through nonpayment by the person receiving the professional services, was nothing else than free treatment in a private hospital (could socialized or state medicine give as much or one whit more?), and ponder on the greatness of heart and mind of the publicist who, from this special instance, would draw the general conclusion—a well-established fallacy in logic is drawing a general conclusion for a special instance, al-

though in this case the real facts belie the premises concocted from the particular instance!—that nothing more is needed to justify the institution of state medicine than this isolated case!

If the advocates of socialized and state medicine having nothing better to rely on as factual propaganda for the exploitation of their theories than misinformation such as this, then they are, indeed, hard put to sustain their cause.

The space here devoted to these comments is given in order to acquaint members of the profession, who may have seen or heard of the article referred to, with the real, unadorned facts.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 410.

EDITORIAL COMMENT†

ACUTE URINARY INFECTIONS

An attack of acute ascending infection of the urinary tract, as characterized by frequency, dysuria, fever and, if particularly severe, chills, was until recently usually treated by the administration of urotropin, hexamethylenetetramin, or methenamin, depending upon the name under which that formaldehyd-liberating drug was dispensed. To insure the liberation of the formaldehyd, which is only given off in an acid media, acid sodium phosphate was also prescribed. This method of treatment met with failure in all cases in which the urine remained alkaline, either because of the simultaneous ingestion of alkalizing drugs or, more frequently, due to the presence of a mixed infection in which were included urea-splitting organisms which were constantly liberating ammonia. In other cases the liberation of the formaldehyd resulted in so much irritation to the urinary mucosa that the patient's symptoms were aggravated rather than improved. When such unfortunate results developed, it has been customary to reverse the process by the administration of alkalizing drugs. If the urine was already alkaline this, of course, brought no relief, while in many cases rendering of the urine alkaline made the conditions for the growth of the offending organism more favorable.

This belief in the virtues of alkalinity was based on the following: That the acidity of the urine rather than the products of bacterial growth, was responsible for the irritated urinary mucosa. In fact, the idea that increased acidity will produce untoward symptoms is so firmly fixed in the minds

† This department of CALIFORNIA AND WESTERN MEDICINE presents editorial comments by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California Medical Association to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

of the profession that we find several large corporations, by a campaign of fear, proclaiming the fact in their national advertising, most soda fountains having become virtual prophylactic stations where the purchase of that universal panacea, alkalizer, is supposed to prevent the worst. The only difficulty with this situation is that it is based on total misapprehension of the facts: an acid urine is not irritating; an alkaline urine is not soothing.

If to these distracted citizens one adds the number of individuals who, by the same or similar urge, are persuaded to ingest ever-increasing amounts of pineapple, orange, and tomato juice, it is little wonder that the urologic profession is seeing more and more cases of cystitis, and the incidence of stone formation is yearly increasing; for nothing so favors the precipitation of the majority of urinary salts as a constantly alkaline media. How frequently the laity is warned against eating meat because of urinary irritation, only a urologist can appreciate. The number of individuals who have even become anemic from lack of protein digestion in the hope of relieving urinary frequency is astounding.

Space does not permit extended comment on the innumerable dyes that have been foisted on the profession as urinary antiseptics. Except for the psychic action of the various colors they develop in the voided specimen, most are devoid of any therapeutic effect, usually lacking germicidal action.

Due to the recent work of numerous investigators led by Clark and Helmholtz, we now have a rational basis for the treatment of urinary infections. The normal reaction of the urine being acid, it was found that this acidity could be increased to as much as 4.5 pH without any irritation resulting. It was further ascertained that most members of the colon group of organisms could not multiply in a media much below a pH of 5.5, and if it was still further lowered the organisms were actually killed. The acidity of the urine cannot be measured satisfactorily by litmus paper. Fortunately, today nitrazine papers will enable not only the physician but the patient to judge accurately the degree of acidity.

With this knowledge these workers suggested the production of this high acidity by the Ketogenic diet. While efficacious, this proved difficult of ingestion except under the direct supervision of a dietitian, and then few were hardy enough to stay on it for more than a week or ten days. Because of this difficulty a search was commenced to ascertain what drugs could produce a satisfactory bactericidal action by increasing the urinary acidity without the necessity of such a rigid diet. Ammonium chlorid proved of considerable benefit in the milder cases, while nitrohydrochloric was advocated by some; but, to date, mandelic acid in conjunction with ammonium chlorid has proved the most reliable. By its administration it is possible to render the urine not alone bacterial static, but actually bactericidal.

It is to be hoped, however, that the greatest good from this knowledge will be realization that the too

extensive ingestion of alkaline ash foods and drinks is distinctly injurious, and the eating of protein foods is not dangerous even in the presence of extensive urinary infection.

"MEDICAL MILITARY PREPAREDNESS"

Military medicine, with its complex administrative problems and its special medical and surgical requirements, no longer interests the great body of the profession after war is over. It is, therefore, quickly forgotten, and when another war comes our profession has to start all over again, and with much delay, confusion and lost motion, receive a new education in military medicine. Dr. Harvey Cushing's "From a Surgeon's Journal" gives a graphic picture of our predicament twenty-five years ago. He impresses the point that the last war, thanks to our allies, gave us a year for preparation and protected our shores. The next war will see a different opening period.

Medicine is more valuable in military affairs than ever before, chiefly because it has more to offer. The World War was the first to have an equal number of deaths from war wounds and communicable diseases. This brought us the Carrel Dakin solution, improved thoracic surgery, the Thomas splint, a broader recognition of neuropsychiatric problems and a better conception of cardiology, but little progress in the treatment of influenza, measles, and cerebrospinal meningitis. New weapons and a general alliance between science and military affairs will extend future warfare from the battlefield to the homestead. Tomorrow's battles will entail taking care of our own neighborhoods as well as our distant (?) battlefronts.

What the next war will be like no one can say. Instead of trench warfare until exhaustion, it will more likely be consummated by sudden movements or thrusts toward the economic heart of the lesser-prepared nation. Present Army plans for two field armies will call for 47,000 medical officers. The Navy Medical Corps will expand to eight times its present strength. This will entail the enlistment of one-third of the whole civilian medical profession and probably four-fifths of those eligible will be needed. This does not include replacements. The other two-thirds will have the care of the civilian population which will present many new and difficult problems, requiring special training on the part of physicians before the onset of war.

We cannot interpret the war of tomorrow exclusively in the terms of the war of yesterday. The next war, it is believed, will be on a much greater scale, not only numerically but in the war zones covered. There will be a great demand for medical men capable of concentrating their efforts in overcoming influenza, measles, pneumonia, pulmonary tuberculosis, and neuropathic recognition of individuals with inferiority or psychopathic complexes. There will be fame for the

men who can offer an adequate treatment of mustard, thermit and white phosphorus burns.

We all remember the hurried physical and mental examinations of our troops before their departure to France. Had we had adequate medico-military preparedness, much postwar grief would have been avoided. The draft boards rejected 500,000 men and passed 750,000 who were rejected and discharged from the Army camps on examination as unfit for military duty.

The part in which the military surgeon plays the most important rôle is the selection of men for military service. We are fortunate in having a splendid Veterans' Bureau to serve as a nucleus for our next campaign. The importance of accepting men is balanced by the necessity of accurate observation by the men in charge at the end of service for postwar ratings for disability compensation purposes. About \$12,000,000,000 have been paid out in war pensions and compensation by the Government for war disabilities based on examinations by physicians.

The civilian physicians of today will be the medical officers of tomorrow. Military medicine differs from civilian practice in that it centers on two objectives—the prevention of disease and the conversion of casualties into rifle carriers. The last war brought home one great deficiency in the medical personnel—that of specialists. The hope of any man to continue in his specialty or to attach himself to a specialty in the next war, will lie in his preparation now and enrollment in the Reserve as a specialist. The formation of national boards for specialists allows acknowledged men to be correctly placed in the sphere of their greatest usefulness.

The Reserve was organized to perpetuate the framework of the organization developed in the World War. The medical veteran not only transmits his experience, but also sets an example for the younger generation in the Reserve who will in time become replacements. The various military sections, both in the Reserve and in the county medicals, might well sponsor courses in schools or forums toward medical military preparedness.

The coming convention of the Association of Military Surgeons will offer a well-balanced program along these lines. Their meeting at the Ambassador Hotel in Los Angeles, October 14-16, will be attended by surgeons from all parts of the world. The program will contain the latest information of military medicine as well as a glimpse into the future. There will be both scientific and commercial exhibits of note. Hence, members are urged to mark their calendars ahead for this timely meeting.

PNEUMONIAS: THEIR MANAGEMENT*

By JESSE G. M. BULLOWA, M.D.†
New York

PNEUMONIA ranks third among the causes of death. In the City of New York alone during the year 1935 there died from this disease 809 men and 292 women between the ages of twenty and fifty. If we consider the annual earnings of the males to have averaged \$2,500, the approximate present worth of the net future earnings of these men would have amounted to twenty million dollars. I shall not attempt to value the earnings of the women.

WHAT SHOULD MANAGEMENT INCLUDE?

The management of the pneumonias should include the prevention of these diseases, which are largely carried by human vectors and spread by the ordinary contacts of business and pleasure. Prevention may ultimately be by means of immunization against the viruses of the common cold and influenza, which prepare for the subsequent bacterial invasion. Eighty per cent of my cases have the history of a head or chest cold preceding the chill or chest pain which marks the onset of pneumonia. It may, however, be more important to protect against the secondary invaders, which are the primary causes of the pneumonias. The work of Felton, with a group antigenic fraction of the pneumococci, may prove of great value. It is being evaluated in the Civilian Conservation Camps at the present time. Until active immunization is perfected, reliance must be placed upon the prompt segregation and cure of those who are stricken. Vaccination against the specific organisms involved in local epidemics is recommended and was successfully practiced by Smillie.¹ He described an epidemic due to *Pneumococcus* II in a veterans' hospital, which lasted two years and ceased after vaccination of the personnel of the pavilion infected.

CURATIVE MANAGEMENT

The curative management of the pneumonias concerns especially the pneumococci, because the large majority of the pneumonias are due to these organisms. The pneumococcic pneumonias are caused by a group of organisms morphologically and culturally similar, but immunologically separate and distinct. At least thirty-two types of pneumococci are now recognized, due to the brilliant and painstaking work of Georgia Cooper.

SERUM THERAPY

The present favorable position of serum therapy is due to (1) the prompt and precise method for

identification of the responsible organism, and (2) to more adequate methods of administering potent refined and concentrated specific therapeutic sera. The determination of pneumococcus type may be made in 76 per cent of the cases by a direct Neufeld examination of the sputum. Where too few organisms are present, it may be necessary to propagate them in white mice, where they are usually found in the peritoneal exudate after three to four hours, or in the mouse blood after eight to ten hours. The organism obtained from the sputum is responsible for the pneumonia in 93 per cent of the cases, as shown by comparison with simultaneous or subsequent lung aspiration and blood culture.

ROUTINE BLOOD CULTURE

A routine blood culture should be taken to determine the presence of bacteremia, which does not always occur at the onset of the pneumonia. Most of the complications of pneumonia, as well as the deaths, are associated with bacteremia, and may be prevented by the adequate administration of serum. Large doses should be given early in the disease and the most potent serum should be used, as this gives more protection in a shorter time. With severe cases we endeavor to give the entire required dose at once, sometimes in a single intravenous drip, which dilutes the antibody, thus preventing reaction. Frequently, after a single dose of serum, there is a permanent fall of pulse and temperature, and specific agglutinins appear in the blood. The agglutinins in the blood serve as a "marker," *e. g.*, when there is very strong agglutination it is unnecessary to give additional serum, and if the pulse and temperature remain elevated another explanation must be sought. There may be invasion with an additional or a different type from that for which serum was given, a compli-

cation or serum sickness. When serum is given in adequate dose and early in the disease, there is a termination of the disease and absence of complications, and bacteremias are either prevented or cured.

COMMENTS ON RESULTS IN AN EIGHT-YEAR SERIES

The results for pneumococcus I pneumonia over a period of ten years are shown in the accompanying tables (1 and 2) which show the importance of early administration rather than the futility of late administration, and the profound influence of age and bacteremia on mortality.

In the first three years of these observations cases were alternated as they came to the service, the even-number cases receiving serum and the odd-number cases receiving no serum. In the no-serum series the mortality was 32 per cent, in the bacteremic no-serum cases the death rate was 75 per cent.

The reduction in mortality resulting from the use of serum in pneumococcus I pneumonias was also observed in other pneumonias, for which a serum of ample potency was procurable.

Our Harlem Hospital experience is not sufficient to establish statistically the value of serum therapy for pneumococcus II. However, when we combine our own with the experience of the Boston City Hospital, we find a very significant reduction in the death rate of the serum-treated cases. There were 259 cases with 120 deaths (46.3 per cent) in the non-serum treated cases, and 204 cases with 63 deaths (31 per cent) in the serum group. The difference in the death rate of the bacteremic cases is not significant. The incidence of bacteremia was higher in those treated without serum. The effect of early serum administration is shown in the table by decades. In Doctor Finland's series the mor-

tality in serum cases was 50 per cent, and in my own it was 42 per cent. In the table, serum mortality was 23.6 per cent in patients treated before the fifth day. In both series the death rate of patients treated on the first three days was only 20 per cent.

With serums for pneumococcus V, VII, and VIII, and a number of other types, such as XIV and XVIII (given in ample amount so as to very rapidly saturate the blood), the death rate is reduced significantly and the disease is terminated as dramatically as it occurs when serum is used in pneumonias due to pneumococcus I. Over a period of seven years at Harlem Hospital the death rate in pneumococcus V has been 20 per cent; when strong serum was given in sufficient amounts, the death rate was reduced to 11.5 per cent when a moderately potent serum was used (780 units per cubic centimeter) and to 5 per cent when a very potent serum (3100 units per cubic centimeter) was employed.

In pneumococcus XVIII the death rate over a period of eight years has been 26 per cent. In the serum-treated cases it is approximately 6 per cent. Of twelve cases of bacteremia which received no serum, nine patients died. Only one of five cases treated with serum died.

When adequate amounts of serum do not cause a termination of the disease, as evidenced by fall of pulse and temperature, it is because there is (1) a mistyping and the serum is not specific, (2) a second invading type, (3) a complication due to the type involved, or (4) serum sickness from the serum used. This leads to a discussion of adequate dosage. Adequate dosage is sufficient serum given in a short period to sensitize every organism. It cannot be expressed for every patient in cubic centimeters or units. If some organisms

are not sensitized, there is always an opportunity for them to escape into the circulation and multiply. I contrast two cases of pneumococcus VII pneumonia. One, where small doses were given to a bacteremic patient in whom there was a temporary recession of the bacteremia and ultimately a multiplication of the cocci, which was not controlled by later doses of serum. Another patient entered with pulmonary edema on the eighth day of her disease. She had 300 colonies per cubic centimeter of her blood; 400,000 units of concentrated rabbit serum was given. The organisms multiplied and the next day 700 colonies were found. The dose of serum was repeated, and she received 1,800,000 units; the blood stream became sterile and the patient is well.

THERAPEUTIC RABBIT SERUM

A recent development is the employment of therapeutic rabbit serum. This has certain advantages. It has in many instances a greater initial potency before concentration. The protective antibody is in the water-soluble fraction, and is part of or associated with a smaller molecule than in horse serum, so it may penetrate tissues which are impenetrable for horse serum. No prozone has been observed, and it is not inactivated by certain common lipids. Because of the smaller animal and the more rapid production of antibody, it may be possible to have serum for types which would not be made if it were necessary to rely on horses. Two varieties of rabbit serum are being studied. Through the courtesy of Doctors Goodner and Horsfall of the Rockefeller Institute Hospital, I am using a processed serum which has had the chill factors largely removed by heating to 58 degrees for one-half hour, and by absorption with washed kaolin. This preparation gives few chills when preceded by aspirin. The other is a concentrated rabbit

serum; preparations containing 20,000 units per cubic centimeter have been made. Although fewer patients seem to be sensitive to rabbit serum than to horse serum, it is impossible to test for sensitivity to rabbit serum by the dermal reaction because a skin reaction is frequent. Sensitivity is tested by administering a small amount, one-tenth cubic centimeter in five cubic centimeters of saline intravenously. If there is less than 20 millimeters fall of blood pressure after five minutes, the patient is not sensitive.

Allergy to other than the specific serum is not a contraindication to the use of serum. We give horse serum to patients suffering from asthma when the asthma is not due to horse serum.

It is of great value to possess antibodies for the different types of pneumococci in two animals, so that when a patient is sensitive to one the other may be used, but it is not essential.

Patients may be sensitive to sera from two animals.

REPORT OF CASE

A high-school boy, age sixteen years, took suddenly ill at 10 a. m. on April 9, 1937, with generalized aches and pains, malaise, cough with occasional expectoration of clear sputum, fever and headache. He stayed at home in bed. With the onset of the illness, he felt nauseous and could not eat.

April 11—10:30 a. m. Acutely ill, in no distress with hot, dry skin, moist tongue and injected pharynx. Chest: Lungs, vesicular respiration throughout, occasional crepitant râles over right lower lobe. Abdomen soft; no distention. 11 p. m.—Blood culture was negative.

April 12—9 a. m. The patient persists in complaint of pain in abdomen. Sputum bloody, tenacious; no organisms. Blood culture was negative.

April 13—9:45 a. m. Chill. The patient had cough productive of blood-streaked sputum. Pain in left lower chest. Over left lower lobe, dullness to percussion, bronchial breath sounds, bronchophony, and crepitant râles. Neufeld Pneumococcus I. Blood culture was negative.

2:30 p. m.—Blood culture was negative.

Sensitivity to horse serum.

4 p. m.—Ophthalmic—Sclera became injected after five minutes. Intradermal—Saline negative, horse serum 1:100 in two minutes, large urticarial eruption around injected area; wheal two centimeters in diameter surrounded by erythematous ring, four centimeters in diameter. Reaction caused itching over entire forearm. No systemic reaction.

O₂ with nasal inhaler at four liters per minute.

X-ray—Increased density of left lower lobe.

8:30 p. m.—Blood culture was negative.

April 14—12 noon. Bronchial breathing over left lower lobe. Diminished breathing over left upper lobe. Mouse Brain—Pneumococcus I.

SERUM SENSITIVITY TEST: RABBIT SERUM

1 p. m.—Rockefeller Rabbit Serum Processed, Pn. I, Lot No. 2.1.6. One-tenth cubic centimeter in five cubic centimeters physiological saline, given intravenously.

Blood pressure before injection was 108/50; pulse, 100; respiration, 32. Blood pressure two minutes after injection was 70/50; pulse, 110; respiration, 36. After injection the patient wanted to sneeze, became dyspneic. 1:02 p. m.—The patient became restless, dyspneic and cyanotic; musical râles throughout entire chest, profuse perspiration, pulse thready, urticarial eruption over face and arms. Edema of eyelids. The patient was given one cubic centimeter of adrenalin and O₂ at eight liters per minute. Condition improving slowly.

Therapeutic rabbit serum injection by Doctor Horsfall.

April 13—8:45 p. m. Infusion of 5 per cent glucose in normal saline begun, six cubic centimeters (180 drops) per minute.

8:48 p. m.—Adrenalin subcutaneously, M IV. All intravenous injections given into tube 18 inches from vein.

Hour	Dilution in Normal Saline	Time
8:55.....	0.5 cc. serum to 20 cc.....	23 min.
9:21.....	1.0 cc. serum to 20 cc.....	7 min.
9:32.....	2.0 cc. serum to 20 cc.....	6 min.
9:40.....	4.0 cc. serum to 20 cc.....	4 min.
9:46.....	8 cc. serum to 20 cc.....	4 min.
9:54.....	16 cc. serum to 20 cc.....	6 min.
10:04.....	20 cc. serum no dilution.....	6 min.
10:12.....	20 cc. serum no dilution.....	4 min.
10:18.....	20 cc. serum no dilution.....	3 min.
10:22.....	20 cc. serum no dilution.....	4 min.
10:26.....	7 cc. serum no dilution.....	½ min.

11 p. m.—Shaking chill lasting ten minutes.

Temperature before chill, 102.4; pulse, 100; respiration, 30.

One-half hour after chill—Temperature, 105.4; pulse, 110; respiration, 32.

Next morning—Temperature, pulse, and respiration were normal.

COMMENT

As you may gather from the data presented, the early use of specific serum terminates the pneumonia. In many of my patients who have received serum on the first or second day, the patients are discharged on the eighth or ninth day completely recovered and feeling able to work.

Sulfanilamide has been used in some of the pneumococcal pneumonias. There is evidence that it may be of value for its bacteriostatic action in patients suffering from pneumococcus III. Three cases, from whose blood a few colonies of pneumococcus III were recovered, received sulfanilamide and recovered. Two patients with heavy invasions

did not recover, although there had been a temporary diminution in the number of organisms. The drug is not without deleterious side effects. It may depress bone-marrow function and reduce the activity of leukocytes. It causes sulfhemoglobinemia evidenced by severe cyanosis. In one case 6 grams of the 15 grams of hemoglobin per 100 cubic centimeters of blood (about 40 per cent) was so converted. The patient had a ghastly aspect for several days after the drug was discontinued.

In some communities, and in some epidemics, streptococcic pneumonias may be of great importance. Pneumonias may be induced by *Streptococcus alpha* or *Streptococcus beta*, but very rarely by *Streptococcus gamma*. The pneumonias due to *Streptococcus alpha* have been either very mild or have induced empyema. In one patient a brain abscess developed. Pneumonia due to *Streptococcus beta* may be due to one of the twenty-seven different types of Griffith. Where the types which cause scarlet fever are present, convalescent scarlet fever serum has induced a critical termination. This serum did not, however, prevent development of empyema. The streptococcic pneumonias cause early pleural effusion. We have also had excellent results in pneumonias due to *Streptococcus hemolyticus* from an adequate administration of sulfanilamid, especially in those cases where an organism has been recovered by lung suction, and the blood culture has been sterile.

IN CONCLUSION

Unfortunately the precise diagnosis of pneumonia, including the type, may not be made until several days have elapsed. Under such conditions, much larger doses of serum must be employed, and opportunity for marked disturbances in metabolism and destruction of necessary body ingredients have occurred.

A thorough knowledge of physiology and pharmacology is required for the treatment of pneumonia. There is no disease where the emergencies are more sudden and more menacing. Because of the consolidation of the lungs, ability to absorb oxygen is restricted. The oxygen deficiency leads to changes in the circulation and the nutrition of the brain, so that restlessness and delirium are frequent. In addition, through the skin and gastrointestinal tract there may be marked losses of water and salt, and exhaustion of hormones leading to loss of tissue turgor. On this account there must be a careful selection of sedatives, while extreme vigilance is exercised in nursing and feeding.

SUMMARY

The management of the pneumonias depends upon etiologic differentiation, and a serotherapy is available which saves lives and shortens illnesses. Serotherapy and chemotherapy are available for the *Streptococcus beta*. The principles involved in serotherapy and chemotherapy are indicated.

62 West Eighty-seventh Street.

THE PRACTICE OF PEDIATRICS AS A SPECIALTY*

By E. B. SHAW, M.D.
San Francisco

THE pioneers of pediatrics, a small and scattered group, are only the immediate predecessors of most of us who comprise the second group in this specialty. Ours is a young specialty, and in our generation we have been enabled to observe a great part of its development and definition, many things which constitute the chief activities of the present-day pediatrician, have been developed during this time.

Pediatrics is a direct outgrowth, or at least a concomitant development, of a new idea in intensive puericulture. The old scheme of rearing children was based on the sound biologic law of the survival of the fittest. Children were produced in abundance and an effort was made to supply them with their needs for subsistence but they thrived or not, survived or not, largely dependent on their own inherent powers in the struggle for existence. This older method is biologically sound but economically not so tenable. Thereby was produced a hardy race of survivors, a certain percentage of cripples, and many of the weaker were removed by natural processes.

The modern method is based on a desire for smaller families, accomplished by methods of birth control, with the idea of giving every individual maximum opportunity for obtaining his best possible degree of development—physically, mentally, and culturally. During the last two or three decades the average span of life has been materially lengthened; this result has largely been secured through improvement of health and nutrition during the early years of life. The ultimate result of the improved care of childhood on the physical status of later life is still to be demonstrated but it is not unlikely that there will be unpredictable remote effects in the later years of future generations as the result of such an extensive biologic experiment. Not long ago the chief problems of child health were the product of scarcity of certain essentials, our generation has created some new problems of superabundance.

Formerly most children were born at home—as a matter of fact were delivered sight unseen beneath the bedcovers. This resulted in poor obstetrics and primitive asepsis but only the fittest were expected to survive and asepsis was not nearly so important as later when cases were crowded into hospitals. The mother nursed her baby as a matter of course. As long as she had sufficient milk she needed very little help with the nutrition of her baby and gradually maternal nursing was supplemented by casual additions from the family table. Of course, if the mother's milk supply was inadequate the problem of artificial feeding was extremely complicated and hazardous, and infant mortality in these cases was appallingly high.

* Chairman's address before the Pediatrics Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2-6, 1937.

The babies which comprise your practice and mine are delivered in hospitals. Modern obstetrics and better prenatal and postnatal care have led to a great diminution in the hazards of very early life. The obstetricians learned their lessons in the prevention of infection from Semmelweis and Oliver Wendell Holmes and similar lessons have had to be learned by the pediatrician in the care of infants in the socialized atmosphere of the nursery. A curious by-product of this system has been, however, a marked decrease in breast feeding. In most mammals, including until the last few years the human being, the young are nursed almost incessantly during the first few days of life. Gradually, as the milk supply becomes established, a more convenient schedule is established. This procedure fits poorly with hospital routine. The hospital baby is nursed most infrequently during the first few days and is then generally put upon a final schedule of widely spaced nursings. This results poorly in the establishment of adequate milk supply. Meanwhile the baby is subjected to repeated weighings and there is great and perhaps unnatural concern about his weight increment. Almost inevitably the baby is placed partly or entirely on artificial food somewhere between the first hour and the first week of life. This is entirely inimical to the natural method of feeding an infant; it is not necessarily bad, but it is distinctly abnormal. Quantitatively, of course, the nutrition of the infant is thus improved but qualitatively there is the possibility of far-reaching effects. Colostrum has some effect on the bodily economy of the new-born. Does its absence adversely affect the immunologic status of the individual? The introduction of foreign protein into the digestive tract of the infant is not well borne by most animals and is not always well tolerated by the human being. I cannot help wondering if the apparent tremendous increase in allergy can be thus explained. San Francisco should be an ideal laboratory in which to test this hypothesis. The effect of interference with maternal nursing cannot readily be evaluated; one must reflect on the results of this on the mother both physically and emotionally. The muscular effort of nursing the breast differs entirely from that of taking the bottle, the former requiring an amount of muscular activity of the jaws at variance with their rôle in the latter which almost certainly affects the development of the baby's jaws and teeth. Many of the defects of dental occlusion, currently attributed to thumb-sucking and the use of soft food are thus more rationally explained. Pediatrics must face all of the possible effects of substitution of the artificial for the physiological. It is unlikely that the artificial can preferably supplant the physiologic; proof in support of this will require far more observation than is at our present command. It is, further, most unlikely that a profound biologic change in the mother has suddenly, in one generation, rendered so many unable to nourish their infants.

Nearly every authoritative treatise on infant feeding begins with the precept that breast milk is

the best food for the infant. So explicit is this dictum that, rather surprisingly, the manufacturers of artificial food use it as a slogan—with, of course, the implication that theirs is the next best food. If this be true and not idle pious platitude the pediatrician would do well to adopt a program better fitted for its accomplishment. Infant feeding has become so simple as not to require extreme skill—the superior qualifications of the specialist might much better be devoted to the more difficult problem of breast feeding if it is not heresy to advocate it. Our grandmothers, who nursed their babies because they usually otherwise would die, nursed them frequently at first and never gave artificial food until it was an absolute necessity, followed, in my opinion, a program much more likely to achieve this result than is brought about by pre-lacteal feeding, supplementary feeding with cow's milk, and frequent early abandonment of breast feeding.

Our knowledge of artificial feeding has meanwhile perforce greatly improved. Our knowledge of the quantitative requirements of an infant has especially progressed but knowledge regarding the qualitative requirements has not progressed so rapidly. Undoubtedly, the greatest improvement in the mortality rate of artificially fed infants has resulted from the production of uncontaminated milk and the application of aseptic methods to the preparation of a formula. The qualitative adaptation of cow's milk to the infant's nutrition has not been nearly so well perfected as the principle of giving the baby enough to eat. Mother's milk contains all of the food factors essential to nutrition; cow's milk, especially when it has been heated to destroy pathogenic bacteria and for preservation, does not. Improved knowledge regarding accessory food substances, the vitamins, has gradually improved to reach what we may trust to be a climax at the present time. Gradually vitamins A, B, C, D, and upward have been added to the infant dietary with increasing enthusiasm. Thereby certain diseases produced by deficiency in these vitamins have been gradually eliminated but at the present time these substances are exhibited with such enthusiasm that one must fear the possible effect of superabundance. This problem is particularly acute in the case of vitamin D which the modern infant receives by way of that naturally present in his food, through artificial reinforcement of the content of the milk, by cod-liver oil, other fish oils, and viosterol, and by solar radiation. In all probability the organism is capable of rejecting an excess but we must at least consider the possibility of adverse effects of overdosage. These effects may not be apparent in the first few years of life and may not sufficiently be demonstrated by a single generation of experience. It is unlikely that many children have been overdosed with synthetic vitamins but it is sincerely to be hoped that there will be nothing in the future to reproach present over-enthusiasm.

In the feeding of children past early infancy, pediatrics has gone through several phases. With

improved knowledge of the quantitative requirements of the infant and child we early began to set up a strict standard of nutrition which was indiscriminately applied. For a few years mothers thrust down unwilling throats the exact amount of food prescribed for the child and the scales assumed unnatural importance in evaluating the child's nutrition. This led to a rather curious psychological problem which developed in both mother and child, and led to the absurd problem of the child who will not eat which has been discussed by most pediatricians and all psychologists. In spite of the pediatrician who said that he built his house with the child who will not eat, modern pediatrics has come to recognize that this is a problem which does not naturally exist, but is only an unfortunate by-product of an unnatural system of feeding. We have gradually come to a recognition of the fact that the nutrition of a child must be individually judged. Some are large, some are small, some are fat, some are thin. Every pediatrician should hang above his scales the poem of the little elf man, "I am just as big for me, said he, as you are big for you." The dietary components for the child have been altered materially in the last few years. Not so long ago children received solid food during the first year, mostly surreptitiously. Then came the period when children were given, long after the appearance of their teeth, only soft, sloppy foods and some children never did really learn to chew. More recently solids of almost every kind and of increasing solidity have been added to the diet at earlier and earlier time to a present almost unnatural extreme. The incorporation of vitamin components in the diet of older children has also been carried to ridiculous extremes.

The influence of scientific advance is to be seen not only in the field of nutrition in this matter of intensive puericulture. Past infancy the child is receiving more scientific attention than in any previous time in the world's history. Most of this effort is, doubtless, on the whole beneficial, and is partly responsible for the tremendous improvement in nutrition, stature, and general well-being of our present-day children. But pediatrics must not attempt to gild the lily, the purpose of periodic health examinations is to maintain a state of health in the individual, and not to elevate him to a state of supernutrition. It is the wise pediatrician who can counsel the mother without providing her a complete substitute for her own common sense and maternal devotion. It will be well if the phrase, "the triumph of technique over reason" which has been leveled at some other specialties, can never properly be flung at pediatrics.

The energetic application of specific immunization in communicable diseases has been an outstanding development of modern pediatrics. The prevention of smallpox rests on a century of experience which demonstrates its usefulness, effectiveness, and safety most convincingly. During the past thirty years, experience has demonstrated that

diphtheria can be prevented by a method which is not directly analogous to smallpox vaccination, but which even more thoroughly complies with essential criteria. These methods have engendered an enthusiasm which has led to the introduction of numerous methods designed for the specific prevention of communicable disease. It is utterly essential that before such methods be generally applied there should be adequate evidence regarding the criteria of usefulness, effectiveness, and safety of each individual measure considered solely on the basis of its own merits and not by way of an analogy. One must constantly maintain a critical point of view and must be mindful of the fact that there is a practical limit to the number of such procedures to which a child should be subjected.

Our interest in the well child has not stopped with his physical well-being, the study of child psychology has progressed enormously in the past few years. Surely, no one would wish to deny that this field has contributed much to the rearing and education, to the correction of defects in personality, and to the adaptation of the child to his environment. The greatest danger in this particular sphere is that the intensively reared individual be shaped by many and inexperienced hands. The physician, especially the pediatrician, must be adequately grounded psychologically, but no scientific subject has been more popularized and at the same time more obfuscated to both the physician and the public by an intricacy of technique and terminology. Most of the psychological problems of childhood can be handled by most simple methods based on a thorough and sympathetic understanding of the child. The pediatrician who realizes how frequently physical defects are remedied by the natural processes of growth and development must not lose sight of a similar natural mechanism for the correction of psychological defects. The psychological problems of childhood, as pointed out by Brenne-
man, are seldom static.

Whatever the value of pediatrics to the well child, pediatricians must be equipped to deal even more expertly with the ill child. Almost none of the problems of diagnosis in childhood and only a few therapeutic procedures are beyond the scope of the adequately trained pediatrician. A good definition of a specialist is one who attempts only that which he does expertly. Pediatrics, in contrast to other specialties, restricts itself not to organs, systems, or to kindred diseases but to the particularized study of patients during a restricted age period. The pediatrician must bring to this pursuit certain prerequisites of knowledge which differentiate him from the internist who may be equally familiar with the disease processes themselves. He must be adequately schooled in growth and development, and must properly understand the practical aspects of child psychology, but he must be possessed of no less keen clinical sense than the internist and must, furthermore, combine his scientific qualifications with personal attributes of kindness and gentleness.

The most difficult, as well as the most interesting and important, diseases which fall within the scope of pediatrics, are the communicable diseases. The specialist in pediatrics must be exceedingly well trained in this field, for here come a great many of his emergency problems in which the outcome is greatly influenced by the promptness and accuracy of his diagnosis and treatment.

One of the greatest opportunities in pediatrics is that of clinical research conducted along the methods suggested by Sir James Mackenzie. The child is an ideal subject for the type of accurate and detailed observations necessary for the scientific study of disease and is altogether unrivaled by any experimental animal. In childhood, disease problems usually present themselves as entities unaccompanied by the numerous complicating factors which obscure observations in the adult. The pediatrician sees his patients frequently from birth to adolescence and can trace the beginnings of disease, as well as the modifications brought therein, by growth and development. Here are to be found the recognizable first-infection forms of tuberculosis and rheumatic fever; we should be alert to detect similar first-infection forms of other diseases important to adult life. Some of the most profound problems of modern medicine are more likely to be solved by the pediatrician, if he is sufficiently alert, than by any other specialist.

These clinical problems are numerous, but can be aptly illustrated by one or two examples. In the child is to be observed the interplay of endocrine influences as they affect growth, developmental changes, and the catalysis of sexual maturity. The problems of endocrine deficiency or of superabundance can be observed from their inception, the problem of therapy is thus made far more hopeful, and the opportunity for scientific study is infinitely superior to the static end-result which is presented to the observation of the internist.

Another clinical research in which the pediatrician must maintain interest and in which he has enormous opportunity in the field of his own practice is the problem of allergy, the mysterious mechanism of altered reactivity which is important to almost every field of medicine. Allergic problems which present in later life are extremely complex, in childhood one confronts the problem in its simplest guise. Only the pediatrician has the opportunity to follow the child through years which permit him to observe the modifications brought about by heredity, prenatal state, nutrition, environment, nervous influences, infection, the response to therapy, and the multitude of factors which influence the problem before it reaches the internist later on. I do not believe that there is any greater opportunity presented to the modern pediatrician. One cannot escape the conviction that the accumulated laboratory data lacks only an ingenious clinical approach to open the door to tremendous advances in our knowledge. I am convinced that a continued and truly scientific study of this condition in clinical pediatrics should be far more productive of valuable conclusions than

any similar expenditure of energy in older patients or in experimental animals.

It is, I think, unlikely, that the pediatrician will quickly be supplanted by any other type of medical practitioner. The public has been trained to demand intensive care of a restricted output of children. Continued survival of our speciality necessitates, however, that the pediatrician bring to his task highly specialized attributes of training and skill. Artificial feeding of infancy has been so simplified and standardized as no longer to make the greatest demand on this skill. The pediatrician must keep abreast of changing trends and be prepared to meet a multitude of demands in every aspect of child care, nutrition, disease prophylaxis, psychological guidance, and must offer a superior technique in the treatment of the ill child. The scientific advance of this specialty will be greatly served by proper appreciation of the extraordinary opportunities in this field for clinical research.

PERTINENT COMMENTS ON ANESTHESIA*

By HARRY J. SMITH, M.D.
Oakland

KNOWLEDGE concerning a fact goes through certain phases. These are: Discovery, appreciation, and investigation. Knowledge of anesthesia, being a fact, went through this same process in development.

Anesthetic agents were known many years before their practical application, but at last came the discovery of the fact and their use quickly followed. During the next phase, or that of appreciation, the use of ether became quite universal. It seemed so safe and satisfactory that no great effort was put forth to find anything better.

The "A. A. A." that nurtured modern surgery—anaesthesia, antisepsis, and asepsis—never needed a court decision to prove their constitutionality. They were proved beyond a doubt by their benefit to mankind.

However, anesthesia lagged behind in the rapid development of medical and surgical science. Whether due to a false sense of safety or not, the administering of ether was delegated to others who did not have the scientific training of the surgeon. Abroad that was not the case, perhaps because chloroform (which was more popular) was recognized as a dangerous agent when used by the unskilled and, therefore, was never let out of professional hands. During this phase of anesthetic knowledge, surgery made great advances in technical skill and mechanical devices to assist in operations. Also, surgical science was advanced by extension of medical curricula and development of clinics, while a few lectures sufficed to stimulate a

* Chairman's address before the Anesthesiology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2-6, 1937.

zest for further enlightenment of the student in anesthesia.

INVESTIGATION AND RESEARCH WORK AT THE PRESENT TIME

Fortunately, we are now entering or progressing in the phase of investigation and research. During the years 1880 to 1903, much work and experimentation was carried on relative to the placing of drugs and solutions near or into the spinal canal. Spinal anesthesia was the outcome, and directly many agents were tried and various techniques used. After a few years, accumulated statistics pointed a discouraging finger at this method, and it was not until more information and less toxic drugs were available that the revival of spinal anesthesia became general.

The use of gaseous agents depended on accurate mechanical devices, lack of which handicapped the development of nitrous oxid and ethylene. The ingenious brain of the late E. I. McKesson—and we may well pause to honor him—produced some of the lacking facilities. Others followed, until now we have the means of regulating doses of gases with exactness.

PROPAGANDA FOR NEW PREPARATIONS

At present, we are in the midst of a flood of literature and frequent, but not unwelcome, visits of detail men proclaiming the virtues of their brand of sedative, analgesic and anesthetic, for oral, rectal, and intravenous use. We hardly hear of these before their use in thousands of cases are reported, and some of our colleagues, without special knowledge of anesthesia, are carried away by the description of the ease and simplicity of the drug being exploited, and are frequently rewarded with unsatisfactory or disastrous results. Here may be a good place to mention another observation. New appliances that are constantly superseding those in use are demonstrated a time or two to anesthetic technicians and, without further instruction, the salesman leaves them to develop skill in using the machine on a human being who is paying for expert care. The use of such a potent gas as cyclopropane has been tried in these devices by the same technicians with little, if any, knowledge of its pharmacologic or physiologic action.

PROCEDURE IN CAPE TOWN, SOUTH AFRICA

Perhaps such a situation as exists in Cape Town¹ might tend to put anesthesia on a sounder basis. There the anesthetist is put on the defensive and is charged with all possible accidents, and has to vindicate himself in a public trial following a police postmortem examination. The newspapers make capital of the misfortune, and the gossips have a ready-made subject for conversation. It would, at least, be a novel experience for an anesthetist hereabouts to be of enough importance to be discussed over the teacups!

THE PROBLEM OF THE NONMEDICAL ANESTHETISTS

Whatever reasons exist for nonmedical anesthetists have been discussed many times. The financial profit to hospitals is the main one. The only argument against professional anesthetists that I have

heard was that there were not enough graduates in medicine interested in such a specialty to properly handle the situation. In the third largest center of population in California, the writer knows of several doctors who looked longingly at such a career and finally abandoned it because the hospitals were practicing medicine by employing technicians and making a profit on the work they did. By this procedure the advancement of the science, as well as the living, for members of our profession are stymied.

Frank H. Lahey² says: "The training of men in anesthesia has not kept pace with the other progress in this field. Hospitals will ultimately realize that the present attitude regarding relatively low-cost anesthesia will prove a penny-wise and pound-foolish policy. Certainly, one of the present practices in anesthesia should be condemned: in the light of the present progress in anesthesia, it is quite wrong for hospitals to show a profit by charging for nurse anesthetists, even though this profit is utilized in other departments of the hospitals—if there should be a surplus income for anesthesia, it should be devoted to that for what it is paid by the patient, that is, the best anesthesia possible and the training of better anesthetists."

Why not devote more time to the teaching of anesthetic technique in nursing schools, if that training is all that is necessary in producing a proficient anesthetist? At least a better course in medical curricula would be a help to those who chose surgery as a specialty, since by recent decision they are directly responsible for the supervision of the technician in the administration of the anesthesia as well as the outcome.

Arthur M. Wright³ says: "The progress of anesthesia as a specialty has been apathetic. For this apathy the medical school has been chiefly responsible, the surgeon particularly and the anesthetist specifically." Again, he says: "Changes and experiments must come, and future advances must be made with confidence and promise. The surgeon must walk, arm in arm along the road of clinical efficiency." Let us see how this "arm in arm" procedure works out in California. Quoting from the decision of the Supreme Court of May 18, 1936: "The findings, which are amply supported by the testimony in this case, show conclusively that everything which was done in the present instance, and is generally done in the administering of anesthetics, was and is done under the immediate direction and supervision of the operating surgeon and his assistants. . . . We are led further to accept this practice and procedure as established when we consider the evidence of many surgeons who supported the contention of the defendant, and whose qualifications to testify concerning the practice of medicine in this community and elsewhere were beyond dispute."

WHY A MORE COÖPERATIVE PROFESSIONAL UNDERSTANDING SHOULD EXIST

The "road" along which such an "arm-in-arm walk" proceeds certainly will never advance the science of anesthesia, and will not bring to the surgeon's patients those benefits to which they are rightly entitled. The only way in which the surgeon

and anesthetist can walk "arm-in-arm" is on a basis of equality, not on the basis that the surgeon is in the "immediate and direct supervision of the anesthetist's work." In other words, the anesthetist should be a specialist with whom the surgeon can discuss problems as he would with an internist, and one in whose hands he would confidently leave his patient after his diagnosis and operative procedure were determined.

ENCOURAGING SIGNS

Perhaps we should not be discouraged by the slow development of our science as a specialty. There are certainly many encouraging events happening, and these events are being spaced by shorter intervals. Never was there a time when the search for new agents was so keen. In the pharmacology and physiology departments of our medical schools there is a renaissance of interest in the anesthetic problem. Several centers are open to those who would pursue knowledge and skill in the art. The genius of inventors has placed at our disposal more accurate mechanical equipment for administering inhalation anesthesia, and through accumulated statistics and writings are brought the views of others on the various drugs and methods of administering them.

The growth of our societies has been steady, and if we read aright there is a growing interest in anesthesia throughout our own country, as well as abroad.

Our great achievement will be to continue to do our best to relieve suffering and to render painless these ordeals, both natural and accidental, that come to our fellow man.

SURGICAL PRACTICE: LOOKING FORWARD*

By JOHN HUNT SHEPHARD, M.D.
San Jose

THE ideals of the medical profession always have been, and always will be, beautifully expressed by an inscription over the amphitheater in old Rush Medical College, which reads: "Dedicated to the relief of suffering and the prolongation of life."

ETHICAL CODE OF PHYSICIANS

For centuries the medical profession has marched forward under its self-established principles of ethics, which are quite incomprehensible to the average layman. In essence, these principles may be summarized in three words: "Service to humanity." From time to time, down through the centuries, we find slight glimmering reflections of these principles in various crafts, trade-unions and industry, but never without the stronger light of selfishness almost completely obliterating these reflections.

*Chairman's address before the General Surgery Section at the sixty-sixth annual session of the California Medical Association, Del Monte, May 2-6, 1937.

Health is the greatest personal and national asset; yet we, the purveyors of health, are being told that we are incompetent to direct the distribution of our knowledge and service, even though we have made the United States the healthiest country in the world—a country where the highest attainments of medical service, both preventive and curative, are available to each and all who will accept of our services, and at a price within their ability to pay.

I do not believe there has ever been an individual denied medical service on account of his or her lack of material worth. It has been this willingness on the part of the members of our profession to serve their fellow man that is largely responsible for the periodic attacks made by the self-styled "social altruists" to attempt to crush us under their heel and make us subservient to their fads and fancies.

Unfortunately, there have always been and always will be members of our profession unwilling or unable to see the light or, if seeing, unwilling to follow through the portals of sacrifice and devotion so necessary to their calling.

The progress we have made (and our journey will never end) has been the result of working together, of our organized efforts for the public welfare, of the daily living according to the ideals set forth in our principles of ethics; and if these are ever forsaken, our value to humanity will drop like the value of tampered currency.

EARLY LEGAL REGULATIONS OF MEDICAL PRACTICE

A glance at the early legal regulations of the practice of medicine is not only interesting, but is evidence that the thoughts I wish to submit for your consideration were in the minds of men as long ago as 1736. The earliest legislation pertaining to the practice of medicine enacted in this country was passed by the colony of Virginia in 1639, and concerned that much discussed question of today, "medical economics." It provided that it should be lawful for any person believing the charge of a physician or surgeon to be unreasonable, to have such physician or surgeon arrested, and cause him to be brought before the proper court where he should declare upon oath the true value, worth and quantity of his drugs, and medicines administered to or for the use of the patient. The court thereupon allowed the physician or surgeon such fee as in its discretion it found fit.

From this it is logical to assume that even at this early period of our Colonial settlement there were those who felt that medical service should be provided at the expense of the state, namely, by some form of taxation.

In 1736 the Virginia Assembly passed an act regulating the fees and acts of "practitioners in physic." This act may well be considered the first legal recognition of specialization in the practice of medicine, since it made a distinction between the charges of "surgeons and apothecaries," whose training had been limited to serving an apprenticeship to those trades, and those who had studied physic in any university and taken a degree therein.

FIRST MEDICAL PRACTICE ACT: MASSACHUSETTS COLONY

The colony of Massachusetts in 1649 enacted the first measure regulating, in any way, the practice of medicine. This act may be considered as the origin of the judicial ruling which requires a physician to adhere to the principles and procedures recognized as proper by his fellow practitioners. It forbade "chirurgeons, midwives, phisytians or others to treat patients contrary to the known approved rules of art, without the advice and consent of such as are skilled in the same art, or at least some of the wisest and gravest then present."

There is no definite evidence who the sponsors were of the above first two legislative acts, but the act of the colony of Massachusetts was sponsored by members of the medical profession.

NEW YORK'S INITIAL CODE

On June 10, 1760, the General Assembly of New York enacted the first well-considered Medical Practice Act. It applied only to the city of New York, and in part reads: "No one whatsoever shall practice as a physician or surgeon in the said city of New York before he shall first have been examined in physick and surgery, and approved of and admitted by one of His Majesty's Counsel, the judges of the Supreme Court, the King's Attorney General and the Mayor of the city of New York for the time being, or by any three or more of them, taking to their assistance for such examinations such proper person or persons as they in their discretion shall think fit"; and it provided that to any candidate satisfactorily passing the examination, a testimonial of his examination and admission should be issued.

In 1792 the State of New York enacted the first law specifying certain educational requirements of applicants for medical licensure. This act provided that the applicant should have had a two years' course of study under a recognized physician, after having had a college education, or a three years' course of study without a college education; and if he possessed a medical degree from an American college or university, he was not required to secure a license.

The other colonies and states in rather rapid succession passed similar laws, and at frequent intervals the educational prerequisites for medical licensure have been increased until, today, these requirements have reached a height undreamed of fifty years ago.

PRESENT-DAY STANDARDS

To many it may seem that our present requirements for licensure are now high enough; yet I am certain that eventually and rightfully they will be raised, and these new and higher standards will be brought about by the action of the organized medical profession.

The young men and women who are now being admitted to the practice of medicine are better trained and qualified than those of us who entered practice thirty years ago. The individual knowl-

edge possessed by the older men of today has been gained partly through continued study since graduation and partly from their mistakes, some of which are marked by marble monuments which might appropriately bear the inscription: "Sacrificed for the acquisition of knowledge that in years to come will save others." Is the fact that recent licentiates are better qualified than I was when a license was granted me in 1904 justification for them to be permitted to engage in all branches of the practice of medicine and surgery as soon as they have finished one year of internship?

APPENDICITIS MORTALITY

No doubt you have read statistical reports during the last two or three years showing that the general mortality from appendicitis has been rising in recent years. You who are master surgeons have not experienced a rising mortality in your own work; yet you surgeons are seeing more and more cases requiring reoperation and frequently are finding that the original operation was either incompletely performed or accompanying pathologic processes had not been attended to. A few years ago, in reviewing 304 operations for the relief of duodenal ulcer, I found that 17 per cent of the patients had been subjected to an appendectomy within the immediately previous four years for the relief of the same group of symptoms which caused them to undergo the second laparotomy.

STANDARDIZATION OF SURGICAL PRACTICE

Surgery is something more than cutting and sewing, and having the patient leave the hospital by the front door. We have made great improvements in our hospitals through our efforts of standardization, and now inexperienced men may open and close the abdomen with a low operative mortality rate; but the pathologic laboratories of even our standardized hospitals contain far too great an array of specimens of normal tissue. It reminds one of the early days of abdominal surgery when a snowball in hell was almost as secure as an ovary in New York.

Is it not time for us to begin to standardize surgeons? Is one year of a rotating hospital internship, with three months spent as a second assistant in the operating room, sufficient training to justify granting to that man a license to do surgery? Or does an additional year of internship, magnanimously spoken of as a "year of residency," qualify one as a specialist?

Time sees many changes. Requirements which were proper and just twenty-five years ago may not be sufficient today. Twenty-five years ago there was little opportunity for a young man to be associated with a master surgeon. Even today there are less than one hundred and fifty positions yearly available in the United States for surgical fellowship. However, I believe there is another way of offering training to those young men desirous of becoming surgeons—less efficient and requiring a longer period of time than a surgical fellowship in a teaching institution, nevertheless possessing possibilities very little utilized today.

APPRENTICE AND MASTER SURGEONS

Would it be asking too much to seek the grading of surgeons into apprentice and master surgeons, requiring, except in extreme emergencies and isolated communities, the presence of a master surgeon at all operations? There are at the present time a few hospitals where the work of the junior members of the staff, until they have demonstrated their ability, is carefully watched and supervised by the senior members, and, strange as it may seem to some, the position of junior surgeon in these institutions is eagerly sought. At the present time only closed staff hospitals can enforce such a procedure. If such is proper, its endorsement by organized medicine will greatly hasten its widespread adoption.

Senior surgeons must become more sympathetic with and helpful to the younger men. Too frequently we find inexperience assisting inexperience, not because the young man who has been entrusted with the patient's welfare does not desire the assistance of an experienced surgeon, but because the experienced, established surgeon refuses to assist; yet perhaps he, himself, has acted as an assistant to the same young man only a few months previously when the youth was his intern or resident. What makes this difference of attitude? Who is to blame?

Some believe, or at least claim to believe, that if they are to assume any of the responsibility, they must assume all and take complete charge of the case. Can we not learn a lesson in charity, humility and service from our brother internists who gladly assist the young physician in obscure and difficult cases, yet allowing the young man to retain his position as the doctor in charge? I lovingly remember how Drs. E. Willys Andrews and L. L. McArthur acted as my assistants during my second year of internship and helping me to realize what a valuable service during my earlier years of practice, both to me and to my patients, it would have been could I have had a master surgeon looking over my shoulder, giving me words of advice and encouragement, and ready and willing to step in when the going became too tough for me.

IN CONCLUSION

Much study of, and changes in, the curriculum of our medical schools is being made. Is it not proper that the supervision of an embryo surgeon should continue after he has served his one or two years of internship? Postgraduate supervision, if you wish to call it such, should, I believe, continue until, figuratively speaking, the youth is safe to fly alone. Such supervision can continue if those who have been through the fire of experience cast aside their selfishness and follow that portion of the Hippocratic oath which binds one to "hold my teacher in this art equal to my own parents, to consider his family as my own brothers, and to teach them this art if they want to learn it; to impart precept, oral instruction and all other instruction to my own sons, the sons of my teacher, and to indentured pupils who have taken the physicians' oath."

Medico-Dental Building.

INFLUENZA: THE SAN FRANCISCO
OUTBREAK OF JANUARY-
FEBRUARY, 1937*

By J. C. GEIGER, M.D.

AND

J. P. GRAY, M.D.
San Francisco

DISCUSSION by Benjamin W. Black, M.D., Alameda;
William J. Kerr, M.D., San Francisco.

ACCORDING to personal telephone communications, influenza occurred in several cities in eastern and middle-western United States, notably New York, Chicago, and Denver—during late December and early January—to an extent described as "bordering on epidemic proportions." During this same period, the reported incidence in San Francisco was well below the "expected normal."¹

As many as five cases of influenza per week had not been reported in more than nine months prior to January 1, so that the higher reported incidence for San Francisco for the second week in January (ending the 9th) (24), although still below the "expected normal" level (41), was of definite significance, apparently; for the reported cases for the third, fourth, and fifth weeks ran markedly higher (317, 720, 737), with a definite decline during the sixth week (first week in February) (497).²

REPORTS RECEIVED

As expected, the reporting of influenza, during this period as in others, was grossly incomplete. It is believed, however, that the reported cases may serve as morbidity data of some value as epidemic indices. The latency that exists between the dates of onset and of reporting is a variable of no little importance, an impression frequently confirmed in the current series. The true incidence, obviously, will be some function of the reported cases, by dates of onset. It is apparent from such a tabulation that the elevated incidence in San Francisco actually antedated New Year's Day, with a gradual rise through the first eight days of January (thirteen to thirty-one cases daily), with a sharp increase (53, 62, 90, 105) to a peak on the eighteenth day (144). For the half month between January 10 and January 25, the consistently high level of approximately one hundred cases daily was maintained (minimum of 78 to maximum of 144, mean of 106). The decline was as sharp as the incline, dropping to less than ten cases daily by February 1.

QUESTION, WHETHER IT WAS INFLUENZA

Quite naturally, one asks: Was the affection reported really influenza? In the absence of detailed epidemiologic case investigation, of clinical

* From the Department of Public Health, city and county of San Francisco.

¹ The expected normal represents the mean number of cases reported or deaths recorded for the week or month, based on the nonepidemic years of the previous seven years' period, adjusted to population.

² The total of 497 cases reported included many in which the dates of onset preceded the dates of reporting by varying periods. The decline was actually much more precipitous than the weekly totals indicate.

laboratory data, and of experimental research directed at the recovery of the virus of influenza from nasal washings in early cases, by passage through the ferret, the answer to this question is obviously unsatisfactory. From clinical impressions, however, there can be little doubt that San Francisco experienced an outbreak of influenza. Fortunately, the disease was mild in its course, apparently, although debilitating in its effect in a high proportion of those affected. The more important symptoms and signs included: general malaise, moderate fever, absence of physical signs of pulmonary involvement, evidence of upper respiratory infection, leukopenia, and marked general weakness of the skeletal musculature. Gastro-intestinal disturbances were, also, not infrequent.

Added support for the premise that the outbreak was one of influenza is found in the reflection of increased morbidity in the general crude mortality rate and the specific rates for acute lobar pneumonia, bronchopneumonia, heart disease, and influenza. The weekly crude death rate fluctuates considerably, of course, as a result of the effects of small numbers and of short periods of time. Over a period of years the dispersion has been between the minimum of eight and the maximum of eighteen, with the usual swing occurring within a smaller range, between the limits of nine and fifteen. During the first six weeks of the present year, however, the rates have been 16, 14, 19, 23, 25 and 21, significantly higher than the expected rates. During these same weeks, 1,571 deaths were recorded, as contrasted with an expected normal total of 1,156. The increase in influenza mortality was first noted for the third week (ending January 16), when seven deaths were recorded as compared with the expected normal of three. The succeeding weeks showed: 19 as compared with 2; 27 as compared with 2; and 17 as compared with 3. The numbers of deaths due to acute lobar pneumonia ran parallel to those resulting from influenza, by weeks, again beginning with the third week: 14 deaths (expected normal of 7); 16—6; 31—6; and 14—8. Bronchopneumonia, likewise, as a cause of death, showed figures of almost identical significance: 9—5; 22—7; 23—9; 19—8.

Perhaps even more striking are the data related to heart disease as a cause of death: 78—52; 107—55; 110—45; 83—52. Heart disease, during recent years in San Francisco, as in several other cities, has been involved, with increasing frequency, as a cause of death. In fact, the number of deaths attributed to heart disease, week by week throughout the past year, has consistently been above the expected normal. In only eight instances, however, has the ratio of recorded deaths to expected normal been above 1.5, and in no one week did the number of deaths recorded as due to heart disease exceed seventy-one, facts which indicate that the higher weekly rates during the early weeks of 1937 were significant.

COMMENT

Of definite interest to the student of these data is the fact that there was a period of cold weather in the San Francisco Bay area during this same interval. Several standing records for low temperatures were broken by those registered during the month, with below freezing readings quite frequent. The combination of low temperatures, with high humidity and rather high velocity movement of air, in the California climate works a real hardship on certain population groups. Such conditions are expected, and appropriate precautions are taken in other parts of the country, but such weather changes in California are more than "distinctly unusual." Whether these weather changes are related to the incidence of influenza, acute lobar pneumonia and bronchopneumonia is subject to debate, obviously; but it is believed that the weather changes are definitely related to the elevation in heart disease mortality because of the inability of the person already handicapped by heart disease to meet the sudden demands of increased metabolism incident to low temperatures and high humidity.

On the basis of past experience and the meager data available in this outbreak, the prediction was made in the public press before the end of the fourth week in January that the outbreak would be definitely on the decline during the first week in February (sixth week of the year), a prediction which, fortunately, was accurate in being fulfilled.

San Francisco then experienced an outbreak of influenza during the early weeks of 1937, in which about 2,300 cases were reported. The increased reported incidence of the disease, though incomplete and inaccurate, served as an index of value in predicting the course of the epidemic. Morbidity was definitely reflected in mortality, with significant elevation of rates for influenza, acute lobar pneumonia, bronchopneumonia, and heart disease, with the highest general mortality rates recorded in San Francisco since the pandemic of 1918-1919.

101 Grove Street.

DISCUSSION

BENJAMIN W. BLACK, M. D. (Medical Director of Alameda County).—The paper by Doctors Geiger and Gray is most timely, presenting some very interesting facts, and draws some pertinent conclusions covering the subject so ably discussed. The experience on the east side of the San Francisco Bay, in Alameda County, parallels very closely that reported by Doctors Geiger and Gray for San Francisco. One is impressed, however, with the fact that there were probably more cases of influenza than actually reported. The reason for this state of affairs appears to be that physicians hesitate to report cases unless a diagnosis is definitely established. Sometimes symptoms last for several days, and the patient is very much debilitated without a positive diagnosis of influenza having been made. Some of these cases seem to present grave complications when they later appear, particularly in public hospitals.

This paper in itself will tend to make physicians more conscious of the problem, but it is to be expected that all cases of influenza will not be reported until there is a more simple manner of making diagnosis with less complicated studies having to do with the epidemiology of the disease. It is fortunate that the disease was mild; but in spite of this statement there were many complications in the cases as found later in public hospitals. For example, in January,

1937, there were fifty-five cases of influenza admitted to the Alameda County Hospital, with seven deaths, complicated by pneumonia; one complicated by a cardiac condition, and one complicated by a genito-urinary condition. In February, 1937, this number was reduced to twenty-one cases, and one death with a heart complication. In March, 1937, three cases were admitted, with no deaths.

By contrast, influenza cases admitted to the Alameda County Hospital during the months of January, February, and March of 1935 show six cases, with no deaths. During the same months in 1936, there were eight cases, with no deaths. In January, 1937, there were eighty cases with bronchopneumonia, and fifty-two deaths; eleven of these were complicated with influenza and other respiratory conditions. In February there were eighty-two cases, with nineteen deaths; nine complicated by respiratory conditions. In March fifty-three patients were admitted, with fourteen deaths; three complicated by respiratory conditions.

Certain precautions might be taken in order that the incidence of influenza, acute lobar pneumonia and bronchopneumonia might be abated, and to reduce mortality by protection against marked changes in temperature. It is to be expected that similar outbreaks will occur in the future, and the paper is timely, as it points to these influences which affect the records of this disease.

✽

WILLIAM J. KERR, M. D. (University of California Hospital, San Francisco).—Most clinicians agree with the authors that the outbreak of respiratory disease which occurred during the first weeks of the current year was influenza. In general, the symptoms and signs were identical with those seen during the great pandemic of 1918 and 1936. The recent outbreak, however, was similar to that of 1936 in that the number of complications did not seem to be very great. In our own experience at the University of California Hospital, among students, staff and the employees, we were struck by the number of persons who showed *Staphylococcus aureus* in nasopharyngeal cultures at the time of admission with the disease. We believe that this was of importance in the character of the complication where *Staphylococcus aureus* empyema was observed in two individuals. The increased number of deaths from pneumonia and heart disease was to be expected in the face of such an outbreak.

I did not hear any reports of influenza or some similar disease among the swine during the current season, but in 1936, in several parts of the State, there was an outbreak of a disease similar to influenza among the swine. As Doctor Shope has pointed out in his experimental work, the two diseases are closely related and almost identical. Doctor Shope feels that the uncomplicated disease, influenza, which he believes is due to a filtrable virus, is not a serious disease, but the joint effects of the virus with the bacteria present in the individual produce the clinical picture which we call complicated influenza. Pfeiffer's bacillus, however, is not constantly present in man as a somewhat similar organism is present in swine, complicating the virus disease.

Preventive measures are not yet available for the general population, but it is to be hoped that in the near future we shall have a preparation or vaccine which will protect individuals from the primary disease. There is fairly good evidence that the immunity lasts for a considerable period of time, which would be of importance in protecting the population at large.

The authors bring up the question of exposure to the weather during the recent outbreak. The relationship between such outbreaks and the weather seems to be a very close one, but it is difficult to state what conditions are necessary to bring about the disease. It is possible that the underlying factor in this case is probably a virus, is present more or less generally, and that overcooling or unusual strain upon the mechanisms of the body responsible for the control of temperature, and the water balance, are put to such a strain that they fail to function properly. The great increase of respiratory diseases during the changeable or colder winter months quite likely is related to the physical changes in the environment and their effects upon the organism in general. Whether specific immune substances are reduced to such a point that bacterial agents or viruses can attack the individual more readily under the circumstances, is open to question.

BLACK WIDOW SPIDER BITE*

REPORT OF FORTY-FOUR CASES

By H. M. GINSBURG, M.D.

Fresno

DISCUSSION by William J. Kerr, M. D., San Francisco;
Emil Bogen, M. D., Olive View.

SINCE the last report of Frawley and Ginsburg¹ there have been treated at the General Hospital of Fresno County forty-four additional bona fide cases of black widow spider poisoning. No case is listed in this report unless the patient was able accurately to describe or present the spider. If there was any doubt, the case was classified as an insect bite.

In all there have been treated at this institution ninety-six cases. The majority of the previous fifty-two cases and all of the forty-four cases herein reported received the same treatment, which will be given in detail. The literature² contains reports of cases with fatal terminations. In our entire series there were no fatalities, and in the last forty-four cases none were even critically ill. Table 1 gives a brief summary of the patients who were treated.

SITE OF BITE

This is of special interest. The area where the bite occurred was carefully inspected in the majority of cases. If seen early, the only evidence was a slightly reddened area which was not elevated, and in most cases exhibited no tenderness. If seen three to four hours after the bite, nothing was visible at the site of the bite. In the majority of cases the bite occurs from the buttock down, due to the use of outdoor privies. A few cases received bites on the upper extremity levels.

SYMPTOMS

These differ with the region bitten. A typical course of events following a bite on the buttock, penis or scrotum would be as follows. The patient experiences a bite which is sharp and smarts slightly. Within one-half to two hours a cramping sensation is noted traveling down the thigh and up the abdomen. This is then followed by severe pain in the abdomen, together with some nausea and vomiting. There is slight headache in some cases. The ache in the thighs becomes very painful and extends to the legs and feet. The patient then presents himself for treatment, complaining of excruciating pain in the abdomen, cramping pains in the thighs, legs and feet, malaise, nausea, vomiting, slight headache, and a general feeling of not being well.

If the bite occurs in the upper extremity the pain radiates to the shoulder levels first and then down toward the kidney region, with involvement of the abdomen, but not to the same extent as when bitten on the scrotum. The headache and malaise are more marked, but the nausea and vomiting are not so marked.

DIAGNOSIS

It is very important that a correct diagnosis be made. The patient bitten, when examined, pre-

TABLE 1.—Summary Concerning Forty-four Patients (*Black Widow Spider Bites*)

Name	Age	Sex	Occu- pation	Site of Bite	Presenting Complaints	Length of Stay in Hospital	Termi- nation	Blood Count	Urinary- sis	Blood Pressure	Tem- pera- ture	Pulse	Respi- ration
A. B.	14	M.	Student	Not given	Tenderness, pain in abdomen and legs	24 hours	Well	Not done	Not done	160/70	98.8° F.	86	20
L. T.	24	M.	Laborer	Penis	Abdomen rigid, no tenderness; red area on penis	48 hours	Well	14,100 white blood cells. 76 percent polymorphonuclears, hemoglobin 70 per cent	1.025, acid, 1 plus albumin	125/80	99° F.	96	20
T. C.	25	M.	Laborer	Penis	Abdominal pain, malaise; abdomen rigid	24 hours	Well	Not done	1.021, acid, 1 plus albumin	120/80	99° F.	96	20
P. M.	51	M.	Laborer	Not given	Abdominal pain and tenderness	38 hours	Well	Not done	1.031, acid, negative	135/90	98° F.	78	20
E. P.	41	M.	Rancher	Left big toe	Sharp pain over epigastrium and at site of bite; acute urinary retention	27 hours	Improved	Not done	Not done	120/80	98° F.	72	20
F. F.	70	M.	Wood cutter	Left leg	Left leg swollen, one day; small skin abrasion	26 hours	Good	Not done	1.017, acid, negative	140/80	98.4° F.	70	20
T. M.	61	M.	Laborer	Not given	Not given	24 hours	Not given	Not done	Not done	Not done	98.8° F.	80	20
L. M.	23	M.	Laborer	Back of neck	Pain in back of neck, weak legs, respiration difficult, clammy skin and rigid abdomen	24 hours	Improved	11,750 white blood cells. 84 percent polymorphonuclear- leukocytes	Not done	Not done	99° F.	68	24
R. B.	14	F.	Student	Buttocks	Chills, sweats, vomiting, nau- sea and abdominal pain	36 hours	Improved	Not done	1.020, acid	124/80	99.2° F.	100	24
W. P.	41	M.	Laborer	Penis	Pain in lower extremities, tes- ticles, chest and abdomen	56 hours	Good	Not done	1.010, acid	160/110	98.6° F.	70	22
A. J.	29	M.	Laborer	Back	Nervous, thirst; pain over kid- ney regions and chest	50 hours	Improved	Not done	1.031, acid	110/90	98.2° F.	80	19
J. V.	47	M.	None	Left toe	Pain in left toe, thigh and left region of body	92 hours	Improved	Not done	1.024, acid	145/90	99.2° F.	84	20
H. H.	27	M.	Laborer	Right arm	Pain in extremities and ab- dominal cramps	32 hours	Improved	11,250 white blood cells. 74 percent polymorphonuclears, 70 per cent hemoglobin	1.020, alkaline	140/80	98.8° F.	82	18
W. S.	34	M.	Laborer	Left lower extremity	Pain up the back, groins and epigastrium; flushed	36 hours	Improved	9,100 white blood cells. 64 percent polymorphonuclears, 80 per cent hemoglobin	1.020, acid	120/85	98.8° F.	68	19
F. E.	36	M.	Laborer	Left shoulder	Pain in left leg and shoulder; abdomen not tender	22 hour	Good	6,800 white blood cells. 75 per cent hemoglobin. Poly- morphonuclears not done	1.022, alkaline	120/80	98.6° F.	72	18
H. T.	16	M.	Student	Right cheek and leg	Dull ache in back and extremi- ties	52 hours	Good	17,500 white blood cells. 92 percent polymorphonuclears, 6 per cent lymphocytes. Red blood count 4,566,066	1.020, alkaline	140/100	99° F.	80	20
B. H.	23 months	M.	Infant	Both thighs	Pain in abdomen and extremi- ties	48 hours	Improved	Not given	Not given	None	99.6° F.	120	28

B. M.	20	M.	None	Penis	Pain in abdomen and chest; vomiting	24 hours	Improved	7,860 white blood cells, 72 percent polymorphonuclears, 80 per cent hemoglobin 28 per cent lymphocytes	Not done	130/80	98.6° F.	80	20
C. S.	75	M.	None	Back, neck	Headache, pain in back and neck; abdomen rigid	24 hours	Improved	5,000 white blood cells, 50 percent polymorphonuclears, 70 per cent hemoglobin 50 per cent lymphocytes	1,010, alkaline	170/70	98.6° F.	72	18
C. N.	29	M.	Laborer	Palmar aspect, left thigh	None	12 hours	Improved	(No laboratory work)		120/80	98.8° F.	68	18
A. S.	42	M.	Mechanic	Left testicle	Pain in scrotum, arm pits, shoulders and legs	120 hours	Improved	6,200 white blood cells, 75 per cent hemoglobin, 65 per cent polymorphonuclears	1,020, acid	156/110	98.8° F.	82	20
S. G.	48	M.	Laborer	Scrotum	Pain over scrotum, legs, heart and left side of head; rigid abdomen	48 hours	Improved	Not done	1,009, alkaline	120/80	99° F.	70	18
E. C.	21	M.	Laborer	Right scapular region	Abdomen rigid, no pain	36 hours	Improved	Not done	1,029, acid	130/100	98.6° F.	72	18
J. S.	29	M.	Miner	Right knee	Pain from bite, down leg and abdomen on right	8 hours	Improved	16,150 white blood cells, 70 per cent hemoglobin, 82 per cent polymorphonuclears	Not done	140/88	98.8° F.	78	22
M. R.	20	M.	Laborer	Second right toe	Pain, right toe and up back	18 hours	Not given	Not done	Not given	140/90	99° F.	82	20
J. S.	16	M.	School boy	Not given	Pain in leg, shoulder and arm	80 hours	Good	8,500 white blood cells, 56 percent polymorphonuclears, 80 per cent hemoglobin	1,019, alkaline	140/100	98.6° F.	84	20
A. F.	30	M.	Laborer	Left leg	Pain in leg and arm; headache and pain in back	32 hours	Improved	11,400 white blood cells, 74 percent polymorphonuclears, 80 per cent hemoglobin	1,022, alkaline	135/80	98.6° F.	70	20
E. R.	16	F.	House- work	Right thigh	Pain in right and left legs down to feet	52 hours	Improved	10,350 white blood cells, 66 percent polymorphonuclears, 80 per cent hemoglobin	1,013, acid, pus cells	130/90	98.8° F.	84	18
R. A.	25	M.	Farm- hand	Dorsal surface right arm	Pain in right arm	13 hours	Improved	Not done	Not given	120/80	98.8° F.	84	18
R. L.	12	M.	School boy	Left chest	Pain in left hand, arm, chest and right lumbar region down to legs	14 hours	Improved	Not done	Not given	135/70	99.2° F.	80	22
J. H.	34	M.	Rancher	Right hip	Abdominal cramps and pain; pain in back	8 hours	Improved	Not done	Not given	140/80	98.8° F.	70	20
A. T.	27	M.	Laborer	Not given	Not given	24 hours	Improved	16,650 white blood cells, 77 percent polymorphonuclears, 75 per cent hemoglobin	1,010, acid	Not given	99° F.	74	20
E. B.	25	M.	Soda fountain work	Not given	Not given	24 hours	Improved	Not done	1,025, acid	Not given	99° F.	74	20

TABLE 1.—Summary Concerning Forty-four Patients (Black Widow Spider Bites) (Continued)

Name	Age	Sex	Occu- pation	Site of Bite	Presenting Complaints	Length of Stay in Hospital	Termi- nation	Blood Count	Urinary- sis	Blood pressure	Tem- pera- ture	Pulse	Respi- ration
A. S.	17	M.	Laborer	Foot	Aching over body, headache, chills and vomiting	72 hours	Improved	16,900 white blood cells, 93 percent polymorphonuclears, 80 per cent hemoglobin	1.010, acid	140/100	99° F.	86	20
N. W.	26	M.	Laborer	Right gluteal region	Pain in left thigh and leg radiating to abdomen down back to the right leg; abdomen rigid and cramps	10 hours	Improved	Not done	1.004, neutral	135/85	98.2° F.	82	20
A. W.	34	M.	Laborer	Right shoulder	Abdominal cramps, lumbar region and leg pain	24 hours	Improved	6,600 white blood cells, 72 percent polymorphonuclears, 75 per cent hemoglobin	Not done	140/90	99.4° F.	78	20
B. C.	24	M.	Laborer	Right thigh	Numbness in right leg, back weak and abdominal cramps	72 hours	Improved	19,000 white blood cells, 90 percent polymorphonuclears, 75 per cent hemoglobin	Not done	160/120	99.2° F.	90	20
J. B.	19	M.	Laborer	Right ankle	Pain in thigh, cramp in abdomen and chest	20 hours	Improved	Not done	Not done	140/70	98.8° F.	94	21
J. B.	22	M.	Laborer	Penis	Cramps in lower abdomen; vomiting	24 hours	Improved	Not done	Not done	120/72	99.6° F.	88	20
A. E.	29	M.	Laborer	Scrotum	Pain in abdomen and legs	110 hours	Improved	4 plus Wassermann	Not given	145/90	99.2° F.	86	24
C. N.	30	M.	Laborer	Left thigh	Pain in groins and legs	30 hours	Improved	Not done	1.008, acid	132/80	98.8° F.	80	24
F. W.	16	M.	Laborer	Left foot	Pain in abdomen and chest	64 hours	Improved	Not done	1.005, acid	110/65	98.6° F.	68	20

sents an abdomen not unlike and very similar to that seen in ruptured peptic ulcer. No doubt numerous cases have been operated for ruptured ulcer. Lobar pneumonia, angina pectoris, renal colic, enteritis, acute appendicitis, volvulus of stomach, acute pancreatitis, coronary thrombosis, and food poisoning, must also be differentiated. A careful history and examination are essential. In the cases seen here the abdominal rigidity following a bite is board-like, simulating a ruptured ulcer, the differential points of which are as follows:

Spider	Ulcer
(a) Positive for bite.	(a) Negative for bite.
(b) No ulcer history.	(b) Ulcer history
(c) Course of spread from bitten area to abdomen.	(c) Knife-like pain at point of rupture.
(d) Mild or no collapse.	(d) Collapse.
(e) Temperature normal or slightly elevated.	(e) Temperature subnormal.
(f) Pulse slightly faster.	(f) Pulse usually normal.
(g) Abdomen rigid.	(g) Abdomen rigid.
(h) Cramp of extremities.	(h) No cramps of extremities.
(i) X-ray negative for gas bubble.	(i) X-ray evidence of gas bubble in majority of cases.
(j) Can sit up or move about.	(j) Remains very quiet—Does not want to be moved.

The temperature, pulse, and respiration show very little differentiation from the normal to be of any prognostic value. The blood pressure, aside from those found in aged individuals, were well within normal limits. The blood analyses were not constant enough to be of great value, although it seems that a slight elevation does occur in the white blood cells and polymorphonuclear leukocytes.

TREATMENT

A routine treatment is used, as described previously, and consists of the following:

1. Morphine sulphate, grain one-quarter, hypodermically.

2. Magnesium sulphate, a 20 cubic centimeter ampoule of 10 per cent solution is given intravenously, to be repeated if necessary.

3. Fluids freely.

4. Amytal, grains iii, for restlessness.

5. Absolute bed rest for twenty-four hours.

6. Glucose, 10 per cent, intravenously if patient's condition demands it.

RESULTS

In this series the average length of stay in the hospital was 37.3 hours. In the majority of cases, within three to five hours after the use of morphin and magnesium sulphate, the patients had marked relief. In a few cases it was necessary to repeat the morphin. When the patients were discharged all symptoms had disappeared except in eight, who had slight tingling and ache in the lower extremities, which persisted from one to seven days. There were no fatalities and no seriously ill cases.

COMMENT

It is believed that the venom or toxin injected by the black widow spider travels very rapidly, and the acuteness of the case depends upon the amount and area injected. It is felt that the spider does not inject a sufficient amount at one time to cause a fatality. Acute symptoms set in within one-half to two hours after biting, and the effects appear self-limiting, the duration depending upon the amount of toxic material injected. The toxic effect of the bite can be controlled by medication as outlined. Thirty to forty hours should be sufficient to overcome the effects of the bite. The systemic reaction is not so marked as previously thought.

IN CONCLUSION

1. Forty-four additional cases of black widow spider bite are described.
2. No fatalities were noted in ninety-six cases.
3. Symptoms appear to be constant, depending upon region bitten.
4. Treatment, as previously and here outlined, proved very successful.

The General Hospital of Fresno County.

DISCUSSION

WILLIAM J. KERR, M.D. (University of California Medical School, San Francisco).—Doctor Ginsburg has had an unusual experience in the diagnosis and treatment of black widow spider bite, or arachnoidism. Very few of us who live in urban districts have an opportunity to study such patients because the family physician in the rural districts is the one who sees them during the acute stages, and particularly during the period when they have severe aches, abdominal cramps and other abdominal symptoms.

It has been of especial interest to me to learn how widespread the habitat of these spiders is in this country and in other parts of the world, and to be able to emphasize to medical students the importance of considering the bite of this spider in the differential diagnosis of abdominal crises. Although most individuals know that they have been bitten, there are some instances where there is no clear-cut history of a bite. From all I can learn, those who have been bitten previously may have bites on subsequent occasions without developing serious symptoms.

Once the diagnosis is established, the important thing is the relief of the symptoms, which may be obtained by the measures suggested by Doctor Ginsburg. However, other drugs may be used with benefit. Calcium chlorid given intravenously in doses of 0.5 gram or more may be of benefit in relieving the symptoms, as has been recently reported. Also convalescent serum has been reported of value in relieving the symptoms. In some of the larger

hospitals in rural districts, it may be advisable to keep such antisera on hand for control of the serious acute symptoms. It is possible that individuals may be vaccinated against the toxic effects of the bite of this spider by being given increasing doses of the toxic material. This, of course, would be of importance only in highly infested regions. A low mortality from the bite of this spider is quite universal. I understand that natural parasites are being sought which will destroy the eggs of the black widow spider, and if such measures are found effective, we may be able to eradicate this pest from our gardens and privies.

✽

EMIL BOGEN, M. D. (Olive View).—The forty-four additional cases of spider-bite poisoning reported by Doctor Ginsburg emphasize the increasing frequency of recognition of this condition. Since this spider has been seen in all parts of the United States and Canada, except Alaska, Vermont, Connecticut, Rhode Island, New Jersey and Delaware, and serious poisoning from its bite has been reported from more than half of the states of the Union, this can no longer be considered a California problem alone, although California physicians appear to have been more alert in its recognition.

The mode of spread of the local symptoms, as described by the author in agreement with earlier descriptions, suggests rapid passage through the central nervous system, with symptoms arising as it reaches the spinal cord, particularly the motor cells, rather than the generally assumed lymphatic absorption with effect on the myoneural junctions.

In differential diagnosis, the history of a bite, or of seeing the spider, although helpful, is not essential, either in making or in excluding the diagnosis, nor should the presence of an ulcer history, or the possibility of eliciting other complaints by leading questions, exclude the possibility of coincident arachnoidism. Collapse with subnormal temperature, as developed by Blair following an experimental spider bite, is rare, but increased blood pressure and spinal fluid pressure are commonly observed.

The author is to be congratulated on the simple, safe, and successful treatment used. The intravenous or intramuscular injection of 10 cubic centimeters of 10 per cent calcium gluconate, as described by Gilbert and Stewart and confirmed by others, seems to be even more effective than the magnesium sulphate. Spinal puncture, or a simple hot tub bath, may also give marked symptomatic relief. In view of the excellent results reported with these simple measures, the use of convalescent human serum, or the even more potent animal antisera now commercially available are, perhaps, mainly of academic interest. Since many of the reported fatalities resulted from secondary infection of the site of the bite, the use of any simple local antiseptic, and avoidance of the useless trauma of incision, cauterization or suction, may be worth remembering.

CANCER OF THE KIDNEY*

PRESENT-DAY STATUS OF ITS TREATMENT,
AND END-RESULTS

By CHARLES PIERRE MATHÉ, M.D.
San Francisco

DISCUSSION by Lionel P. Player, M.D., San Francisco;
J. A. Dougherty, M.D., Oakland; Wirt B. Dakin, M.D.,
Los Angeles.

WHILE serving on the section for study of genito-urinary tumors, recently created by the Cancer Commission of the California Medical Association, I was impressed by the diversity of the present-day methods of attacking cancer of the kidney. From the replies to a questionnaire,

* From the Urological Department of the Southern Pacific General Hospital and Saint Mary's Hospital, San Francisco.

Read before the Urology Section of the California Medical Association at the sixty-fifth annual session, Coronado, May 25-28, 1936.

Fig. 1a

Fig. 1b

Fig. 1c

Fig. 1a.—Right pyelogram of male patient, age 46, suffering from pain and hematuria of four days' duration. Note filling defect of lower major calyx. Defects so slight and symptoms of such short duration that recheck pyelogram was decided upon before intervening.

Fig. 1b.—Pyelogram made six weeks later, showing increase in size of filling defect due to growth of tumor.

Fig. 1c.—Sagittal section of kidney removed by operation, presenting very early cortical tumor of lower pole. The patient is living and well two and a half years after nephrectomy.

we found that practically all urologists favored nephrectomy, which had given them the greatest number of five-year cures, while they reserve radiation for postoperative treatment and for palliative treatment of inoperable tumors. However, the radiologists also desire *preoperative* radiation, pointing out the fact that it causes regression of huge growths, thereby rendering certain inoperable tumors operable, and also lessens metastasis and diminishes hemorrhage.

And so, with the object of improving the end-results obtained in treating cancer of the kidney, which are generally acknowledged to be quite poor, I made a review of thirty-five cases of kidney tumors that were treated in the urologic service of St. Mary's Hospital and the Southern Pacific General Hospital during the past twenty years. The fact that 44 per cent of our patients were restored to health and are living as long as fourteen years after operative removal, with and without radiation, acted as a stimulus for early detection of renal tumor, at which time surgical removal can be favorably employed and is more likely to be followed by success.

Hematuria was found to be the most outstanding symptom, occurring in 62.8 per cent of our cases. When hematuria occurs in conjunction with pain and tumefaction of the kidney, accompanied by other urinary symptoms, one's attention should be directed to the kidney with the object of searching for renal tumor. The earlier the diagnosis the more likelihood there is of effecting a cure, and yet cancer of the kidney is so insidious in its early clinical manifestations that one is unlikely to detect it during its early stages. We encountered three very early cases, all of which were relieved and are living fourteen, seven, and three years after nephrectomy. Therefore, we advise that physicians be cancer-minded when investigating and attempting to make a differential diagnosis of patients suffering from hematuria.

EARLY DIAGNOSIS OF RENAL TUMORS

The early diagnosis of malignant tumors of the kidney is quite difficult. In the past a goodly number were recognized on the autopsy or in the last stages when large swelling had developed and extensive metastasis had taken place. Two of our cases were diagnosed on the autopsy table, and these had presented vague symptoms during life. Two others were encountered when operating on the kidney for another condition, hypernephroma of adrenal body, encountered while removing a calculous pyonephrosis; sarcoma of the upper pole while operating on hydronephrosis, secondary to ptosis. We also treated four advanced patients with metastases in the lungs, pelvis, and long bones, which were in a stage far beyond surgical aid. These often presented a history of symptoms dating back over a long period of time. A proper diagnosis could have been made at the onset of symptoms if the possibility of renal tumor had occurred to the attending physician, and if a complete urologic investigation had been made.

Hematuria.—Hematuria is the most constant and outstanding symptom. Whether it is slight or extensive, transient or persistent, it calls for a complete examination of the kidneys before assuming that bleeding is harmless. Pain and tumefaction aid in confirming the diagnosis. In cases in which the tumor is located in the cortex of the kidney, hematuria does not occur, at least until invasion of the pelvis has taken place. We observed a sudden swelling in the left upper abdomen and loin in a patient on whom neoplasm of the left kidney had been previously diagnosed by urologic investigation. Operation was refused and the patient rapidly went into collapse and died. Autopsy revealed spontaneous rupture of the kidney, with extensive extravasation of blood in the retroperitoneal space. Crane reported a similar case, presenting no previous urinary signs nor symptoms. A large tumor mass suddenly de-

Fig. 2a.

Fig. 2b

Fig. 2a.—Left pyelogram of female, age 36, presenting hematuria, pain, and tumefaction. Note elongation and enlargement of upper major calyx, with extension of the opaque media into adjacent cortex.

Fig. 2b.—Sagittal section of kidney removed by operation, showing large hypernephroma of the upper pole presenting necrosis in its center.

veloped in the right upper abdomen, and at operation this was found to be due to extensive subcapsular hemorrhage from a cortical tumor. Some patients present symptoms due to obstruction of the urinary outflow; others have gastro-intestinal symptoms, pain in the abdomen, weakness, loss of weight, cachexia, etc., with no actual symptoms pointing to the kidney. In all these obscure cases one should bear the kidney in mind, and should make a complete urologic examination, including intravenous and retrograde pyelography, with the object of detecting renal tumor. Unfortunately, when the classical triad of cardinal symptoms, consisting of hematuria, pain, and tumefaction, do occur, the tumor has often metastasized and is beyond surgical relief.

Retrograde Pyelography.—In the diagnosis of early renal tumor, retrograde pyelography should be employed. Although excretory urography aids in localizing the tumor in the kidney, it is of decisive value only in fairly well-advanced cases. In patients presenting early small tumors it is inaccurate and often leads to erroneous conclusions, and therefore cannot be depended upon. In cortical tumors, hypernephroma, embryoma, sarcoma, etc., the elongation, displacement, filling defect, or occlusion of one or two calices due to compression, and obtained in making the pyelogram, are quite characteristic. With its growth the tumor may compress the pelvis, resulting in a so-called spider- or dragon-shaped distortion. In advanced cases the tumor can almost entirely obliterate the pelvis. Secondary necrosis simulates the impression of abscess formation. However, these phenomena can be produced by fibrolipomatosis of the perirenal tissues, congenital anomalies, cyst, carbuncle,

abscess formation, or tuberculosis, and confused with neoplasm of the kidney. In renal carbuncle, cortical abscess of the kidney, and tuberculosis, the kidney is fixed and this lack of renal mobility is demonstrated in taking the pyelogram in the vertical position. We recently emphasized this important sign as a diagnostic point in distinguishing these inflammatory conditions from other lesions of the kidney, such as renal tumor, in which the kidney usually retains its normal mobility. Tumors of the pelvis present the characteristic filling defect and a moth-eaten appearance of the pelvic outline. Rarely filling defects in the pelvis are also caused by a blood-clot or large air bubbles.

The characteristic x-ray findings of cortical and pelvic tumors have been repeatedly described and are now recognized by all competent urologists. However, the diagnosis of early tumors requires intelligent interpretation of the patient's history and careful analysis of the clinical findings. In case of doubt the pyelogram should be repeated, and if positive findings are still found to be present, exploratory operation should be performed. Four patients were operated for renal tumor in whom none was encountered:

In one the pyelographic changes were due to perirenal fibrolipomatosis, involving the pelvis; in another they were produced by congenital deformity; in the third they were caused by arteriosclerotic changes localized in the upper pole of the kidney, and in the fourth the filling defect was found to have been due to a huge blood-clot. An extremely early case of adenocarcinoma of the lower pole of the kidney was recently diagnosed and relieved by operation. The patient presented hematuria of four days' duration, and in making the pyelogram a small filling defect was noted in the lower major calyx by Dr. Lloyd Crow, roentgenologist of the Southern Pacific General Hospital. The defect was so slight, and the patient's symptoms of such short duration, that we decided to wait and repeat

Fig. 3.—Sagittal section of kidney, presenting adeno-papilloma of pelvis removed from male, age 59, presenting hematuria, pain, and frequency. The pelvic type of tumor is radio-resistant and highly malignant. The patient died of metastasis seven months after operation.

the pyelogram before intervening. A month later a recheck pyelogram revealed that the growth had slightly increased in size. The kidney was, therefore, removed and an adenocarcinoma about 1.5 centimeters in diameter was found in the lower pole of the kidney. As far as I know, this is the earliest case of primar carcinoma of the kidney ever diagnosed prior to operation, and the patient is well and free of symptoms two years after operation.

TREATMENT

In spite of the advances and improvements of technique in radiation therapy, early nephrectomy remains the treatment of choice for malignant tumor of the kidney. Heminephrectomy is indicated in cases of tumor limited to one portion of a bifid kidney, and partial resection can be carried out in cases in which cysts, benign tumors, or well-encapsulated malignant tumors are encountered. We successfully carried out heminephrectomy and partial resection in two cases of malignant tumor. One was limited to the upper half of a bifid kidney, whereas the other was well encapsulated. Preoperative irradiation has been recently advocated by Waters, and has been adopted by many roentgenologists. In 1904, Berjonié and Tribondeau observed the selective action of the roentgen ray in rats, pointing out that immature cells and those in an active state of division are more sensitive to radiation than are cells which have already acquired their adult morphologic and physiologic characteristics. Roentgenologists soon utilized this principle in applying radiation therapy to malignant growths in the body, including the kidney. It has been observed that cortical tumors, comprising hypernephromata and embryomata, are quite radiosensitive, whereas pelvic tumors, consisting of malignant papillary carcinoma, are radio-resistant. Therefore, it is important to identify the type of tumor before instituting preoperative radiation, and this can be ascertained by carefully studying the pyelogram. One should not lose time

in employing preoperative radiation in the tumors of the renal pelvis, as these are radio-resistant. Before 1935 radiation of kidney tumors was limited to inoperable advanced growths, usually presenting extensive metastasis. In 1927 we were impressed by the marked regression of a huge inoperable perirenal lymphoblastoma, which was achieved by radiation. We reported the case at the 1926 meeting of the Western Branch of the American Urological Association. The patient died of metastasis, but the original extensive growth was reduced to such an extent that it led us to believe that this phenomena might be utilized in rendering inoperable growths operable. Waters, however, was the first to actually use preoperative radiation for this purpose. This principle has since been adopted by many roentgenologists and urologists. Radiation not only causes marked regression in the size of the tumor, but controls hemorrhage and also minimizes metastasis without producing any lasting damage to the remaining healthy kidney. Regression by radiation is brought about by stimulating the normal tissue defense against cancer, which is due to changing the balance between stroma and parenchyma of a given tumor. Postoperative radiation is also used for the purpose of devitalizing any cancerous cells that might have been left behind at the time of operation, thus preventing metastasis as well as recurrence of the growth in the wound. We feel that radiation will never supplant surgical removal nor will it render operative interference unnecessary.

TECHNICAL POINTS NECESSARY FOR
SUCCESSFUL REMOVAL

We wish to emphasize certain technical points which should be carried out in performing nephrectomy. These aid in the prevention of the spread of cancerous cells into the blood stream, thereby minimizing the risk of metastasis. The renal pedicle should be clamped early in order that manipulation necessary to deliver and free the

kidney will not introduce cancerous cells into the blood stream. In attacking tumors of considerable size, one can employ the abdominal route in order to obtain easier access to the pedicle. Nephrectomy by the abdominal route, however, has a higher mortality, is more likely to be followed by peritonitis, obstruction of the intestines, etc., and does not have to be employed, as one can extend the numerous types of retroperitoneal incisions now at our command to such an extent as to provide sufficient exposure for access to the pedicle. In cases of papillary carcinoma of the pelvis, in which involvement of the ureter is encountered, a complete nephro-ureterectomy should be performed. The kidney is removed through the lumbar incision, after which the usual abdominal retroperitoneal curvilinear incision for exposure and removal of the lower ureter is carried out. Some surgeons advise the use of the cutting current in order to seal the blood vessels as the tissues are incised. Alcohol sponges are used in order to destroy any cancerous cells that might have been liberated in the wound. In the surgical attack of renal cancer, success depends upon reasonable operative skill, minimum trauma, gentle manipulation, early ligation of the pedicle and sufficient exposure to facilitate the operation, and in this field there is no place for the tearing, prying, delving, and hard-retracting surgeon.

ANALYSIS OF CASES

Of the thirty-six cases in this series, twenty-four were treated by nephrectomy, and three by resection of the tumor mass (encapsulated sarcoma, adrenal cyst, and hypernephroma of the suprarenal gland). Of the remaining nine cases, two were discovered on the autopsy table, three proved to be inoperable at the time of operation, and four were found to be far advanced with numerous metastases. Postoperative radiation, consisting of radium and deep x-ray therapy, was utilized in a large number of cases in which nephrectomy was performed. Preoperative radiation is

employed in the treatment of exceedingly large growths, in which regression of the tumor is desired in order to make possible radical removal. In small growths we do not employ it, as we do not wish to lose any time and prefer to operate immediately before metastasis will have a chance to set in. Our operative mortality for nephrectomy for renal cancer was 11.11 per cent (three in twenty-seven operations). One patient died on the table. He presented an extremely large pelvic tumor of the right kidney, with numerous large capsular blood vessels; and just as we exerted traction on the kidney in order to ligate the pedicle and to extirpate the kidney the patient went into shock and rapidly succumbed. The second patient died of pulmonary embolus two days after nephrectomy, and the third died five days later because of cardiac collapse.

OPERATIVE MORTALITY

In reviewing statistics on nephrectomy we find that the operative mortality is far higher than that performed for other lesions of the kidney. To name a few: Squier (1909) 50 per cent; Braasch (1913) 11 per cent; Hyman (1920) 23 to 37 per cent. Its present-day mean mortality is about 19 per cent. The reasons for the unusually high mortality for nephrectomy for tumor are: shock resulting from the manipulation necessary for the removal of large tumors, hemorrhage, the formation of thrombi due to cancerous cells breaking off and entering the circulation by way of the renal vein, and cardiac failure due to toxemia. Death from cardiac failure following nephrectomy has been explained by the fact that toxins, formed

by the cancerous cells which have entered the circulation by way of the renal vein, cause toxic myocarditis, resulting in a fatal issue. Generally speaking, tumors presenting huge dimensions, and those offering technical difficulties in their removal, have a higher mortality and a poorer prognosis. Tumors that have ruptured through the capsule or the pelvis, and those that have involved the peritoneum and renal vessels, present a higher mortality and poorer prognosis. This is not always true, as two of our patients presenting huge adenocarcinomata of the kidney cortex in which the removal was exceedingly difficult, are living seven and five years after operation; whereas others, operated for small growths involving the pelvis, soon developed metastases, rapidly became cachexic and died five to seven months following operation. Of interest was a patient, referred by Dr. G. Milani, presenting a huge adenopapilloma of the renal pelvis, with direct extension into the renal vein. We were forced to incise the vena cava in order to resect the renal vein which had been invaded by the tumor. The patient went into collapse on the table, but was resuscitated with the administration of intravenous glucose and of cardiac stimulants. He made an uneventful recovery, is now living and is in excellent health some five years after operation! Two other patients presenting huge adenocarcinoma of the pelvis, in whom removal of the kidney was very difficult, are living eight and two years after operation. It is a question if preoperative radiation would have assisted in making the operation easier in these patients, as they presented radio-resistant pelvic tumors. In contradistinction to the high operative mortality that we experienced in connection with nephrectomy for renal tumor (13.04 per cent), we noted that extirpation of the kidney for tuberculosis, calculous pyonephrosis, hydronephrosis, etc., was followed by a mortality of less than 2.5 per cent!

RESULTS

It is generally conceded that the results obtained by the treatment of cancer of the kidney are rather poor, yet an analysis of those obtained in our patients in which operation was possible were found to be quite satisfactory. Nephrectomy was performed on twenty-four patients, ten of whom are living and well 14, 12, 11, 8, 7, 6, 5, 3, and 2 years after operation (eight five-year cures). Three patients were relieved by less radical operations, viz., heminephrectomy (one), partial resection (one), and resection of an adrenal cyst (one). One patient developed metastasis shortly after removal of an advanced pelvic adenocarcinoma, is still in the hospital, is rapidly going down hill, and is now in the last stages of cachexia. Three died as a result of the operation, and seven died at intervals of time, varying from three months to one and a half years after operation. Two patients were lost sight of. The fact that thirteen of the twenty-seven patients operated upon (44 per cent) are living and well after operative intervention clearly demonstrates that surgical removal is well worth while, is the treatment of choice and should act as a stimulus for the early

detection of renal tumor, at which time operation is more likely to be followed by a cure. In this group were three exceedingly early cancers, two of which were encountered in the course of operating on the kidney for other lesions, whereas the third was diagnosed four days after the onset of the patient's first and only attack of hematuria. Of interest was a patient presenting a very early tumor of the upper pole, diagnosed by pyelography, in which elongation of the upper major calyx was encountered. Exploratory operation was refused, however; her symptoms became worse and six months later, at the San Francisco Hospital, Doctor Sullivan removed the left kidney, containing a fairly well-advanced carcinoma of the organ.

SUMMARY

1. An analysis of a study recently made by the Cancer Commission of the California Medical Association and of our end-results obtained in the treatment of thirty-six cases of cancer of the kidney led us to believe that nephrectomy is still the treatment of choice.

2. Radiation is of value, but should not supplant surgical removal. Preoperative radiation is of value in producing regression of huge growths, thereby rendering certain inoperable tumors operable. Postoperative radiation is employed in order to lessen the risk of metastasis. Radiation for the treatment of inoperable tumors, although of some palliative value, has not effected permanent relief.

3. Hematuria is the most constant and outstanding symptom, and the attending physician should bear cancer of the kidney in mind when investigating or attempting to make a differential diagnosis of patients suffering from hematuria.

4. The earlier the diagnosis the more likelihood of effecting a clinical cure, yet the early manifestations of renal tumor are so insidious that one is likely to overlook them in the early stages. In doubtful cases, one should repeat the pyelographic studies and the surgeon is justified in making an exploratory operation.

5. Success following surgical excision depends on the employment of certain technical surgical points, consisting of early ligation of the renal pedicle, sufficient exposure, minimum trauma, gentle manipulation, postoperative radiation, etc.

6. Ten of the twenty-four patients treated by nephrectomy (twelve of which also had postoperative radiation) are living and well from fourteen to two years after operation (eight five-year cures); three patients were relieved by partial resection; thirteen of the twenty-seven patients operated upon (44 per cent) apparently have been relieved, 33⅓ per cent of which are five-year cures, demonstrating that surgical removal, supplemented by radiation, is the treatment of choice and is more likely to be followed by a cure.

DISCUSSION

LIONEL P. PLAYER, M. D. (384 Post Street, San Francisco).—The essayist aptly emphasizes important facts concerning the diagnosis, symptoms, preoperative and surgical treatment of renal tumors. When sifted down to

bare facts the earliest symptom in the great majority of cases of renal tumor is hematuria, which may be so slight as to go unnoticed by the patient.

Roentgenograms showing pressure or filling defects are the next early signs. Pain and tumor are late manifestations of renal cancer. Red blood cells in the voided urine, unless the source is ascertained otherwise, demand a full cystoscopic, laboratory and roentgenologic study, as it is only by careful correlation of all findings that an early diagnosis of renal tumors can be established. Pyelograms in renal tuberculosis may simulate cancer of the renal pelvis, and for this reason guinea-pig inoculation and frequent acid-fast stains of the catheterized urine are indicated.

Judging from the statistics available at the moment, success in the surgical handling of these cases is in direct proportion to the early recognition of tumor.

The results in Doctor Mathé's collection of cases are strikingly gratifying; the number of patients living after the accepted period of from three to five years being particularly great when compared with the general average contained in other statistical reports.

Surgery alone, or in combination with diathermy, radium, x-ray, fulguration, etc., excepting in very early cases of cancer, is in general most disappointing, and the mortality rate, as a rule, has not changed materially in the last ten years.

The more or less recent studies of Kolisher, Horn, Goldschmidt, Landau, Aschoff, Kitasato, and others, conducted on animals previously inoculated with cancer, offer a new angle for constitutional treatment of cancer. They have demonstrated, in the reticulo-endothelial system, macrophages which possess migratory properties and are attracted to points in the body where there is an unbalance in metabolism; thus, they are attracted to the site of the tumor when agents such as radium, x-ray, etc., are employed for the destruction of these neoplasms. From these reports one is led to believe that what has been termed sensitivity to radium in reality does not exist; the effect on the tumor is dependent upon the specific action of the macrophage is effective only when taken from and presence of radium causes an unbalanced metabolism.

Injectations of macrophage emulsion into and around the tumor in experimental animals caused the disappearance of or diminution in the size of the tumors. In other instances the cancer cells have been inactivated. The action of the macrophages is effective only when taken from and employed in like species.

Scientists engaged in research in this new field of therapy are endeavoring to produce a macrophage emulsion from the spleen and other tissues of the reticulo-endothelial system which, in itself or associated with surgery, promises new hope in the eradication of cancer.

✽

J. A. DOUGHERTY, M. D. (3115 Webster Street, Oakland).—In a consideration of renal malignancies there are three points which force themselves upon our attention. First: In the early signs and symptoms there is no one sign post which points indisputably to renal cancer, or which might not be caused by some other renal lesion, or otherwise. Second: The kidney does not lend itself kindly to exploration, and in most cases these investigations end in nephrectomy. Third: When the diagnosis is clearly evident it is oftentimes too late for effective surgery.

For the purpose of early diagnosis it would be better if the triad of hematuria, pain, and tumor were forgotten and the medical profession impress it upon themselves and their patients that the presence of blood in the urine is a sign of the gravest import, which merits the most painstaking investigation. In this connection it must not be forgotten that in the mixed tumor of childhood the above signs are in reverse order and that a palpable tumor and pain may exist for an indefinite period without hematuria. I have recently seen a three-year-old boy, whose right abdomen was occupied by a Wilms tumor, in whom repeated urine examinations showed no red blood cells.

Among the conditions which may make the diagnosis of renal tumor difficult, those deformities produced by

blood-clots within the pelvis have given me most trouble. It is sometimes necessary to repeat the pyelograms within a few weeks to differentiate between tumor and blood-clot. To explain this program to a patient who has just gone through the discomfort and expense of a cystoscopic seance may tax the resources of the most seasoned diplomat.

Doctor Mathé's consideration of treatment leaves little to discuss. In my brief experience preoperative radiation has been most effective in tumors of the Wilms type. I must confess that I have never used radiation preoperatively in tumors of the renal pelvis. Doctor Mathé has advised the removal of the ureter in pelvic tumors, and I would like to add my emphasis. These tumors commonly invade the bladder via the ureter, and to leave the ureter behind is to court disaster. Likewise, when there are transplants in or around the ureteral orifice it is necessary to excise the tumor-bearing area of the bladder.

I have recently reviewed the histories of forty-nine renal neoplasms. Of this group 18.9 per cent are symptom-free on an average of 3.5 years; 45.8 per cent are recurrent on an average of 20.5 months; and 35.4 per cent are dead on an average of 12.3 months, postoperative. In this group the preoperative duration of symptoms was sixteen months. In a smaller series, where the preoperative duration of symptoms was 6.8 days, the recurrence was 50 per cent.

While this comparison may strike a pessimistic note, it is at least a small step in the right direction. Probably the adoption of such steps as outlined by Doctor Mathé will further this difference.

✽

WIRT B. DAKIN, M. D. (802 Pacific Mutual Building, Los Angeles).—Doctor Mathé has given us an interesting study in this review of all the cases of cancer of the kidney that have been operated in two of the leading hospitals of the Pacific Coast.

During the last few years the highly commendable endeavors of various commissions for the study of cancer throughout the country have been most helpful in giving medical men a summary of general opinion which enables them better to manage this serious disease. Different commissions have concentrated their efforts on the study of cancer in various parts of the body, but none have obtained better results than the urologists. Although men holding teaching positions are surrounded by better facilities to give more voluminous reports than some of their fellow practitioners, this should not discourage the man with the occasional case report from contributing his share to the general body of knowledge on the subject. Until we have evolved a treatment such as we now have for most cases of malaria, diphtheria, and syphilis, for example—until the time arrives when we know definitely the cause of cancer, the best we can do is to study and make use of the knowledge gained by these recent investigations.

At best, cancer of the kidney can never be detected as early as similar conditions of the skin and some other organs of the body. However, quicker diagnoses would result in many cases if the physician would immediately investigate every case of blood in the urine. Hematuria is the earliest, most frequent, and often the only symptom. By the time the pain and tumor mass develop, the condition is far advanced.

In the diagnostic examination a careful history and general examination should always precede the routine urologic investigation. This will give a clue to the real condition present. The blood picture, asthenia, loss of weight, or general appearance of carcinoma, will suggest a malignancy somewhere in the body. Intravenous pyelography should never be anything but a corroborative procedure. Urologists always make retrograde pyelograms in cases of suspected kidney cancer, unless there is a serious contraindication to cystoscopy. Blood-clots, air-bubbles, etc., which might give us an erroneous opinion concerning pyelograms, are a rare occurrence; even when present, they never yield the typical "spider"- or "dragon-shaped" pyelogram of kidney cancer. . . .

BROMID INTOXICATION*

By G. CRESWELL BURNS, M.D.

AND

J. L. HENDERSON, M.D.

Compton

DISCUSSION by Clinton H. Thienes, M.D., Los Angeles; Edward W. Twitchell, M.D., San Francisco; George S. Johnson, M.D., San Francisco.

SEVERAL writers in the past quarter of a century have pointed out that the injudicious use of bromids may produce a toxic psychosis.¹⁻²⁴ Our observations indicate that the general practitioner, puzzled by the alarming mental symptoms that develop, may even unwittingly prescribe larger doses of the drug in an effort to quiet his delirious patient. That we have seen twenty-one such patients in the past year and a half seems sufficient reason for feeling that this condition requires more emphasis.

Twenty-six years have elapsed since Ulrich²⁵ discovered a method of determining the bromid content of the blood. Long before 1910, clinicians recognized that the continued use of bromids not infrequently produced mental symptoms.^{1,2} Walter²⁵ in 1912 published a simpler procedure than Ulrich's for determining quantitatively the amount of bromid in the blood, and this procedure, with modifications, was principally in use until 1927, when Wuth devised his comparator. Since then probably Wuth's method has been more widely employed.³

It was not until after Wuth's article, with a report of nine cases, that papers on the subject began to appear with any degree of regularity. Wagner and Bunbury,¹⁰ soon after Diethelm's work was published, reported on their investigation of one thousand consecutive admissions to the University of Colorado Psychopathic Hospital, in which they found that 7.7 per cent of those patients studied showed bromid in the blood of 75 milligrams per 100 cubic centimeters and over. Forty-four, or 4.4 per cent of the total number, had mental symptoms due to or increased by the bromid.

PHARMACOLOGY

The chlorid content of the body is automatically maintained at a remarkably constant level.^{26, 27, 28} When excess chlorid is ingested an excess is excreted. When the amount ingested is reduced to a minimum, the amount excreted is likewise reduced.²⁶ When bromid or iodid is ingested, a comparable amount of chlorid is excreted, indicating that the chlorid has been replaced.²⁷ If no further bromid is ingested, the amount already in the body is excreted slowly in diminishing amounts (assuming a small constant chlorid intake) for weeks or months.²⁶ If, however, more bromid is daily ingested, further chlorid is excreted and further replacement occurs until there is sufficient accumulation to produce clinical effects.

The bromid ion at first is distributed in such a manner that its concentration is greater in the

cells than in the plasma.^{28, 29} Mason³³ found this condition is maintained throughout the period of intoxication, while Palmer and Clarke²⁶ reported that a balance is soon reached when the cell walls do not differentiate between chlorid and bromid ions.

The degree to which, and the rapidity with which, bromid replaces chlorid are dependent on the ratio between ingested bromid and chlorid.³⁴ A most striking example of the correlation between the replacement by bromid and the ratio of the bromid-chlorid intake has been reported by Harding and Harding.¹⁸ A patient with epilepsy over a period of twelve years took a certain daily dose of bromid which kept in abeyance his major seizures. He then visited his sister, who used no salt in her cooking, and with the same daily bromid intake developed symptoms of a bromid delirium, necessitating hospitalization.

The amount of bromid accumulation necessary for the production of clinical symptoms varies to an astonishing degree. Among the factors mentioned in the literature predisposing to bromid accumulation are found: age, arteriosclerosis, syphilis, alcoholism, nephritis, dehydration, cachexia, and anemia. Most of these appear to be causative on the basis of impaired renal elimination. A few of these factors probably have already impaired the central nervous system, leaving it more susceptible to any toxin. Then, too, each person has a threshold which, with all the foregoing factors eliminated, is extremely variable,³⁴ just as there are individual variations in the susceptibility to alcoholic intoxication³¹ or to convulsive disorders. Thus, Katzenelbogen, Goldsmith, and White¹⁷ cited two cases in which symptoms appeared at the neurologic level with blood bromid concentrations of 120 and 147 per 100 cubic centimeters, and two other cases in which there were no demonstrable clinical manifestations with blood bromid values of 315 and 385 milligrams per 100 cubic centimeters. Sippe and Bostock¹² produced blood bromid concentrations of 350 and 375 milligrams per 100 cubic centimeters, with drowsiness as the only symptom, and at the same time reported six cases of bromid intoxication with blood bromid values ranging from 200 to 275 milligrams per 100 cubic centimeters.

If the ingestion of bromids is stopped, the symptoms of intoxication slowly clear up. This is largely due to the replacement by sodium chlorid in the ordinary diet, which daily amount of salt has been estimated to be 10 to 20 grams. Wuth³ found the ordinary hospital diet had a daily sodium chlorid value of 2.68 to 15.84 grams, with an average of 7.4 grams. If this supply of table salt is supplemented by additional chlorid, the bromid is displaced and excreted proportionately faster.

It has been shown that the production of diuresis by means of urea does not increase the excretion of bromid (or halid).²⁶ Nevertheless, excretion of large amounts of either chlorid or bromid always carries along with them proportionally large amounts of water. Therefore, there is need for a large fluid intake. The daily amount

* Read before the General Medicine Section of the California Medical Association at the sixty-fifth annual session, Coronado, May 25-28, 1936.

of sodium chlorid given therapeutically, as indicated in the literature, varies from 2 to 25 grams, in addition to that in the ordinary diet. These authors correctly emphasize that with the higher doses a large fluid intake be maintained.

It has been shown experimentally that the replacement of chlorid by bromid in the cell so shifts the Donnan membrane equilibrium that water migrates to the plasma. If this condition is maintained over a period of time necessary to produce a bromid intoxication, this shift in water balance would largely explain the dehydration almost always observed as a part of the clinical picture.

SYMPTOMATOLOGY

The clinical effects of bromid appear slowly because their production is dependent on accumulation. The first effect is that of drowsiness and diminution of sensory perception. The latter accounts for the early abolition of pharyngeal, abdominal and corneal reflexes.¹⁷ Next appears a picture of intoxication with headache, weakness, irritability, anorexia, thick, hesitant speech, uncertain gait, generalized coarse tremors, and vacuous facies. The pupils are frequently sluggish in response to light, and occasionally unequal. Dizziness, diplopia, and blurring of vision are fairly common. These symptoms are expressed principally at the neurologic level, and the syndrome is not unlike that of alcoholic intoxication.

As the bromids accumulate there is superimposed, usually suddenly, an acute delirium characterized by confusion, disorientation, memory defect and vivid hallucinations of any type, but principally of sight and sound, to which there is an acute reaction of fear or horror. The patient is acutely disturbed and noisy, making attempts to fight or escape. This second group of symptoms is expressed at the psychologic level and is not unlike delirium tremens.

With further bromid accumulation, stupor is superimposed. The skin is muddy, the breath foul, and the tongue heavily furred. Dehydration is almost always present. There is frequently difficulty in swallowing, and tube feeding is often necessary. Usually there is a breaking through of the delirium with noisy intervals. Only occasionally are there skin manifestations.

The blood bromid concentration responsible for these symptoms is indefinite because of the many factors influencing susceptibility. Harding and Harding¹⁸ have stated that in general no symptoms appear when the blood bromid concentration is under 100 milligrams per 100 cubic centimeters. Between 100 and 150 milligrams per 100 cubic centimeters there occurs a depressed stage. Above 300 milligrams per 100 cubic centimeters, stupor usually occurs. However, it must be remembered that blood bromid concentrations well over 300 milligrams per 100 cubic centimeters have frequently been seen without producing symptoms other than drowsiness.

The delirium usually clears with striking suddenness, generally in the morning. Occasionally the patient remains clear, but more often there is a recurrence of the confusion in the afternoon or

evening for a few days. At times hallucinations recur with the confusion, but more often there are complaints of terrifying dreams at night.

The time required for the clearing up of the symptoms is directly proportional to the amount of bromid accumulated and inversely proportional to the amount of chlorid and fluid given,¹⁶ and the degree of renal impairment if this is present.

REPORT OF CASE

CASE 19.—F. R. R., 41-year-old unmarried woman, assistant in a physician's office, was admitted to the sanitarium on October 23, 1935, because of a confused mental state. An emotional disturbance had led her to take bromids and other sedatives in excess periodically for the past year, but symptoms of intoxication did not become pronounced until five days before admission, when she thought people were bothering her through a radio in her room. She became noisy, thought that a dog and man were after her, and was afraid of being shot. On admission she was suspicious, talkative, and overly active. Her speech was rambling and slurred. There was a papulopustular eruption over her back. Her pupils were widely dilated and equal, reacted well to light, but the reflex was not sustained. There was a fine tremor of her tongue and outstretched hands. Incoördination was marked, the patient being extremely uncertain in her walking. Deep and superficial reflexes were sluggish. Blood bromid the day of admission was 266 milligrams per 100 cubic centimeters. Though oriented on entering the sanitarium, the patient became in the next few days completely out of touch with her surroundings, and the delirium lasted for three weeks. She was tube-fed for the first week, and given eight grams of salt daily while the delirious state continued. Her mind cleared up suddenly on November 12, 1935. She said it all seemed like a terrible nightmare. During her delirium she would hold her breath to the point of becoming cyanotic, and then would cry out that "they" were holding a dog with hydrophobia over her face and letting the dog's saliva run down into her mouth. Later she had the idea that various persons were cut up into small pieces, and she was afraid she had been taken to an island and was to be mutilated. She was discharged on November 24, 1935, one month after admission, recovered from the toxic psychosis. There was still present evidence of a mild depression.

COMMENT

Of our twenty-one patients, seventeen were women and four men. Their ages varied from thirty-two to seventy-eight, with an average of fifty. In nearly all there was an underlying nervous or mental disorder. Six patients suffered from an involutional psychosis; five patients were definitely psychoneurotic; two had symptoms of a reactive depression; two had a manic-depressive psychosis. One patient suffered from general paresis with cerebral arteriosclerosis and hypertension. One patient was a chronic, periodic alcoholic, and had had a recent sunstroke. Another patient was classified simply as being emotionally unstable. One woman developed a bromid psychosis postoperatively. In one other patient there was no apparent underlying emotional disturbance.

It was difficult to determine the amounts of bromid taken by many of the patients. Most of them took the bromid-containing preparation only as prescribed, but three of the sixteen patients receiving bromid on prescription had refills without their physicians' knowledge, or took in addition another preparation of bromid. Three of the twenty-one patients had been using bromids of their own accord. The source of the bromid in two cases was undetermined. The list of incrimi-

nated preparations is long.³² No one in particular is apparently more to be blamed than another. But some preparations have a higher percentage of bromids than others.

Bromids are generally not prescribed to patients unless there is some good reason for doing so. It follows then that, upon recovery from the bromid intoxication, most of these patients still have a neuropsychiatric problem that requires treatment, the same problem that prompted the use of bromids. Occasionally, in patients quite stable emotionally to begin with, no neuropsychiatric problem remains. In this type of patient, once having recovered from the bromid intoxication, he is well. In our experience, however, and in that of other observers there is usually an underlying emotional disorder with which to contend. The manner in which this personality disturbance alters the composite picture produced by bromid intoxication has been commented on by several writers, notably Diethelm⁶ and Levin.¹⁴ In our series of cases, especially in those in which the blood bromid content was well above the toxic threshold, the psychic picture was strikingly uniform, being one of confusion-delirium, which tended to mask the underlying mental illness. But as the delirium abates, these disorders become apparent. Some patients become paranoid in keeping with their schizoid make-up; others do not. Some patients have more vivid hallucinations than others. In some the fear reaction is pronounced, while in others there is less affect displayed. In retrospect, nearly all of our patients looked upon their experience as something dreadful or horrible. Skin manifestations occurred only occasionally.

DIAGNOSIS

The question of diagnosis brings up several points of interest. We feel certain that in the past we have overlooked cases of bromid intoxication, calling them toxic psychoses. The course of these bromid psychoses may be prolonged for weeks, and even months, when no measures are taken to withdraw the drug.²⁴ One of our patients (Case 9) was in a mild delirious state for five months before admission. Clearing up from the delirium, she demonstrated a surprisingly clear sensorium, became interested and alert again though she continued to be mildly neurotic. One patient (Case 15) with general paresis of recent development, occurring late in life, behaved so differently from the usual parietic patient that a further etiologic factor was considered. Another patient (Case 14) was thought to be suffering from general paresis until bromid was found in the blood. Perhaps many cases of so-called post-operative psychosis might well be instances of bromid psychosis. Relatively small amounts of bromids may easily in a short time result in intoxication if insufficient fluids and saline are administered postoperatively. One of our patients (Case 10) with a mild degree of hyperthyroidism was intentionally given bromids some time before she was operated on for a fibroid uterus. The excitement continued after the operation, and additional bromid medication, instead of diminishing

the excitement, precipitated a delirium. One other patient (Case 7) had a postoperative convalescence that extended into weeks, whereas if no bromids had been prescribed following the operation the period of hospitalization would in all probability have been no longer than usual. Occasionally, the added effect of cannabis indica in neurosine may account in part for the vivid hallucinations which occur when the blood bromid is relatively low (Case 17).

The diagnosis is made by finding bromids in the blood in amounts above the toxic level. All our bromid determinations were done according to the method outlined by Wuth.³ We found blood bromid levels ranging from 133 to 410 milligrams per 100 cubic centimeters.

PROGNOSIS

We were usually able to offer a favorable prognosis. In some instances relatives had abandoned hope and were surprised when recovery, which we expected would occur, did take place. The period of delirium in our cases lasted from ten to twenty days. Those patients with renal sclerosis recovered more slowly (Cases 5 and 9). One death occurred due to myocardial failure (Case 4).

TREATMENT

Treatment consists of supplying the patient with plentiful amounts of fluids and giving sodium chlorid. The rationale of this simple procedure is apparent when the biochemistry of the intoxication is understood. In the usual case, six to eight grams of sodium chlorid daily are given. When patients require gavage the salt may be given in the tube feedings. Later, when they are able to eat, salt may be given in capsules. Obviously all bromid medication should be discontinued as soon as the possibility of bromid intoxication is suspected. Other sedatives to allay extreme restlessness and anxiety may be required. Warm continuous baths have a greater sedative effect and favor diaphoresis. These patients need food rich in vitamins and of high caloric value. After the acute symptoms have subsided, attention should be directed to a study of the underlying psychiatric problem.

Compton Sanitarium,
820 West Compton Boulevard.

DISCUSSION

CLINTON H. THIENES, M.D. (Department of Pharmacology, University of Southern California, Los Angeles). These are days when physicians are again becoming aware of the fact that there is a certain hazard involved in drug therapy which must be balanced against the dangers peculiar to the disease. Any remedy which is pharmacologically active is a potential poison. Bromids have been advertised as harmless, and yet it is quite apparent that physicians have given little heed to the danger of prolonged, poorly supervised bromid therapy.

In recent years there has been a renewed interest in the pharmacology of bromids, due largely to the development of simple methods of bromid determination. Of great importance are the observations on distribution of bromid in tissues and body fluids. It has been shown that most of

the bromid in the body may be found in the blood, lymph and intercellular fluid, and that the plasma contains approximately thrice the bromid ion as do the blood cells.

Malamud, Mullins, and Brown found three times as high a concentration of bromid in blood as in cerebrospinal fluid in their patients; a case of fatal poisoning examined by Vilen exhibited twice as much bromid in the gray matter of the cerebrum as in the white matter. In experimental animals the spinal fluid contains much less bromid than the blood, and the brain and cord still less. Masserman found that with blood bromid at 45 milligrams per cent, the cysternal fluid contained 11.9 milligrams per cent, and the lumbar fluid 13.4 per cent; in the total series of experiments, he found the lumbar spinal fluid to contain an average of 60 per cent higher concentration of the ion than the cysternal fluid. Bier compared different parts of the central nervous system, with this result: medulla and diencephalon, 1.5 milligram per cent, cerebellum 0.5 milligram per cent, and 0.4 milligram per cent, and cerebrum 0.3 milligram per cent.

In spite of the fact that it has been pointed out, time and again, that it is the bromid ion which is the effective radical, from the point of view of both therapeutics and toxicology, drug manufacturers continue to find profit in preparing "triple bromids," "mixed bromids," etc., for the doctor to prescribe. A rudimentary knowledge of mineral metabolism should convince the physician of the fallacy of claims for such preparations. It seems trite, but necessary, to remark that standard textbooks on pharmacology are more dependable sources of information on drug therapy than the advertiser's pamphlets.

✽

EDWARD W. TWITCHELL, M.D. (909 Hyde Street, San Francisco).—It has long been known that continued use of the bromids produced certain mental effects, and one was always warned of the possible appearance of signs of bromism. The patient became dull and sluggish, the breath became foul and the tongue coated, symptoms which disappeared when the bromids were withdrawn for some time. In fact, there were those who maintained that the after-effects of long-continued bromid medication were as bad as the epilepsy or the effects of the epilepsy itself; in other words, the remedy was worse than the disease.

Bromid delirium, however, was not so well known, and even now there are many who are not fully alive to its dangers. Bromid delirium is particularly apt to occur in the patient who is not under constant observation, but who has a bottle of bromid solution at hand which he takes oftentimes in far greater amount than he was supposed to take it. Then, without apparent reason, the psychosis develops and may go to the point of wild delirium, the true cause of which may at first be unsuspected. The situation finally clears up when the medication is stopped.

The authors deserve credit for bringing this toxic psychosis, so frequently overlooked, to the notice of the profession, and particularly for the excellent exposition of the pharmacology and the therapy based upon this pharmacology.

✽

GEORGE S. JOHNSON, M.D. (Stanford University School of Medicine, San Francisco).—The problem to which Doctors Burns and Henderson have directed attention fully deserves the emphasis placed upon it. The general usefulness of the bromids has so long been recognized that a certain false security has developed. The newly developed methods for determining blood bromid concentration have revealed the lack of correlation between blood bromid levels and those traditional signs of bromism—acne, stupor, etc. These signs may be present, but are not constant. The determination of the blood bromid level is necessary in directing the therapy in a patient who takes bromid for any considerable period of time.

Special emphasis is warranted in the case of the aged and sclerotic patient. With impaired elimination, cumulative effects are likely in this group, in which self-medication is so common. As restlessness, insomnia, and other evidence of a delirious type of reaction appear, they are met by an increase in medication which, in turn, may exaggerate the toxemia.

HUMAN STERILIZATION TODAY*

By E. S. GOSNEY, LL. B.
Pasadena

DURING the last twenty-eight years, California state institutions have sterilized nearly 12,000 insane and feeble-minded patients.

The following pages embody results shown by a case study of the first 10,000 of these sterilizations.

But first, what is sterilization?

It is a surgical operation that prevents parenthood *without unsexing the patient!*

This operation does not remove any gland or tissue. It does not interfere with any blood or nerve supply. It merely cuts and seals the tubes through which the germ cells—the spermatozoa and ova—must pass. It does not in any degree unsex the individual save to prevent parenthood. It is wholly different, therefore, from the crude and brutal operations of castration and asexualization. Primitive and pagan peoples castrated boys to produce eunuchs. Roman Catholics continued the practice until modern times, to provide male soprano voices for their cathedral choirs. Unlike these practices, modern sterilization is not a mutilation.

In men, the operation can be performed under a local anaesthetic in fifteen or twenty minutes. In women, the operation is more serious, involving the opening of the abdomen. It is thus comparable in severity to an uncomplicated operation for chronic appendicitis. It means a week or two in bed. In either sex, failures are almost unknown.

EUGENIC STERILIZATION IS NOT AN EXPERIMENT

Eugenic sterilization in this form represents one of the greatest advances in modern civilization. It is not a novelty or an experiment. It has been continuously used by American institutions since 1899, when the first sterilizations were performed in Indiana.

More than 130,000,000 people, including the citizens of twenty-nine American states, are now living under eugenic sterilization laws. Apart from the United States, the countries which have adopted such legislation are the Canadian provinces of Alberta and British Columbia; Norway; Sweden; Denmark; Finland; Esthonia; Germany; the Free City of Danzig; the state of Vera Cruz, Mexico; and the Canton of Vaud, Switzerland.

The following table shows the American states that now have sterilization laws in force, with the year of the adoption of the first statute:

Alabama	1919	Nebraska	1915
Arizona	1929	New Hampshire	1917
California	1909	North Carolina	1919
Connecticut	1909	North Dakota	1913
Delaware	1923	Oklahoma	1931
Georgia	1937	Oregon	1917
Idaho	1925	South Carolina	1935
Indiana	1907	South Dakota	1917
Iowa	1911	Utah	1925
Kansas	1913	Vermont	1931
Maine	1925	Virginia	1924
Michigan	1913	Washington	1909
Minnesota	1925	West Virginia	1929
Mississippi	1928	Wisconsin	1913
Montana	1923		

* A reprint of a publication of the Human Betterment Foundation, 321 Pacific Southwest Building, Pasadena. See also article on "Human Betterment" in May, 1937, issue, page 296, by Dr. Edward M. Pallette, retiring president of the California Medical Association.

THE PROBLEMS BEFORE AMERICAN CITIZENS

The situation which has led all these commonwealths to adopt sterilization laws grows out of such facts as the following:

Births among families living on public charity are often 50 per cent higher than births among self-supporting families.

The families that contribute children to the state homes for the feeble-minded in California are multiplying about twice as rapidly as the rest of the population.

The burden of taxation due to the mentally diseased and mentally defective is at the same time steadily mounting.

Few of the feeble-minded are given institutional care, but their presence in the population at large is none the less expensive both in direct costs and in lowered efficiency of industry, in crime and delinquency, and in the deterioration of citizenship which is inevitable when a large number of the citizens are mentally abnormal.

Psychologists estimate that at least 1,000,000 persons in the United States are so feeble-minded as to need special care and supervision. If anyone with less than 70 per cent of average intelligence for his age is called mentally deficient, the number of such persons in the United States is found to be about 6,500,000.

The number of insane persons in hospitals is growing from year to year. Only 435,000 are cared for at any one time, but the turnover is rapid, 95,000 new admissions being reported each twelve months. Statisticians have calculated that nearly 5 per cent of the American population or 6,000,000 people will at some time during life be legally committed as insane. But there are many who break down to an equal degree, enough to prevent them from carrying on their regular work, but who are not committed to hospitals by the courts. Calculations by Dr. W. F. Ogburn of the University of Chicago show that these amount to an additional 5 per cent, making the total number of mentally diseased about 10 per cent of the entire population.

EUGENIC STERILIZATION IS NOT A PANACEA

Sterilization is no panacea for these ills of mankind, but it is one of the many measures indispensable to any far-sighted and humanitarian program for dealing with society's tremendous burden of mental disease, deficiency, and dependency.

The principle of compulsory sterilization by the state, under proper safeguards, was upheld as constitutional by the Supreme Court of the United States in the case of *Buck vs. Bell* (1927). In writing the decision, Justice Oliver Wendell Holmes remarked: "Three generations of imbeciles are enough."

Agreeing with this view, state after state is now extending the application of sterilization to such of its defectives as are legally committed to state institutions. In this practice, every state benefits by the experience of California, studied intensively and continuously since 1925 by the Human Betterment Foundation.

The first study (1926-1929) covered 6,000 California sterilizations. Its details were published in

a score of technical papers in various scientific journals. A bound volume of these, entitled "Collected Papers on Eugenic Sterilization in California," is accessible in most of the important libraries of America. A more popular digest of the facts was published in 1929 by The Macmillan Company, New York City. This book, entitled "Sterilization for Human Betterment," by E. S. Gosney and Paul Popenoe, can be had for \$2 through any bookstore or from this Foundation.

A second complete study (1932-1936) brought the subject up to date and confirmed the findings of the first study. Full results are reported in a booklet entitled "Twenty-eight Years of Sterilization in California," which is being published the middle of this year.

STERILIZATION IS APPROVED BY ALL

The most striking revelation from our studies is the extent to which the policy of eugenic sterilization is approved by those who know most about it.

Patients, relatives of patients, state officials, physicians and surgeons, parole and probation officers, social workers, agree on the value of this practice.

It is a protection, not a punishment, and therefore carries no stigma or humiliation.

It permits many patients to return to their homes without danger of producing handicapped children. It thus keeps homes together by removing the threat of defective offspring, prevents the break-up of families, and relieves the California taxpayers of a burden estimated at more than \$2,000,000 per year. Even among the feeble-minded, at least two-thirds of the sterilized and paroled patients adjust themselves successfully to life outside the institution.

SEX OFFENSES LESS FREQUENT

Sterilization has been followed by a marked decrease in sex offenses. This is not because the operation changes the sexual life, for it produces no such change. It is because of better health, educational discipline, careful placement, and supervision on parole. But the record once for all disposes of the charge that sterilization will result in increased promiscuity and the spread of venereal diseases. Just one illustration: Of 304 feeble-minded girls sterilized and paroled, nine out of every twelve had been sex offenders before commitment. After sterilization, only one out of every twelve became sex delinquent on parole.

Sterilization prevents the birth of children who, even if not defective, would otherwise be brought up in unfavorable environments by mentally diseased or mentally deficient parents or by the state. It enables many handicapped persons to marry and to have a life normal in most respects, whose marriage otherwise would be unwise if not disastrous. A study of marriages of 130 feeble-minded patients after sterilization and parole shows that two-thirds of them have been successful. This is as good as the record of all California marriages.

STERILIZATION IS HIGHLY SELECTIVE

It must be understood that not everyone who is sent to a state institution is sterilized. Mass sterilization has no place in this program. Each case is

judged on its own merits. Of the feeble-minded who have been paroled, about one-half have been sterilized. Of the persons admitted to state hospitals for the insane, one in six of the new admissions is sterilized before leaving. Selection of the patients for this operation is made after careful study by medical specialists, and usually with the written consent of the nearest relatives.

Sterilizations in California have been about equally divided between men and women. Two-thirds of the number sterilized were committed as insane, the remainder as feeble-minded.

The consistently careful administration of this measure in California is reflected by the fact that during the first six years sterilizations per year increased from 11 to 116; total, 577; a yearly average of 96. During the succeeding years they have gradually increased from 182 in 1915 to the peak of 874 in 1935. The average during the past two decades has been 537 per year.

WHAT IS THE HUMAN BETTERMENT FOUNDATION?

The Human Betterment Foundation is a non-profit corporation, organized under the laws of California. Its members, eminent in a wide range of professional and business activities, are as follows (members of the Board of Trustees being marked with an asterisk):

- *E. S. Gosney, President, Pasadena.
- *Henry M. Robinson, Banker, Los Angeles.
- *George Dock, M. D., Pasadena.
- Herbert M. Evans, Experimental Biology, University of California, Berkeley.
- Samuel J. Holmes, Professor of Zoölogy, University of California, Berkeley.
- Rabbi Rudolph I. Coffee, San Francisco.
- Lewis M. Terman, Professor Psychology, Stanford University.
- David Starr Jordan, Chancellor Emeritus, Stanford University (deceased).
- *C. M. Goethe, Philanthropist, Sacramento.
- Justin Miller, Department of Justice, Washington, D. C.
- Charles H. Prisk, Publisher, *Star-News* and *Post*, Pasadena.
- Rev. Robert Freeman, Pastor of First Presbyterian Church, Pasadena.
- Rev. Merle N. Smith, Pastor of First Methodist Episcopal Church, Pasadena.
- *A. B. Ruddock, Philanthropist, Pasadena.
- *William B. Munro, California Institute of Technology, Pasadena.
- *Otis H. Castle, Attorney, Los Angeles.
- Mrs. E. S. Gosney, Pasadena.
- John Vruwink, M. D., Los Angeles.
- *Joe G. Crick, Horticulturist, Pasadena.
- Mrs. Joe G. Crick, Pasadena.
- Mrs. Lois G. Castle, Pasadena.
- A. D. Shamel, Physiologist, United States Department of Agriculture, Riverside.
- Oscar Ford, Former Mayor of Riverside, Riverside.
- Paul McBride Perigord, University of California at Los Angeles, Los Angeles.
- R. B. Von KleinSmid, President of University of Southern California, Los Angeles.

This organization is not designed to take up original scientific research work, but rather to investigate the results and possibilities for human betterment by a safe, conservative application of the discoveries made by scientists, and to give this information to the public.

Its first major problem is to investigate the possibilities for race betterment by eugenic steri-

lization, and to publish the results. When the public is familiar with these facts, some other major subject will be substituted. The scope of the Foundation is as broad as its name indicates. It is restricted only to conservative, preventive work for humanity as distinguished from ordinary charity relief work or patchwork. Its goal is the constructive, practical advancement and betterment of human life, character, and citizenship, in such manner as to make for human happiness and progress.

The possibilities of fundamental, constructive, preventive work along these lines are broad. They are limited only by the ability and number of workers.

This Foundation is not designed to perpetuate any name or to be a monument to any individual or family; but to be a center from which effective, constructive work can be carried on by all who feel the importance of such work and are in a position to help either by the contribution of capital or by the contribution of talent. The articles of incorporation leave the future free from undue limitations of organization and policy.

The officers and trustees of this Foundation will be glad to confer with anyone who is interested in the work above outlined, or who may wish to use the opportunity afforded by this organization to realize his own ideals in the promotion of race betterment.

Suite 321, Pacific Southwest Building.

*Eugenic Sterilizations Performed in State Institutions
Under State Laws Up to January 1, 1937*

State	Male	Female	Total
Alabama	129	95	224
Arizona	10	10	20
California	5,933	5,551	11,484

Washington	31	165	196
West Virginia	0	10	10
Wisconsin	96	696	792
Totals	10,674	14,729	25,403

1. The above figures were furnished by state authorities.

2. In many states lacking sterilization laws, the state institutions sterilize patients with consent. No account is here taken of such operations, nor of those that are primarily therapeutic, not eugenic, in purpose.

3. These reports show an increase of official sterilizations in the United States for the year 1936, of 2,241.

Georgia has just enacted (1937) a sterilization law.

* The New York law was declared unconstitutional in 1918.

Addenda

DISTINCTIONS BETWEEN STERILIZATION AND "BIRTH CONTROL"

There is a wide difference between sterilization and "birth control" by contraception. Unless this difference is recognized in any study of the subject, no reliable conclusions involving both can be drawn.

Eugenic sterilization, primarily, is applied by the state or with its sanction, to persons who would be likely to produce defective children. It protects such persons, their potential children, the state, and posterity. Such persons may not have the intelligence, the foresight, or the self-control, to handle contraceptives successfully, nor the ability to care for children intelligently. Sterilization is practically irreversible—permanent—and 100 per cent effective. It is the only reliable method of birth control which many defectives can use.

Birth control by contraceptive methods is voluntary and applied by the individual for his own purposes. It requires extreme care, intelligence, and a practical biological understanding of the problem. When not applied under definite instructions from a competent, experienced physician or nurse, after examination, it frequently results in failure. At best, what succeeds with one may fail with another, especially with the young and inexperienced.

Both sterilization and contraception have a place in modern society. Both demand careful consideration, but they apply to different classes of people and for different reasons. They should never be confused as merely parts of one program. The best results of each will be promoted by a frank recognition of their differences and the limitations of each.

THE LURE OF MEDICAL HISTORY†

JOSEPH POMEROY WIDNEY, A.M., M.D.,
D.D., LL.D.*

FOUNDER OF THE LOS ANGELES COUNTY MEDICAL
ASSOCIATION AND OF THE COLLEGE OF MEDICINE
OF THE UNIVERSITY OF SOUTHERN CALI-
FORNIA; OLDEST LIVING GRADUATE OF
THE UNIVERSITY OF CALIFORNIA
(TOLAND MEDICAL COLLEGE, 1866)

UNVEILING OF BRONZE BUST OF DOCTOR WIDNEY

A MOST unusual event took place at the Los Angeles County Medical Association Tuesday noon, May 11.

The founder of the Los Angeles County Medical Association, who also founded the School of Medicine of the University of Southern California—Joseph Pomeroy Widney, A.M., M.D., D.D., LL.D., physician, soldier, leader, scholar, statesman, and grand old man of medicine—now

† A Twenty-five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of CALIFORNIA AND WESTERN MEDICINE. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

* For biographical notes concerning Dr. Joseph P. Widney, readers are referred to CALIFORNIA AND WESTERN MEDICINE (April, 1936, page 292, and May, 1936, page 396).

in his ninety-seventh year, attended a luncheon meeting, at which time a bronze bust of himself was unveiled.

Doctor Widney then paid the assemblage the high honor of addressing them on a subject that all through his long life has remained closest to his heart, "The Science of Medicine."

Unusual again is the fact that this bust of Doctor Widney was created by one of the newer graduates of the school of medicine which Doctor Widney founded. The artist is Dr. Emil Seletz, who was also a guest of honor with relatives of Doctor Widney at the luncheon; and his bust has won the recognition of famous sculptors in this country, including George Grey Barnard, who entitled the masterpiece, "The Great Prophet."

Doctor Widney's message to the profession at this memorable meeting follows:

"I wish, first of all, to thank my associates in the medical profession for the honor they have conferred upon me this day. I appreciate highly the personal friendships it expresses. I have had many friends among my associates of the profession. I know of no enemies. It is a pleasure to me to be able to say this after seventy years spent in the active prosecution of the science of disease—its causes, its prevention. That the physician cures disease might be questioned. That disease may be prevented or successfully led to a favorable ending is beyond question. This is the broader field. In this broader sense, I have never retired from the active practice of the science of medicine; but have patiently, painstakingly, thoughtfully been seeking for the causes which lie back of disease. When I received my diploma—and it came with the honors of the class—two factors had been impressed upon me, the diseases of the man physical and the drug store as the cure-all. I doubted as to the major importance of both. It seemed to me the field was broader than that.

"In press now I have another work—'Civilizations and Their Diseases. Why Do They Die?' And as a sub-topic, another question—'Religions and Their Diseases. Why Do They Die?' It is the instinct of the trained physician that lies back of these books. It is the diagnosis. Then comes another volume, 'The Rebuilding of a Wrecked Civilization.' It is the medical treatment of the case.

"And the prognosis? That while civilizations and religions may die, Civilization and Religion will live on. It is the law of growth. And man has not yet finished his life upon this globe.

"There is one book yet to be completed, for it is now partly written—'Life and Its Problems, as Seen by a Blind Man at Ninety-Seven.' In this book, the search passes out beyond our globe to the globes of many constellations, so distant that the ten-foot reflectors show them as only patches of light. Such questions will arise as 'Life, What Is It? Whence? Whither? Wherefore? When the boundaries of the Universe are reached, what lies beyond? When time shall be no more, what comes after?' And then, the vital question, 'What, in the present stage of man's existence, is the limit of the knowable?'

Bronze Bust: Joseph Pomeroy Widney, M.D., Founder of the Los Angeles County Medical Association. Sculptor: Dr. Emil Seletz, member of the Los Angeles County Medical Association

"I soon found that by the side of the man physical was a man intellectual and that this man had to be taken into consideration as well as the man physical, and that, too, in every case. They could not be separated and they mutually influenced each other.

"I was called to the bedside of a young woman, handsome and strong and really not very sick, although she thought she was. I was looking into the face of a frightened animal, terror-stricken at the thought of death. A wolf at bay in the chase may look like that and over this the drug store had no power. Cases like that soon turned me to the quest for something higher than drugs in the cure of disease. My mental life began to shape itself more and more along the line of research into the underlying principles of disease. I wanted causation. It was the eternal—Why? Then began my part in the educational work. One lesson I always impressed upon the students in their educational work: 'Never be satisfied unless you have found the cause of the disease. You may not find it, for Medical Science is yet incomplete, still in the empirical stage; but be dissatisfied with yourself if you have failed to keep on trying.'

"I found still another fact, that, by the side of the man physical and the man intellectual, is yet another—the man spiritual. And he, too, must be considered in the curing of the disease. Some of my friends have wondered why I entered the ministry in mid-life. It was not that I was abandoning the Science of Medicine. It was only that I was broadening the field of research. I wished opportunity for clinical study into the souls of

Dr. Joseph P. Widney, the bronze bust of Doctor Widney, and Dr. Emil Seletz. Taken at the time the bust was unveiled on May 11, 1937

men. This could best be found among the churches. I carried this line of research among the velvet-cushioned pews of the rich and respectable, and in the slums of the poor and disreputable. I gave years to this, and everywhere that soul was the same. Environment had made the difference. Then came the curative question, 'How may the environments be improved?' and here, the drug store had no place.

"The field still kept broadening. I found men, differing in types of race life, differing physically, differing intellectually, differing spiritually; and yet having sprung from one common race stock in some original race home. It is so that the old Proto-Aryan of the Uplands of Asia, leaving his land, ages ago as one, has peopled Europe with a progeny so diversified, so unlike each other that we can hardly believe they came from the one primitive stock; and they differ in the types of diseases which they develop. The goitre of the Swiss Alps is not found along the shores of the Mediterranean. Scrofula and consumption of Mid-Europe, with its diet of pork, are less frequently found with the olive and the tart wines of Italy and France. Again comes the eternal — Why? The answer lies, again, in the one word, Environment. And now, Medical Science is dealing not with the individual man, but with races. And now, also, Medical Science, in its researches is dealing—not with the drug store—but with earth problems—physiography, geology, climatology, and is reaching back to the primitive man, and the ice-sheets and earth fissures, into a world life that is ever transforming and re-transforming itself. These settle the fate of the races. We find that peoples upon the earth have appeared, lived their race lives and are gone, leaving only some carven stones or rude monoliths to tell that ever they lived.

"The *elephas giganteus* and the saber-toothed tiger and the cave bear have disappeared with those older races. They shared a common fate. And again comes the eternal Why? Medical Science must help to solve the problem. And again, away back at the beginning of the long, long trail is the glimmer of the green bottle of the apothecary's window. To the credit of the medical profession, it may be said, the search began there. And over the broad earth, in every department of research, into the evolution of man and of globes, the men of medical training are in the lead.

"The books which, for fifty years, I have been slowly thinking out, I am now elaborating and publishing. Through them all runs one connecting thought.

"In the recent years of blindness, sitting alone in the dark, I have been slowly thinking it out. These books are my contributions."

THE CALIFORNIA STATE BOARD OF PUBLIC HEALTH*

CALIFORNIA'S STATE BOARD OF HEALTH, THE
SECOND TO BE ESTABLISHED IN THE
UNITED STATES

By GUY P. JONES
Sacramento

THE California State Board of Health was organized by statute April 15, 1870. It was the second such board to be established in the United States, the Massachusetts State Board of Health having been organized but six months earlier. Dr. Thomas M. Logan, a native of Charleston, South Carolina, and later a resident of New Orleans, was primarily responsible for the organization of the California State Board of Health. He arrived in Sacramento in 1850 and resided there continuously until his death in 1876. Almost single-handedly he put through the legislation for the organization of the California Board and became its first secretary, remaining in this post until his death.

PERIOD: 1870 TO 1905

The activities of the Board from the beginning, in 1870 until 1905, were conducted solely by seven doctors of medicine, who held meetings at least quarterly, generally oftener. During these years serious problems in the prevention of communicable disease were encountered. The appearance of plague in 1900 and again in 1908 produced major crises which jeopardized the cordial relationship between California and the rest of the states.

PERIOD: 1905 TO 1929

In 1905, upon the accession of Dr. George C. Pardee of Oakland to the governorship of California, Dr. N. K. Foster became secretary of the State Board of Health. With the appointment of Doctor Foster, the State public health organi-

* From the office of the Chief of the Division of Vital Statistics, California Department of Public Health.

zation developed into a practical and efficient organization. Under Doctor Foster's régime, laws pertaining to the establishment of standards for pure foods and pure drugs were enacted, the state-wide registration of vital statistics began, and the State Bacteriological Laboratory was founded. The structure of the organization, by bureaus, was started.

During the years that followed, other public health activities have been developed and have become part of the standard plan for protection of the public health. Among these are sanitary engineering, tuberculosis control, child hygiene, registration of nurses, sanitary inspection, cannery inspection, relief for the physically handicapped, and many other activities.

REORGANIZATION IN 1929

In 1929, under a reorganization of the State government into departments, the California State Department of Public Health was organized and the State Department of Health that had functioned for so many years became the State Board of Public Health. Under the laws then enacted the State Department of Public Health was placed under the control of the State Board of Public Health, where it has since remained.

THE SIX DIVISIONS OF THE CALIFORNIA DEPARTMENT OF PUBLIC HEALTH

The Department is organized into six divisions: Administration, Communicable Diseases, Public Health Education, Laboratories, Sanitation, and Vital Statistics. Following is an outline of the general type of activities that are carried on by the various divisions and bureaus of the Department:

(a) Under the Division of Administration are carried on activities to assist local health departments, finance, crippled children, publicity, and statistical service.

(b) Under the Division of Communicable Diseases are grouped activities of the Bureau of Epidemiology (including morbidity registration) and the Bureau of Tuberculosis.

(c) Under the Division of Public Health Education are grouped the activities of the Bureau of Child Hygiene, Bureau of Registration of Nurses, and the Bureau of Public Health Nursing.

(d) Under the Division of Laboratories are grouped activities relating to the bacteriological diagnosis of communicable diseases, food and drug examinations, research, water and sewage examinations.

(e) Under the Division of Sanitation are grouped the activities of food and drug law enforcement, the Bureau of Cannery Inspection, Bureau of Sanitary Inspections, Bureau of Sanitary Engineering (including mosquito control).

(f) Under the Division of Vital Statistics, the registration of births, deaths, and marriages is carried on.

I. DIVISION OF ADMINISTRATION

Finance.—Keeps records of all income and expenditures. Prepares budgets and estimates of

expense. Prepares and submits claims to Department of Finance and State Controller.

Crippled Children.—Conducts searches for crippled children who may be amenable to the provisions of the so-called Crippled Child Act. Conducts diagnostic clinics and conferences, and follows up cases of crippling diseases. Provides for treatment of physically handicapped whose parents or guardians are unable to provide treatment, if certified by the superior court of the county within which the crippled individual resides.

Publicity and Statistical Service.—The law provides for publishing statistical and other information which may be of value to scientists, medical profession, and the general public in the maintenance of proper health conditions. A weekly bulletin providing such information is published and distributed to all individuals who may require it. A biennial report is published. Special bulletins and circulars are issued as occasion may require. Newspapers are provided with material of current interest and value in the maintenance of the public health. Public health exhibits are prepared. Special information and special statistical data are provided, as requested.

II. DIVISION OF COMMUNICABLE DISEASES

Bureau of Epidemiology.—The law requires that action be taken, as necessary, to protect and preserve public health, and requires the reporting of certain classes of communicable diseases, as well as other diseases which may be specified by the State Board of Public Health. Health officers are required to send reports at the end of each week. From these reports morbidity statistics are compiled and distributed. Epidemiologists are available at all times for the investigation of outbreaks of communicable diseases. Assistance is given in the demonstration of various procedures that may be of use in the prevention of disease. Efforts are made continuously toward the provision of safeguards against the introduction of communicable diseases from other states and foreign countries.

Bureau of Tuberculosis.—The Board is charged with the preparation of rules and regulations for the administration of tuberculosis sanatoria within the State, and the law requires the State Board of Public Health to administer the State subsidy to counties which maintain the required standards in county tuberculosis sanatoria. All tuberculosis sanatoria, both public and private, are inspected regularly. In addition, special clinics for the discovery of tuberculous cases among certain groups of individuals are carried on. Surveys are made of communities to determine the extent of tuberculosis. Literature relating to the prevention of the disease is distributed. Exhibits are maintained and an informational service is provided for the benefit of the general public.

III. DIVISION OF PUBLIC HEALTH EDUCATION

Bureau of Registration of Nurses.—The State Board of Public Health is required to examine eligible candidates for registration as nurses; to conduct examinations for their registration; and

to maintain standards of reciprocity in the registration of nurses from other states without examination. Training schools for nurses are inspected and prerequisites are determined for the eligibility of candidates desiring examination. An informational service is maintained for the benefit of both training schools and student nurses.

Bureau of Child Hygiene.—Under the law the State Board of Public Health is charged with the investigation of conditions affecting the health of children in California and with the dissemination of educational information relative to the health of children. The law also requires the board to inspect and license maternity homes and hospitals. Infants and children in rural communities are provided with physical examinations only where such examinations are not available. A wide variety of literature pertaining to these and related subjects is distributed. Maternity homes and hospitals are inspected and recommended for licensure. Institutes on child care, prenatal, and maternity care are conducted.

IV. DIVISION OF LABORATORIES

Bacteriological Laboratory.—The law requires the maintenance of a laboratory for bacteriological examinations at the University of California in Berkeley. Diagnostic examinations are made of specimens from individuals in whom communicable diseases may exist. This service is available to all physicians and health officers, except for those in cities having populations of 20,000 and over. The laboratory manufactures typhoid vaccine for free distribution to physicians, as well as antigens and similar products to other laboratories at nominal cost. Outfits containing two ampules of silver nitrate are manufactured in the laboratory and distributed free of charge to physicians and midwives for administration in the eyes of the newly born for the prevention of ophthalmia neonatorum.

Food and Drug Laboratory.—A laboratory is also maintained at the University of California where samples of foods and drugs are analyzed. In addition to official samples, many unofficial samples are examined. Most of these are of food materials supplied to state institutions. Such samples are purchased under contract and the laboratory makes frequent analyses in order to provide assurance that state wards receive foods which conform to required standards.

Water and Sewage Laboratory.—For the benefit of purveyors of water supplies, a laboratory is maintained where bacteriological checks upon the quality of water supplies are made. This service is available to all municipalities which may need it. The efficiency of sewage disposal plants is also checked through examinations of sewage which are made whenever they may be required by any community.

Hooper Foundation for Medical Research.—Through the coöperation of this institution, which is connected with the University of California School of Medicine, a large amount of research work is accomplished in the control of the more rare communicable diseases. Since it is equipped for accomplishing work of the highest order,

which is not available at any other place in the state, an added safeguard in the prevention of communicable diseases is provided. The coöperative efforts of the institution and its director, Dr. K. F. Meyer, have been particularly beneficial in the study of psittacosis, relapsing fever, botulism, meningitis, epidemic poliomyelitis, shellfish poisoning (particularly clams and mussels), and other diseases.

V. DIVISION OF SANITATION

Bureau of Food and Drug Inspections.—The state law requires that such duties, as may be essential, shall be performed for the detection and prevention of adulteration of articles used for food and drugs, and for the punishment of persons guilty of violation of any law providing against such adulteration. There are also many acts of the legislature pertaining to the control of foods, among which are those pertaining to cold storage, egg standardization, feeding stuffs standardization, etc. Samples of foods and drugs are gathered and analyzed in the laboratory, to determine if they are mislabeled or adulterated. Inspections of food and drug establishments are made to determine sanitary conditions and to determine, also, if their products conform to the food and drug laws. A bureau of information is conducted for the benefit of manufacturers and distributors of food and drug products. Advice relative to proper labels and methods of manufacture is given. Products held in cold storage are inspected. Many tons of food products, which are found unfit for human consumption, are condemned and destroyed. Special attention is given to manufacturers, in order that food supplies at their sources may be found to comply with the laws. This policy works in the interest of the general public and in that of the retail dealer, as well.

Bureau of Cannery Inspection.—All packers of meat and vegetable products in whose plants steam sterilizers and retorts are maintained, must secure licenses for the operation of such equipment from the State Board of Public Health. Operators of such equipment must also obtain permits from the board. Special regulations for the operation of canneries and the proper sterilization of products packed in such places have been developed and are enforced by the bureau. In all canneries which come within the scope of this law, inspectors are provided, whose duty it is to pass upon the quality of the raw product and to check the records pertaining to cooking and sterilization of such products throughout the canning process. No state funds are appropriated for this work, the service being provided by the canning industry at its own expense.

Bureau of Sanitary Inspections.—Regulations pertaining to food sanitation, domestic sewage disposal, garbage disposal, and the abatement of nuisances are explicit, and cover a wide range of duties pertaining to the maintenance of general sanitation throughout the state. A staff of sanitary inspectors receives complaints of insanitary conditions, makes inspections, and provides machinery for the abatement of nuisances which may

be discovered. The bureau coöperates with local health officers in the maintenance of sanitary conditions in their communities, and makes sanitary surveys of towns, cities and rural communities, as required. It undertakes special activities pertaining to the control of rabies in dogs, plague in rats and ground squirrels, and similar undertakings. Proper disposal of garbage and domestic sewage constitute a large part of its work.

Bureau of Sanitary Engineering.—The law requires a permit from the State Board of Public Health for the operation of any community sewage disposal plant or water supply system. A staff of sanitary engineers passes upon plans for sewage disposal plants and water supply systems, which must be submitted, together with application for a permit to operate. Field inspections of all such plants are undertaken, advice is given relative to the engineering process involved, and recommendations for the issuance of permits are made to the State Board of Public Health. In addition, surveys are made of shellfish-growing beds, and the board's regulations pertaining to the growing of shellfish are enforced. Another activity of the Bureau of Sanitary Engineering is that pertaining to the control of mosquitoes. The bureau coöperates with the twenty-five mosquito-abatement districts which are organized and operate in the various counties of the state. Advice and assistance are given in these districts.

VI. DIVISION OF VITAL STATISTICS

The registration of vital statistics is an important function of the State Department of Public Health. All birth, death and marriage certificates that may be recorded locally in California are sent each month to the office of the chief registrar at Sacramento. All of these records are indexed in order that they may be found on file, if needed for legal or other purposes. State registration of births, deaths and marriages began in July, 1905, and since that time more than six million names have been placed upon the general index. Statistics relating to births, deaths and marriages are compiled regularly and published. This bureau is the vital bookkeeping office of the department. Through proper use of the data supplied by this bureau, the trend of public health generally throughout the state is determined.

VII. ACCESSORY FUNCTIONS OF THE STATE BOARD OF HEALTH

In addition to the duties of the State Board of Public Health as performed through the organized functions of the State Department of Public Health, other duties have been added to its administrative program during recent years. The inspection and licensure of clinics and certification of nonprofit hospitals that may comply with required standards are the newest of such duties imposed by law. The functions of the board that pertain to inspection, certification and licensure are expanding with each session of the legislature, and the regulatory duties of the board are becoming, upon public demand, more intensive each year. Among the licenses, permits, and certificates now issued by the board are the following:

- Certification of registered nurses;
- Certification of public health nurses;
- Certification of proficiency as laboratory technicians in (a) Bacteriology, (b) Serology, (c) Parasitology, and (d) Biochemistry;
- Certification of approval to bacteriological laboratories;
- Certification of nonprofit hospitals of required standards;
- Permits for municipal or corporate sewage disposal;
- Permits for municipal or corporate water supply;
- Licenses to operate cold storage warehouses;
- Licenses to canneries, using steam retorts (vegetable and meat products);
- Licenses to operate steam retorts in certain canneries;
- Licenses to conduct aviaries;
- Licenses to conduct clinics; and
- Licenses to operate maternity homes and hospitals.

401 State Office Building, Sacramento.

CLINICAL NOTES AND CASE REPORTS

INTERLOCKING OR COLLISION OF TWINS— DYSTOCIA—LOW CESAREAN DELIVERY

By LINDSAY PETERS, M.D.

Alameda

THE Index Catalogue of the Surgeon-General's Library, covering world-wide medical literature from 1912 to 1932, lists only three titles referring to collision or locking of twins. One of these is a separate treatise; the other two, reports in medical journals, including a total of three cases (all in Swedish literature). I have been unable to find a single report of this complication in American obstetrical literature, outside of casual references in textbooks. A definite statement of the infrequency of the condition is found in an article by Coleman, who reports two cases* and quotes from Eden and Holland's Manual of Midwifery, London, 1925, page 358, as follows: "According to Von Braun, the condition occurred only once in 90,000 deliveries in Vienna."

REPORT OF CASE

The rarity of the complication, as shown by the above facts, suggests the desirability of recording the following case:

History.—On February 12, 1936, Mrs. J. B., white, aged seventeen years, placed herself in my care for her first pregnancy. There was no history of multiple birth in her own, nor in her husband's, family. Her last menstruation began September 20, 1935. Except moderate nausea and vomiting during one month, she had felt very well. Otherwise her history was devoid of interesting data.

Physical Examination.—She was a small girl, her weight before pregnancy having been ninety-two pounds. At her first visit her weight, with clothing, was 101½ pounds. Hemoglobin, 70 per cent (Talquist). Urine negative for albumen and sugar. Teeth good. Tonsils

* J. S. Coleman, M. B., *Lancet*, January 25, 1936, p. 196.

Fig. 1.—The relative positions of the twins shown forecast the danger of collision and locking when the breech descends and the two heads attempt to enter the pelvis at the same time.

normal. Thyroid normal. Breasts and nipples well formed. Heart normal. Lungs normal. Abdomen normal. Fundus midway between symphysis and umbilicus. Vulva nulliparous, normal. Cervix conical, soft, normal. Pelvic diameters: interspinous, 24 centimeters; intercrystal, 20 centimeters; bitrochanteric, 29 centimeters; Baudeloque's, 17 centimeters; bischial, 10.5 centimeters; diagonal conjugate (?) (unable to reach sacral promontory).

On May 15, 1936, the patient reported a pruritic eruption, of two or three days' duration, showing first on the abdomen, then extending to the lower and upper limbs. This was found to be urticaria, the cause of which was not ascertained. It was alleviated by alkalizing diet and alkaline topical applications.

At this time the abdomen was seen to be greatly enlarged. Fetal small parts were felt on both sides of the front of the abdomen. No fetal head could be felt at either pole, either by abdominal or vaginal palpation. A fetal heart was distinctly heard in the right flank, slightly below the level of the umbilicus. At one time it was thought that another heart was heard in the upper, left quadrant, where there was a loud placental bruit, but it was not definite.

On account of the inability to locate a fetal head, together with the apparently sudden increase in size of the abdomen, suggesting hydramnios, the possibility of an encephalus was thought of, in addition to the possibility of plural conception.

Subsequent Course.—On May 16 an x-ray examination showed twins, one presenting by the breech, the other in cephalic presentation, with the head in the left iliac fossa, being displaced by the breech, which occupied the pelvic cavity.

The relative positions of the twins made one anticipate a probable collision of the heads at the pelvic inlet during labor, and this was discussed with some who saw the film. However, it was thought best not to interfere unless the necessity arose.

Labor began June 14, 1936, with rupture of the membranes about 7 a. m. On arriving at Alameda Sanatorium, about 11 a. m., it was now possible, since the membranes had ruptured, to palpate the two fetal heads and to hear the two hearts. The positions were the same as shown in the x-ray film. Rectal examination showed the breech in the upper part of the pelvic cavity, the cervical canal obliterated and dilatation 2.5 centimeters diameter. Contractions, about every ten minutes, were not painful. About 9 p. m. the patient began to cry out with pains; there was a bloody show and the patient was taken to the

delivery room. On account of poor uterine contractions no analgesic was given, except whiffs of ether during pains. The breech gradually came down so that by 10:30 p. m., by separating the lower vaginal walls, it could be seen, almost on the pelvic floor. From this time onward there was no progress in the labor, and at 11:30 p. m. the patient, showing fatigue from long suffering, was etherized; and, after episiotomy, exploration showed the two heads interlocked at the pelvic brim, the cephalic presentation preventing descent of the head of the child in breech presentation. As it was found impossible to push up the obstructing head, this "collision" and locking of the heads made delivery through the vagina impossible without mutilation of at least one child. Abdominal delivery was, therefore, clearly indicated.

The patient was taken to the operating room, and about 12:45 a. m., under ether, a 14-centimeter midline abdominal incision, extending from pubis to umbilicus, was made. There was diastasis of the recti, and the abdominal wall was very thin. The peritoneal cavity was opened high up to avoid the bladder, and the incision was then extended down to near the pubis. Retracting the bladder forward, the vesical reflection of the peritoneum was incised transversely to the extent of 9 centimeters in order to make upper and lower flaps, exposing the uterine wall underneath. After freeing the bladder from the uterus by blunt dissection as far down as possible, a low, longitudinal incision was made through the anterior wall of the thinned-out cervix and a short distance into the lower uterine segment. The child presenting by the breech was first delivered by pulling up the breech. This offered no difficulties. The head of the second child then presented in the wound; and, after rupturing its amniotic sac, was easily delivered. Pituitrin had been given just before incising the uterus, and bleeding after delivery of both children was negligible until the placenta was manually stripped from the upper, posterior uterine wall, when there was sharp hemorrhage, requiring packing of the uterus to control it. Considerable amounts of fetal membranes were found adherent to the uterine walls, and these were removed as completely as possible. The uterine wound was closed by two layers of chromic catgut, No. 2, for the inner layer, and No. 0 for the outer. The cervical portion was so thin that it was difficult to close without including endometrium in the sutures. The flaps of visceral peritoneum and also the parietal peritoneum were brought together with continuous sutures of fine, plain catgut. The fascia was united by a continuous suture of No. 2 chromic catgut, reinforced by two silkworm gut sutures, which included skin, fat, and fascia. The skin was closed with a continuous suture of fine dermal.

On account of the rather free bleeding after removing the placenta, 1,000 cubic centimeters of 10 per cent dextrose solution in normal saline was given immediately by vein. There was a moderate bloody vaginal discharge, and ergoklonin, one dram in water, was given by rectum. After returning the patient to her room, Murphy drip 1,000 cubic centimeters, with coffee and glucose, were given.

Both infants were females. They did not breathe promptly, but were of good color and easily made to breathe.

Weights and measurements:

	No. 1 (Breech)	No. 2 (Cephalic)
Weight.....	5 lbs. 4½ ozs.	4 lbs. 6½ ozs.
Length.....	45 cm.	45 cm.

Head diameters:

Occipito-frontal	10.5 cm.	10 cm.
Suboccipito-bregmatic	8.75 cm.	8.75 cm.
Occipito-mental	12 cm.	12 cm.
Biparietal	9 cm.	8.25 cm.
Bitemporal	8 cm.	7.5 cm.

Postoperative.—During the first twelve hours postoperative, the patient was nauseated and vomited several times. This was relieved by 1,000 cubic centimeters of 10 per cent dextrose in normal saline given intravenously. Then 4 per cent solution of mercurochrome was instilled into the vagina daily. As the postoperative temperature had not exceeded 100 degrees Fahrenheit and the pulse ranged between 90 and 100 plus, of good quality, on account

of financial considerations the patient was allowed to be taken to her sister's home by ambulance the night of June 17. The temperature and pulse continued about the same as previously; the patient was comfortable and apparently doing well when, on June 20, the breasts became engorged and, after chilly sensations, the temperature suddenly rose to 104.4 degrees, pulse 140. Although there was slight moisture on the lower part of the wound dressings, there were no signs of wound infection. As the patient lacked the resources for providing care for herself under these conditions, she was sent to the County Hospital, where, under treatment for acute mastitis, the temperature promptly came down. On removal of abdominal and episiotomy sutures, both wounds were found well healed, without infection.

A blood count, showing red blood cells 2,800,000, hemoglobin 43 per cent, on June 16, immediately after operation, and another count on June 24, eight days later—red blood cells 3,800,000, hemoglobin 75 per cent—is a striking demonstration of the recuperative powers of the blood-forming organs, even without the aid of blood transfusion.

COMMENT

In each of the two cases reported by Coleman, both twins were in cephalic presentation. Where one twin is a breech and the other in cephalic presentation, it would seem that danger of locking occurs only when the breech descends before the presenting head, as in the case here reported.

1361 Park Street.

INTERMITTENT CLAUDICATION: THE USE OF TISSUE EXTRACT (PANCREATIC) IN ITS TREATMENT

By ROBERT A. STEVEN, M.D.
San Francisco

THIS report is submitted for the purpose of stimulating greater interest in a form of treatment for arterial disease, particularly of the extremities, which is not used as frequently as it should be. Many excellent reports on the use of certain pancreatic extracts in the treatment of intermittent claudication of the extremities, and of angina pectoris, have appeared since 1929. By far the best results are obtained in intermittent claudication of the legs. Wolffe¹, whose paper includes a complete bibliography, treated twenty-six cases of this disorder, seventeen experiencing complete, and nine partial relief. The following report is that of a patient who had rather a dramatic result.

REPORT OF CASE

M. A., single, Jewish male, age 66, a retired clothing manufacturer, was first seen on December 9, 1935, complaining of pain, of several months' duration, in the left calf. This pain would appear only when walking, and would rapidly disappear with cessation of walking. It had begun insidiously and had been getting progressively worse, with a corresponding diminution in the distance he was able to walk without stopping to rest. When I first saw him he was able to walk only two blocks before the pain forced him to stop and rest for a few seconds, after which he could proceed another two blocks. He was unable to walk grades at all.

He also complained of chronic constipation (nearly all his life), insomnia (sedative every night for years), and hypertension (many years). He never had had any chest pain, dyspnea, or edema. He had stopped the use of tobacco two years previously.

¹ Wolffe, Joseph B.: Further Studies on Tissue Extract No. 568, Tr. Amer. Ther. Soc., 163-169, 1934.

There was nothing else of significance in his history. He had already used the standard treatment of contrast baths, heat, graduated exercises and vasodilators, with little, if any improvement. There was no history nor were there any signs of phlebitis.

Physical Examination.—The heart sounds were hollow. There was slight, if any, cardiac enlargement determinable by physical signs. A₂ P₂. There were no murmurs. The blood pressure was 180/115. Both feet and legs up to the knees were cold to the touch, the left definitely more so than the right. On elevation of the lower limbs above the heart level, both feet and lower legs, but especially the left, rapidly assumed an ashen-white color, while in the dependant position they assumed a very dusky color after one minute. A faint pulsation could be felt in the right dorsalis pedis and post-tibial arteries. No pulsation could be obtained on the left. With the blood-pressure cuff in place at the mid-calf, and inflated between the diastolic and systolic pressures, there was very slight oscillation of the needle when testing the right, and practically no oscillation when testing the left, as compared with a wide swing of the needle on either arm. There were no other significant findings.

I gave him tissue extract No. 568 (Sharp and Dohme) intramuscularly in the deltoid region as follows: 2.5 cubic centimeters on December 11, 18, 26, 30, January 2, 9, 16, 23, and February 10 and 25. Because of the severe local pain, the injections were preceded by novocain the last three times.

COMMENT

On December 16 he walked seven blocks before pain appeared. On December 26 he stated that he could walk as far as he pleased on level ground, but that he had pain when he tried hills. On January 2 he walked one mile without stopping; both legs were warm to the touch down to the ankles. On January 9 he reported a slight return of pain on January 8 and 9. On January 16 he had had no pain all week, although he had walked about town at will. On February 10 and 25 there was no pain at all; he took a trip to the Grand Canyon on February 26, and while there had one hike of three miles, with no pain. On September 14 he reported that he had had no pain since January 9; he walked at will on level ground or slight grades; steep grades gave rise to pain. I have never been able to get any pulsation of the left dorsalis pedis or post-tibial arteries. The last blood-pressure reading, taken on February 10, was 200/110.

384 Post Street.

Surgeon Not Responsible for Error of Nurse.—Attempts are made from time to time to make a surgeon responsible for the error of a nurse or assistant during an operation, but they have failed because it has been held that in the legal sense these persons are not his agents. The most recent case occurred in New Zealand and was due to an unusual cause. A woman claimed damages against a surgeon for injuries received during an operation in a private hospital. The nurse was instructed to paint the patient's skin with iodine, but used a mixture containing phenol (carbolic acid). The New Zealand Court of Appeal, in giving judgment, said that the plaintiff's submission would impose an intolerable burden on the surgeon. Under the conditions of modern surgery it was impossible for the surgeon to do the whole of the work involved in an abdominal operation. He had to work in a team. It was true that he was in complete control, but those subject to him were skilled collaborators with independent duties and there was no delegation of duties in the ordinary sense. He did not intend and could not be taken to have intended to do the work of others in the team. He was not vicariously liable for negligence found against the nurse.—*American Medical Association's London Correspondent.*

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

CHRONIC PROSTATITIS

I. ETIOLOGY AND SYMPTOMS

NATHAN G. HALE, M.D (Medico-Dental Building, Sacramento).—The etiology of chronic prostatitis, in the major portion of the cases treated, is traceable to infection by the Neisserian organism, which, in most instances, has long disappeared from the secretion. The cause of chronic prostatitis, however, is not limited to the gonococcus, and greatest stress should be placed on this fact. Infected teeth, tonsils, and gastro-intestinal abnormalities are not uncommon causes of chronic prostatitis, and in the general examination for these possible foci of infection should not be overlooked.

Trauma in the perineum has resulted in a flare-up of a dormant prostatitis. Infections of the upper urinary tract will also produce this condition. However, in many cases it is difficult to determine whether the prostatitis is the cause of the upper urinary tract infection or, reversely, whether the prostatitis is caused by the infection in the kidney.

There are instances of instrumentation causing prostatitis, and one can say with certainty that prostatitis may become chronic by improper massage of the prostate, or by poor management of an acute infection.

The symptoms may be divided into two groups, the usual and the bizarre. Low back pain is perhaps one of the most common symptoms. Morning urethral drop, particularly following a history of gonorrheal infection, should make one suspicious, and investigation should be made several times before one can be thoroughly convinced that the microscopic picture clearly indicates the condition of the prostate.

Pain in the suprapubic and inguinal regions is not uncommon. Chronic prostatitis and chronic seminal vesiculitis are often associated, and it is difficult to differentiate between the two.

TABLE 1.—*Predominating Symptoms: Analysis of 50 Cases*

Low back pain.....	10
Morning urethral discharge.....	6
Burning on urination.....	6
Frequent urination.....	6
Perineal discomfort.....	4
Rheumatism.....	3
Diminished force of urination.....	3
Pain in the inguinal region.....	3
Pain and redness of eye diagnosed as iritis.....	2
Urgent urination.....	2
Decreased vision diagnosed as thrombosis vein of eye.....	1
Abdominal pain, gastric disturbance.....	1
Urethral discomfort.....	1
Slight terminal hematuria.....	1
Continuous urethral discharge.....	1

6—Eight months previous to examination	
2—Six months previous to examination	

The patient may or may not have obstructive urinary symptoms, as they are often contingent upon the involvement of the vesical neck with fibrosis and irritation produced in the posterior urethra.

It must be remembered that the prostate, when it is a foci of infection, is capable of producing symptoms far from the site of infection. Impotency and decrease in erection are not uncommon. However, one should not be so impressed with this fact as to conclude that the treatment of chronic prostatitis will improve all symptoms, without looking to other portions of the anatomy for possible causes of the same symptoms.

Fifty cases of chronic prostatitis collected alphabetically from case histories, either now under treatment or recently treated, are here segregated as to causes and symptoms presented at the time of examination.

In reviewing this small group, several points are presented that tend to prove that the symptoms of chronic prostatitis are bizarre, and that the usual textbook cause of prostatitis, 20 per cent nonvenereal and 80 per cent venereal, may not be correct. In this small group, seventeen cases, or 34 per cent, had no venereal history, and if one notes, fourteen other cases presented could be added to this list in which gonorrhea may have played only a remote part in producing prostatitis. This would bring the total to 64 per cent without a definite venereal background. However, the author believes 64 per cent is too high and 20 per cent is too low.

It is of interest to find that five cases of the fifty presented were harboring in the genital tract the original organism—one case four years after the onset of the infection. No doubt, if a more careful method could be used to search for and to isolate the organism, more cases would have shown the gonococcus.

Three cases of the fifty had eye symptoms. Iritis is more common than is suspected by most

TABLE 3.—*Gonococcus Identified in Cases of Chronic Prostatitis*

1—Four years following onset of infection
1—Two years following onset of infection
1—Nine months following onset of infection
1—Six months following onset of infection
1—Eight months following onset of infection

general practitioners. The case of the thrombosis of a vein of the eye associated with increase in blood pressure bears emphasis, as a careful search was made in this case for all possible foci of infection. Eighty per cent pus was found in the massaged secretion from the prostate, and the patient's condition steadily improved.

Median bars and other pathology of the vesical neck region were found in this group of fifty cases, and no doubt such conditions will be emphasized by other collaborators.

The case with the gastro-intestinal symptoms may not have had a definite relationship to the chronic prostatitis, as the physician's knowledge of the gastro-intestinal tract was not complete. There was, however, a marked prostatitis. Under treatment for this condition the symptoms improved, and the patient could not be convinced that gastro-intestinal series, etc., were necessary at this time.

Stress, then, should be laid on the fact that prostatitis is not always gonorrheal in origin. In a series of fifty unselected cases, 34 per cent were nongonorrheal. One should also stress that, in spite of seeming evidence that symptoms have been produced by the prostate, these symptoms may have been produced by other pathology, and emphasize that even cases diagnosed as chronic prostatitis should have a thorough physical examination.

* * *

II. DIAGNOSIS

ROGER W. BARNES, M. D. (College of Medical Evangelists, Department of Urology, Los Angeles).—The presence of chronic prostatitis is frequently overlooked, and it sometimes produces symptoms attributed to other causes. In the examination of every adult male, care and thoroughness should be used to determine whether or not prostatic disease is present, and especially so when a focus of infection is being sought. Before making the digital examination of the prostate, the patient voids, preferably in two or three glasses, in order to cleanse the urethra of any secretion harbored there. Shreds or cloudiness in these glasses aids in determining the nature and extent of a urethral infection, but does not help in the diagnosis of prostatitis *per se*. After voiding, the patient stoops forward or kneels on a table so that the body is acutely flexed on the thighs, and either he or an assistant holds a glass under the penis to catch the prostatic secretion as it is expressed. The examiner uses the gloved index finger of either the right or the left hand (the same finger should be used each time so as to become accustomed to its use). With a light touch the finger

is slowly moved over the entire surface of the gland and its size, mobility, limitations, and consistency are noted. When chronic infection is present, there are areas of induration which are somewhat harder than normal prostatic tissue, and these can be palpated as small or larger islets with normal prostatic tissue between. If the infection is extensive, the entire gland may be indurated and somewhat fixed, or if periprostatitis is present the hardness extends beyond the limits of the prostate. This type is occasionally mistaken for prostatic malignancy, but the latter is usually more stony-hard and more fixed. If the chronic inflammation in the prostate has been of long standing, fibrosis may dominate the picture. In this case rectal palpation reveals a gland which is somewhat smaller than average, quite "tough," but not stony-hard, and quite movable and well defined. A prostate which is quite symmetrically enlarged, tense and tender, feeling like a tightly stretched skin over an area of acute cellulitis, is acutely inflamed, and should not be massaged under any circumstances.

A form of chronic prostatitis without infection exists. As palpated through the anterior rectal wall, this type of gland is somewhat larger than average, well defined, soft, boggy, and sometimes "pits" on pressure. It is sometimes designated as chronic congestion of the prostate, or "toxic hyperplasia," and from it 0.5 cubic centimeter to 2.0 cubic centimeters of prostatic secretion can be expressed by proper massage. Even though this secretion shows no pus or other evidence of infection, it causes symptoms which are relieved by massage and proper sex hygiene.

In some cases a definite diagnosis of chronic prostatitis can be made by rectal palpation; nevertheless an examination of the prostatic secretion is essential either to confirm or to make a diagnosis. If the prostate is massaged properly, it is very seldom that this cannot be obtained. The ball of the finger is placed as high as can be reached on one side of the prostate, and with gentle pressure it is slowly moved downward and medially, following its lateral margin until the apex in the midline is reached. This stroke is repeated three or four times, each time starting a little nearer the midline. After one side is massaged in this manner, the same procedure is repeated on the other side, and lastly two or three gentle downward strokes in the midline are given. This will almost always express a few drops of secretion, which are placed on a slide, covered with a cover glass, and examined under first the low, then the high, dry power of the microscope. If more than one or two leukocytes are seen in a high, dry field, a diagnosis of chronic prostatitis can be made. A convenient method of designating the amount of pus present is to estimate the approximate per cent of the entire field covered with leukocytes and record it in this way—2 per cent, 20 per cent, 80 per cent, etc. Granular prostatic epithelial cells are sometimes difficult to distinguish from pus cells, especially mononuclear leukocytes, and a Gram stain of the dried smear is necessary to determine the amount of pus. Such a stained

smear will also reveal bacteria if many are present. If facilities are available for making bacterial cultures, these should be used in diagnosing infection in the prostate, for, by it more accuracy can be attained both in diagnosis and treatment. However, for the general practitioner to whom these facilities are not available, the microscopic examination of the freshly obtained prostatic secretion is sufficient. Occasionally a case may present findings by rectal palpation which are suggestive of chronic prostatitis, but no pus is found in the prostatic secretion. This may be because the infection is deep in the gland and the massage did not express the secretion from the infected alveoli. In such cases the massage is repeated every three or four days until pus is found, or until prostatic infection has been definitely eliminated.

Endoscopic examination of the prostatic urethra may aid in diagnosing chronic prostatitis, but is not essential to such a diagnosis. When this is done it is found that the mucous membrane of the prostatic urethra is fibrotic in character, being lighter in color than normal, and retracted. The prostatic duct orifices are dilated and rigid, and frequently pus can be seen to ooze from these. If fibrosis is extensive, the bladder neck is contracted and rigid, and often thickened as palpated between the cystoscope and the examining finger in the rectum.

For the general practitioner, however, digital examination of the prostate, and examination of the freshly expressed secretion under the high dry power of the microscope is sufficient to make a diagnosis of chronic prostatitis.

* * *

III. TREATMENT

FRANCIS H. REDEWILL, M. D. (870 Market Street, San Francisco).—We have to believe with Paul Broca, who said, "I'd rather be a well-developed ape than a degenerated Adam," when we physicians continually come in contact with male patients, in all walks of life from laborers to undertakers, from clerks to dentists, from plumbers to philanthropists, who report to us that from five to thirty years or more they have been seeking merely relief from chronic prostatitis. As involved as are the prostates of these individuals—pathologically speaking—with proper urological treatment, over 95 per cent of them can become clinically cured. Yet, to effect a cure may test the skill of the best trained specialists in the genito-urinary field.

Needless to say that the patients with chronic prostatitis must have a complete physical examination. On the one hand, the general examination may reveal foci of infection in other parts of the body that may have to be cleared up before the prostate can be cured. On the other hand, the whole urinary tract should often be studied to determine and attempt to eradicate any pathology in way of obstruction and infection from the kidneys to the meatus before or during the treatment of the prostate, because other parts of the urinary

and sexual apparatus are so intimately connected to that gland that, with untreated pathology in the former, it may be impossible to cure the latter. Besides having these focal infections in any part of the body, including the genito-urinary tract, the patient with chronic prostatitis may be run down and generally debilitated from excesses, overwork, lack of rest, worry, and improper diet—any of which conditions will have a tendency to impede the curative treatment of the prostate. It often becomes the duty of the practitioner to give advice that may radically change the patient's mode of living together with prescriptions for tonics, sedatives, and diet lists containing generous amounts of vitamins. Thus, we must often consider the patient's entire physical condition, rather than confine our attention solely to the genital tract, in successfully treating prostate cases.

An outline of chronic prostatitis treatment may be made more comprehensible if we divide the pathologic conditions of this gland into two classes, namely, (1) chronic prostatitis without morbid structural changes in the posterior urethra or vesicle neck, (2) those in which there are visible pathologic changes in the way of dilated ducts, sinuses, crypts and contractures of the neck, or stones.

The one prerequisite factor to effect a cure in chronic prostatitis is to establish efficient drainage. The only method of establishing drainage is by way of the forty-odd ducts leading from the prostate into the prostatic urethra; the obstruction in the minute ramifications of these ducts must be opened up, and the universal practice of accomplishing this is by means of prostatic massage. The force, intensity, and duration of each prostatic massage is determined entirely by the pathologic condition of each individual prostate. The general rule to follow is that better results are obtained by massaging gently for a period four times as long rather than to massage forcibly for ten to thirty seconds. There is a reflex sympathetic nerve response in those who have never had a prostatic massage, so that, if one gives the first massage very forcibly, it may place the patient in deep surgical shock, and even deaths have been reported from such indiscreet procedure. Also such harsh preliminary treatment may induce the rapid formation of prostatic abscesses and epididymitis that are very painful and incapacitating. Therefore, the rule is, "Go slowly, and feel your way." Following massage, through and through irrigation is in order. Such solutions as potassium permanganate 1-4000, warmed to about 100 degrees Fahrenheit, or weak mercurials such as metaphen methiolate or mercurochrome and acriflavine in 1-1000, are very efficient. If there is a concomitant irritating cystitis, especially in elderly feeble men, a boric acid 2 to 4 per cent solution, with distilled water, is the most soothing irrigation to use following massage. Because, at least, a mild chronic cystitis and posterior urethritis often exist in these prostate cases, most urologists usually inject into the emptied bladder, following irrigation, a mild silver salt such as

5 per cent silvol. However, with a more intense involvement of the prostatic urethra, such as a verumontanitis, stronger antiseptics should be applied topically, with a Keys syringe or soft rubber catheter. Four cubic centimeters of 1 per cent acriflavine can be locally applied. Also astringents are often required, of which silver nitrate from one-half to 4 per cent is very extensively used. Antiseptic astringent that is very efficient is made of the following formula:

Zinc sulphatis	0.25
Liq. plumbi subacetatis dil.	100.00

With verumontanitis associated with chronic prostatitis, gratifying results, following massage, are often obtained with a dehydrating agent such as 5 per cent sulphonated bitumen in glycerin; inject the posterior urethra with a Gunyon or ordinary soft rubber catheter. When using these stronger injections, it is far more comforting to the patient, for the first few treatments, to precede such injections with topical application of a few cubic centimeters of 2 per cent novocain.

It is generally agreed by many leading authorities that when stripping of the prostate continues to yield pus, heat applied to the pelvis and more particularly to the prostate through the rectum is indicated, thereby increasing the circulation and aiding the tissues to put up a fight against the infection. It is puzzling doctors today to know whether to use diathermy, short-wave, or ultra-short-wave heat in these cases. It is generally recognized now that both diathermy and short-wave have their respective fields of usefulness and, contrary to what was predicted more than a year ago, we cannot replace diathermy with short-wave. Undoubtedly, diathermy is by far the best modality for continued treatment of the prostate through the rectal walls. For more diffuse heat through the pelvis, bipolar short-wave can be used or monopolar ultra-short-wave magnetic coil can be placed above the lower abdomen and apply heat with the inductotherm. Heat applied by any of these methods should be given for periods of thirty to forty-five minutes from two to three times a week.

While chronic prostatitis disturbance—which is understood as prostatism—seems to occur more in persons who do not present a history of gonorrhea, it is to be kept in mind that prostatitis is a frequent complication of acute gonorrhea, it being held probably true by many leading authorities that there are few cases of male gonorrhea in which the prostate is not involved to a more or less serious degree. When the gonorrheal infection has become established in the prostate, it is soon complicated by secondary bacteria, usually the staphylococcus, but less often by the colon bacillus, streptococcus, enterococcus, and pseudodiphtheroid bacillus. The infectious factor justifies deliberate attempt at immunization, in which vaccines—especially autogenous vaccines—come into consideration. Then, also, nonspecific protein therapy with milk, typhoid vaccine, proteolac, omnadin, activin, edwenil, and similar preparations, may be used to stimulate leukocytic activity,

and thereby build up increased bodily resistance to various types of prostatic infection. There is also chemotherapy, as suggested by a host of authors which, like vaccinothrapy, and foreign proteid therapy, aims to overcome the infection through utilizing powers of the patient himself by increasing his resistance. The stimulation of the antibacterial powers include an increase in the ability of the phagocytes to remove the products of infection, and, of course, the white blood cells are a means to that end. Hence, any leukocytic stimulant may prove of value.

Two classes of patients with chronic prostatitis that are the "bugbear" of physicians are the sexual neurasthenics that have been rendered neurotic by years of prostatic massage without obtaining relief, and the so-called "gleet" cases in which there is a more or less continuous discharge from the urethra. These sorts of cases that have had all kinds of routine treatment mentioned above, without receiving permanent benefit, may complain of definite perineal pain, aching, throbbing, or perirectal discomfort. Some have dysuria of varying degrees; some have definite histories of recurring acute prostatic abscess; most of them have chronic urethral discharge, many of them, especially of the neurasthenic type, have metastatic symptoms such as lumbar pain, sciatic neuritis, and pain in the sacro-iliac or other joints, sometimes with acute synovitis. The chronicity of these cases may be realized when it has been reported by several authors that the average duration of symptoms extend over a period of seven years, and the trouble may have existed as long as thirty years.

Endoscopic, or better, cystoscopic studies should be made, at least of all chronic prostatic cases of long standing. With such thorough examination it will be found that these more chronic types exhibit a more extensive pathology with such condition as median bar at the internal sphincter, which is generally believed to be irritated and stimulated to hypertrophy by chronic infection at the vesicle neck. Also, there may be minute subacute abscesses of the prostate and there may even be diverticula of the prostatic ducts with very small openings from these diverticula leading from the prostate to the urethra. Urethrograms have demonstrated relatively large pockets draining into the urethra through narrow ducts. Then such dilated ducts filled with prostatic calculi may be numerous. These classes of cases come under the second group mentioned in the first part of this paper, and to obtain permanent relief must be submitted to minor surgical procedures. Fulguration and electric coagulation will correct local urethral pathology. The deeper pathologic processes should be subjected to electrocautery, with free openings of the abscesses and ducts, removing of the calculi, and even removal of median bar and considerable prostatic tissue to establish free drainage of prostatic ducts on the one hand, and the free drainage of the bladder on the other. Such surgery will clear up and cure, along with routine treatment, over 95 per cent of all intractable, old chronically infected prostates.

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

ASSOCIATION ACTIVITIES

HOUSE OF DELEGATES MINUTES

Minutes of the Sixty-Sixth Annual Session of the House of Delegates of the California Medical Association

Held at Del Monte, California, Monday, May 3, 1937, and Wednesday, May 5, 1937

Foreword.—By action of the House of Delegates the official minutes of the House of Delegates, as electrically transcribed during the two meetings of this session, were ordered abstracted by the Speaker, the Chairman of the Council, and the Secretary, and published in abbreviated form in CALIFORNIA AND WESTERN MEDICINE. The official and complete minutes, with all discussions upon the various questions considered by the House of Delegates are on file in the office of the Association and are open for inspection, consultation, and reference to any officer, delegate, or member of the Association.

The following, therefore, is an abbreviated transcript of those minutes. (Signed) WILLIAM W. ROBLEE,

Speaker of the House of Delegates.

MORTON R. GIBBONS,

Chairman of the Council.

F. C. WARNSHUIS,

Secretary of the Association.

* * *

FIRST MEETING

Monday, May 3, 1937

1. **Call to Order.**—The opening session of the House of Delegates of the California Medical Association was called to order by Speaker William W. Roblee of Riverside, in the Auditorium of Hotel Del Monte, Del Monte, California, at 8:30 p. m., Monday, May 3, 1937.

2. **Personnel and Report of Credentials Committee.**—The Speaker announced the appointment of the following

*All articles listed under the caption, "This Month's Topics," have been written and sent to the Editor by the Association Secretary, Dr. Frederick C. Warnshuis.

Committee on Credentials: Stanley Mentzer of San Francisco (chairman), Walter F. Wessels of Los Angeles, and S. J. McClendon of San Diego. Chairman Mentzer reported 103 delegates accounted for and ready to be seated, and there being no objection the Chair ordered the approved delegates seated for this meeting.

3. Personnel of Reference Committee No. 1—Reports of Officers and Standing Committees; and Reference Committee No. 2 Resolutions and New and Miscellaneous Business.—The Speaker announced the appointment of Fred N. Scatena of Sacramento (chairman), Louis A. Packard of Bakersfield, and John P. Nuttall of Los Angeles, as Reference Committee No. 1.

And Lowell S. Goin of Los Angeles (chairman), E. J. Best of San Francisco, and Henry J. Ullmann of Santa Barbara, as Reference Committee No. 2.

4. Address of President Edward M. Pallette.—President Edward M. Pallette addressed the delegates in the customary manner, supplementing his printed address published in the Pre-Convention Bulletin.

5. Presentation of Gavels to Past Speaker.—William H. Kiger, Councilor-at-Large from Los Angeles, presented to President Pallette a redwood gavel as a token of appreciation for the services he had rendered as Speaker of the House of Delegates for a period of six years, from 1929 to 1935.

Past President Robert A. Peers of Colfax presented to Speaker William Wallace Roblee of Riverside a redwood gavel suitably engraved as a token of appreciation for his services as Speaker of the House during the sessions of 1936 and 1937.

President Pallette and Speaker Roblee made very gracious responses to these presentations.

6. Presentation of Certificates to Past Presidents.—By action of the Council, suitable certificates were presented to all living past presidents of the Association, reading as follows: "The California Medical Association confers this certificate upon Past President . . . At the conclusion of his term as president of the California Medical Association during the Association year of . . . Recognition is given to the services rendered by him and the contributions he has made to this Association, to public health welfare, and to the advancement of medical science and practice. Presented this third day of May by the authority and action of the House of Delegates of the California Medical Association." Signed by the Chairman of the Council, the Speaker of the House, and the Secretary.

Speaker Roblee in a very dignified manner conferred these certificates upon Doctors George Evans (president in 1907), San Francisco; John C. King (1910), Pasadena; O. D. Hamlin (1912), Oakland; George H. Kress (1916), Los Angeles; John H. Graves (1921), San Francisco; Edward N. Ewer (1925), Oakland; William H. Kiger (1928), Los Angeles; Morton R. Gibbons (1929), San Francisco; Lyell C. Kinney (1930), San Diego; Junius B. Harris (1931), Sacramento; Joseph M. King (1932), Los Angeles; George G. Reinle (1933), Oakland; Clarence G. Toland (1934), Los Angeles; Robert A. Peers (1935), Colfax.

7. Tribute of Alameda Members to Councilor O. D. Hamlin.—George G. Reinle, representing the Alameda members, presented a very beautiful lamp and desk set to Councilor O. D. Hamlin in appreciation of his services and also as a testimonial and memorial of his term as president of the Association, to which office he was elected twenty-five years ago at Del Monte, in 1912.

8. Presentation of President of National Woman's Auxiliary.—Under instruction of Speaker Roblee, the Secretary escorted Mrs. Robert E. Fitzgerald of Wauwatosa, Wisconsin, President of the National Woman's Auxiliary, to the platform. President Fitzgerald responded as follows:

It is indeed a great pleasure for me to be with you. Many years of experience have taught me that a woman, like a child, should be seen and not heard, and so I shall take this opportunity merely to thank the men of California for the wonderful cooperation they have shown the Auxiliary of this State and to thank you all for the great courtesy that you have extended to me this evening. I do thank you.

9. Report of the Council.—Morton R. Gibbons, Chairman of the Council, presented the following as the Council's report to the House of Delegates:

REPORT OF THE CALIFORNIA MEDICAL ASSOCIATION COUNCIL

This is the 1937 report of the Council to the Speaker and the House of Delegates. This annual report of the Council is hereby presented to you and through you to the members

of the Association. CALIFORNIA AND WESTERN MEDICINE has published the full minutes of all the meetings of the Council or digested Executive Committee meetings. Such publications form part of this report. This annual report is limited to summarization, comment, and emphasis on such subjects as your Council feels should receive special consideration by the House of Delegates and membership. As an appendix to this report there will be found the statement and comments of the Association's certified public accountant. The Council submits this without further comment.

Annual Dues.—The Council recommends that the House of Delegates fix the annual dues for 1938 at \$10.

The annual report of the Secretary shows a total of 5,567 members. There were 397 new members for 1936. The Secretary-Treasurer's report analyzes the subject of membership in several ways, and a careful scrutiny and consideration of its revelations are of value. You are again reminded that approximately 20 per cent of the desirable and eligible members of the profession are not members of this Association.

Council Meetings.—During the year the Council has held six meetings, besides one emergency meeting on two days' notice, attended by all councilors, to consider legislative matters. The Executive Committee has held three meetings. Many members of the Council attended the conference of county secretaries.

The reports of councilors are printed in the Pre-Convention Bulletin. They disclose the individual experiences and problems of the various councilor districts.

Great impetus has been given to the Association's activities and county units' contact therewith by the self-sacrificing work of President Pallette and his immediate predecessors, who, accompanied by the Secretary-Treasurer, visited and met with practically every county unit. We should pause a moment to realize what such devotion entails.

Appeals.—The Judicial Council of the American Medical Association has acted upon the following appeals: On April 5, 1937, the Judicial Council, finding no reversible error or injustice in the case, sustained the decision of the Council of this Association in the matters of the appeals of Doctors F. W. Callison, J. L. McClure, Harry W. Davis, George J. Heppner, James F. Pressley, Frank E. Stiles, Edward Melville Talbott, Bertram Stone, Louis Clive Jacobs, and Herbert J. Cohn.

The Judicial Council has also sustained the decision of the Council of this Association, affirming, in part, orders entered by the Kern County Medical Society against Doctors Joe K. Smith, John M. Kirby, and R. M. Jones.

Scientific Sections.—A special committee which reported last year suggested a plan for consolidation of scientific sections. Section officers will report at this session of the House of Delegates. Careful study and consideration of this report is recommended. The Council makes no further recommendation in this matter.

County Hospitals.—County hospital legislation is still pending. It is a serious question and may become one upon which the people will have to vote. Therefore, you should listen carefully to the report of the Legislative Committee.

Hospital Insurance.—The Committee on Public Relations will discuss this subject. The Council is fully cognizant of and in intimate contact with all matters pertaining to this subject and stands ready to act in any contingency which may arise.

Health Insurance.—The Committee of Five will report upon the present status of this subject. You should be informed that the California Medical Association has worked in close accord with the California State Board of Health and is using every effort to bring about the publication of the report by the end of the present fiscal year.

Legislation.—The Committee on Public Policy and Legislation will make a report. It is not necessary here to comment upon the subject matter. In listening to the Committee's report, the members of the Association should appreciate the tremendously valuable and unique service which the members of the Committee have rendered to the cause of public health and to every member of this Association and to the medical profession. Such service has entailed sacrifice for which no one should ask and for which no compensation would be adequate. The greatest thanks and admiration of which we are capable are inadequate.

The American Medical Association Meeting for 1938.—Doctor West, Secretary of the American Medical Association, and Doctor Sleyster, Chairman of the Trustees of the American Medical Association, made a recent visit to San Francisco, and were entertained at dinner by Association members around the Bay. They gave a hopeful prognosis. It will be well to instruct the delegates to the American Medical Association to use every honorable means to procure the selection of San Francisco for the 1938 American Medical Association convention.

COUNCIL RESOLUTIONS

Governmental Health Activities.—The Council submits and recommends the adoption of the following resolution:

Resolution on Federal Health Activities. (See p. 421)

Doctor Gibbons then presented another resolution on behalf of the Council:

Resolution Concerning Procedure in Admission of New Members. (See p. 422)

Doctor Gibbons then presented another resolution introduced by the Council:

Resolution for an Additional Reference Committee at Annual Sessions. (See p. 422)

In Conclusion.—Finally, it should be reported that the members of the Council and Executive Committee have attended meetings with truly remarkable regularity and maintained wonderful enthusiasm, often in spite of great personal inconvenience and sacrifice. Our Secretary-Treasurer and his staff are most efficient and indefatigable. Our Editor has produced a journal better than ever and second to none, and has been more intimately conversant with Association affairs than any other individual. Our General Counsel and his associates have been ever on the alert for our interests, most responsive and cooperative. To them all we owe generous appreciation and thanks.

(Signed) THE COUNCIL OF THE CALIFORNIA MEDICAL ASSOCIATION.

M. R. Gibbons, *Chairman.*

The Speaker referred the resolutions presented by the Council to Reference Committee No. 2. The remainder of the report of the Council was referred to Reference Committee No. 1.

10. Report of The Trustees Of The California Medical Association.—Morton R. Gibbons, President of the Trustees Of The California Medical Association, presented a financial report on the Trustees stating that they had a reserve fund of \$52,719.70.

The Speaker referred the report to Reference Committee No. 1.

11. Report of the Auditing Committee.—Karl L. Schaupp, Chairman of the Auditing Committee, submitted the following report:

You will notice the report of the Auditing Committee is on the budget. That is, there is a change in the set-up we have had in previous years. Each year a certain amount of money was allocated to departments, which was charged against these departments for their operations. This year, under the set-up of the auditors, there is a new form in which, this being a nonprofit organization, we have only two listings: one, that of the estimated income; and the other, that of the estimated expenditure. The estimated income for the incoming year, 1937-1938, is:

Dues, at \$10.....	\$56,000.00
Advertising sales (advertising in the Journal).....	27,500.00
Subscriptions to the Journal.....	250.00
Reprint sales.....	1,000.00
Interest.....	80.00
Commercial exhibits.....	5,000.00
Miscellaneous.....	3,000.00
Addressograph service.....	100.00
Total.....	\$92,930.00

There is one thing we wish to call your attention to in this estimated income and that is, the commercial exhibits. At the present time the income from the exhibits is such that the convention is not only paid for, but makes a profit.

Also, subscriptions to the JOURNAL in the amount of \$250 do not mean the subscriptions of the members, but copies actually sold through the office.

That takes care of the estimated income. Appropriations from this amount would be as follows:

ESTIMATED EXPENSES

Rent.....	\$ 3,288.00
Estimated telephone and telegraph.....	500.00
Postage for the Association.....	750.00
Stationery and printing.....	1,000.00
Office supplies.....	500.00
Clerical salaries.....	8,175.00
Secretary-Treasurer-Director.....	12,000.00
Travel expense of officers.....	200.00
Travel expense of the Council.....	1,000.00
Executive Committee.....	400.00
Travel expense of the Secretary.....	1,000.00
American Medical Association delegates.....	1,500.00
Department of Public Relations.....	4,000.00

Council and general expense.....	250.00
Postgraduate instruction.....	2,000.00
Committees' expense.....	1,000.00
Annual meeting.....	1,000.00
Legislation and public relations.....	3,000.00
Legal Counsel.....	4,000.00
Extra legal services.....	1,000.00
Legal costs.....	4,000.00
Sundry expenses.....	200.00
For the libraries.....	3,500.00
Printing California and Western Medicine.....	25,000.00
Editor's expense and postage.....	300.00
Mailing of the Journal.....	750.00
Advertising commissions.....	4,000.00
Discounts.....	500.00
Editor's salary.....	4,000.00
Journal supplies.....	300.00
Cuts for illustrations.....	500.00
Addressograph service.....	75.00
Copyrights.....	24.00
Reprint costs.....	600.00
Committee of Five.....	2,500.00
Unexpended balance.....	3,618.00
Total.....	\$92,930.00

In explanation of travel expense, when the officers of the Association travel or the Council travels, there is reimbursement for railroad fare and Pullman, but none of the other expenses. In the matter of the American Medical Association delegates, the expenses vary from year to year because of the location of the American Medical Association convention.

There is another thing to note in regard to this, that this is estimated. There are certain items for which we are sure the expenditure will not equal the estimated appropriation, so that at the end of the year the unexpended balance will be quite in excess of the estimated unexpended income.

The Chairman of the Auditing Committee recommends that the report be adopted.

(Signed) THE AUDITING COMMITTEE.

By Karl L. Schaupp, *Chairman.*

The Speaker referred the report of the Auditing Committee to Reference Committee No. 1.

12. Reports of Officers, Standing and Special Committees.—The reports of the Secretary-Treasurer, Editor, General Counsel, and the Councilors and Standing and Special Committees, as printed in the Pre-Convention Bulletin, were referred by the Speaker to Reference Committee No. 1.

13. Report of Committee on Public Policy and Legislation.—Junius B. Harris, Chairman of the Committee on Public Policy and Legislation, submitted the following report:

With the opening of the Legislature, our first concern was the personnel of the committees which would consider public health legislation. Both Lieutenant-Governor George J. Hatfield and Speaker of the Assembly, William Moseley Jones, were very cooperative, and as a result the committees appointed are very fair-minded.

To date, 4,185 proposed laws have been introduced—an all-time record for California. We have scanned all of these bills and find over 250 have some reference to the practice of the medical professions and public health legislation. We are concerned with fifty-four committees, which meet from 8:30 in the morning until the wee sma' hours of the following morning, to say nothing of the actual sessions of the Assembly and the Senate, where measures of concern to us pop up for a vote almost every day. Subdivided by groups, we find the following:

Board of Health.—Fifteen bills were introduced relating to the powers of the State Board of Health. Representatives of the department are watching this legislation carefully.

Chiropody.—The chiropodists are sponsoring two bills to regulate misleading advertising. These have passed the Assembly and are now before the Senate.

Chiropractors.—The chiropractors have been on the job in force, as usual, trying to extend their rights through two bills. To date, both of these are buried in committee.

Clinical Laboratories.—The lay laboratories reintroduced their bill, which was passed in 1935, but found unconstitutional. It has passed the Senate and is now before the Assembly.

Code Bills.—During the last two years the California Code Commission has been busy codifying the existing laws relating to the business and professional acts of the State. These are known as the Dental Code, Medical Code, Optometry Code, etc. These bills have passed the Senate and the Assembly and are now before the Governor for consideration.

Compensation Act.—Several bills were introduced by persons who have sought to amend the Compensation Act. Two of these were the medical and hospital-records bills, requiring records to be exhibited to the patient and any person he authorizes to examine the same. Seven others would give the injured employee free choice of healer (not confined to M. D.'s). To date, none of these bills and nothing vitally concerning the Compensation Act have been passed.

County Hospitals.—One of the hottest fights has been against three bills and a proposed constitutional amendment which would open up county hospitals to so-called "pay patients." These bills have had powerful backing from the Farm Bureau, from labor and from various boards of county supervisors, and it has only been through the united work of the California Medical Association, the Public Health League of California, the Hospital Associations, and the State Dental Associations that they have been held in check. One of them was tabled in committee; two others have failed to muster sufficient votes to emerge from committee, and the constitutional amendment has been sent back to committee.

Expert Testimony.—Senate Bill 446, sponsored by the California Medical Association, has passed the Senate and is now in the Assembly.

Health Insurance.—The toughest battle to date has been on the subject of health insurance. Two bills were introduced early in the session—one in the Senate and one in the Assembly—to set up control of voluntary health service associations in the Department of Insurance. These "companion" bills were sponsored by interested medical "groups" in Los Angeles and San Francisco. They enlisted the support of the Farm Bureau and large groups of public employees, teachers, etc., who are subscribers to one or the other service. The Farm Bureau has made this one of its major objectives, its representative apparently giving more time to trying to regulate the medical and dental service than to promoting strictly farm problems. This subject has been constantly before the Assembly Committee on Insurance since March 26. To meet an apparent demand for legislation enabling voluntary medical service insurance, the California Medical Association sponsored two bills on this subject (Senate Bill 605 and Assembly Bill 1491). Such strong objection was rendered from various sources that Assembly Bill 1491 was amended in many of its provisions, and is now before the Assembly for vote.

On May 10, the supporters of Assembly Bill 1283 (sponsored by the above-named groups) brought it before the Assembly for vote. It received twenty-four favorable votes and forty-six in opposition!

Hospitalization Insurance.—The Association of California Hospitals is sponsoring Assembly Bill 1132, designed to set up machinery for the sale of hospital service on an insurance and nonprofit basis. This has passed the Assembly, and is now before the Senate for vote.

Medical Practice Act.—Thirty-three bills proposing to amend the Medical Practice Act are before the Legislature, only seven of which were sponsored by the Board of Medical Examiners. The remainder are from outsiders who seek to dress up the Act according to their special ideas.

Naturopaths.—Developing unexpected strength, and with a well-financed organization, the naturopaths have carried on a hot campaign to enact Assembly Bill 1472, which is almost identical with the old Proposition 17 which was defeated in 1934 as an initiative. The bill was defeated in the Assembly, 16 to 49.

Optometry.—The optometrists brought up a proposal to amend their Act so as to permit them to treat eyes. When the battle was over, the "treatment" provision had been deleted.

Osteopaths.—The osteopaths have been more active and more determined at this session than ever before. They have combed every bill before the Legislature and, wherever possible, have proposed seemingly harmless amendments to present themselves to the public on the same basis as Doctors of Medicine.

X-Ray.—Assembly Bill 1009, sponsored by the Pacific Roentgen Club, was introduced on January 20, but to date it has not been taken up by the committee for hearing.

The Speaker referred the report of the Committee on Public Policy and Legislation to Reference Committee No. 1.

13. Report of the Committee on Venereal Diseases.—Howard Morrow, Chairman of the Committee on Venereal Diseases, requested the privilege of presenting this report at the Wednesday meeting of the House of Delegates, and there being no objection the Speaker so ruled.

14. Report of Committee on Relation of Trauma to Malignancy.—Charles A. Dukes, Chairman of the Cancer Commission and of the Special Committee to which the

resolution on relation of trauma to malignancy adopted at Coronado was referred, stated that the question was of such import that the Committee requested an extension of time. There being no objection, the Speaker stated that the House accorded to the request.

15. Report of Committee on Practice of Radiology and Pathology in Hospitals.—Charles A. Dukes, Chairman of the Special Committee on Practice of Radiology and Pathology in Hospitals, submitted a resolution. (See p. 419.)

The Speaker referred the report on practice of radiology and pathology in hospitals to Reference Committee No. 1.

16. Report of the Committee of Five.—The report of the Committee of Five, as published in the Pre-Convention Bulletin (Supplement, April issue, page 153), was referred by the Speaker to Reference Committee No. 1. (See p. 425.)

17. Introduction of Resolutions.†

(a) Public Health Education and Educational Films. Introduced by Dr. Fred B. Clarke of Long Beach. (See p. 420.)

* * *

The Speaker referred resolution (a) to Reference Committee No. 2.

* * *

(b) Annual Conference of Standing Committees. Introduced by Dr. John V. Barrow of Los Angeles. (See p. 417.)

* * *

Speaker Roblee referred the resolution to Reference Committee No. 1 for action, since this resolution overlapped the recommendations contained in the Secretary's report.

* * *

(c) Physicians' Listings in Classified Section of Telephone Directories. Introduced by Dr. Dewey R. Powell of Stockton. (See p. 422.)

* * *

Speaker Roblee referred the resolution to Reference Committee No. 2.

* * *

(d) Amendment to Constitution, Article VII, Section 1—Election of Councilors. Introduced by Dr. Loren R. Chandler of San Francisco.

(d) Resolution Regarding Nomination and Election of District Councilors

RESOLVED, That Section 1 of Article VII of the Constitution of this Association be and hereby is amended as follows, by striking out all of the third paragraph of said Section 1 of Article VII, reading as follows:

"The nine district councilors shall be elected as follows: Prior to the time set for the election of district councilors the delegates of each councilor district for which a councilorship is about to become vacant, shall meet, organize, and in due form elect one or more members of the said councilor district as the nominee or nominees for the said vacancy. Such nomination or nominations shall be submitted in writing, signed by at least two delegates who were present at such meeting, and shall be given to the Secretary-Treasurer, by him to be transmitted to the House of Delegates. The House of Delegates may make additional nominations from the floor of the House, and in the event that the delegates from a councilor district fail to submit a nomination or nominations, shall on its own account proceed to make nominations for each district councilor vacancy. A vote shall then be taken by the House of Delegates to determine who shall be elected to the vacant councilorship"; and by inserting in lieu thereof the following:

The nine district councilors shall be elected as follows: At least one month prior to the time set for the election of district councilors, the Secretary-Treasurer shall mail a written notice to each delegate, addressed to his address listed in the Association's records, of each councilor district for which a councilorship is about to become vacant, notifying the delegates of the time, which must be at least two weeks after the mailing of the notices, and a place designated by the Secretary-Treasurer, for the nomination meeting of the delegates of said councilor district.

†Editor's Note.—For convenience of reference, the original resolutions as introduced at the first meeting of the House of Delegates, appear in the Reference Committee reports as presented at the Wednesday evening meeting, in order that the action taken by the House thereon may be more easily appreciated.

At the time and place designated in said written notice, delegates shall meet, organize and elect by a majority vote a member of the said councilor district as nominee for district councilor for such councilor district for the ensuing term. The delegates shall then transmit in writing to the Secretary-Treasurer the result of such nomination meeting, and the Secretary-Treasurer shall report the same to the House of Delegates. The nominee, regularly nominated by the delegates present at the nomination meeting pursuant to this section, shall be deemed elected by the House of Delegates at the time of the report of the Secretary-Treasurer. In the event that the delegates from a councilor district fail to submit a nomination, the House of Delegates shall, on its own account, proceed to make nominations from the floor of the House, and in such event a vote shall be taken by the House of Delegates to determine which nominee shall be elected to the vacant councilorship.

* * *

Speaker Roblee stated that this being a constitutional amendment, it would lie over until the 1938 session of the House of Delegates.

* * *

(e) Legislation. Introduced by Dr. Loren R. Chandler of San Francisco. (See p. 423.)

* * *

Speaker Roblee referred the resolution to Reference Committee No. 2.

* * *

(f) Blind Assistance under Social Security. Introduced by Dr. Wilber Swett of San Francisco. (See p. 421.)

* * *

Speaker Roblee referred the resolution to Reference Committee No. 2.

* * *

(g) Individual Responsibility and Paternalistic Aid. Introduced by Dr. L. A. Alesen of Los Angeles. (See p. 422.)

* * *

Speaker Roblee referred the resolution to Reference Committee No. 2.

* * *

(h) Nonprofit Hospital Tax Repeal. Introduced by Dr. Frank A. MacDonald of Sacramento. (See p. 420.)

* * *

Speaker Roblee referred the resolution to Reference Committee No. 2.

18. Approval of Minutes.—Upon motion of Henry Ullmann of Santa Barbara, seconded by Frank A. Makinson of Oakland, the Speaker of the House of Delegates, the Chairman of the Council, and the Secretary of the Association, were authorized to edit the electrically transcribed minutes of the meeting of the House of Delegates.

19. In Memoriam.—In compliance with the action of the House of Delegates, the Speaker now called upon the Secretary of the Association to accord suitable tribute to those of our members who passed out of life during the past year. At the conclusion of the memorial address, the House stood in silence and attention for a brief moment in honor and respect of these deceased members. (Note: See Pre-Convention Bulletin for list of deceased members.)

20. Recess.—At 10:45 p. m. the Speaker declared the House in recess until the second meeting, to be held on Wednesday, May 5, 1937, at 8:15 p. m.

* * *

SECOND MEETING

WEDNESDAY, MAY 5, 1937

21. Call to Order.—The House of Delegates was called to order by Speaker William W. Roblee at 8:15 p. m. on Wednesday, May 5, 1937.

22. Organization and Roll Call.—Stanley S. Mentzer, Chairman of the Credentials Committee, stated that the Committee had seated 111 delegates. The Speaker ruled that, as the Secretary called the roll, the chairman of each

delegation should submit for acceptance and seating as delegates, substitutes for regularly elected delegates not present at this meeting. The Secretary thereupon called the roll by counties, and county delegations filled their lists of delegates. At the conclusion of the roll call the Speaker declared 137 accredited delegates seated and constituting the House of Delegates for this meeting. The names of delegates who registered present follows:

23. **Announcement of 1938 Meeting Place.**—The Speaker announced that the Council recommended that the 1938 annual session be held at the Hotel Huntington, Pasadena. On motion of Henry J. Ullmann of Santa Barbara, seconded by Philip Gilman of San Francisco, the recommendation of the Council was approved by the House.

24. **Election of Officers.**—Speaker Roblee relinquished the chair to Vice-Speaker John H. Graves, who declared that nominations were now in order for the office of president-elect.

(a) *President-Elect.*—Bon O. Adams of Riverside nominated William Wallace Roblee of Riverside as president-elect. The nomination was seconded by Charles A. Dukes of Oakland and John P. Nuttall of Los Angeles. On motion of Henry J. Ullmann of Santa Barbara, seconded by A. E. Anderson of Fresno, the Secretary was instructed to cast the ballot of the House for William Wallace Roblee as president-elect. The Secretary did so cast, and the Vice-Speaker ruled that William Wallace Roblee was duly elected to the office of president-elect.

Doctor Roblee in a very gracious and suitable manner expressed his appreciation for the honor that had been accorded him.

Speaker Roblee then resumed the Chair.

(b) *Speaker.*—The Speaker recognized Carl R. Howson of Los Angeles, who placed in nomination for the office of Speaker, Lowell S. Goin of Los Angeles. The nomination was supported by Loren R. Chandler of San Francisco. On motion of Charles A. Dukes of Oakland, seconded by Howard Morrow of San Francisco, the Secretary was instructed to cast the ballot of the House for Lowell S. Goin. The secretary did so cast, and the Speaker announced the election of Lowell S. Goin as Speaker of the House for the ensuing year.

Doctor Goin responded in a very happy vein, thanking the delegates for the honor accorded him and pledging the discharge of the duties of office in an impartial and efficient manner.

(c) *Vice-Speaker.*—The Speaker recognized Ruggles A. Cushman of Talmage, who exercised his prerogative established by precedent in naming the vice-speaker of the House, and placed in nomination the name of John H. Graves of San Francisco. This nomination was seconded by Irving Ingber of San Francisco. On motion of William H. Kiger of Los Angeles, seconded by N. T. Enloe of Chico, the Secretary was instructed to cast the ballot of the House for John H. Graves. The Secretary did so cast, and the Speaker declared John H. Graves elected Vice-Speaker for the ensuing year.

25. Election of Councilors:

(a) *Third District.*—The delegates of the Third Councilor District, representing the counties of Santa Barbara, San Luis Obispo, and Ventura, submitted in writing the nomination of Henry J. Ullmann of Santa Barbara as councilor of the Third District, to succeed himself.

C. S. Compton of Bakersfield placed in nomination the name of Louis Packard of Bakersfield as councilor of the Third District. The Speaker directed that ballots be spread and appointed five tellers. Upon completion of the count the Secretary announced that 128 out of a possible 137 votes had been cast, Louis A. Packard receiving 83 and Henry J. Ullmann receiving 45.

The Speaker, therefore, declared Doctor Packard elected councilor of the Third District for the ensuing three years.

(b) *Sixth District.*—Delegates for the Sixth District placed in nomination the name of Karl L. Schaupp of San Francisco to succeed himself. The nomination was seconded by Loren Chandler of San Francisco. On motion of Loren R. Chandler, seconded by Howard Morrow of San Francisco, the Secretary was instructed to cast the ballot. The Secretary did so cast the ballot, and the Speaker declared Karl L. Schaupp elected councilor of the Sixth District for the ensuing three years.

(c) *Ninth District.*—The delegates from the Ninth District placed in nomination the name of Henry S. Rogers to succeed himself as councilor of the Ninth District. Karl L. Schaupp of San Francisco moved that the Secretary cast the ballot; seconded by A. E. Anderson of Fresno. The Secretary did so cast, and the Speaker declared Henry S. Rogers elected as councilor for the Ninth District for the ensuing three years.

(d) *Councilor-at-Large.*—John P. Nuttall of Los Angeles, placed in nomination the name of William H. Kiger of Los Angeles to succeed himself as councilor-at-large. The nomination was supported by George G. Reinle of Oakland. Upon motion of Harry H. Wilson, seconded by C. A. Dukes, the Secretary was instructed to cast the ballot for Doctor Kiger. The Secretary did so cast, and the Speaker declared William H. Kiger of Los Angeles elected councilor-at-large to succeed himself for the ensuing three years.

(e) *Councilor-at-Large.*—Karl L. Schaupp of San Francisco placed in nomination the name of Junius B. Harris of Sacramento to succeed himself as councilor-at-large. The nomination was seconded by a rising demonstration of the House. On motion of E. Vincent Askey of Los Angeles, seconded by N. T. Enloe of Chico, the Secretary was instructed to cast the ballot of the House. The Secretary did so cast, and the Speaker announced the election of Junius B. Harris of Sacramento to succeed himself as councilor-at-large for a period of three years.

26. Delegates to the House of Delegates of the American Medical Association:

(a) William H. Kiger of Los Angeles nominated Elbridge J. Best of San Francisco to succeed himself as delegate to the American Medical Association. This nomination was seconded by Morton R. Gibbons of San Francisco. On motion of George G. Reinle of Oakland, seconded by Loren R. Chandler of San Francisco, the Secretary was instructed to cast the ballot. The Secretary did so cast, and the Speaker announced the election of Elbridge J. Best of San Francisco as delegate to the American Medical Association for the sessions of 1938 and 1939.

(b) F. E. Toomey of San Diego nominated Lyell C. Kinney of San Diego to succeed himself as delegate to the American Medical Association. The nomination was seconded by H. Wiley of Los Angeles. On motion of Karl L. Schaupp of San Francisco, seconded by Philip Gilman of San Francisco, the Secretary was instructed to cast the ballot of the House. The Secretary did so cast, and the Speaker announced the election of Lyell C. Kinney of San Diego as delegate to the American Medical Association for the sessions of 1938 and 1939.

(c) Fred B. Clarke of Los Angeles nominated John P. Nuttall of Los Angeles to succeed Doctor Clarke as delegate to the American Medical Association. The nomination was seconded by William H. Kiger. On motion of William H. Kiger of Los Angeles, seconded by Stanley H. Mentzer of San Francisco, the Secretary was instructed to cast the ballot. The Secretary did so cast, and the Speaker declared John P. Nuttall elected delegate to the American Medical Association for the sessions of 1938 and 1939.

27. Alternates to the House of Delegates of the American Medical Association:

(a) Irving S. Ingber of San Francisco placed in nomination the name of Robert S. Stone of San Francisco as alternate to Elbridge Best to the American Medical Association. There being no further nominations, the Speaker declared the nominations closed. On motion of Howard Morrow of San Francisco, seconded by George G. Reinle of Oakland, the Secretary was instructed to cast the ballot. The Secretary did so cast, and the Speaker declared Robert S. Stone elected alternate to Elbridge Best to the American Medical Association sessions of 1938 and 1939.

(b) Harry H. Wilson of Los Angeles placed in nomination the name of Bon O. Adams of Riverside as alternate to Lyell C. Kinney to the American Medical Association. There being no further nominations, the Speaker declared the nominations closed. On motion of George G. Reinle of Oakland, seconded by William H. Kiger of Los Angeles, the Secretary was instructed to cast the ballot. The Secretary did so cast, and the Speaker declared Bon O. Adams of Riverside elected alternate to Lyell C. Kinney to the American Medical Association sessions of 1938 and 1939.

(c) William R. Molony, Sr., of Los Angeles placed in nomination the name of F. M. Pottenger, Sr., of Monrovia as alternate to John P. Nuttall to the American Medical Association. There being no further nominations the Speaker declared the nominations closed. On motion duly made and seconded, the Secretary was instructed to cast

the ballot. The Secretary did so cast, and the Speaker declared F. M. Pottenger, Sr., elected alternate to John P. Nuttall to the American Medical Association sessions of 1938 and 1939.

28. Constitutional Amendments:

The following constitutional amendments having been proposed at the Coronado session, and having been published in the official JOURNAL of the Association, were now presented to the House for action:

(a) *Amendment Placing the Past President of Each Year on the Council for one year.*

Resolved, That Section 1 of Article VII of the Constitution of this Association be and is hereby amended by inserting in the first paragraph thereof after the words "the president," the following: "the past president"; and be it further

Resolved, That Section 8 of Article VII of the Constitution of this Association be and is hereby amended by inserting in the first paragraph thereof after the words "the president," the following: "the past president"; and be it further

Resolved, That Section 1 of Article X of the Constitution of this Association be and is hereby amended by inserting after the words "a president," the following: "a past president"; and be it further

Resolved, That Section 2 of said Article X of the Constitution of this Association and the title thereto be amended to read as follows:

"Section 2. President-Elect, when and how elected; term of office. Past president.

"The House of Delegates at the regular annual session thereof shall elect the president-elect to serve until the adjournment of the final meeting of the House of Delegates at its next regular annual session. At the conclusion of the final meeting of the House of Delegates at its next regular annual session, such president-elect shall assume the office of president, and serve as such for the term of one year thereafter, or until his successor assumes office.

"At the expiration of his term of office the president shall become the past president and serve as such for a term of one year thereafter, or until his successor assumes office; and be it further

Resolved, That Section 4 of Article X of the Constitution of this Association be and is hereby amended by inserting in the first paragraph thereof after the word "president," the following: "past president."

* * *

William R. Molony, Sr., of Los Angeles, seconded by Clifford Mack of Livermore, moved the adoption of the amendment. Discussion was engaged in by Doctors Robert A. Peers of Colfax, Loren R. Chandler of San Francisco, and George G. Reinle of Oakland.

On a rising vote, the Speaker declared the amendment adopted with 103 affirmative votes.

* * *

(b) *Amendment Outlining Conditions Applying to House of Delegates' Appropriations in Excess of \$1,000.*

Resolved, That Section 1 of Article XI of the Constitution of this Association be and is hereby amended as follows:

By striking out all of the fourth paragraph of said Section 1 of Article XI, reading as follows:

"All resolutions providing for appropriations shall be referred to the Council, and all appropriations approved by the Council shall be included in the annual budget."

And by inserting in lieu thereof the following:

"Any resolution passed and adopted by the House of Delegates at any regular or special session thereof, which provides for or contemplates the appropriation or expenditure of more than the sum of \$1,000 shall not be effective for any purpose unless and until approved by the Council. All appropriations, regardless of amount, approved and made by the Council shall, if expended, be reported to the House of Delegates at its next annual session, and any unexpended portion of any thereof shall be included in the annual budget."

William R. Molony, Sr., of Los Angeles, seconded by F. M. Pottenger, Sr., of Monrovia, moved the adoption of the amendment. On a rising vote, the Speaker declared the amendment adopted.

29. **Nominations for Standing Committees.**—Under instruction of the Council, the Secretary presented the following nominations for standing committees for approval

by the House of Delegates, and on motion of Irving Ingber of San Francisco, seconded by Fred B. Clarke of Long Beach, the membership of standing committees was approved by the House:

COMMITTEE ON ASSOCIATED SOCIETIES AND TECHNICAL GROUPS

John V. Barrow (Chairman), Los Angeles.....	1940
Edwin L. Bruck, San Francisco.....	1938
William H. Geistweit, San Diego.....	1939

COMMITTEE ON HEALTH AND PUBLIC INSTRUCTION

B. W. Black, Oakland.....	1940
Fred B. Clarke (Chairman), Long Beach.....	1938
W. R. P. Clark, San Francisco.....	1939

COMMITTEE ON HISTORY AND OBITUARIES

A. E. Belt, Los Angeles.....	1940
F. R. Makinson (Chairman), Oakland.....	1938
J. Marion Read, San Francisco.....	1939
The Secretary ex officio	
The Editor ex officio	

COMMITTEE ON HOSPITALS, DISPENSARIES AND CLINICS

Karl L. Schaupp, San Francisco.....	1940
George Dawson, Napa.....	1938
Daniel Crosby (Chairman), Oakland.....	1939

COMMITTEE ON INDUSTRIAL PRACTICE

Harry E. Zaiser, Orange.....	1940
Morton R. Gibbons, Sr. (Chairman), San Francisco.....	1938
Philip Stephens, Los Angeles.....	1939

COMMITTEE ON MEDICAL DEFENSE

John P. Nuttall, Santa Monica.....	1940
George G. Reinle (Chairman), Oakland.....	1938
Fred R. DeLappe, Modesto.....	1939

COMMITTEE ON MEDICAL ECONOMICS

Percy Magan, Los Angeles.....	1940
John H. Graves (Chairman), San Francisco.....	1938
William R. Molony, Sr., Los Angeles.....	1939

COMMITTEE ON MEDICAL EDUCATION AND MEDICAL INSTITUTIONS

John B. Doyle, Los Angeles.....	1940
B. O. Raulston, Los Angeles.....	1938
Loren R. Chandler (Chairman), San Francisco.....	1939

COMMITTEE ON MEMBERSHIP AND ORGANIZATION

G. Dan Delprat, San Francisco.....	1940
E. Vincent Askey (Chairman), Los Angeles.....	1938
Dewey R. Powell, Stockton.....	1939

COMMITTEE ON POSTGRADUATE ACTIVITIES

John C. Ruddock (Chairman), Los Angeles.....	1940
F. E. Clough, San Bernardino.....	1938
F. F. Gundrum, Sacramento.....	1939
The Secretary ex officio	

COMMITTEE ON PUBLICATIONS

Ralph Eusden (Chairman), Long Beach.....	1940
Ruggles A. Cushman, Talmage.....	1938
Oscar Reiss, Los Angeles.....	1939
The Secretary ex officio	
The Editor ex officio	

COMMITTEE ON PUBLIC POLICY AND LEGISLATION

E. T. Remmen, Glendale.....	1940
J. B. Harris (Chairman), Sacramento.....	1938
T. Henshaw Kelly, San Francisco.....	1939
President ex officio	
President-elect ex officio	

30. **Report of the Reference Committee on Reports of Officers and of Standing and Special Committees.**—Dr. Frederick N. Scatena, Chairman of the Reference Committee on Reports of Officers and of Standing and Special Committees, submitted the following comments on the reports of officers, councilors, and standing and special committees.

REPORT OF THE COMMITTEE

Report of the President.—President Pallatte is to be commended for the excellent manner in which he has administered the affairs of the California Medical Association. He has visited many local societies, has been instrumental in increasing the membership of the California Medical Association to 85 per cent of the eligible practicing physicians in the State. His request that special effort be made to enroll as large a number as is possible of the 1,200 non-

members who are eligible and residing in the Los Angeles and San Francisco areas is to be commended.

Your Committee especially commends Doctor Pallette for the fine coöperation he has obtained from his standing committees and for his efforts in behalf of public education in scientific medicine achieved through the excellent exhibits maintained by the California Medical Association.

The Committee recommends adoption. *Carried.*

* * *

Report of the President-Elect.—The California Medical Association has in the past demonstrated excellent judgment in the selection of its presidents. In Dr. Howard Morrow, your Committee feels we have a man who, because of his long experience in executive and administrative offices, is particularly well qualified to carry on the traditions of the California Medical Association in a manner that will reflect advancement and prosperity to the California Medical Association.

The Committee recommends adoption. *Carried.*

* * *

Report of the Speaker of the House of Delegates.—Speaker Roblee is to be commended for the excellent manner in which he has conducted the meetings of the House of Delegates. His knowledge of parliamentary law and his interest in the faithful execution of the duties of this office have helped in no small measure to make this year the successful one that it is.

The Committee recommends adoption. *Carried.*

* * *

Report of the Council.—The report of the Council points out that the members thereof have given of their time and effort in the performance of Association duties, and all of the members of the Secretary-Treasurer's staff have worked in conjunction with the Council, as have the Editor of the JOURNAL and the General Counsel.

* * *

The recommendation to the House of Delegates that the annual Association dues be \$10 for the year 1938 is especially commended. *Carried.*

* * *

The Committee notes with gratification the large increase in membership and recommends that special effort be made by the county societies to enroll all the eligible men in their immediate districts, and that the large metropolitan areas of Los Angeles and San Francisco be especially requested to exert every effort to enroll the large numbers in their areas who are at present not members. *Carried.*

* * *

Your Committee recommends that, in the proposed plan or organization of the consolidated sections, a committee be formed consisting of the chairman of each section and the Secretary of the California Medical Association, and that each section receive recognition especially in the matter of selection of officers, selection of papers, allocation of papers and time, and that each section be given a voice in the selection of guest speakers.

After a discussion as to whom the power is vested in to select guest speakers for annual meetings, the Association Secretary, Doctor Warnshuis, pointed out that the Scientific Committee makes recommendations to the Council, which body selects guest speakers. Dr. Charles E. Schoff of Sacramento stated that no plan for the consolidation of sections had been adopted, therefore there was no need for this portion of the report. The portion of the report dealing with consolidation of sections—*Not carried.*

* * *

Your Committee feels that the Committee on Legislation and Public Policy is thoroughly capable of handling all problems which confront it. The excellent work of these men under the able leadership of Dr. Junius B. Harris is such that we find it impossible to express in words the appreciation which we know the members of the California Medical Association feel toward them.

The Committee recommends adoption. *Carried.*

* * *

Your Committee endorses the desirability of the San Francisco County Medical Society entertaining the American Medical Association in San Francisco in the year 1938. The Committee recommends that the California Medical

Association delegates to the American Medical Association be instructed to make a special effort to obtain the convention. *Carried.*

* * *

Your Committee has observed from the annual report of several standing committees, such as the Committee on Hospitals, Dispensaries and Clinics, the Committee on Industrial Practice, the Committee on Medical Economics, and the Committee on Medical Education and Medical Institutions, that no meetings have been held during the past year and that any matters pertinent to the said committees which have arisen have been referred to other committees. Your Committee feels that a study of the needs for consolidation of standing committees should be made and that all committees considered unnecessary be deleted and others deemed necessary, because of new standards and conditions, be added.

* * *

(b) Resolution Regarding Annual Conference of Standing Committees

WHEREAS, The By-Laws of the California Medical Association provide for the appointment of certain standing committees, each group having distinct responsibilities concerning activities of the California Medical Association; and

WHEREAS, In order to have the profession of the various parts of the State properly represented, each committee consists of members who live in different sections of California; and

WHEREAS, Because of the size of the State, the expense of travel is considerable, so that these important standing committees up to the present time have not had opportunity to function either at or between annual sessions; and

WHEREAS, It would be of real benefit to the interest of organized and scientific medicine and of the California Medical Association and its component county societies if these California Medical Association standing committees would be given opportunity to function to better advantage; now, therefore, be it

Resolved, By the House of Delegates of the California Medical Association that it recommend that the Council take steps to provide that all standing committees shall be called together for joint and individual meetings at the same time and place, not only at the annual session, but at least once in the mid-year between annual sessions, at such place and time as the Council may decide, the railroad expense of the members of the standing committees for the mid-year meeting to be paid by the Association.

In the Secretary-Treasurer's annual report, there are suggestions incorporating the subject matter of the Barrow resolution, and we endorse the resolution as modified by the suggestions made in the report of the Secretary-Treasurer, Doctor Warnshuis. The suggestions are as follows:

1. The re-creation of certain standing committees and the abolishment of others.
2. The holding in October of each year of a two-day session for an annual conference of county secretaries and the members of the standing committees.

The Committee recommends adoption of this section of the report. *Carried.*

* * *

Report of District Councilors.—Your Committee notes from the reports of the District Councilors that they have fulfilled the duties of their respective districts. Special commendation should be given to these councilors, and particularly to Doctors Rogers and Schoff, who, because of the vastness of their respective districts, have had to travel great distances to reach the component societies.

The Committee recommends adoption. *Carried.*

* * *

Report of the Secretary-Treasurer.—The Secretary-Treasurer, in conjunction with the President, has visited many of the local societies and, in addition, has met with many public clubs and made contacts with other associations for the purpose of spreading knowledge of the work done by organized medicine. Your Committee has noted the suggestions made at the end of the Secretary's report and submits the following comments and suggestions concerning adoption thereof:

1. The re-creation of certain standing committees and the abolishment of others.

2. The holding in October of each year of a two-day session for an annual conference of county secretaries and members of standing committees.

The above suggestions have been adopted by a previous vote here, and we believe they are steps forward which will make for better and more intelligent management of the affairs of the various committees. As for the remainder of the suggestions:

1. The establishment of permanent headquarters.
2. The establishment of a packet library reference service.
3. The solicitation of funds for the establishment of a permanent endowment fund.

Your Committee feels that, with the insufficient information at hand, the above questions should be presented at a later meeting.

4. The sponsoring of an annual conference of representatives of the three Pacific Coast state organizations.

Your Committee feels that the establishment of such a relation between the Pacific Coast states may be of advantage. However, it feels that the Council should, after adequate study of the proposed plan, decide as to its establishment.

The Committee recommends adoption of this modified report. *Carried.*

* * *

Report of the Editor.—Your Committee recommends that the first page of CALIFORNIA AND WESTERN MEDICINE be kept free of advertising. It also recommends continuation of permanent locations in CALIFORNIA AND WESTERN MEDICINE for departmental matters. We feel that the Journal has achieved a place of importance, and we recommend that its high standard be continued in the future.

The Committee recommends adoption.

The report was changed to read, "the front cover of CALIFORNIA AND WESTERN MEDICINE" in place of "first page." The report as changed was *carried*.

* * *

Report of the Legal Department.—The report of the Legal Department shows increased activity, special attention having been given to such matters as the disciplinary appeal of members to the Judicial Council of the American Medical Association, the matter relative to the status of expert witnesses and also to the matter of modification of the Business and Professional Code of California.

Your Committee especially commends the idea of issuing a physician's handbook as proposed by the Counsel. Valuable work was done in clarifying the relationship between hospital insurance service and the policies of the California Medical Association. We hope this type of service will continue in the future.

The Committee recommends adoption. *Carried.*

* * *

Report of the Committee on Associated Societies and Technical Groups.—The report as submitted by Dr. W. J. Kerr shows the increasing importance of the Woman's Auxiliary to the California Medical Association and everything possible should be done to guide and encourage these activities along proper lines. We feel that the local component medical societies should work in close relationship with their respective auxiliaries in any proposed activity in which the help of the Auxiliary is requested.

The Committee recommends adoption. *Carried.*

* * *

Report of the Committee on History and Obituaries.—Your Committee recommends that the question of gathering historical data be left to the component county societies and that when these compilations are completed, a copy thereof be sent to the California Medical Association so the collection in its entirety would give the historical background of the entire State of California. Your Committee also recommends that this matter be brought to the attention of the secretaries at the annual conference of secretaries.

We view with a great deal of regret the large number of our brothers who have passed to the "great beyond." We

know that in their respective communities and in the State in general, the memory of their work will linger.

The Committee recommends adoption. *Carried.*

* * *

Report of the Committee on Medical Education and Medical Institutions.—Your Committee feels that membership activities should be relegated to the component county units. However, we appreciate the work this committee has done thus far, and we feel it should be commended for the coöperation secured between the county societies and the State Association.

The Committee recommends adoption. *Carried.*

* * *

Report of the Committee on Postgraduate Activities.—Your Committee urges the adoption, as far as possible, of the recommendations set forth in the annual report of the Committee on Postgraduate Activities. To facilitate the work of this committee, we recommend that the membership be increased from three to five members.

The Committee recommends adoption. *Carried.*

* * *

Report of the Committee on Publications.—The recommendations set forth in this report are incorporated in the Editor's report, and have received the approval of this committee.

The Committee recommends adoption. *Carried.*

* * *

Report of the Committee on Scientific Work.—Your Committee commends the Committee on Scientific Work for their efforts in the development of a department of scientific exhibits.

The following resolution is set forth in this report:

Resolved, That the second general session of each annual meeting shall be devoted to a Clinico-Pathological Conference conducted under the auspices of the Scientific Committee.

Your Committee recommends that the House of Delegates go on record as requesting the Scientific Committee to include a Clinico-Pathological Conference whenever an especially interesting program can be arranged at the second general session.

The Committee recommends adoption. *Carried.*

* * *

Report of the Committee on Public Relations.—With regard to the recommendations set forth in this report, your Committee recommends that Health Institutes be discontinued and educational films be instituted therefor. Because of the wide scope of the clinical problems and the many issues involved in the establishment of a Public Health Hour in physicians' offices, your Committee recommends that this suggestion be not acted upon at the present time.

Your Committee feels that the expenditure involved in acquiring a library of educational films for public meetings is too great to be handled by the State Association and should be a function of the American Medical Association.

* * *

Referring to the Supplementary Report on Medical Exhibits at the 1936 California-Pacific International Exposition at San Diego, your Committee feels duty-bound to express to these gentlemen the highest regard and appreciation for the time and money expended in the maintenance, continuation, and expansion of the exhibits at the San Diego Fair. Your attention is expressly called to Doctor Geistweit's report, wherein he commends both Dr. M. C. Harding and Dr. L. C. Kinney for the fine work these gentlemen accomplished and for which they have so modestly refused recognition.

The Committee recommends adoption. *Carried.*

* * *

Report of the Auditing Committee.—This report in brief was published in the Pre-Convention Bulletin. The Committee makes no comment upon it and moves its adoption. *Carried.*

The California Medical Association's proposed budget for the year 1938-1939 was presented by Dr. Karl Schaupp at the first meeting of the House of Delegates. (See Item 11, page 412.)

Examination of the proposed budget for 1938-1939 suggests the following recommendations by Reference Committee No. 1:

1. We feel that the Association expenses have reached a maximum peak and should not increase over the present amount unless some great emergency should require greater expenditures.

2. Your Committee suggests that the group costs, such as salaries, retainers' fees and other expenses, be broken down to show exactly where the various amounts are used.

3. We recommend a uniform breakdown plan to be followed yearly in future reports.

4. We recommend that the budget be made for the fiscal year beginning January 1 and ending December 31 each year, and be based on anticipated income received during this period.

5. We heartily approve the new audit plan which was placed in use this year.

The Committee recommends adoption. *Carried.*

* * *

Report of the Cancer Commission.—The Cancer Commission has done good work, and your Committee urges the continuation of this important field of research.

The Committee recommends adoption. *Carried.*

* * *

Report of the Special Committee on Qualifying Certificate Law.—Although your Committee is in favor of the passage of the qualifying certificate law, it does not feel that the expenditure of the moneys necessary therefor is feasible at this time, and recommends that this matter be held over for another year.

The Committee recommends adoption.

* * *

After an explanation of the necessity of a qualifying certificate law in this State by Dr. George H. Kress of Los Angeles and Dr. Lowell S. Goin of Los Angeles, a vote was taken and the motion did *not* carry.

* * *

Report of the Committee of Five.—Your Committee recommends that steps be taken to expedite the settlement of this question and to clean the slate as rapidly as possible.

Your Committee recommends adoption.

* * *

On the grounds that the recommendations of the Committee were not clearly stated or defined, a vote was taken and the motion did *not* carry.

* * *

Report of the Special Committee of the California Medical Association Dealing with Hospital Radiology and Pathology.—The report of the Special Committee of the California Medical Association Dealing with Hospital Radiology and Pathology, as presented by Dr. Charles A. Dukes at the first meeting of the House of Delegates, was read by Doctor Scatena.

Text of the Report

This is the final report of the Special Committee of the California Medical Association dealing with hospital radiology and pathology. The Committee has held several meetings during the last few years to consider the solutions of the problems concerned. On March 8, 1935, a joint meeting was held between the Committee and a Special Committee of the Western Hospital Association. At that meeting Dr. Benjamin Black, representing the hospitals, and Dr. Lowell Goin representing the physicians, were appointed a committee of two to formulate the principles governing the practice of radiology and clinical pathology

within the hospitals, and the following points were arrived at:

1. It is the judgment of this joint Committee that the practice of radiology and the practice of clinical pathology are, in every particular, integral parts of the practice of medicine, that it is necessary that a hospital operating a department of radiology and clinical pathology is justly entitled to: (a) a sum which is adequate rental for the space occupied; (b) reasonable amounts for depreciation and obsolescence; (c) all necessary costs accrued in the operation of such departments; (d) a reasonable return on its invested capital; (e) a reasonable amount over and above these charges to create a sinking fund against contingency.

The compensation of the roentgenologists and the pathologists shall be all the moneys received by the respective departments over and above the admitted fixed charges enumerated above, collection and distribution of the fees to be by method agreed upon between the executives of the hospital and the roentgenologist and/or the pathologist.

That employees serving the similar departments of roentgenology and pathology will be considered as part of the staff of the hospital, subject to similar executive control as may be applied to other employees but professionally responsible to the roentgenologist or pathologist serving in charge of the respective departments, employees in the departments to be removed for cause upon recommendation of the head of the department.

In furtherance of the above, and in view of the developments and conclusions reached in the past twelve months, your Committee wishes to recommend that the following specific proposals be promulgated by the Council of the California Medical Association for the guidance of physicians in relation to hospitals and the guidance of hospitals in relation to physicians, especially in connection with physicians practicing radiology and pathology:

1. Private hospitals: A lease type of arrangement. The physician should rent space and equipment or space alone from the hospital, paying the latter a monthly or annual sum therefor, this sum being adequate to assure an equitable return to the hospital. It is essential that the hospital receive reasonable remuneration for space occupied and equipment used.

Bills should be sent directly to the patient by the radiologist or the pathologist on his own billhead, as is customary for other physicians. The hospital office need not be asked to handle the collection for him. The radiologist or pathologist should be selected by the executive medical staff of the hospital on the basis of professional ability, standing, and qualifications.

2. University hospitals: As far as patients are concerned, the same arrangements outlined under (1) should apply. However, if all of the other members of the medical staff are on a salary basis or secure their compensation in some similar manner, then it is not inequitable for the staff radiologist or pathologist to be treated in the same manner as are their medical confrères.

3. Municipal, state, and federal hospitals: Since no fees are collected from patients in these hospitals for medical services, the problem of hospital-physician relationship in regard to the private practice of medicine does not arise.

In summary, therefore, we urge the members of the California Medical Association, particularly those who are on the executive boards of hospitals, to present these carefully formulated recommendations to their respective hospitals, to the end that all physicians practicing radiology and pathology in their institutions shall do so on a legal and ethical basis. The welfare of the patients and the welfare of the hospital will then be assured. The status of these physicians with respect to private practice should be essentially the same as that of the surgeon, internist, and other clinical specialists.

* * *

Your Committee recommends the adoption of the report of the Special Committee of the California Medical Association on Hospital Radiology and Pathology with the following corrections:

In paragraph 1, page 2 of the report, on private hospitals, after the words "lease type" add "rental or similar type of arrangement"; and delete the following: "Bills should be sent directly to the patient by the radiologist or the pathologist on his own billhead, as is customary for other physicians. The hospital office need not be asked to handle the collections for him." We delete this section because we feel it is in conflict with the statement made on page 1, which states: "The compensation of the roentgenologists and pathologists shall be all the moneys received by the respective departments over and above the admitted fixed charges enumerated above, collection and distribution of the fees to be by method agreed upon between the ex-

ecutive of the hospital and the roentgenologist or the pathologist."

Your Committee recommends adoption as amended. *Carried.*

* * *

Report of The Trustees Of The California Medical Association.—Your Committee has examined this report and moves its adoption (Supplement, April, 1937. CALIFORNIA AND WESTERN MEDICINE, page 39). *Carried.*

* * *

Report of the Local Committee on Arrangements.—We are now terminating the sixty-sixth annual session of the California Medical Association, and many pleasant memories will remain of the hospitality of the Monterey County Medical Society and the splendid accommodations and service rendered by the hotel management of the Hotel Del Monte. Your Committee thanks the local Committee on Arrangements and the Monterey Society for their hospitality and thoughtfulness.

The Committee recommends adoption. *Carried.*

The above report is signed:

COMMITTEE ON REPORTS OF OFFICERS AND STANDING
AND SPECIAL COMMITTEES.

By Frederick N. Scatena, *Chairman.*

Louis A. Packard

John P. Nuttall

✓ ✓ ✓

On motion duly made and seconded, the report of the Reference Committee on Reports of Officers and of Standing and Special Committees was adopted as amended.

31. Report of Committee on Public Policy and Legislation.*—The Speaker called attention to the report of the Committee on Public Policy and Legislation as submitted at the third general session. Dr. Junius B. Harris then made several explanatory remarks, and also reported that at a conference an agreement had been reached between the State Department of Health and those who were sponsoring another venereal disease control bill in the present session of the legislature. This was discussed by Dr. Russell Lee of Palo Alto and Dr. Howard Morrow of San Francisco.

Dr. Howard Morrow moved that the report of the Committee on Public Policy and Legislation be adopted. This motion was seconded by Dr. C. A. Dukes, and carried.

32. Venereal Disease Control.—Howard Morrow of San Francisco, Chairman of the Association's Committee on Venereal Disease Control, submitted the following report:

At a meeting of the Committee of the California Medical Association on the Control of Venereal Diseases, held May 4, 1937, the following recommendations were drawn up:

1. We urge the use of modern methods in the diagnosis and treatment of syphilis.
2. We urge diagnosis at the earliest possible moment.
3. We urge the tracing of sources of infection, investigation of contacts and the following up of delinquent venereal disease patients.
4. We urge the reporting of all cases as prescribed by the California State Board of Health.
5. We urge the full cooperation of the private physician with public health agencies. This cooperation is most important.
6. We urge the taking of a blood Wassermann on every pregnant woman. Any woman who has had syphilis should be treated during each pregnancy regardless of the blood Wassermann reaction.
7. We urge the continuation of professional secrecy between physician and patient in so far as is possible in compliance with the rules of the State Board of Health.

* See also in this issue of CALIFORNIA AND WESTERN MEDICINE, item 13 of House of Delegates minutes (page 412) and editorial comments presenting a digest of the report (page 364).

8. We recommend that the California Medical Association take the initiative in the development of a venereal disease educational program for the physicians of the state.

(Signed): WILLIAM H. GOECKERMAN,
Los Angeles.

CHARLES W. BARNETT,
San Francisco.

HOWARD MORROW, *Chairman.*
San Francisco.

✓ ✓ ✓

On motion of Russell V. Lee, seconded by A. E. Anderson, the report of the Committee was adopted.

42. Report of Reference Committee No. 2 on Resolutions and New and Miscellaneous Business.—Lowell S. Goin of Los Angeles, Chairman of Reference Committee No. 2, stated that his report covered ten resolutions. With the unanimous consent of the House, Doctor Goin dispensed with the re-reading of the resolutions as introduced in the first meeting.*

✓ ✓ ✓

*(h) Resolution Regarding Nonprofit Hospital
Tax Repeal*

WHEREAS, Hospitalization insurance as provided by nonprofit hospitalization associations has proved of great benefit to the medical profession and to the general public; and

WHEREAS, The type of hospitalization insurance provided by nonprofit associations conforms to the ideals and ethics of the medical profession; and

WHEREAS, Nonprofit hospitalization insurance associations must be relieved of all unnecessary expense in order to continue providing this type of hospitalization insurance at minimum cost to the public; therefore be it

Resolved, That the California Medical Association exert its influence with the State Administration to repeal state taxation of nonprofit hospitalization insurance associations.

✓ ✓ ✓

On the resolution introduced by Frank A. MacDonald of Sacramento, on advice of legal counsel and the consent of Doctor MacDonald, the Committee offers the following substitute resolution:

WHEREAS, The Constitution of the State of California provides for the imposition of a tax of 2.6 per cent on the gross premiums incurred by all insurers; and

WHEREAS, This tax constitutes a serious burden by increasing the cost of hospital insurance to not-for-profit associations formed for the purpose of providing hospital insurance; and

WHEREAS, These plans are a benefit to the public at large, as well as the medical profession; and

WHEREAS, There is now pending in the Legislature of the State of California an assembly constitutional amendment proposing to add a section to Article XIII of the Constitution exempting corporations, associations or insurers organized without capital stock and carried on solely for the mutual benefit of its members and not for profit, from all state, county and municipal taxes; therefore be it

Resolved, That the Legislative Committee of this Association is informed that the House of Delegates of the California Medical Association urges passage of the constitutional amendment.

✓ ✓ ✓

The Committee moves the adoption of the substitute resolution. Seconded by F. N. Scatena of Sacramento, and unanimously *carried*.

* * *

*(a) Resolution Regarding Public Health Education
and Educational Films*

WHEREAS, The public today is seeking and demanding dependable health information and knowledge; and

WHEREAS, This demand is being partly met by self-seeking, non-authentic and non-scientific sources, namely, the advertisers and vendors of remedies, and self-constituted, inadequately educated cults and charlatans; and

WHEREAS, Misleading and false information is being transmitted to the public through the various avenues of publicity which constitute a very definite menace to the

* Editor's Note.—For convenience of readers, the resolutions as presented at the first meeting of the House of Delegates will be printed in place with the recommendations of the committee.

health welfare of the public of this nation and, therefore, demands the concerted action of organized medicine to aid and support the physician in fulfilling his duty to the public as expressed in Sections 1 and 3, Chapter IV of the Principles of Medical Ethics of the American Medical Association; and

WHEREAS, Methods and channels through which educational information is being imparted have materially changed in the past twenty-five years from the written page to the radio, and now to the moving picture with sound-effect; and

WHEREAS, Motion pictures bringing the story of medicine to the public have been used in a very limited way by the profession and by organized medicine; and

WHEREAS, The visual story of medicine in film lends itself to dramatization of great general interest and offers effective means for desirable educational work in the public's behalf, and will create an appreciation of the science of medicine and of those who represent it; and

WHEREAS, Motion-picture films must be of understandable pictorial and dramatic quality that calls for the expenditure of money for scenarial writing of scripts and dialogue; and

WHEREAS, Such moneys cannot be expended by individual physicians or by component county medical units; and

WHEREAS, Motion-picture films of a character contemplated in this resolution should be used nationally to the benefit of the public; therefore be it

Resolved, That the House of Delegates of the California Medical Association at Del Monte, California, in May, 1937, instruct its delegates to the House of Delegates of the American Medical Association meeting at Atlantic City, June 6 to 11, 1937, to introduce and to support a resolution calling upon the Board of Trustees of the American Medical Association to give immediate consideration to the production of educational films, with and without sound-track, and that such films be made available for the various component state and county medical societies throughout the country for these educational purposes.

The Committee feels that this resolution embodies possibilities of incalculable value, and if it were adopted in this House and in the House of Delegates of the American Medical Association and its intentions were carried out properly, the resultant benefit to the medical profession would be enormous.

The Committee moves the adoption of the resolution. Seconded by F. M. Pottenger, Sr., and unanimously *carried*.

(f) *Resolution Regarding Aid to the Blind Under the Social Security Act*

WHEREAS, The Federal Social Security Act in Title Ten having placed on the Social Security Board the responsibility of entering into cooperative arrangements with the various states for the purpose of aiding states in granting financial assistance to needy blind individuals, and the Social Security Board having ruled that individuals in the various states applying for blind assistance must be examined by an ophthalmologist or a physician skilled in diseases of the eye; and

WHEREAS, The Social Security Board has advised the official state agencies having the responsibility of administering this aid in the various states to employ a supervising ophthalmologist, part or full time, who will have general supervision of the medical determination of blindness within the state; therefore be it

Resolved, That the California Medical Association commends the action of the Social Security Board on requiring that applicants for blind assistance within the various states be examined by ophthalmologists or physicians skilled in diseases of the eye, as such a procedure will serve to secure fuller knowledge as to the causes of blindness within the state; be it further

Resolved, That the California Medical Association goes on record as approving the suggestion of the Social Security Board that the official agency in this state, charged with the responsibility of administering blind assistance, employ a supervising ophthalmologist whose duty will be the general supervision of the medical determination of blindness of those needy individuals applying for blind assistance; be it further

Resolved, That since the Social Security Board has ruled that applicants for blind assistance within the various states must be examined by ophthalmologists or physicians skilled in diseases of the eye, that it is the sense of this body that, if requested to do so, the Council of the California Medical Association will appoint a committee to advise with the responsible officials in this state for the

purpose of designating those physician in the state who are ophthalmologists or physicians skilled in diseases of the eye and to advise on any other medical matters that will aid in building up the scientific approach to this matter of granting assistance to the needy blind.

The Secretary of this body is directed to send a copy of this resolution to the state official, commission or department administering blind assistance in this state; and be it further

Resolved, That the delegates of the California Medical Association to the American Medical Association be and hereby are instructed to present this resolution in the House of Delegates of the American Medical Association at its coming meeting.

The resolution submitted by Wilber Swett of San Francisco, relating to the needy blind, the Committee has altered this resolution slightly, so that the phrase, "a physician skilled in diseases of the eye," which occurs in several places in the resolution, shall clearly be a definition of the word "ophthalmologist," and by adding a clause to the end of the resolution giving the delegates of this Association an opportunity to either present this resolution or support a like resolution, as circumstances may require. I will read the additional phrase: "And Be It Resolved, That the delegates of the California Medical Association to the American Medical Association be and are hereby instructed to present this resolution in the House of Delegates of the American Medical Association at its coming meeting, or to support a similar resolution, as circumstances may require." With these slight changes the Committee moves the adoption of the resolution. The definition of the word "ophthalmologist" was discussed by the various members of the House, and Henry J. Ullmann of Santa Barbara moved, seconded by Stanley S. Mentzer of San Francisco, that wherever the words "physician or physicians" appeared in the resolution, the words "must be examined by an ophthalmologist, who is a doctor of medicine skilled in diseases of the eye," be substituted.

On motion of Irving S. Ingber of San Francisco, seconded by Howard Morrow of San Francisco, the resolution as amended was *adopted*.

The next is a resolution introduced by the Council, regarding the formation of a bureau in the Federal Government governing health and medicine. This was approved by the Committee as submitted at the first meeting of the House of Delegates:

Resolution Concerning a National Department of Public Health

WHEREAS, The Board of Trustees of the American Medical Association has promulgated the following policy and principles:

"Recognizing that committees of the Senate and the House of Representatives of the United States Government and a special committee appointed by the President are at this time concerning themselves with the reorganization of government activities with a view to greater efficiency and economy, and recognizing also that the President, in his opening address to Congress, indicated that he would shortly present to the Congress recommendations for such reorganization of governmental activities in the executive branches, and recognizing, moreover, the great desirability that all activities of the Federal Government having to do with the promotion of health and the prevention of disease might, with advantage, be consolidated in one department and under one head, the Board of Trustees of the American Medical Association would recommend that such health activities as now exist be so consolidated in a single department which would not, however, be subservient to any charitable, conservatory or other department interests. The reorganization and consolidation of medical departments need not, under present circumstances, involve any extension or expansion of governmental health activities, but should serve actually to consolidate and thus to eliminate such duplication as exists. It is also the view of the Board of Trustees that the supervision and direction of such medical or health department should be in the hands of a competently trained physician, experienced in executive administration"; and

WHEREAS, The medical profession by reason of its members' medical education, training and experience, is most competent to determine the medical needs and services that are essential to the conservation of the public's health welfare; therefore be it

Resolved, That the California Medical Association endorse the policy and recommendation of the Board of Trustees of the American Medical Association as herein stated; and be it

Resolved, That the Secretary of the California Medical Association is hereby instructed to transmit this resolution to the President of the United States, to the members of the Senate and the House of Representatives of Congress, and to the Board of Trustees of the American Medical Association; and be it

Resolved, That the Chairman of the Council and the Secretary of this Association address a communication to the Senators and Congressmen of California respectfully urging them to support this policy and recommendation.

✓ ✓ ✓

The Committee moves the adoption of the resolution. Seconded by Henry J. Ullmann, and unanimously *carried*.

* * *

(g) *Resolution Regarding Paternalistic Aid*

WHEREAS, The California Medical Association notes with apprehension the recent increasing tendency of a large group of our citizens to shift the responsibility for their present and future welfare upon a willing paternalistic central government; and

WHEREAS, History records that all of the panaceas proposed or attempted for our economic ills have been repeatedly tried in the past and have always failed; and

WHEREAS, The fundamental reason for these repeated failures is the fact that the measures so failing violate nature's age-old immutable law of individual responsibility; now, therefore be it

Resolved, That the California Medical Association urges the people of this state, as well as of the entire nation, to scrutinize most carefully all proposals for social change and to reject everyone that does not embody the fundamental principle of individual responsibility; and be it further

Resolved, That this principle of individual responsibility is peculiarly essential in any plan contemplating the rendering of medical service on an insurance basis.

✓ ✓ ✓

Resolution introduced by L. A. Alesen of Los Angeles, dealing with social changes in medical service and insurance. Although highly sympathetic with the contents of this resolution, the Committee feels that it would be politically inexpedient to publicize such material at this time and, therefore, recommends that the resolution be not adopted.

✓ ✓ ✓

The Chairman of the Committee moved the adoption of the Committee's recommendation that the resolution be not adopted. Seconded by Karl L. Schaupp of San Francisco. Carried. *Resolution defeated*.

* * *

Next is the Council resolution dealing with membership ritual:

Resolution Concerning Procedure in Admission of New Members

WHEREAS, Membership in the constituent units of our medical federation is a valuable and dignified affiliation; and

WHEREAS, Such affiliation should be consummated by means of an impressive ceremony when applicants are admitted to membership; therefore be it

Resolved, That the House of Delegates authorize the Council of the California Medical Association to prepare a suitable procedure and ritual that will convey to the new members the ideals and objectives of our organizational units; and be it

Resolved, That officers of the county societies are requested to observe this induction ceremony whenever new members are admitted to their units.

✓ ✓ ✓

In this resolution the Committee feels that the words "impressive ceremony" and "ritual" are somewhat misleading and, therefore, offers the following substitute resolution, which it is hoped will serve the same purpose:

Resolved, That the House of Delegates authorize the Council of the California Medical Association to prepare a simple form for the induction of the new members into the component county societies.

The Committee moves the adoption of this substitute resolution. Seconded by Wilber Swett of San Francisco. Rising vote taken: 72 ayes. *Substitute resolution adopted*.

* * *

Next is the resolution introduced by the Council amending paragraphs (a) and (b) of Section 6 of Chapter III of the By-Laws, referring to Reference Committees:

Resolution Regarding an Additional Reference Committee at Annual Sessions

Resolved, That paragraphs (a) and (b) of Section 6 of Chapter III of the By-Laws be and they are hereby amended to read as follows:

Section 6 (a) Appointment of Committee on Credentials and Three Reference Committees.

Prior to or at the beginning of an annual session, the Speaker of the House shall appoint from the members thereof the following committees:

1. A Committee on Credentials.
2. A Reference Committee on Reports of Officers and Standing Committees.
3. A Reference Committee on the Report of the Council and the Report of the Secretary-Treasurer.
4. A Reference Committee on Resolutions, Amendments to the Constitution and By-Laws and New and Miscellaneous Business.

(b) Membership of Credentials and Reference Committees.

Each of the aforesaid committees shall consist of three members, the chairman of each to be designated by the Speaker.

The Speaker, the House concurring, shall refer said reports, resolutions, and business to the respective Reference Committees, but may allocate among them any of said reports, resolutions or portions thereof, and other business, to avoid duplication and to expedite the business of the House of Delegates.

* The Reference Committees shall present written reports dealing with and making recommendations on all matters submitted to them. The report of each committee shall be read by its chairman first as a whole, and the House of Delegates shall then act and vote upon the report as a whole or section by section, as it may deem best.

✓ ✓ ✓

The import of this amendment is to expedite the work of the House of Delegates by the allocation by the Speaker of the work of the House of Delegates to various Reference Committees and creates one new Reference Committee.

The Committee notes that this resolution as printed makes no mention of the reports of special committees. Feeling that it was undoubtedly the intention of the author of this resolution to include the words "special committees" in the phrase "Reference Committee on Reports of Officers and Standing Committees," which should undoubtedly read "Officers, Standing and Special Committees," your Committee has inserted the words "and Special Committees," making the sentence read, "A Reference Committee on Reports of Officers, Standing and Special Committees."

✓ ✓ ✓

With this slight change the Committee moves the adoption of the resolution. Seconded by William H. Kiger of Los Angeles, and unanimously *adopted as amended*.

* * *

The next resolution was introduced by Dewey R. Powell of San Joaquin County, and deals with classified telephone listings.

(c) *Resolution Regarding Physicians' Listings in Telephone Directories*

WHEREAS, Several instances have been reported where unqualified men have been listed in the Classified Directory of the telephone company under the heading of Physicians and Surgeons; and

WHEREAS, It is an injustice to the public to have chiropractors, osteopaths, and naturopaths so classified; and

WHEREAS, Protests of local county societies to district officers have been of no avail because of lack of jurisdiction of such local telephone officials; be it therefore

Resolved, That the Secretary of the California Medical Association be instructed to present this matter to the head of the Pacific Telephone and Telegraph Company requesting that a policy be formulated by that company, governing the accurate listing in classified directories of those practicing the healing art, and that appropriate instructions be submitted to their various local managers.

This resolution complains of a matter that has been an irritant in many parts of the State and which undoubtedly needs correction. The telephone directories of the State of California, however, are under the immediate jurisdiction of the Railroad Commission, and the Committee therefore recommends a substitute resolution which it is believed will accomplish the same end, namely, be it

Resolved, That the secretary of the California Medical Association be and hereby is instructed to confer with the Railroad Commission and other authorities to the end that a uniform policy be formulated governing the listing in the classified telephone directories in California of doctors of medicine and other persons practicing the healing art, in order that such practitioners be listed under their true headings.

✓ ✓ ✓

The Committee moves the adoption of the substitute resolution. Seconded by A. E. Anderson of Fresno, and there being no objection the substitute resolution was unanimously *adopted*.

* * *

The next resolution dealing with legislation was introduced by the San Francisco delegation.

(e) *Resolution Concerning California Medical Association Annual Sessions in Legislative Years*

WHEREAS, In each session of the California Legislature there is introduced much legislation of vital interest to the medical profession; and

WHEREAS, Such legislation often is fully developed before the annual session of the California Medical Association, thus preventing its members from being intelligently informed as to the import of such legislation and from basing a proper course of action thereon; therefore be it

Resolved, That in order to correct this anomalous and frequently unfortunate situation, the California Medical Association hold its annual meeting during the second and third week of the legislative session in those years in which the legislature meets.

✓ ✓ ✓

The Committee, with the consent and assistance of the Chairman of the San Francisco delegation, offers the following substitute resolution:

Resolved, That in the years when the California State Legislature is in session, the Council of the California Medical Association shall, if in its judgment it be necessary, call a special meeting of the House of Delegates for the purpose of considering the legislation then pending. If such meeting be called, it shall be called before March 1 in such year.

✓ ✓ ✓

I would like to explain that the Constitution provides that the Council shall fix the time and place of the annual meeting and all other meetings, and that the House of Delegates could not by resolution fix another meeting date. The Committee adds to this resolution the following clause:

Resolved, That the House of Delegates of the California Medical Association, at the 1937 session assembled, hereby empowers the Council of the California Medical Association to employ a liaison secretary during each session of the California State Legislature, if and when the Legislative Committee of the California Medical Association deems it advisable. Under the direction of the Legislative Committee, this secretary shall send as frequently as seems necessary information and instructions regarding legislative matters to the secretary of each component county society. It will be the duty of the secretary of each component society to immediately transmit this information to the members of his society.

✓ ✓ ✓

The Committee recommends the adoption of the substitute resolution. After discussion, John P. Nuttall of Los Angeles, seconded by Charles A. Dukes of Oakland, moved that the resolution be tabled. The Speaker called for a vote and the motion was *tabled*.

* * *

The next resolution is one of appreciation:

Resolution on the Woman's Auxiliary

The California Medical Association is sincerely appreciative of the most valuable and helpful coöperation of the California Woman's Auxiliary to the California Medical Association. With deep interest we note the expand-

ing growth of the Auxiliary and its activities, which are so effectively administered by the officers of the State Auxiliary and its several county branches in the movements that deal with public health welfare and professional service. The California Medical Association is firm in its opinion that the Woman's Auxiliary constitutes one of our Association's most valuable helpmates; therefore be it

Resolved, That the House of Delegates tenders to the Auxiliary its grateful thanks and earnest appreciation of its past activities and urges that every county society take immediate steps to organize an Auxiliary; and be it further

Resolved, That we hereby assure the California Woman's Auxiliary of our desire to coöperate with them in every possible manner in order to enable the Auxiliary to promote its purposes and expand its activities.

✓ ✓ ✓

The Committee moved the adoption of the resolution. Seconded by Charles A. Dukes and Howard Morrow, and unanimously *carried*.

✓ ✓ ✓

The above report was signed:

REFERENCE COMMITTEE ON RESOLUTIONS AND NEW AND MISCELLANEOUS BUSINESS.

By E. J. Best
Henry J. Ullmann
Lowell S. Goin, *Chairman*.

✓ ✓ ✓

On motion of Lowell S. Goin of Los Angeles, seconded by Howard Morrow of San Francisco, the report as a whole, as amended, was *adopted*.

43. Appreciation of Work of Chairman of Legislative Committee.—With the unanimous consent of the House, O. D. Hamlin of Oakland expressed the appreciation of the House and of the Association for the untiring and self-sacrificing efforts of Junius B. Harris, Chairman of the Committee on Public Policy and Legislation, on behalf of the health welfare of the people of California and the medical profession.

The members of the House expressed their appreciation of Doctor Harris's services by a rising vote.

44. Honorary Members.—With the consent of the House and on behalf of the Council, Morton R. Gibbons presented the following resolution regarding honorary members:

Resolved, That the Council be empowered to revise the list of honorary members of this Association, removing therefrom the names of removed and deceased individuals; and be it further

Resolved, That as of May 5, 1937, the honorary members of this Association shall consist of Henry Harris, of San Francisco, and John C. King, of Los Angeles; and be it further

Resolved, That future elections of honorary members shall be in strict accord with the Constitution and By-Laws, which vests the authority in the House of Delegates.

✓ ✓ ✓

The motion of Morton R. Gibbons for adoption of the resolution was seconded by Stanley Mentzer of San Francisco, and unanimously *carried*.

45. Resolution on Committee of Five.—With the consent of the House, Morton R. Gibbons introduced the following resolution on behalf of the Council:

WHEREAS, The California State Board of Public Health as legal sponsors for this commonwealth of Works Progress Administration Project, known as No. 1453, has in its possession what has been called the final report of the California Medical Economic Survey, which report was made under the supervision of one Paul A. Dodd; and

WHEREAS, The California State Board of Public Health, in accordance with instructions of the Works Progress Administration regarding such survey, now proposes to bring to publication and distribution the California Medical Economic Survey in accordance with the Works Progress Administration rules thereon; therefore be it

Resolved, By the California Medical Association, that it go on record as being in full accord with the California

State Board of Public Health to bring to a conclusion this project; and be it further

Resolved, That the Committee of Five be discharged with thanks and that its powers and duties be and they are hereby transferred to the Council, and that the Council be and is hereby authorized and empowered to take all necessary steps and proceedings to fulfill any outstanding obligation of the Association pertaining to the survey.

Discussion was participated in by Rodney Yoell of San Francisco, Karl L. Schaupp of San Francisco, Russell V. Lee of Palo Alto, Alson R. Kilgore of San Francisco, Dewey Powell of Stockton, Loren R. Chandler of San Francisco, and Harry H. Wilson of Los Angeles.

At the conclusion of the discussion the Speaker called for a rising vote. Eighty-nine delegates voted in favor of adoption of the resolution, and four delegates voted against adoption; and the Speaker declared the resolution adopted.

46. Introduction of President.—The Speaker called upon the retiring president, Edward M. Palette to introduce the incoming president, Howard Morrow, to the House. The entire House rose in tribute and respect to Doctor Morrow, who responded, expressing appreciation for the honor conferred upon him and pledging his efforts for the best interests of the Association during the coming year.

47. Presentation of Past President's Certificate.—President Howard Morrow presented Past President Palette with his honorary past president's certificate.

48. Induction of Speaker.—William W. Roblee, retiring speaker, presented Speaker Lowell S. Goin to the House. Doctor Goin responded, expressing his appreciation for the honor and confidence that had been accorded him in election to the office of Speaker, and concluded with the following biblical quotation: "For what doth the Lord require of thee but to keep His commandments, to show mercy, and to walk humbly before Him."

49. Minutes of the Session.—The Secretary reported that there was no unfinished business upon his desk, and that the minutes of this session of the House of Delegates were electrically transcribed. With the approval of the House, the Speaker of the House of Delegates, the Chairman of the Council, and the Secretary, were authorized to edit the minutes of the House for publication.

50. Adjournment.—There being no further business the Speaker declared this session of the House of Delegates to be adjourned, without day, at 1:20 a. m. on Thursday, May 6, 1937.

WILLIAM W. ROBLEE, *Speaker*.
F. C. WARNSHUIS, *Secretary*.

COUNCIL MINUTES

Minutes of the Two Hundred and Fifty-Second Meeting of the Council of the California Medical Association*

Held in Room 723, Hotel Del Monte, Del Monte, California, Sunday, May 2, 1937, at 7:30 p. m.

The meeting was called to order by the chairman, Morton R. Gibbons, with the following members present: President Edward M. Palette; President-Elect Howard Morrow, Speaker William W. Roblee, Chairman of Council Morton R. Gibbons, Chairman of Executive Committee Karl L. Schaupp; Councilors H. J. Ullmann, Calvert Emmons, Carl R. Howson, A. E. Anderson, A. L. Phillips, O. D. Hamlin, C. E. Schoff, H. S. Rogers, H. H. Wilson, W. H. Kiger, J. B. Harris, C. O. Tanner; Charles A. Dukes, Chairman of Public Relations Committee; George H. Kress, Editor; F. C. Warnshuis, Secretary; Mr. Hartley F. Peart, General Counsel; and his associate, Mr. Howard Hassard.

Absent: T. Henshaw Kelly.

* The minutes of the two hundred and fifty-first meeting of the Council of the California Medical Association were printed in the May, 1937, issue of CALIFORNIA AND WESTERN MEDICINE, page 331. Minutes in this series now printed are for the two hundred and fifty-second to the two hundred and fifty-sixth meetings, inclusive.

1. Report of the Auditors.—The annual report of the audit of the funds of the Association were presented and on motion of Councilor Phillips, seconded by Councilor Ullmann, the audit of the Association's books for 1937 as prepared by Ernst & Ernst, certified public accountants, was approved for submission to the House of Delegates. Carried.

2. Standing Committee Reports.—It was moved by Councilor Ullmann, seconded by Councilor Kiger, that the reports of standing and special committees as published in the Pre-Convention Bulletin be approved for submission to the House of Delegates. Carried.

3. Order of Business.—It was moved by Speaker Roblee, seconded by Councilor Phillips, that the order of business for the two meetings of the House of Delegates be approved. Carried.

4. Scientific Exhibit Awards.—The Secretary reported that the Scientific Committee requested that the Council appropriate \$200 for prize awards for the scientific exhibits at annual sessions.

It was moved by Councilor Ullmann, seconded by Councilor Schaupp, that the Council appropriate, with the approval of the Auditing Committee, \$100 as first prize, \$60 as second prize, and \$40 as third prize for the scientific exhibits awarded first, second, and third places by the Committee on Scientific Awards. Carried.

5. Appeals.—The following report, which was approved for inclusion in the report of the Council, was submitted:

The Judicial Council of the American Medical Association has acted upon the following appeals:

April 5, 1937, the Judicial Council, finding no reversible error or injustice in the case, sustained the decision of the Council of this Association in the matter of the appeals of Doctors F. W. Callison, J. L. McClure, Harry W. Davis, George H. Heppner, James P. Pressley, Frank E. Stiles, Edward Melville Talbott, Bertram Stone, Louis Clive Jacobs, and Herbert J. Cohn.

The Judicial Council has also sustained the decision of the Council of this Association, affirming in part orders entered by the Kern County Medical Society against Doctors Joe K. Smith, John M. Kirby, and R. M. Jones.

On motion of Councilor Ullmann, seconded by Councilor Rogers, the Secretary was instructed to include this decision in the minutes of the Council and transmit the same to the secretaries of the county societies involved and that those societies be instructed to apply the decisions as effective as of April 5, 1937. Carried.

6. Council Report.—The report of the Council was read by Chairman Gibbons, and acted upon section by section.

After full discussion the Council recommended to the House of Delegates that the annual dues be set at \$10 per year, and that such recommendation be included in the Council report.

It was moved by Councilor Schaupp, seconded by President-Elect Morrow, that the report of the Council, as amended, be approved. Carried.

7. California Hospital Association.—A letter from the California Hospital Association was read and action at this time was deferred.

8. Committee on Survey of Expenditures.—C. E. Schoff, Chairman of the Committee on Survey of Expenditures, stated that the Committee would be ready to report tomorrow and that it would like further time for the report on publication costs of CALIFORNIA AND WESTERN MEDICINE, and also wanted a clarification of Doctor Kress's wishes as stated in the previous resolution on publication costs adopted by the Council.

It was moved by President Palette, seconded by Councilor Harris, that the matter of printing costs be made a special item of business for the Thursday Council meeting. Carried.

9. Committee of Five.—It was moved by Councilor Kiger, seconded by Councilor Emmons, that the supplemental report of Dr. W. W. Molony, Chairman of the Committee of Five, be filed for future reference. Carried.

10. Amendments to By-Laws.—Councilor Emmons submitted proposed amendments to the By-Laws providing for one additional Reference Committee in the House of Delegates.

It was moved by Councilor Schaupp, seconded by Councilor Harris, that the proposed amendments to Chapter III, Section 6, of the By-Laws be approved for inclusion in the

report of the Council and submission to the House of Delegates. (See House of Delegates minutes.)

11. Financial Statements.—Financial statement for the month of May, 1937, was submitted by the Secretary and approved by the Council.

12. Councilor Kelly.—It was the sense of the Council that a telegram be sent to Councilor T. Henshaw Kelly expressing appreciation of the services rendered by him to the Association and its regret that his professional duties prevent his attendance at this annual session.

13. Venereal Diseases.—A letter from Dr. Russell Lee was presented and on motion of Councilor Rogers, seconded by Councilor Schaupp, was referred to the Chairman of the Council for reply.

It was moved by Editor Kress, seconded by President-Elect Morrow, that the following resolution be adopted:

WHEREAS, The Council of the California Medical Association has expressed its approval of proposed legislation designed to combat and reduce the prevalence of the venereal diseases, syphilis and gonorrhea; and

WHEREAS, Assembly Bill 2790 (Burns) is designed through constituted State authorities, to combat and bring about, as far as possible, the control and elimination of these diseases; now therefore, be it

Resolved, By the Council of the California Medical Association, that it approves in principle the provisions contained in Assembly Bill 2790; and be it further

Resolved, That this resolution be forwarded to the Honorable Speaker of the Assembly and the Lieutenant Governor for the information of the respective Houses.

14. Appeals.—It was moved by Councilor Howson, seconded by Councilor Schaupp, that the representatives of the Association at the hearing of the appeals to the American Medical Association, Doctors C. A. Dukes, Louis A. Packard, and Elbridge Best, be tendered a vote of thanks. Carried.

15. Adjournment.—At this point adjournment of the Council was taken until 2 p. m. Monday, May 3.

MORTON R. GIBBONS, *Chairman*.

F. C. WARNSHUIS, *Secretary*.

* * *

Minutes of the Two Hundred and Fifty-Third Meeting of the Council of the California Medical Association

Held in Room 723, Hotel Del Monte, Del Monte, California, Monday, May 3, 1937, at 2:30 p. m.

The meeting was called to order by the chairman, Morton R. Gibbons, with the following members present: President Edward M. Pallette, President-Elect Howard Morrow, Speaker William W. Roblee; Chairman of the Council, Morton R. Gibbons; Chairman of the Executive Committee, Karl L. Schaupp; Councilors H. J. Ullmann, Calvert Emmons, Carl R. Howson, A. E. Anderson, A. L. Phillips, O. D. Hamlin, C. E. Schoff, Henry S. Rogers, H. H. Wilson, William H. Kiger, J. B. Harris, C. O. Tanner; Chairman of Public Relations Committee Charles A. Dukes; Editor George H. Kress; Secretary F. C. Warnshuis; General Counsel Hartley F. Peart; and his associate, Mr. Howard Hassard.

Absent: T. Henshaw Kelly.

1. Budget for 1938.—Karl L. Schaupp, Chairman of the Auditing Committee, submitted a revised budget for the year 1937 based on an annual assessment of \$10.

It was moved by Councilor Schaupp, seconded by Chairman of Public Relations Committee Dukes, that the budget of Association receipts and expenditures for 1938, as amended, be approved. Carried.

2. County Society Programs.—Doctor Anderson stated that the smaller counties were having difficulties securing speakers for their scientific programs and offered a resolution in relation thereto.

It was moved by Chairman of Public Relations Committee Dukes, seconded by Councilor Anderson, that the resolution be revised and submitted to the Committee on Postgraduate Activities with the recommendation that the Committee take action along these lines. Carried.

3. Standing Committees.—The Chairman stated that he had appointed as members of the Committee to review

the membership of Standing Committees, Doctors W. H. Kiger, Henry Rogers, and Karl L. Schaupp.

4. Legislative Committee.—J. B. Harris, Chairman of the Legislative Committee, submitted a brief report on outstanding legislative bills and stated that a full report would be submitted at the third general meeting. (See minutes of the third general meeting.)

Discussion was had of the proposed vivisection initiative.

5. Minutes.—On motion of President Pallette, seconded by Chairman of Public Relations Committee Dukes, the minutes of the 242nd, 243rd, 244th, 245th, 246th, 247th, 248th, 249th, 250th, and 251st meetings of the Council and the minutes of the 147th, 148, and 149th meetings of the Executive Committee, were approved. Carried.

6. Reinstatement of Delinquent Members.—It was moved by Councilor Phillips, seconded by Councilor Schoff, that all members whose memberships had lapsed on account of nonpayment of dues and whose dues have been remitted since April 1 by the component county societies be reinstated to membership. Carried.

7. Place of Next Annual Session.—After discussion of the place of the next annual session, on motion of Councilor Kiger, seconded by Councilor Hamlin, the Huntington Hotel, Pasadena, was selected as the place of the 1938 annual session. Carried.

The Executive Committee was authorized to fix the time of the next annual session after determination of the date of the American Medical Association and other meetings.

8. Animal Experimentation.—It was moved by President Pallette, seconded by Councilor Rogers, that the Chairman of the Council appoint a Committee of Three, to determine legislative policies concerned with animal experimentation. Carried.

9. Retired Membership.—The Secretary presented membership data and requests for retired memberships from Albert J. Houston, Asa W. Collins, Ellis Harbert, and Leonard Ely.

It was moved by Councilor Emmons, seconded by Chairman of Public Relations Committee Dukes, that Albert J. Houston, San Francisco, Asa W. Collins, San Francisco, Ellis Harbert, Stockton, and Leonard W. Ely, Palo Alto, be granted retired membership in the California Medical Association. Carried.

10. Indemnity Defense Fund Trustee.—On nomination duly made and ballot duly cast, Howard Morrow, San Francisco, was reelected trustee of the Indemnity Defense Fund for a term of three years, term expiring January 1, 1940.

11. Adjournment.—There being no further business, the meeting adjourned to meet at 9 a. m. Tuesday, May 4.

MORTON R. GIBBONS, *Chairman*.

F. C. WARNSHUIS, *Secretary*.

* * *

Minutes of the Two Hundred and Fifty-Fourth Meeting of the Council of the California Medical Association

Held in Room 723, Hotel Del Monte, Del Monte, California, Tuesday, May 4, 1937, at 9 a. m.

1. Call to Order and Adjournment.—The meeting was called to order by the chairman, Morton R. Gibbons, and there being no business that demanded immediate action, adjournment was taken until 9 a. m. Wednesday, May 5.

MORTON R. GIBBONS, *Chairman*.

F. C. WARNSHUIS, *Secretary*.

* * *

Minutes of the Two Hundred and Fifty-Fifth Meeting of the Council of the California Medical Association

Held in Room 723, Hotel Del Monte, Del Monte, California, Wednesday, May 5, 1937, at 9 a. m.

The meeting was called to order by the chairman, Morton R. Gibbons, with the following members present: President Edward M. Pallette, President-Elect Howard Morrow, Speaker William W. Roblee; Chairman of the Council, Morton R. Gibbons; Chairman of the Executive Com-

mittee, Karl L. Schaupp; Councilors H. J. Ullmann, Calvert Emmons, Carl R. Howson, A. E. Anderson, A. L. Phillips, O. D. Hamlin, C. E. Schoff, H. S. Rogers, H. H. Wilson, William H. Kiger, J. B. Harris, C. O. Tanner; C. A. Dukes, Chairman of Public Relations Committee; George H. Kress, Editor; F. C. Warnshuis, Secretary; Mr. Hartley F. Peart, General Counsel; and his associate, Mr. Howard Hassard.

Absent: T. Henshaw Kelly.

1. Golden Gate International Exposition.—A letter from Mr. Leland V. Cutler, President of the Golden Gate International Exposition, was read and the Secretary was instructed to reply thereto. Doctor Gibbons announced that Mr. Sandusky and Mr. Milton Silverman, publicity representatives of the Exposition, were desirous of addressing the Council regarding coöperation with the California Medical Association in promoting a Hall of Health, Science and Education. With the permission of the Council, Mr. Sandusky and Mr. Silverman then outlined the plans of the Exposition to the Council. It was requested that the California Medical Association appoint an advisory committee to work with the Exposition Committee and confer with other committees for the purpose of securing outstanding types of commercial exhibits from industrial firms; to assist in censorship and advise on applications for space and exhibition of products.

The Chairman of the Council was instructed to appoint a committee to coöperate with the Golden Gate International Exposition.

2. Committee of Five.—William R. Molony, Chairman of the Committee of Five, reported on the present status of the report of the Committee of Five. Doctors A. R. Kilgore and Rodney Yoell, members of the Committee of Five, then discussed the report.

It was moved by Councilor Schaupp, seconded by Councilor Anderson that the Council instruct the Committee of Five to proceed with whatever measures or steps may be necessary to secure this report and the prevention of its unauthorized publication by Doctor Dodd or any other unauthorized person, after consultation with the legal department.

After discussion, on motion of Councilor Schaupp, seconded by Councilor Ullmann, the motion was tabled until the afternoon meeting of the Council. Carried.

3. Standing Committees.—William H. Kiger, Chairman of the Committee on Review of Standing Committee appointments, submitted the following recommendations which were approved by the Council for submission to the House of Delegates:

Lemuel P. Adams of Oakland reelected as member of Scientific Committee.

T. Henshaw Kelly, San Francisco.....	1939

4. Commercial Exhibits.—The Secretary reported on thefts of commercial exhibits during the present session and on motion of Councilor Phillips, seconded by Councilor Kiger, the Chairman of the Council and the President were requested to accompany the Secretary on a visit of these exhibitors. Carried.

5. Recess.—At this point a recess of the Council was declared until 1:30 p. m.

6. Call to Order.—The Council was called to order by the Chairman, with the following members present: Doctors Palette, Morrow, Roblee, Gibbons, Schaupp, Ullmann, Emmons, Howson, Anderson, Phillips, Hamlin, Schoff, Rogers, Wilson, Kiger, Harris, Tanner, Dukes, Kress, Warnshuis, Mr. Peart and Mr. Hassard.

7. American Psychiatric Society.—The Secretary presented a letter from the Committee representing the Section on Neuropsychiatry requesting that an invitation be extended to the American Psychiatric Society to hold its 1938 annual meeting on the Pacific Coast, and on motion of Chairman of Public Relations Committee Dukes, seconded by Councilor Hamlin, the Secretary was authorized to extend a formal invitation by wire to the American Psychiatric Society to hold its 1938 annual meeting in California. Carried.

8. Refund of Dues.—It was moved by Councilor Ullmann, seconded by Councilor Anderson, that the request of the San Luis Obispo County Society for the refunding to the widow of a deceased member of annual dues paid, be granted. Carried.

9. Cultists.—After discussion of the question of consultations of doctors of medicine with cultists and appointments of such cultists to hospital staffs, it was moved by Councilor Ullmann, seconded by Chairman of Public Relations Committee Dukes, that the matter be referred to the Executive Committee for study and report to the Council. Carried.

10. Nurses' Advisory Committee.—It was moved by Councilor Emmons, seconded by Councilor Rogers, that Carl R. Howson of Los Angeles be appointed as the Association's representative on the Advisory Committee to the Chief of the Bureau of Registration of Nurses. Carried.

11. Membership.—A letter from the American Medical Association advising Doctors Ross and Loos that, in view of the outcome of the appeals to the Judicial Council, their fellowships in the American Medical Association had not lapsed and their names were restored to the Fellowship Roster was presented.

It was requested that similar action be recorded in the records of the California Medical Association.

12. **Editor.**—A letter from the southern delegation commending the Editor was presented for the information of the Council.

13. **W. Chalmers-Francis.**—It was moved by Chairman of Public Relations Committee Dukes, seconded by Councilor Tanner, that the Association absorb the balance of \$79 due from the Anesthetists' Association and consider the matter closed. Carried.

14. **Cancer Commission.**—Doctor Morrow, incoming president, announced that he had reappointed as members of the Cancer Commission, Charles A. Dukes, Lyell C. Kinney, and A. R. Kilgore. The appointments were approved by the Council for submission to the House of Delegates.

15. **Scientific Committee.**—In accordance with Section 8, Chapter V, of the By-Laws, and on nomination of Chairman of Public Relations Committee Dukes, seconded by Councilor Tanner, Dr. Lemuel P. Adams of Oakland was reelected as a member of the Committee on Scientific Work.

16. **Honorary Membership.**—After full discussion and consideration, it was moved by Editor Kress, seconded by Councilor Rogers, that the following resolution be submitted to the House of Delegates:

Resolved, That the Council be empowered to revise the list of honorary members of this Association, removing therefrom the names of removed and deceased individuals; and be it further

Resolved, That, as of May 5, 1937, the honorary members of this Association shall consist of Henry Harris of San Francisco and John C. King of Los Angeles; and be it further

Resolved, That future elections of honorary members shall be in strict accord with the Constitution and By-Laws, which vests this authority in the House of Delegates.

17. **Committee of Five.**—It was moved by Councilor Ullmann, seconded by Councilor Wilson, that motion of Councilor Schaupp and the report of the Committee of Five be taken from the table. Carried.

After full discussion, with the consent of the Council Doctor Schaupp withdrew the motion made at the morning meeting of the Council, and on motion of Councilor Ullmann, seconded by Chairman of Public Relations Committee Dukes, the following resolution was adopted for submission to the House of Delegates:

WHEREAS, The California State Board of Public Health as legal sponsors for the commonwealth of Works Progress Administration Project, known as No. 1453, has in its possession what has been called the final report of the California Medical Economic Survey, which report was made under the supervision of one Paul A. Dodd; and

WHEREAS, The California State Board of Public Health, in accordance with instructions of the Works Progress Administration regarding such survey, now proposes to bring to publication and distribution the California Medical Economic Survey, in accordance with the Works Progress Administration rules thereon; therefore, be it

Resolved, By the California Medical Association, that it go on record as being in full accord with the California State Board of Public Health to bring to a conclusion this project; and be it further

Resolved, That the Committee of Five be discharged with thanks, and that its powers and duties be and they are hereby transferred to the Council, and that the Council be and is hereby authorized and empowered to take all necessary steps and proceedings to fulfill any outstanding obligation of the Association pertaining to the survey.

18. **House of Delegates Minutes.**—It was moved by President Pallette, seconded by Councilor Wilson, that the Editor, the Secretary, and the Chairman of the Council be constituted a committee to edit the minutes of the House of Delegates and that such minutes be in condensed form. Carried.

It was moved by President Pallette, seconded by Councilor Emmons, that in publishing the minutes of the House of Delegates, the Committee on Public Relations, and the Executive Committee, they be published in condensed form.

19. **Publicity.**—It was moved by Editor Kress, seconded by Councilor Ullmann, that the Secretary and the Editor secure the names of newspapermen who will be willing to write press comments on articles in CALIFORNIA AND WESTERN MEDICINE and that they be furnished with complimentary copies of the JOURNAL. Carried.

20. **Malpractice Insurance.**—The General Counsel discussed the hearing before the American Bar Association on the corporate practice of law by state medical associations in regard to furnishing of malpractice insurance. Mr. Peart stated that there was no Association activity in this regard in California.

21. **Minimum Wage.**—It was the sense of the Council that the General Counsel furnish information on minimum wage laws for publication in the JOURNAL.

22. **Committee on Association Expenditures.**—C. E. Schoff, Chairman of the Committee on Association Expenditures, read the revised report of the Committee on Publication Costs of CALIFORNIA AND WESTERN MEDICINE and on motion of Councilor Schaupp, seconded by Councilor Kiger, the revised instructions as contained in the report re publication costs were approved.

Doctor Schoff then read the report of the Committee as related to employees of the Association.

It was agreed that the entire report would be sent to each member of the Council for consideration and placed on the docket of the next meeting of the Council.

23. **Intercoast Rider.**—The General Counsel reported that new policy forms had been issued by the Intercoast Hospitalization Insurance Company embodying the principles contained in the rider approved by the Council since the rider form was not acceptable to the Insurance Commissioner.

24. **Woman's Auxiliary.**—On motion of Speaker Roblee, seconded by Councilor Schaupp, \$200 was included in the budget for the Woman's Auxiliary. Carried.

25. **Financial Statement.**—Financial statement for the month of April, 1937, was presented and approved by the Council.

26. **Committee of Five.**—It was moved by Councilor Ullmann, seconded by President Pallette, that the Secretary be authorized to open the report of the Committee of Five and have a sufficient number of copies made, furnishing three copies to the Board of Health. Carried.

It was moved by Speaker Roblee, seconded by President Pallette, that a copy of the report of the Committee of Five be furnished to Dr. A. R. Kilgore for review and revision by him and that the Council designate Doctor Kilgore as liaison representative to the Board of Health.

27. **Adjournment.**—There being no further business, the Council adjourned to meet at 9 a. m. Thursday.

MORTON R. GIBBONS, *Chairman*.

F. C. WARNSHUIS, *Secretary*.

* * *

Minutes of the Two Hundred and Fifty-Sixth Meeting of the Council of the California Medical Association

Held in Room 723, Hotel Del Monte, Del Monte, California, Thursday, May 6, 1937, at 9 a. m.

The meeting was called to order by Acting Chairman Morton R. Gibbons, with the following members present: Past President Edward M. Pallette, President Howard Morrow, President-Elect William Roblee, Speaker Lowell Goin, Acting Chairman of Council Morton R. Gibbons; Councilors Karl L. Schaupp, Calvert Emmons, A. E. Anderson, A. L. Phillips, C. Howson, O. D. Hamlin, C. E. Schoff, H. S. Rogers, H. H. Wilson, J. B. Harris, C. O. Tanner; C. A. Dukes, Chairman of Public Relations Committee; George H. Kress, Editor; F. C. Warnshuis, Secretary; and Mr. Hartley F. Peart, General Counsel.

Absent: Councilors T. Henshaw Kelly and Louis Packard.

1. **Committee on Public Relations.**—The Acting Chairman announced that by virtue of his election as chairman of the Committee on Public Relations, Dr. Charles A. Dukes was a member of the Council for the ensuing year.

2. **Election of Chairman.**—On nomination duly made and ballot duly cast, Morton R. Gibbons was elected chairman of the Council for the ensuing year.

3. **Papers for Official Journal.**—Correspondence from Harold Brunn, M. D., re publication of papers of undergraduate students of the University of California was presented and on motion of Councilor Kiger, seconded by Chairman of Public Relations Committee Dukes, full juris-

diction in the matter was left in the hands of the Editor. Carried.

4. Fall Meeting of the Council.—It was moved by Chairman of Public Relations Committee Dukes, seconded by Councilor Kiger, that the determination of the date of the fall meeting of the Council be left to the Executive Committee. Carried.

5. Woman's Auxiliary.—It was moved by Chairman of Public Relations Committee Dukes, seconded by Councilor Anderson, that the Chairman of the Council be directed to write to the Woman's Auxiliary, expressing the desire of the Council to cooperate with them in every way and stating that if they will indicate their wishes we shall be glad to carry them out as far as possible and that we shall also be glad to consult with them regarding their arrangements for meetings, etc. Carried.

It was suggested that a letter be written to the women in San Bernardino County, encouraging them to organize an auxiliary.

6. Committee of Five.—It was moved by Councilor Wilson, seconded by Councilor Emmons, that the moneys allocated in the budget to the Committee of Five (California Medical Economic Survey) be returned to the general fund for use by the Council in order to carry out the purport of the resolution adopted by the House of Delegates in relation to the report of the Committee of Five. Carried.

7. Election of Vice-Chairman.—On nomination of Chairman of Public Relations Committee Dukes, seconded by Councilor Anderson, and on ballot duly cast, Junius B. Harris was elected vice-chairman of the Council for the ensuing year.

8. Executive Session.—At this point the Council went into executive session. At the close of the executive session the Council again proceeded with elections.

9. Election of Secretary-Treasurer.—On nomination of Chairman of Public Relations Committee Dukes, duly seconded, and on ballot duly cast, F. C. Warnshuis was elected secretary-treasurer of the Association at the same salary on a month-to-month basis.

10. Election of Editor.—On nomination of Councilor Kiger, duly seconded, and on ballot duly cast, George H. Kress was elected editor of the JOURNAL at the same salary on a month-to-month basis.

11. Appointment of Counsel.—On motion duly made, seconded and carried, Hartley F. Peart was appointed General Counsel of the Association at the same retainer for the ensuing year.

On motion duly made, seconded and carried, Hubert Morrow of Los Angeles was appointed associate counsel for the ensuing year, without retainer.

12. Committee of Five Report.—It was moved by Past President Pallette, seconded by Councilor Phillips, that the matter of publication and other matters in connection with the report of the Committee of Five (California Medical Economic Survey) be delegated to the Executive Committee with full power to act in any emergencies. Carried.

13. Legislation.—It was moved by Councilor Schaupp, seconded by Chairman of Public Relations Committee Dukes, that the Lieutenant-Governor and members of the Legislature who have rendered valuable service to the health welfare of the State be commended. Carried.

14. Auditing Committee.—The Chairman of the Council announced that he had appointed as members of the Auditing Committee, Doctors Karl L. Schaupp (chairman), T. Henshaw Kelly, and O. D. Hamlin. The appointments were approved by the Council.

15. Delegates to the American Medical Association. Dr. William H. Kiger resigned as alternate to Dr. Edward M. Pallette. On nomination of Chairman of Public Relations Committee Dukes, seconded by Kiger, Harry H. Wilson was elected alternate to the American Medical Association meeting of the House of Delegates, to take the place of Dr. William H. Kiger.

16. Appreciation.—On motion of Past President Pallette, seconded by all the Councilors, the Secretary was instructed to address a communication to Mr. Carl Stanley, Mr. Head, Mr. Huckins, and Mr. Parker of the Hotel Del Monte, conveying to them the thanks and grateful appreci-

ation of the officers, Council, and members for all the courtesies and cooperation that they had extended during the annual session for the pleasure and comfort of all in attendance. Carried unanimously.

17. Adjournment.—There being no further business the meeting adjourned.

MORTON R. GIBBONS, *Chairman.*

F. C. WARNSHUIS, *Secretary.*

DIGEST OF MINUTES OF ONE HUNDRED AND FIFTY-FIRST MEETING OF THE EXECUTIVE COMMITTEE

Held in the offices of the Association, San Francisco, May 29, 1937.

Members Present.—President-Elect William W. Roblee; Speaker Lowell S. Goin; Chairman of the Council, Morton R. Gibbons; Chairman of the Auditing Committee, Karl L. Schaupp; Chairman of the Public Relations Committee, Charles A. Dukes; Editor George H. Kress; Secretary F. C. Warnshuis; General Counsel Hartley F. Peart and his associate, Mr. Howard Hassard.

Members Absent.—President Howard Morrow and Past President Edward M. Pallette.

1. Election of Chairman.—Karl L. Schaupp of San Francisco was elected chairman for the ensuing year.

2. Annual Experimentation.—The following Committee on Policy and Education was appointed: Philip K. Gilman (chairman), Charles A. Dukes, and Loren R. Chandler. The following constitute an advisory committee: Deans of the four medical colleges, President of the State Board of Health, Director of the Hooper Foundation, and Dr. J. C. Geiger of San Francisco.

3. Staffs of Hospitals.—The following committee was appointed to review the question of irregular practitioners, their relation to private hospitals, and consultations: Lowell S. Goin (chairman), W. W. Roblee, Benjamin W. Black, Dewey Powell, Glenn Myers, J. B. Harris, and George H. Kress.

4. Medical Economic Survey.—Letter from Paul A. Dodd was read, and letter and reply were ordered published.

University of California at Los Angeles,

May 26, 1937.

Dr. Frederick C. Warnshuis,
Secretary, California Medical Association,
450 Sutter Street,
San Francisco, California.

Dear Doctor Warnshuis:

In the absence of any official notification, I take this opportunity to seek information concerning final action of the California Medical Association and/or the State Department of Public Health relative to plans for the publication and release of the California Medico-Economic Survey.

Will you kindly inform me at your earliest convenience as to the present status of this question, and also as to what official final stand the California Medical Association committed itself to at its recent conference in Del Monte? In the absence of any reply to this simple inquiry on or before June 5, 1937, it will be my understanding that no action has been taken and that those interested are free to complete plans for a private publication of the final report. Will you, therefore, kindly advise me accordingly if this is not the case?

Sincerely yours,

(Signed) PAUL A. DODD.

cc—to Members of the Committee of Five,
Members of the Advisory Committee.

Four Fifty Sutter, San Francisco,

May 27, 1937.

Professor Paul A. Dodd,
University of California at Los Angeles,
405 Hillgard Avenue,
Los Angeles, California.

Dear Professor Dodd:

Acknowledgment is made of your letter sent by registered mail, May 26, 1937.

Dr. Morton R. Gibbons, Chairman of the Council and Dr. Howard Morrow, President of this Association and of the State Board of Health, asked me to transmit the following information to you:

1. On Wednesday, May 5, 1937, the House of Delegates of the California Medical Association discharged the Association's "Committee of Five."

2. The House of Delegates authorized the Council, through its Executive Committee, to take over all the responsibilities of the Committee of Five and to fulfill any outstanding obligations of the Association pertaining to the survey.

3. The Council of this Association was also authorized and empowered to take all necessary steps and procedures to join with the State Board of Health, the sponsors of the survey, and bring it to publication and distribution in accordance with the rules and the directions of the Works Progress Administration.

4. The State Board of Health is proceeding in accordance with the instructions of the Director of Projects of the Works Progress Administration.

5. On May 4 or 5, the Committee of Five, through its chairman, Dr. W. R. Molony, wired you the committee's position.

6. This Association, therefore, holds that your responsibilities in connection with this survey are terminated and that the responsibilities for the final disposition and publication of this report now lies with the State Board of Health and the Director of Projects of the Works Progress Administration.

It should, therefore, be your definite understanding that you are without authority to seek to attain publication through "private plans" as this concluding function rests solely with the Board of Health and the Federal Government through its Projects Director. It is expected that you will conform to this federal rule and instruction.

Sincerely yours,

MORTON R. GIBBONS, M. D.,
Chairman of the Council.

HOWARD MORROW, M. D.,
President of the Association.

Attest: F. C. Warnshuis, M. D.,
Secretary.

5. **Resettlement Administration.**—This matter was referred to Chairman Gibbons, President Morrow, and Secretary Warnshuis.

6. **Annual Meeting Expense.**—Secretary Warnshuis reported a profit of \$2,919.57 over all expenses.

7. **Delegate to the American Medical Association.**—W. W. Roblee was elected as a delegate from California to serve in place of Fred B. Clarke and A. J. Scott, alternate, unable to serve.

8. **Teletype.**—Future use was referred to the Chairman of the Council and the Executive Committee.

9. **Fall Conference of County Secretaries, Council, and Standing Committees.**—This was set, subject to subsequent final Council approval, for October 30 and 31, 1937, at Fresno, California.

10. **San Francisco Golden Gate Committee.**—The following committee was appointed: T. Henshaw Kelly (chairman), Edward M. Palette, C. A. Dukes, F. C. Warnshuis, and Hartley F. Peart. The Committee was authorized to appoint subadvisory committees.

11. **Senate Bill 118.**—The Chairman was instructed to review Senate Bill 118 and initiate indicated Association action.

12. **Resignation.**—The resignation of Councilor Charles E. Schoff was referred to the fall Council meeting.

13. **Council on Pharmacy and Chemistry.**—Reaffirmation was recorded in regard to the Association's adherence to the rules relating to therapeutic preparations advertised in CALIFORNIA AND WESTERN MEDICINE.

14. **History.**—An appropriation of \$100 was made to establish a Revolving Fund for the Committee on History and Obituaries to purchase and reproduce photographs for Association records.

15. **Farm Bureau Magazine Article.**—This was referred to the fall Council meeting.

16. **Telephone Listing.**—Secretary Warnshuis was instructed to proceed in accordance with the resolution adopted in Del Monte.

17. **Routine.**—Routine matters were considered and indicated action recorded.

18. **Adjournment.**—Meeting adjourned at 12:45 p. m.

KARL L. SCHAUPP, *Chairman.*
F. C. WARNSHUIS, *Secretary.*

HEALTH INSURANCE LEGISLATION: IMPORTANT MESSAGE FROM THE C. M. A. COMMITTEE ON PUBLIC POLICY AND LEGISLATION

To Officers, Councilors, and County Society Secretaries.

Dr. Junius B. Harris, Chairman of the Committee on Legislation and Public Policy, has requested that the following be transmitted to officers, councilors, and county society secretaries for their information:

BULLETIN

There will be no legislation adopted on health insurance at the present session of the California Legislature. In order that our members may all fully understand the situation, I will transmit the following information to members of our Association.

For the past two years, certain groups now engaged in rendering medical and hospital service on a group basis, have been actively campaigning for legislation to legalize such service under the regulation of the Insurance Commissioner. In their efforts they enlisted the active support of the California Farm Bureau Federation, the California Firemen's Association, and many groups of city and county employees, teachers' groups, etc. On January 14, 1937, they caused to be introduced Senate Bill 121 by Senator Williams, and on January 20 an identical measure, Assembly Bill 1283, by Assemblyman Welsh.

During this same period the California Medical Association, through special committees, studied the subject of voluntary health insurance and were convinced that a determined and possibly successful effort would be made to pass some legislation along that line at the present session of the Legislature, caused to be introduced on January 21, 1937, Senate Bill 605 by Senator McGovern and an identical measure, Assembly Bill 1491, by Assemblymen Boyle, Cronin, and McMurray.

Proponents of this legislation elected to press their case in the Assembly through Assembly Bill 1283 (Welsh) and we met them squarely with our Assembly Bill 1491 (Boyle, Cronin, and McMurray). This was one of the most hotly contested issues of the Legislature. For four weeks the battle raged in the Committee on Insurance with the Farm Bureau groups in the front ranks insisting upon passage of Assembly Bill 1283 (Welsh). We were equally aggressive in opposing this measure and pushing our own Assembly Bill 1491 as a bill giving better protection to the public. During the many arguments we were repeatedly charged with insincerity; the California Medical Association was attacked as simply trying to befog the issue and kill all health insurance bills. We stood by our guns; amended our bill to meet expressed wishes of the Committee on Insurance and stood determined to fight for what we deemed proper protection of the public in any health insurance bill that might be passed. This Committee sent both bills 1283 and 1491 to the floor of the Assembly with "do pass" recommendations on April 23.

Assembly Bill 1283 came before the Assembly for vote on May 10. Through splendid cooperation in informing assemblymen as to the bad features of this bill, it was defeated 24 to 46. The assemblymen were promised that a better bill would be forthcoming in Assembly Bill 1491. However, Mr. Welsh immediately gave notice of reconsideration of the vote by which Assembly Bill 1283 had been defeated, thus keeping it alive for his emergencies.

The Ways and Means Committee of the Assembly insisted that if Assembly Bill 1491 were to pass, it must contain an appropriation of funds to carry out its proposals. The appropriation feature would have required fifty-four votes for passage as compared with forty-one votes on an ordinary bill.

All county societies and many individual physicians responded nobly to our calls for help in our efforts to pass this bill, but late Friday afternoon we were convinced that we could not pass the measure in the form approved by your Committee on Legislation and Public Policy. We were advised that eleven amendments would be submitted to weaken and destroy some of its basic principles. If these were adopted, our bill would not be acceptable to its sponsors. If we failed to pass our bill, the sponsors of Assembly Bill 1283 would again press its passage with probable chances of success, basing their arguments on the plea that

there is a public demand for some regulatory legislation to control alleged irresponsible outfits offering health service. Many of our most ardent supporters were under terrific pressure from farm and local groups, based, we believe, on a lack of understanding of the merits of our proposal as outlined in Assembly Bill 1491 as submitted through Assemblymen Boyle, Cronin, and McMurray.

Within a few moments of the time for consideration of our bill, the author of Assembly Bill 1283 proposed that he would drop his bill with its motion for reconsideration and suggest no hasty legislation be enacted at this session, but that the subject be further considered in 1939. He asked authors of our bill to join him in dropping the issue and suggesting the appointment of a committee to draft a bill for the 1939 Legislature. Not to study or investigate the issue, but merely to draft a bill. He further stated that he was willing to prepare and insert, and did prepare and insert, in the journal of the Assembly a signed statement to the effect that his previous charges of insincerity on the part of the California Medical Association were erroneous and that he is now of the opinion we "were actuated by the highest motives, and an honest and sincere desire to furnish to the people of the State an adequate low-priced health and medical service."

After consultation with authors of our bill, our legal counsel and competent legislative observers, your Committee agreed to this course and both bills were dropped at a late hour Saturday night, May 22.

We wish to express our appreciation to Senator McGovern; Assemblymen Boyle, Cronin, and McMurray, authors of our bill; Assemblymen Johnson, Garibaldi, and Sawallisch, who assisted in the floor fight against Assembly Bill 1283; and to Assemblyman Peek, who acted very fairly as chairman of a subcommittee which considered both bills. A measure that we felt was inadequate in its protection of the public was defeated; we made a sincere effort to enact what we felt would be a forward step in health insurance legislation, but could not muster the necessary fifty-four votes.

Many of the assemblymen from districts to which this bulletin is being sent were firm in their support of your bill. Will you please express to them personally our appreciation of their assistance, and fully advise all of your members of this splendid coöperation.

COMMITTEE ON PUBLIC POLICY AND LEGISLATION

J. B. Harris, M. D., *Chairman*

T. Henshaw Kelly, M. D.

E. T. Remmen, M. D.

THE PUBLIC HEALTH LEAGUE OF CALIFORNIA

By Ben H. Read, *Executive Secretary*

COMMENT

SIXTY-SIXTH ANNUAL SESSION

At noon on May 6, with the final adjournment of the Sections on Medicine, Surgery, and Eye, Ear, Nose and Throat, the Association's 1937 session passed into the historical archives of the Association.

Held in Del Monte—that holds so many memories of former annual sessions—with an attendance registration of 1,420, with a scientific program that was characteristic of scientific progress, with guest speakers who justified their selection by reason of their national prominence, with social opportunities that were inductive to cementing bonds of fraternal fellowship—this sixty-sixth session was an outstanding one in the Association's history.

It was gratifying to hear the many, many expressions of commendation and approval from those in attendance. There was a unanimous attitude that all were well repaid for the time spent in Del Monte.

The two sessions of the House of Delegates were characterized by the diligence and earnestness of the delegates in the transaction of the business of the Association. The principal enactments were:

1. Discharge of the Committee of Five and delegating to the Executive Committee of the Council the work of closing the activities of that committee.

2. Making the retiring president a member of the Council for one year.

3. Providing for a scientific exhibit at each annual session.

4. Establishing a definite program for postgraduate courses.

5. Providing for an annual joint conference of county secretaries and standing committees in October of each year.

6. Creating an additional reference committee for the House of Delegates.

7. Fixing Association dues for 1938 at \$10—a reduction of \$5.

8. Passing a resolution endorsing the policy of the American Medical Association trustees relating to a medical man as chief head of all federal health activities.

9. Endorsing a qualifying certificate initiative.

10. Authorized establishment of a film library for public health education.

The following officers were elected: President-Elect, W. W. Roblee, Riverside; Speaker, Lowell S. Goin, Los Angeles; Vice-Speaker, John H. Graves, San Francisco; Councilors-at-Large, Junius B. Harris of Sacramento and William H. Kiger of Los Angeles; Councilor, Third District, Louis A. Packard, Bakersfield; Councilor, Sixth District, Karl L. Schaupp, San Francisco; Councilor, Ninth District, Henry S. Rogers, Petaluma. Delegates to the American Medical Association: Elbridge J. Best of San Francisco, Lyell C. Kinney of San Diego, and J. P. Nuttall of Los Angeles. Alternates to the American Medical Association: Robert S. Stone of San Francisco, Bon O. Adams of Riverside, and F. M. Pottenger, Sr., of Los Angeles.

Pasadena was selected as the place for the 1938 annual session.

Committee appointments for standing committees will be found in the forepart of each issue of this journal.

The course is set for another year of Association activity, a year that will evidence sustained activity to enhance the interests of all members and to fulfill our organization's purposes and objectives.

DEL MONTE SCIENTIFIC PROGRAM

The Scientific Committee and the Section Officers are to be congratulated for a most interesting, instructive scientific program. This was attested by the sustained interest and large attendance at all section and general meetings. It is impossible to summarize the papers and presentations. A goodly proportion will be published during the year.

At the general meetings our invited guests justified their selection by the scientific and practical presentation of their subjects. Our appreciation and thanks are extended to Doctors Cyrus Sturgis and Norman Miller of the University of Michigan; Henry Alsop Riley of Columbia University and Jesse G. M. Bullowa of the New York University College of Medicine.

The following Section officers were elected:

Anesthesiology Section—Chairman, W. L. Garth of San Diego; Secretary, John G. Dunlop of Los Angeles.

Dermatology Section—Chairman, Stanley O. Chambers of Los Angeles; Vice-Chairman, Arne Ingels of San Francisco; Secretary, Nelson Paul Anderson of Los Angeles.

Eye, Ear, Nose and Throat Section—Chairman, Frank Baxter of Oakland; Vice-Chairman, Dewey R. Powell of Stockton; Secretary, Clifford B. Walker of Los Angeles.

General Medicine Section—Chairman, Edwin L. Bruck of San Francisco; Secretary, Howard F. West of Los Angeles.

General Surgery Section—Chairman, Harlan Shoemaker of Los Angeles; Secretary, Nelson J. Howard of San Francisco; Assistant Secretary, Ray B. McCarty of Riverside.

Industrial Medicine and Surgery Section—Chairman, Frederick C. Bost of San Francisco; Vice-Chairman, H. G. McNeil of Los Angeles; Secretary, George H. Sanderson of Stockton.

Neuropsychiatry Section—Chairman, Fred O. Butler of Eldridge; Secretary, John B. Doyle of Los Angeles.

Obstetrics and Gynecology Section—Chairman, R. Glenn Craig of San Francisco; Vice-Chairman, George W. Coon of Riverside; Secretary, John N. Ewer of Oakland.

Pathology and Bacteriology Section—Chairman, Gertrude Moore of Oakland; Secretary, George D. Maner of Los Angeles; Assistant Secretary, Paul H. Guttman of Sacramento.

Pediatrics Section—Chairman, E. Earl Moody of Los Angeles; Secretary, Hartzel H. Ray of San Mateo; Assistant Secretary, W. W. Belford of San Diego.

Radiology Section—Chairman, John D. Lawson, Sacramento; Secretary, Karl M. Bonoff of Los Angeles.

Urology Section—Chairman, Lloyd Kindall of Oakland; Secretary, Carl F. Rusche of Hollywood.

A new feature was developed in the establishing of a scientific exhibit department, which featured forty-two scientific exhibits. The Committee on Awards reached the following appraisals:

First award: "A New Amputation Through the Femur at the Knee"—C. Latimer Callender of San Francisco.

Second award: "Reconstructive Surgery"—Arthur E. Smith and James B. Johnson of Los Angeles.

Third award: "Skin Malignancies"—William H. Sargent of Oakland.

Honorable mention: "Peritoneoscopy"—John C. Rud-dock of Los Angeles.

"Hydronephrosis: Renal Circulation"—Frank Hinman of San Francisco.

"Some Phases of Dentistry Which Are Also of Interest to the Physician"—California State Dental Association.

"New and Simplified Physical Method for Blood Detection"—Frederick Proescher of San Jose, Jesse Carr and A. M. Moody, San Francisco.

It is intended in future years to expand these exhibits and to present visualized demonstration of scientific subjects. Members are now requested to begin the preparation of scientific exhibits for next year's Pasadena session.

ENEMIES

"You have no enemies, you say?

Alas! my friend the boast is poor—

He who has mingled in the fray

Of duty that the brave endure

Must have made foes! If you have none,

Small is the work that you have done;

You've hit no traitor on the hip,

You've dashed no cup from perjured lip,

You've never turned the wrong to right—

You've been a coward in the fight.

"Alas! Poor Yorick."

There is no desire to encourage individuals to go on a drive to make enemies—there is sufficient enmity rampant among men today. The thought in mind is to cause men to pause and ponder, ere shunning another when someone declares that individual to be an enemy. Pause and inquire whether the appellation resulted because a traitor has been exposed, perjury refuted, or attempted wrong was righted. If these or similar causes be the reason, the individual who was branded as an enemy by one whose quest was foiled is not an enemy—he is a person of honor—we wish there were more in business, government, professions, and society.

In the years that have gone, encounters have been had with men listed as enemies of this or that person, persons or organizations. Letters have been seen branding an individual as an enemy, or worse, because the man had exposed and defeated the ulterior quests of the writers of these letters. Men have been discredited because they had the fortitude to stand for that which was right, a principle that was just, and a cause that was fair. In their stand they did tread on the toes of one or more less honorable persons or possibly selfish individuals, and such parties now go about embracing every opportunity and occasion to publicize that "So-and-so is an enemy—beware of him." The warning should be: Beware of *him* who calls another an enemy until you ascertain the justice for such a charge.

Our members, individually and collectively, undergo adverse criticism and discrediting because of the unprofessional conduct and avariciousness of a small minority group. The regrettable part is that the profession is judged and condemned by the acts of these minorities and unprincipled individuals. What is still more serious is that legislators become aware of these unprofessional acts and cite them as being representative of the profession as a whole. It is one of the reasons why desirable legislation is frequently defeated. The acts of one medical man at times brings about widespread adverse criticism in a community of the profession as a whole. A drop of kerosene can spoil a whole crock of butter. An act of a single doctor can react adversely upon the entire profession in a community. Only recently one legislator was extremely bitter, and would have nothing to do with a legislative matter because of the act of a single individual. He stated, "he would have nothing to do with the profession or their legislative quests because of that doctor's professional conduct." Because this doctor was called to account he subsequently embraced every opportunity to condemn and vilify and brand as an enemy the American Medical Association official who sought to prevent recurrence of similar practices.

Professional conduct standards are set forth in our principles of ethics. In these changing times and conditions it behooves every doctor to conform to these principles.

ANNUAL MEETING—BYSTANDER COMMENTS

Fine weather, bright sunshine, beautiful foliage and flowers, golf courses in excellent shape, fine hotels and cuisine—that was, and always is Del Monte.

In the North and South Golf Tournament on Sunday, the North players were the winners.

Excellent attendance at all section meetings. The three general meetings held capacity audiences in earnest attention.

Forty-seven scientific exhibits and forty-two technical exhibits made a splendid showing, and engaged members' attention.

Delegates were alert and attentive to their responsibilities. Discussions were frank and constructive. Resolutions, timely and important. The last session adjourned at 1:10 a. m. with work well done. Reference committees merit generous thanks for their capable discharge of arduous duties.

Fun, fellowship, good cheer and relaxation characterized the President's banquet and ball. There were many sleepy eyes at breakfast on Wednesday morning because of the "wee small hours" of retirement.

Woman's Auxiliary had a fine registration and excellent program. Congratulations to this growing, valuable, efficient organization.

"Fine meeting," "excellent arrangements," "details well executed," "schedules were observed promptly"—these and similar were the many spoken and written expressions.

A few Barber-Shop Quartets held forth on Tuesday night with a marked improvement of voices in minors and sharps.

The opening ceremonies of the House of Delegates, with presentation of gavels to past speakers and certificates to past presidents, was ably conducted in a dignified way by Speaker Roblee. "What do we delegates get?" was asked by a delegate. "Work," was the answer.

Carl Stanley, Nat Head, Mr. Huckins and Mr. Parker of the Hotel Del Monte managerial staff were untiring in their efforts for the comfort and pleasure of the members. There is a rumor that a convention auditorium is to be built in connection with the hotel.

Where is Tom Kelly? was the frequent inquiry. Tom was as sorry as the inquiring members, but professional duties compelled him to remain at home and miss his first meeting in many years.

A fine sight to see the House of Delegates arise en masse to support the nomination of "June" Harris to succeed himself as councilor. "June" surely deserved this tribute.

Hurry along, 1938! Every one is eager for that annual session in Pasadena.

C. M. A. DEPARTMENT OF PUBLIC RELATIONS†

Chairman

The Committee on Public Relations at its Del Monte meeting reflected Charles A. Dukes as its chairman. By constitutional provision Doctor Dukes becomes a member of the Council by virtue of his office.

Proposed Activities

The Committee is developing plans for the coming year and proposes to initiate them early in the fall months.

One activity will be to establish a program of public meetings and lectures, and create a speakers' bureau for these meetings.

Another feature will be the creation of a moving film library for use in local health meetings.

Contacts will be continued with civic organizations and governmental agencies. Whenever possible, invitations will be accepted to address lay organizations on topics and problems of mutual interest and concern.

A Bureau of Public Information will be continued in order to enable lay persons to obtain authoritative answers to their inquiries. During the past year some three hundred such inquiries were answered by mail or telephone and in certain instances by telegraph.

Press releases of health and medical articles will be continued at intervals, and a press bureau contact will be maintained with the three national news agencies, as has been done during the past year.

Other plans and activities will be announced from month to month in this department. Suggestions are invited from all members as to how this department can extend its services.

Medical-Legal Services

The Committee on Unethical and Illegal Practices of the American Bar Association conducted a hearing in Washington on May 2 to determine whether state medical organizations that provided legal defense for members in malpractice suits were practicing corporate law. Corporate law practice has been declared illegal. The inquiry was particularly directed against the Ohio State Medical Association.

On May 8 the following telegram was received:

Am informed that committees on the unauthorized practice of law on professional ethics and grievances of American Bar Association have expressed unanimous opinion that the operation of medical defense plans of one state medical association constitutes unauthorized practice of law. Stop. Presumably this opinion will apply to other state associations. Olin West, Secretary.

The California Medical Association provides no legal defense for its members. Consequently, it is not affected by this decision. Many sister states render such service to members. They are, therefore, confronted with the necessity of discontinuing this service.

To Be a Funeral Director

California laws require that funeral directors and embalmers must be licensed. To be eligible for license the applicant must meet the following qualifications:

- (a) Shall be over twenty-one years of age.
- (b) Shall hold a junior college diploma or shall have completed two years of college.
- (c) He shall have had a full course of instruction in an embalming school of Class A type.

†The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. Charles A. Dukes of Oakland is the chairman, and Dr. F. C. Warnshuis is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. F. C. Warnshuis, Room 2004, Four Fifty Sutter Street, San Francisco.

(d) He shall pass an examination in (1) theory and practice of embalming; (2) anatomy, including histology, embryology, and dissection; (3) pathology, bacteriology; (4) hygiene, including sanitation and public health; (5) chemistry, including toxicology; (6) restorative art, including plastic surgery and demisurgery.

(e) He shall have completed a two-year term of apprenticeship and shall have assisted at the embalming of at least fifty human bodies.

Splendid, excellent! The query is pertinent—why not higher education and training for those licensed cultists who seek to care for the physical needs of the living? Surely, there can be no question as to the necessity of enacting a qualifying certificate law for all who desire to treat the living human being.

Group Hospitalization

For informative purpose the following extract from the American Medical Association Bureau of Economics annual report is presented:

The Bureau of Medical Economics has consistently maintained that the decision as to whether or not a group hospitalization plan is essential must rest primarily with the medical profession and the hospital officials of the local community. Furthermore, if it is decided that a group of hospitalization plan is necessary to complete or to augment the existing hospital facilities of the community, certain principles of organization and administration should be observed. The following principles are suggested in the interest of fairness, efficiency and greater security, and in the event that hospital insurance is deemed necessary:

1. The plan of organization should conform to state statutes and case law. The majority of the governing body of the hospital insurance plan should be chosen from among members of official hospital groups and members of medical societies. Great care should be taken to assure the non-profit character of these new ventures.

2. The plan should include all reputable hospitals. The qualifications of the participating hospitals should be closely supervised. Member hospitals should be limited to those on the hospital register of the American Medical Association or to those approved by the state departments of public health or other state agencies in those states in which there is approval, registration or licensing of hospitals.

3. The medical profession should have a voice in the organization and administration of the plan. Since hospitals were founded to serve as facilitating means to the practice of medicine, the medical profession must concern itself intimately with plans likely to affect the relations of hospitals to physicians.

4. The subscriber's contract should exclude all medical services—contract provisions should be limited exclusively to hospital facilities. If hospital service is limited to include only hospital room accommodations, such as bed, board, operating room, medicines, surgical dressings and general nursing care, the distinction between hospital service and medical service will be clear.

5. The plan should be operated on an insurance accounting basis with due consideration for earned and unearned premiums, administrative costs and reserves for contingencies and unanticipated losses. Supervision by state insurance departments has been advantageous for both the buyer and the seller of insurance contracts. Laws permitting the formation of hospital service corporations should not remove the benefits of such supervision nor violate the principles enumerated.

6. There should be an upper income limit for subscribers. If group hospitalization plans are designed to aid persons with limited means to secure hospital services, they should render such service at less than regular rates. If no consideration in rates is made for persons with limited means, group hospitalization plans lose their altruistic purpose and there may be little justification for an income limit.

7. There should be no commercial or high-pressure salesmanship or exorbitant or misleading advertising to secure subscribers. Such tactics are contrary to medical and hospital ethics and are against sound public policy.

8. There should be no diversion of funds to individuals or corporations seeking to secure subscribers for a profit. The moment hospitals lose their traditional character as institutions of charity and humanitarianism the entire voluntary hospital system will break down.

9. Group hospitalization plans should not be utilized primarily or chiefly as means to increase bed occupancy or to liquidate hospital indebtedness. Such plans, if they are necessary, should place emphasis on public welfare and not on hospital finances.

10. Group hospitalization plans should not be considered a panacea for the economic ills of hospitals. They can serve only a small portion of those persons needing hospital services. Hospitals must continue to develop efficient methods of administration and service independent of any insurance method of selling their accommodations.

Notwithstanding the efforts of medical societies and this bureau, as well as the reports of the Judicial Council and the action of the House of Delegates on group hospitalization at the Kansas City session to develop principles for the guidance of the group hospitalization movement, few, if any, of the plans exclude all medical services from their group hospitalization contracts. The extent to which medical services are included in the hospital service contracts is shown in the report of the Bureau.

For many years there have been serious discussions among physicians and hospital administrators concerning the most equitable arrangements for anesthesia, clinical pathology, radiology, and other special medical services in hospitals. These are fields in which hospitals and the medical profession must seek and apply adjustments. Just now, when a more satisfactory relationship in some of these fields seems to be in view, group hospitalization tends to accentuate and perpetuate the very conditions which the medical profession and some hospital authorities have sought to improve. Hospital insurance plans tend to force the continuation of undesirable practices and relations between physicians and hospitals.

These prepayment plans for hospital care show a distinct tendency to place hospitals themselves in the field of medical practice. If group hospitalization organizations become sufficiently strong in membership support, and if they pursue the announced policy of liberalizing benefits, the future course of such plans seems clear. Either they will offer a longer period of hospital stay, or they will include more medical services. It is only occasionally that patients need more than the twenty-one days of hospitalization now offered. At the time of hospitalization every patient needs one or more medical services. Who can deny that the directors of these schemes may propose to include additional medical services to make their contracts more salable? There is only a remote possibility that a future development in these plans will be a decrease in subscription rates.

If group hospitalization schemes were to confine their benefits strictly to hospital facilities, the movement would avoid most of the undesirable disturbances in the field of medical practice without impairing the value of the plan as a method of assisting persons with limited incomes to receive hospital services. In this connection there is need for a thorough understanding on the part of the organizers and administrators of group hospitalization plans as to what constitutes medical services.

Because of the several reasons outlined, group hospitalization, instead of preventing the advent of some form of sickness insurance, is more likely to be the first step toward the opening of hospitals for all persons in the community and then a system of state-managed medicine. The group hospitalization movement is clearly one of the major issues demanding action by the medical profession if the future of medical practice is to be maintained on a basis which guarantees that the welfare of the sick individual is the first consideration.

COMPONENT COUNTY MEDICAL SOCIETIES

MARIN COUNTY

The regular meeting of the Marin County Medical Society was held Thursday evening, April 22, at the Marin Golf and Country Club.

Dr. J. B. McNaught of Stanford University gave an interesting talk on *Trichinosis*.

CARL W. CLARK, *Secretary*.

✽

PLACER COUNTY

The Placer County Medical Society met on April 17 at the Freeman Hotel, with President C. Ettrick Lewis presiding. The meeting was called to order at 8:15 p. m. In addition to President Lewis, there were present the following members and visitors:

Members—Doctors Schofield, Hirsch, Eveleth, Peers, Miller, March, Atkinson, Empey, Rood, Hummelt, Lundegaard, Dunievitz, Briner, L. B. Barnes, Padgett, Kindopp, and Mackay.

Visitors—Dr. F. Lynn Smith of Colfax, Dr. C. E. Schoff of Sacramento, Councilor for the Eighth District of the

California Medical Association; and Mr. Ben H. Read, Executive Secretary, Public Health League of California.

The minutes of the meeting of January 9 were read and approved.

Dr. F. Lynn Smith's application for transfer of membership from the Tulare County Medical Society to the Placer County Medical Society was acted upon favorably.

Dr. Emmeline Banks of Auburn was elected to membership in the Placer County Medical Society.

Correspondence received by the secretary since the last meeting was read and ordered filed.

The president, Doctor Lewis, reported an autopsy on a man accidentally killed which showed an advanced stage of silicosis although, during his lifetime, the patient had exhibited no symptoms of silicosis and suffered no disability. Doctor Dunievitz, in discussing the case, made the following suggestions:

1. That any member having an interesting case for autopsy invite his medical confrères to be present.

2. The advantage of using autopsy material at the county hospital.

3. The appointment of a committee to bring in recommendations regarding the above suggestions.

Dr. Richard O. Schofield of Sacramento, a member of our society and a former president of the Nevada State Medical Association, gave a most interesting and instructive address upon *The Management of the More Common Types of Fractures*. Doctor Schofield discussed the subject from the standpoint of what the man in general practice might meet with in his routine daily work, not as the specialized treatment, but as the recognition, the pathology, and some of the adjuncts of treatment that help to produce better end-results and also which give the patient comfort and relief of pain during the course of treatment. It was suggested that the use of the aeroplane splint for the so-called shoulder sprains always made for a lessened amount of discomfort, which very often is caused by the simple weight of the arm hanging by the side; the ease with which novocain injected directly into the site of the fracture was stressed as being of very decided help to the man who is practicing alone and cannot call upon professional help without a great deal of inconvenience. Firm strapping, which included the whole hand and one-half of the forearm, will give relief in wrist sprains, where the ordinary application of one or two strips of one-inch adhesive is of very little value at any time; the use of metal splints for injuries which occur to the hands or the fingers and often-times returns a man to his usual work days, and sometimes weeks, before the wound or the bone has entirely healed. Actual fractures of the olecranon and patella are probably always best treated by open reduction; it may be accomplished by the apposition of the fragments with sutures through drilled portions of the bone, or may be accomplished by circumferential capsular sutures. Injuries involving the knee can be made more comfortable in the ambulatory stage by the use of the built-up heel or sole on the inner or outer surface, as the case may be, for the particular injury involved. The use of the metatarsal bar on the shoe was considered in regard to fractures of the large toe and also of the metatarsals. The mechanism of the production of fractures and the treatment of specific fractures of the limbs were discussed in some detail, the same being made clear by their demonstration on the actual skeletal manikin. Discussion was by Doctors Rood, Empey, Atkinson, Kindopp, Mackay, Briner, Lewis, Peers, and Schofield.

Dr. C. E. Schoff, Councilor for the Eighth District, gave a short report of legislative matters and the work of the Council. He also called attention to the desirability of attending the California Medical Association meeting at Del Monte.

President Lewis called upon Mr. Ben H. Read, Executive Secretary of the Public Health League of California. This being Mr. Read's first visit to the Placer County Medical Society, he gave our members a description of the make-up of the Legislature, of its powers and of its *modus operandi*. He then discussed very fully the more important of the bills before the present Legislature dealing with the profession of medicine and the public health. Considerable discussion followed the address.

Meeting adjourned for refreshments.

ROBERT A. PEERS, *Secretary*.

SACRAMENTO COUNTY

The regular meeting of the Sacramento Society for Medical Improvement was called to order by the president, Dr. Raymond Wallerius, on April 20 at the Auditorium on Twenty-ninth and L streets. There were fifty-six members and guests present.

The speaker of the evening, Dr. A. H. Rowe of Oakland, gave an excellent talk on the *Problems in Clinical Allergy*. Of two thousand students examined at the University of California, 35 per cent gave a family history of allergy, and 33 per cent a personal history of allergy. Doctor Rowe stated that 10 per cent of all people have allergic manifestations that need trained medical care. The theories of allergy, as well as the diagnosis, specific causes, and treatment, were discussed in detail. The talk was illustrated with lantern slides. The subject was then discussed by Doctors Bramhall, Soutar, Vance, and Turner.

The applications for membership of Doctors Milton Sarkisian, William Harding, and Wilfred Lowe were read for the first time. The application of Dr. E. R. Cole for transfer into the Society was read for the second time, and he was unanimously elected to membership. The application of Dr. Adrian Crossen for transfer into the Society from Placer County was read for the first time.

Dr. Paul Guttman was elected an alternate delegate to the convention at Del Monte.

Dr. F. MacDonald made a resolution that the Society go on record as approving a resolution for the elimination of taxes for nonprofit hospitalization insurance. Resolution passed.

Doctor Soutar made a motion that the Society go on record as disapproving Assembly Bill 1880 (Clark), which would enable osteopaths to obtain public health certificates. Resolution passed.

G. E. MILLAR, *Secretary*.

✱

SAN DIEGO COUNTY

San Diego was well represented during the convention at Del Monte. We wish to congratulate our member, Dr. George Huff, on the presentation of his paper.

Dr. L. C. Kinney was reelected to the position of delegate to the American Medical Association.

Locally, many lectures of interest have held our attention. Dr. C. H. Best of Toronto discussed the following before the Academy of Medicine: (1) *Prolongation of Insulin Action*. (2) *Thrombosis From the Experimental Viewpoint*.

Dr. Elmer Belt of Los Angeles read a paper regarding *Hyperpyrexia in the Treatment of Nisserian Infections*. This at the dinner meeting of the San Diego County Medical Society.

The San Diego Galen Club will consider the complications of female pelvic disease at its next dinner meeting.

F. E. TOOMEY, *Chairman, Publicity Committee*.

✱

SANTA BARBARA COUNTY

The regular meeting of the Santa Barbara County Medical Society was held Monday evening, April 12, at the Bissell Auditorium of the Cottage Hospital.

Dr. William H. Goeckerman of Los Angeles, member of the State Syphilis Committee, spoke concerning the *New Syphilis Movement and the General Practitioner*.

The meeting was well attended by members of the profession and others interested in the subject. The speaker explained what the United States Public Health Service wished to accomplish in the eradication of this disease, and how the profession and interested organizations could aid.

The paper was discussed by Doctors Wilson, Ussher, Roome, Stevens, and Burtness.

At the conclusion of the discussion the Society went into executive session.

The names of Dr. Peter Cohen and Dr. Yukio Miyauchi, both of Santa Maria, and Dr. Richard Hipp of Santa Barbara were proposed and, after balloting, were declared elected into membership of the Society.

Doctor Ullmann gave a report of the activities of the State Council.

A motion was made, seconded and carried, that the May meeting of the Society be held in Santa Maria, under the auspices of the Santa Maria branch.

WILLIAM H. EATON, *Secretary*.

✱

SAN BERNARDINO COUNTY

The regular meeting of the San Bernardino County Medical Society, held at the San Bernardino County Charity Hospital on Tuesday, May 11, was called to order by the president, Doctor Mock, at 8:15 p. m., with fifty members and guests present.

It was moved and seconded that the Medical Advisory Committee to the S. R. A. be dismissed, since the necessity for this committee no longer exists, and that the Society extend a vote of gratitude to this committee for their time and splendid work in forming the first S. R. A. medical program in the State and making it a success. Passed.

Dr. C. N. Abbott of Ontario announced the opening of their new clinic building, and extended an invitation to all members to attend the "open house" and inspect the building and equipment.

The following applications for membership were approved: Dr. Christopher W. Hartsough, Jr., of Patton and Dr. Christopher A. Mason of Loma Linda.

A telegram from Doctor Warnhuis, regarding bills before the Legislature, was read. Members were urged to send telegrams to senators and assemblymen urging them to defeat these measures.

A letter from Doctor Dickie, State Health Officer, regarding the appointment of a successor to Doctor Godfrey, was read.

Dr. Harold Gentry, delegate to the California Medical Association, reported on the meeting of the House of Delegates held at Del Monte, May 2 to 6. California Medical Association dues for next year will be \$10.

The program of the evening was given by members of the Cancer Clinic, as follows:

Radiology in Cancer, with Particular Reference to Cancer of the Breast and of the Skin—Dr. Frank Folkins of Redlands.

The Incidence of Cancer—Dr. Harold Gentry of Redlands.

Work of the Cancer Committee at the San Bernardino County Charity Hospital for the Year 1936—Dr. Carlos G. Hilliard, Chairman of Cancer Committee.

Pathology of Structure and Pathways of Dissemination in Cancer of the Breast and of Skin—Dr. Oran I. Cutler of Loma Linda.

The subject was then discussed by Doctors Thureson of Riverside, C. N. Abbott, A. D. Butterfield, with Doctor Hilliard closing by extending a cordial invitation to all members of the Society to attend the Cancer Clinic, and to bring such patients as they would like to present for consultation.

The meeting adjourned at 10:30 o'clock, following which refreshments were served.

ARTHUR E. VARDEN, *Secretary*.

✱

SAN JOAQUIN COUNTY

The regular meeting of the San Joaquin County Medical Society was held on May 6.

The meeting was called to order by Doctor Boehmer. The minutes of the previous meeting and of the Board of Directors were read and accepted.

The papers of the evening were presented by Dr. Philip J. Lipsett of Oakland, who spoke on *Amputations—Indications for—Circulatory and Skin Tests—Prosthesis*, and Dr. Frank McCullough, also of Oakland, who talked on the *Injection Treatment of Herniae*.

There was an interesting exhibit of artificial arms and legs by Mr. C. H. Hittenberger.

There being no further business the meeting was declared adjourned and refreshments were served.

G. H. ROHRBACHER, *Secretary*.

TULARE COUNTY

The Tulare County Medical Society met in regular session on Sunday, April 25, at 6:30 p. m. The meeting was held at Motley's Café in Visalia, and was preceded by dinner. President Hill called the meeting to order.

Doctor Zumwalt introduced the speaker of the evening, Dr. A. E. Belt, urologist of Los Angeles. His subject was *Gonorrhea—Its Mode of Transmission, Invasion, and Treatment*. He described the newer fever therapy by means of a "hot-air cabinet," and reports a cure in 96 per cent of cases in a present series of about one hundred cases. The patient is kept in the hot-air cabinet for ten hours at a temperature of 106.79. The discourse was well illustrated with lantern slides, and later evoked a lively discussion. Doctor Belt was given a vote of appreciation for his excellent paper.

Communications were read informing of the transfer of Dr. L. Smith to the Placer County Medical Society. Dr. L. Leidig has applied for transfer to the Los Angeles district.

Doctor Zumwalt revived the issue of a full-time health officer in Tulare County, and Doctor Betts made a motion that the president appoint a committee of three to consider ways and means of securing a full-time health officer in this county. The motion was seconded by Doctor Tourtellott and unanimously carried.

Doctor Hill reported on the recent request of the Tulare County Board of Supervisors to meet with them. Doctors Hill and Weiss met with the Supervisors and were asked by Alfred Elliott, Chairman, for cooperation in medical matters pertaining to the County Hospital. The Society expressed unanimous approval of this and instructed the secretary to notify Mr. Elliott of our willingness to cooperate.

The death of Doctor Beck was announced and the meeting adjourned in his memory. KARL F. WEISS, *Secretary*.

CHANGES IN MEMBERSHIP

New Members (38)

Alameda County.—James Hilgesen, Carson E. Hunt, Marshall B. Tucker, R. James Walker.

Lassen-Plumas County.—Herman G. Levin.

Los Angeles County.—Otto Arndal, Willis A. Bird, Robert M. Francis, Elmer W. Gilbert, G. Stanley Gordon, O. Dale Lloyd, B. F. Miller, James G. Rea, Walter C. Rogers, Ewing L. Turner, Roy M. Van Wart, W. Earl Wallace, Sheldon K. Wirt.

Mendocino-Lake County.—George S. Wrinkle.

Monterey County.—A. E. Ghillotti, C. F. Schilling.

Riverside County.—William H. Blackman.

San Bernardino County.—Victor O. Ross, Walter A. Sullivan, Roger A. Vargas.

San Diego County.—Harold C. Torbert.

San Francisco County.—Albert G. Clark, Alvin J. Cox, Jr., Bessie Yeen Jeong.

San Mateo County.—Allan H. Williams.

Santa Barbara County.—Peter Cohen, Yukio Miyauchi, Richard Hipp.

Santa Clara County.—Milo Ellik, W. H. Gardenier, D. L. Morse, Erman Stadler.

Siskiyou County.—J. B. McGuire.

Transferred (1)

Thomas W. Hagerty, from San Joaquin County to Ventura County.

Resigned (1)

M. M. Hare, from Los Angeles County.

In Memoriam

Ellis, James Alexander. Died at Alameda, May 1, 1937, age 59. Graduate of the University of California Medical School, San Francisco, 1903. Licensed in California in 1904. Doctor Ellis was a member of the Alameda County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

Mountford, George Thomas. Died at Coalinga, May 2, 1937, age 52. Graduate of the Northwestern University Medical School, Chicago, 1909. Licensed in California in 1910. Doctor Mountford was a member of the Fresno County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

Trowbridge, Dwight Howe. Died at Fresno, May 4, 1937, age 67. Graduate of Tulane University of Louisiana School of Medicine, New Orleans, 1893, and licensed in California the same year. Doctor Trowbridge was a member of the Fresno County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

Wade, Lyman Trevitt. Died at San Luis Obispo, April 11, 1937, age 70. Graduate of Bennett College of Eclectic Medicine and Surgery, Chicago, 1888. Licensed in California in 1894. Doctor Wade was a member of the San Luis Obispo County Medical Society, the California Medical Association, and the American Medical Association.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION†

Officers for Coming Year

President—Mrs. Hobart Rogers, 1137 Mandana Boulevard, Oakland.

President-Elect—Mrs. John V. Barrow, 142 South Windsor Boulevard, Los Angeles.

First Vice-President—Mrs. Frederick Scatena, 1400 Forty-first Street, Sacramento.

Second Vice-President—Mrs. Elliott G. Colby, 2457 Willow Street, San Diego.

Recording Secretary—Mrs. Harry E. Henderson, 1600 Orange Road, Santa Barbara.

Corresponding Secretary—Mrs. Charles C. Hall, 207 Estates Drive, Piedmont.

Treasurer—Mrs. Harry O. Hund, 400 Grand Avenue, San Rafael.

Councilors-at-Large:

Mrs. W. W. Roblee, 3117 Orange Avenue, Riverside.

Mrs. Fred H. Zumwalt, 3880 Clay Street, San Francisco.

Mrs. A. E. Anderson, 1035 Cambridge Avenue, Fresno.

Mrs. Arthur T. Newcomb, 1 Richland Place, Pasadena.

District Councilors:

First District—Mrs. Dexter Ball, Santa Ana.

Second District—Mrs. Benjamin H. Sherman, 1622 Fairfax, Hollywood.

†As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Fred Zumwalt, Chairman of the Publicity and Publications Committee, 3880 Clay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Zumwalt and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue for Woman's Auxiliary notes.

Third District—Mrs. E. L. Markthaler, 2304 State Street, Santa Barbara.

Fourth District—Mrs. George Walker, 630 Peralta Way, Fresno.

Fifth District—Mrs. Lawrence Knox, Carmel-by-the-Sea.

Sixth District—Mrs. J. C. Geiger, 50 Ventura Avenue, San Francisco.

Seventh District—Mrs. Harold Trimble, 26 Pacific Avenue, Piedmont.

Eighth District—Mrs. George A. Briggs, 1127 Forty-fifth Street, Sacramento.

Ninth District—Mrs. Robert M. Furlong, Linden Lane, San Rafael.

Parliamentarian—Mrs. William H. Sargent, 109 Beechwood Drive, Oakland.

Resolutions Adopted at Del Monte Session

During the recent session of the Woman's Auxiliary to the California Medical Association the following resolutions were passed:

WHEREAS, The 1937 annual session of the Woman's Auxiliary to the California Medical Association held at Del Monte is about to become another milestone in the history of its progress; and

WHEREAS, Many persons and agencies, in addition to a magnificent setting, have contributed to this highly enjoyable meeting; therefore be it

Resolved, That the Woman's Auxiliary to the California Medical Association, in convention assembled, extend its sincere thanks and grateful appreciation:

To Mrs. John Hunt Shephard and her committee for their difficult work and careful attention that have done so much for the success of the session and pleasure of the members and their guests.

To Mrs. H. M. Yates, chairman of the musicale, who with her selected group of artists—Mrs. Gladys Steele, Mrs. Mary Rosalie Haslett, Mr. Charles Frisbee, and Dr. Lawrence M. Knox—contributed to the success of the very delightful evening of music.

To the management and staff of the Hotel Del Monte and Del Monte Lodge for their courtesies.

To Rev. Stewart C. Potter of Monterey, who asked God's blessings on our sessions.

To the Council of the California Medical Association for their support and cooperation throughout the year.

To Dr. William J. Kerr and members of the Advisory Council of the California Medical Association for their cooperation and support and their sympathetic understanding of our problems as an auxiliary.

To Dr. John V. Barrow, Dr. Edward M. Palette, and Dr. George D. Huff for inspiring messages.

To Dr. George H. Kress and Dr. Frederick C. Warnshuis for additional space and courtesies in the publication of Auxiliary news in CALIFORNIA AND WESTERN MEDICINE.

To the Monterey press for its cooperation and able presentation of material pertaining to our annual meeting.

To Mrs. Robert E. Fitzgerald, our National president, for her cheerful and gracious greetings and her words of encouragement and counsel.

To Mrs. Andrew J. Thornton, our State president, whose administrative genius we have much admired, and because of her real leadership and gracious manner which has endeared her to every member of the organization and to the other members of our State Board who have so ably carried their duties to a successful completion.

Be it further

Resolved, That copies of these resolutions be sent by the recording secretary of the convention to the above-named, to whom we are so deeply indebted, and a copy to be placed on file.

MRS. CHARLES C. HALL, *Recording Secretary*.

News Letter

Dear Auxiliary Members:

The convention at Del Monte was very successful, and nearly three hundred members were registered. These ladies attended one session at least, and most of them remained for all sessions and entertainment.

Much credit and a great deal of praise and thanks go to Mrs. Shephard and her committee for their splendid work. It was a difficult task for Mrs. Shephard when one realizes that she lives about seventy miles from Del Monte, and also that she was in ill health and really should not have had any worries at all. The Monterey Auxiliary was a tower of strength to her, and helped in every possible way to make the convention a success. Congratulations to you all on the splendid programs you arranged for our entertainment. I think the concert in honor of Mrs. Palette was especially delightful, but I must not praise it more than the luncheon given in honor of Mrs. Thornton (at which time San Diego received the coveted Doane Membership Cup), nor the beautiful tea in honor of Mrs. Fitzgerald, our National president, and Mrs. Hobart Rogers, our new State president. It would be hard to say which event was the nicest, so we thank you for all of them.

The convention report will be published in next month's CALIFORNIA AND WESTERN MEDICINE.

And now a few words to you before I close this article. Our new editor and chairman of publicity is Mrs. Fred Zumwalt, 3880 Clay Street, San Francisco. Please make her work as easy as possible by sending all communications to her promptly, so she can edit them and send them to CALIFORNIA AND WESTERN MEDICINE on time. She will appreciate it and will enjoy her work so much more if she can depend on you as I have done.

I thank you for your cooperation this past year; it made it easy for me to do my part.

Yours most sincerely,

MRS. ROBERT M. FURLONG.

Seen and Heard at Del Monte

Mrs. Kelly Canelo, our hard-working secretary of last year, sitting with the delegates and really enjoying the convention this year.

Mrs. Frank Makinson, smiling and carefree after turning over a careful of books and papers to a worried-looking Mrs. Hund.

Sincere regret that Mrs. Thomas Clark was too ill to be present at any of the sessions and unable to preside at the luncheon in honor of Mrs. Thornton, but gratitude to Mrs. Philip Schuyler Doane for gallantly saving the day and making the luncheon a great success.

How charming our hostesses looked at the tea in Mrs. Rogers' honor.

Much pleasure that Mrs. Robert Fitzgerald, our National president, was present at the first session of the convention, the first time such an honor has been conferred in California at convention time.

Mrs. John Hunt Shephard looked her usual charming self and disguised, under a gracious smile of welcome, the pain she was suffering.

And the many compliments that were heard on all sides for the smoothness with which everything was arranged for our comfort. Santa Clara and Monterey (our youngest auxiliary) have proved they know how to do things right.

Component County Auxiliaries

Alameda County

The Woman's Auxiliary to the Alameda County Medical Association met at the Claremont Country Club on April 16 for their luncheon and meeting. The clubroom was beautifully decorated with blue and white iris of the season. There were eighty-three members and guests present. The president, Mrs. Page, introduced Mrs. Hobart Rogers as president-elect of the Woman's Auxiliary to the California State Medical Association for 1937-1938.

Mrs. Rogers, Chairman of the Nominating Committee, composed of Mesdames Rogers, John Ewer, D. E. Jeffry, Walter C. Adams, and Charles E. Peters, made the following report: Mrs. Frank S. Baxter, president-elect; Mrs. George Calvin, vice-president; Mrs. Richard Young, corresponding secretary; Mrs. Maxwell Thebaut, recording secretary; and Mrs. Robert Cutter, treasurer. For the board of directors, Mrs. Grant Ellis, Mrs. John C. Condit and Mrs. Harry Akesson.

Mrs. Baxter announced that the May meeting would be the annual one for Mother's Day. Mrs. Page asked for a volunteer committee to assist in the arrangements. Twelve members responded, and Mrs. W. H. Sargent was appointed chairman.

Mrs. Alexander, Chairman of the Membership Committee, reported that the membership, as of May 15, 1936, was 199. The paid-up membership now totals 244. The increase of forty-five members has been due to the efforts of the Membership Committee and with the coöperation of the entire Auxiliary. The following new members were announced: Mesdames John Daugherty, James Campbell, A. L. Guerra, David Hadden, and Melvin A. Shade.

Mrs. Baxter introduced Mr. E. W. Jacobsen, Superintendent of the Oakland Public Schools, who delighted us with a talk on *Pagants of Europe*. His talk was illustrated with beautifully colored lantern slides, and was greatly enjoyed by all who heard him.

✱

Los Angeles County

The regular meeting of the Woman's Auxiliary to the Los Angeles County Medical Association was held on Tuesday, April 27, at the Valley Hunt Club in Pasadena with about 170 members present.

The dining room was abloom with Pasadena's choicest flowers, and a charming garden scene with a Maypole and singing birds was arranged on the stage, giving a delightful spring setting.

Dr. Alvin G. Foord, director of laboratories at the Huntington Memorial Hospital, spoke briefly on the work and future plans of that institution, and then introduced the next speaker, Mr. Lindley Bynum, field representative of the Huntington Library. Mr. Bynum gave a very interesting talk on the *Huntington Library and Art Gallery and Its Collections*, discussing briefly the various departments and their functions.

The regular business of the meeting was conducted quickly by Mrs. Clifford Wright, President, who presided, so as to permit the members to spend the rest of the afternoon at the Huntington Library.

✱

Marin County

A bridge tea was given by the Woman's Auxiliary to the Marin County Medical Society on Friday afternoon, April 23, at the Improvement Club in San Rafael. Thirty-two tables of bridge were in progress during the afternoon. At four o'clock, tea was served. A beautiful azalea plant was awarded as door prize. Proceeds from the tea swell the coffers of the Auxiliary by \$52. Mrs. Robert M. Furlong was in charge of the affair.

Dr. Fred H. Kruse of San Francisco addressed the Auxiliary on Thursday evening, April 22, at the Marin Golf and Country Club on *What Women Should Do After Forty*.

Several of our members are looking forward to attending the convention at Del Monte in May.

BERDELLA M. ROBERTSON, *Publicity Chairman*.

✱

San Diego County

The Woman's Auxiliary to the San Diego County Medical Society have had a busy program these past three months.

On February 9, five benefit bridge teas were held in the homes of Mrs. F. G. Lindemulder, Mrs. Alex Lessen, Mrs. Elliott Colby, Mrs. R. H. Sunderburg, and Mrs. R. E. Bond. Proceeds of these parties were added to our benevolent fund.

On February 24 a health education program, under the leadership of Mrs. E. H. Christopherson, Chairman of Public Relations Committee, was presented at the Young Men's Christian Association. Four prominent San Diego physicians spoke on *What's New in Medicine*. Approximately 150 lay persons were present at this meeting.

On March 8, at our regular monthly luncheon, Mrs. James F. Percy, Chairman of the National Revisions Com-

mittee, talked on the *Aims and Problems of the National Auxiliary*. At this meeting, the president, Mrs. F. G. Lindemulder, announced that \$10 had been given to the building fund of the Society for Crippled Children, \$25 had been given the San Diego Visiting Nurses' Association for five memberships in the organization, and \$50 had been sent to the newly established Auxiliary's lending library.

Dr. C. O. Tanner was guest speaker at the luncheon meeting on April 13. His topic was *Present Trend in Socialized Medicine*.

It was with great pride that the treasurer reported that all 160 members had paid their annual dues. There are 155 active members and five associate members.

ELIZABETH R. BELFORD, *Secretary*.

✱

Santa Barbara County

In April Santa Barbara had a luncheon meeting at the home of Mrs. Edward J. Lamb for the purpose of electing officers and making plans for the annual benefit bridge tea. Those elected were: Mrs. H. E. Henderson, president; Mrs. Richard McGovney, vice-president; Mrs. P. A. Gray, recording secretary; Mrs. Verril Findlay, corresponding secretary; Mrs. C. F. Nicholas, treasurer.

The Auxiliary maintained a table downtown one day of Cancer Control Week, at which \$50 was taken in for the use of the Cancer Control Commission.

In the campaign against the measure of opening the county hospitals to pay-patients, the Auxiliary took an active part. We obtained twenty-six signatures of lay persons for a telegram which we sent to our Senator Hollister, a member of the Committee on Constitutional Amendments.

At the April meeting, Dr. Irving Wills, President of the County Medical Society, reported on his trip to Sacramento and on the encouraging aspects of that visit made in company with Dr. P. A. Gray, Past President. The bill, while not killed in committee, after a hot debate was sent to the Senate with the recommendation, "Do not pass."

The annual bridge tea was a very successful affair, attended by about 160 of the wives of doctors and dentists and their friends. It was held on the afternoon of April 23 at La Cumbre Country Club. A beautiful spring day made it possible to enjoy tea on the terrace, where the rolling hills of the golf course, dotted with live oaks, led away to the distant vista of the sea and Channel Islands. Several young daughters of the doctors made a charming picture in their semi-formal dresses, their hair flower-decked, as they sold candy and passed sandwiches and cake. Much credit goes to Mrs. William R. Hunt, President, and to her hard-working committee, for the very evident success of the party. Sixty-five dollars was raised.

MRS. H. E. HENDERSON, *Publicity Chairman*.

Infected Tonsils and Rheumatism in Children.—Aitken declares that there is much evidence in support of the theory that an acute infection of the nasopharynx by hemolytic streptococcus has a definite relationship to attacks of acute rheumatism, and some evidence to support the opinion that chronically infected tonsils have an injurious effect on the rheumatic child in the sense that, although their removal may not prevent the onset of the disease, it does minimize the chance of serious cardiac complications and recurrences. A preliminary tonsillectomy, or one performed early during the course of the infection, may possibly, in the case of arthritis, render the heart less liable to be attacked, but not so in the case of chorea. Tonsillectomy in the case of carditis following arthritis seems to have a beneficial effect on the progress of the disease, but not in carditis following chorea. The analysis of 117 cases seems to show that the progress in those cases which did not require tonsillectomy and those in which tonsillectomy was done before the onset of juvenile rheumatism was rather more satisfactory than in those in which tonsillectomy was required at the onset of juvenile rheumatism. The patients who had not been tonsillectomized but who did not require tonsillectomy had the most satisfactory result, but those who had had complete tonsillectomy before the onset of the disease had nearly as good results.—*Medical Press and Circular (London)*.

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, Atlantic City, New Jersey, June 7-11. Olin West, M. D., 535 North Dearborn Street, Chicago, Secretary.

California Medical Association, Hotel Huntington, Pasadena (date to be announced later), 1938. F. C. Warnshuis, M. D., 450 Sutter Street, San Francisco, Secretary.

1 1 1

Pacific Northwest Medical Association, Great Falls, Montana, July 8-10. C. W. Countryman, M. D., 407 Riverside Avenue, Spokane, Washington, Secretary.

Vancouver Medical Association Summer School, Vancouver, B. C., June 22-25. J. R. Naden, M. D., 203 Medical-Dental Building, Vancouver, Secretary.

Medical Broadcasts*

San Francisco County Medical Society

A radio broadcast program for the San Francisco County Medical Society for the month of June is as follows:

Tuesday, June 1—KYA, 6 p. m.
Tuesday, June 8—KYA, 6 p. m.
Tuesday, June 15—KYA, 6 p. m.
Tuesday, June 22—KYA, 6 p. m.
Tuesday, June 29—KYA, 6 p. m.

Saturday, June 26—KFI, 9:15 a. m., The Road to Health; KFAC, 10:15 a. m., Your Doctor and You.

University of California Catalogue of Pictures of Medical Men.—Under the direction of the State Medical Library, there has been arranged in the Crummer Room for Medical History of the University of California Medical School, San Francisco, a special catalogue of pictures of medical men. This catalogue was made by Mrs. Francis Tomlinson Gardner, Assistant Librarian of the State Medical Library. It includes some twenty thousand items, and lists the sources where the pictures may be found. This unique catalog is available for the use of California physicians. Inquiries may be addressed to Mrs. Gardner. If a picture of the person desired is available, a photographic reproduction will be furnished at a nominal charge to those desiring it.

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject, to CALIFORNIA AND WESTERN MEDICINE, 450 Sutter Street, San Francisco, for inclusion in this column.

Golden Gate Bridge Facts.—The Golden Gate Bridge Fiesta Citizens' Committee gives the following Golden Gate Bridge facts:

Length over all	9,200 feet
Length of main spans (longest in the world by 700 feet)	4,200 feet
Length of side spans	1,125 feet
Cost	\$35,000,000
Decks	One
Width of roadway (six auto lanes)	60 feet
Sidewalks (each 10½ feet wide)	Two
Clearance over high water (span center)	220 feet
Height of deck above water (at center)	266 feet
Height of two bridge towers (highest in the world) ..	746 feet
Annual automobile capacity	70,000,000
Annual truck and bus capacity	6,000,000
Length of arch span (Fort Point) ..	319 feet
Height of arch span (Fort Point)	200 feet

Class Reunion and Dinner: Cooper, 1905.—During the session of the California Medical Association the class of 1905, Cooper Medical College, had a reunion and dinner. Those attending indulged in the usual reminiscence: "Do you remember—?" and "What has become of—?" The class roll was called and the following were present: Dr. Archibald A. Atkinson, Dr. and Mrs. Irving J. Beattie, Dr. and Mrs. Adolph Berg, Dr. and Mrs. Percival Dolman, Dr. Reuben H. Hunt, Dr. and Mrs. P. N. Jacobson, Dr. Edwin Merrithew and his son, Doctor Merrithew, Dr. Roy H. Morris, Dr. and Mrs. William Quinn, Dr. and Mrs. William James Quinn, Dr. and Mrs. Calvin Walker. Dr. and Mrs. Harry R. Oliver were honor guests of the group representing the Cooper Medical College faculty.

A very pleasant evening was enjoyed by those who were able to attend. Those present at this happy event pledged that they would make every effort to be present at a meeting projected for 1939, D. v.

Medical School Given Mementos of Amazing Operation.—The extensive medical library of the late Dr. Charles Brooks Bingham, the only practitioner known to have removed a human stomach without having the patient succumb in a short period of time, has been presented to the University of California Medical School and is now installed in the Crummer Room of the school. A unique part of the exhibit is the actual stomach which Doctor Bingham removed, together with a description of the operation, which is still regarded as an amazing bit of medical procedure.

Doctor Bingham, who was a member of the Medical School faculty for a number of years, performed the operation on a San Francisco woman in St. Luke's Hospital here in 1898. Dr. Langley Porter, present dean of the school, administered the anesthetic. The operation was performed in a desperate effort to save the woman's life, and so well was it done that she lived in apparently good health for seventeen more years, the only time in medical history that such a long sustained recovery from this type of operation has been recorded.

Doctor Bingham, who was born in 1849, and died in 1903, was also an authority on diabetes, having done much to relieve sufferers from that disease long before the discovery of insulin. His writings on the subject of diabetes are still referred to frequently by members of the medical profession. The library as a whole is a fairly complete history of the progress of medicine in the last three-quarters of the nineteenth century.

The Medical School has made a request to the doctors of the State to send all available old-time books, pamphlets, medical instruments and other exhibits to the school, if they so desire. They will be placed in the Crummer Room with all due acknowledgment to the donors.

Western Branch of the American Urological Association.—The annual convention of the Western Branch of the American Urological Association will be held at Mt. Rainier National Park, July 12, 13, and 14. For further information, address the secretary, Dr. J. C. Negley, 105 Professional Building, Glendale, California.

American Board of Surgery Organized.—In answer to the widespread demand for an agency which will attempt to certify competent surgeons, the American Board of Surgery has recently been organized. This Board is a member of the Advisory Board of Medical Specialties, which includes all of the boards of certification for the different medical specialties which have been already organized. Since boards were in existence for the certification of practitioners of some of the surgical specialties, such as ophthalmology, otolaryngology, obstetrics and gynecology, genito-urinary surgery and orthopedic surgery, it is expected that the American Board of Surgery will be responsible for the certification of general surgeons as well as those practicing in the remaining specialized subdivisions of surgery.

Acting upon the invitation of the American Surgical Association, the following surgical societies cooperated in the creation of the American Board of Surgery: the American Surgical Association, the Surgical Section of the American Medical Association, the American College of Surgeons, the Southern Surgical Association, the Western Surgical Association, the Pacific Coast Surgical Association, and the New England Surgical Society. The first three of these bodies which are national in scope have three representatives on the board. All of the other societies have one representative each. The representatives of the cooperating societies are nominated by the society which they represent and upon approval of the Board shall become members of it. The term of membership on the board will be six years. The following were chosen to represent the cooperating surgical societies:

Representing the American Surgical Association—Drs. Evarts A. Graham, Arthur W. Elting, and Allen O. Whipple.

Representing the American College of Surgeons—Drs. Donald Guthrie, Erwin R. Schmidt, and Harvey B. Stone.

Representing the Surgical Section of the American Medical Association—Drs. Fred W. Rankin, Howard M. Clute, and J. Stewart Rodman.

Representing the New England Surgical Society—Dr. Philemon E. Truetsdale.

Representing the Western Surgical Association—Dr. Thomas Orr.

Representing the Southern Surgical Association—Dr. Robert Payne.

Representing the Pacific Coast Surgical Association—Dr. Thomas Joyce.

The following officers were elected: Dr. Evarts A. Graham, chairman; Dr. Allen O. Whipple, vice-chairman; Dr. J. Stewart Rodman, secretary-treasurer.

Two groups of candidates are recognized for qualification by the Board.

(a) Those who have already amply demonstrated their fitness as trained specialists in surgery.

(b) Those who, having met the general and special requirements exacted by the Board, successfully pass its qualifying examination.

The first of these groups, the Founders' Group, upon invitation by the Board will be chosen from the following:

1. Professors and associate professors of surgery in approved medical schools in the United States and Canada.

2. Those who for fifteen years prior to the Board's organization have limited their practice to surgery.

3. Members of the American Surgical Association, the Southern Surgical Association, the Western Surgical Association, the Pacific Coast Surgical Association, and the New England Surgical Society, who were in good standing January 9, 1937.

All applications for the Founders' Group must be received within two years of the Board's organization, January 9, 1937. No candidates for the Founders' Group will be considered after that date.

Requirements for those to be qualified by examination will be as follows:

1. Graduation from a medical school of the United States or Canada recognized by the Council on Medical Education and Hospitals of the American Medical Association or graduation from an approved foreign school.

2. Completion of an internship of not less than one year in a hospital approved by the same Council, or its equivalent in the opinion of the Board.

3. *Special Training.*—A further period of graduate work of not less than three years devoted to surgery taken in a recognized graduate school of medicine or in a hospital or under the sponsorship accredited by the American Board of Surgery for the training of surgeons. This period of special training shall be of such character that the relation of the basic sciences of anatomy, physiology, pathology, bacteriology, and biochemistry is emphasized. Knowledge of these sciences as applied to clinical surgery will be required in the examination. Adequate operative experiences in which the candidate has assumed the whole responsibility will be required. An additional period of not less than two years of study or practice in surgery.

4. The candidate must present to the Board sufficient evidence of good moral character as to justify it in the belief that he will not engage in fee splitting and other dishonest practices.

It is expected that the Board, with the assistance and cooperation of the American Medical Association and the American College of Surgeons, will be able to increase the facilities which now exist for the adequate training of young surgeons by means of residencies, fellowships, etc., in suitable hospitals.

The above requirements, especially those referring to training, are subject to change from time to time as the existing opportunities for training in this field of specialization may be broadened.

The qualifying examination will be divided into two parts: Part I, written, and Part II, clinical, bedside and practical. The written part, Part I, will concern itself with general surgical problems and with the clinical application of the basic sciences of surgery to these problems. This examination will cover a period of three hours each and will be held simultaneously in as many centers as are necessary to accommodate the number of applicants who are eligible. Part II, is entirely oral and will also concern itself, in the main, with general surgery and, as stated for Part I, clinical application of the basic sciences to the clinical problem represented. In addition to this, in Part II, an examination will be given to test the candidate's knowledge of operative surgery, x-ray plate interpretation, and the principles and application of surgical anesthesia. This examination will be held in as many centers as the Board may determine necessary to accommodate the eligible candidates. Reexaminations will be allowed, provided one year shall elapse between examinations.

The fee for Group A, the Founders' Group, shall be \$25. The fee for Group B shall be \$75, payable as follows: \$5 for registration fee, which shall be returned if the candidate is not accepted for examination; \$20 for Part I; and \$50 for Part II. The same fee will be required for each reexamination. Once the candidate has become qualified, he will have no further financial obligation to the Board.

This Board is a nonprofit organization. All fees will be used, after a reasonable amount is set aside for necessary expenses in maintaining its office, conducting examinations, etc., to aid in improving existing opportunities for the training of the surgeon.

A certificate attesting to a candidate's qualifications in surgery after meeting the requirements of the Board will be issued, having been signed by its officers.

Any certificate issued by the Board shall be subject to revocation by the Board at any time in case it shall determine in its sole judgment, that a candidate, who has received a certificate, either was not properly qualified to receive it or has become disqualified since its receipt.

The Board will hold its first examination (Part I, written) on September 20, 1937. All inquiries concerning applications for this examination should be received by the secretary's office promptly.

Requests for booklets of information, application blanks, and other information should be addressed to the secretary, Dr. J. Stewart Rodman, 225 South Fifteenth Street, Philadelphia, Pennsylvania.

Syphilis and Gonorrhea.—The United States Public Health Service for the calendar year 1936 states:

Annual rates are per 1,000 population for venereal diseases in California cities with population of 200,000 or over.

This statement is issued for the information of health officers in order to furnish current data as to the prevalence of the venereal diseases. It is based on monthly reports received from city health departments.

City	Annual Rates Per 1,000 Population	
	Syphilis	Gonorrhea
Los Angeles	3.42	2.98
Oakland	1.52	1.60
San Francisco	2.47	2.52

This statement (for March, 1937) is issued for the information of health officers in order to furnish current data as to the prevalence of the venereal diseases. The following reports were received from State health officers. The figures are preliminary and subject to correction. It is hoped that this will stimulate more complete reporting of these diseases.

State	Syphilis		Gonorrhea	
	Cases Reported During Month	Monthly Case Rates Per 10,000 Population	Cases Reported During Month	Monthly Case Rates Per 10,000 Population
California	2,362	4.19	1,931	3.42
United States	32,402	2.59	15,166	1.21
City				
Los Angeles	579	4.04	414	2.89
Oakland	40	1.32	36	1.19
San Francisco..	129	1.92	144	2.15

Vienna to Have an International Congress of Short-Wave Specialists.—Doctors D'Arsonval and Zenneck, and Senator Marconi on Committee of July Congress.—From July 12 to 17 the scientific workers in one of the most rapidly advancing fields of physics, chemistry, biology, and medicine will convene in congress in Vienna, under the patronage of official Austria as represented by a committee including the Federal President, the Austrian Chancellor, the Rector of the celebrated University of Vienna, the Rector of the Vienna Technical College, and the Mayor of the City of Vienna. The congress sessions will be comprised of lectures by world-famous scientists followed by brief readings given by members, and general discussions. The papers read by members must not take more than fifteen minutes' reading time. Those wishing to read papers are requested to file a special application. The languages admitted are English, German, French, and Italian. The major papers read, as well as those presented by members, will be printed in full and copies distributed to those attending the congress, provided applications are received in time. In conjunction with the congress an exhibit showing the latest advances in the short-wave field, both in the abstract field and the field of applied practice, will remain open throughout the congress.

The subjects to be dealt with include: physics, biology, chemistry, and medicine. In the field of physics the subjects to be covered are: the properties of short waves and ultra-short waves; generation, conduction, radiation, and propagation; reflection refraction, absorption; measurement of SW and USW. Exploration of Heaviside-Appleton layers of the atmosphere. Chemistry and physical chemistry will be thoroughly explored in its relation to short-wave work and the practical aspects of short-wave application in the physical field will be treated extensively.

In biology the action of short waves of various types on plants, animals, organisms, enzymes, and ferments; heat effect and size particles; percutaneous SW diathermy; destruction of noxious insects; experiments will be included.

In the medical field, the connection of which with short-wave therapy has aroused world-wide interest, the following topics will receive attention: indications and counter-indications for the therapeutical application of SW and USW. USW therapy, its application in cases of acute inflammations of bacterial genesis in internal medicine, surgery, gynecology, dermatology, ophthalmology, otiatry, and neurology; SW therapy in connection with acute infectious diseases, especially with poliomyelitis acuta; sensibilization by SW of malign neoplasms refractory to x-rays; SW diathermy, its application in cases of chronic rheumatic diseases of joints and muscles; the technical side of apparatus.

All lectures and discussions will take place in the morning, leaving the afternoons free for demonstrations, experimental work or sight-seeing tours. Membership fee of the congress is thirty Austrian shillings, which fee includes the cost of all printed reports. The fee is payable in the local currency to the official Austrian representatives abroad. A crowded calendar of social events, including official receptions and merry excursions, has been planned to supplement the serious work of the members of the congress.

Programs and application blanks will be furnished upon request by applying to Austrian State Tourist Department, Publicity Service of the Federal Ministry for Commerce and Traffic, 630 Fifth Avenue, New York City.

Federal Grants for Public Assistance.—Federal grants totaling \$4,457,496.15 for public assistance in California, Connecticut, Idaho, Massachusetts, Michigan, Minnesota, New Mexico, Pennsylvania, and Washington were recently announced by the Social Security Board.

The amounts allotted, the form of assistance and the period of time for which each grant was made, and the number of individuals being aided under each plan in April, according to estimates based on reports received for the past thirteen months, are shown in the following table:

State	Aid to	Grant	Estimated Number of Recipients	Period Covered
California.....	Aged	\$806,688.21	70,500	April
California.....	Blind	189,628.33	4,620	Apr. 1-June 30
California.....	Children	90,438.64	21,600	Apr. 1-June 30

University of California Physician Will Head American College of Physicians.—Dr. William J. Kerr, head of the department of medicine, University of California Medical School, has been nominated as president-elect of the American College of Physicians, now meeting in St. Louis, it was announced recently by Dr. Langley Porter, Dean of the Medical School.

As Doctor Kerr was the only one nominated for the post, his election now becomes a matter of routine.

Doctor Kerr is also president of the American Heart Association, composed of heart specialists throughout the country. This Association will hold its annual convention in June in Atlantic City.

Doctor Kerr joined the faculty of the Medical School in 1916, and was acting head of the medical department from 1922 to 1927. In the latter year he was made full professor of medicine, and simultaneously became head of the department.

Use of Insulin for Dementia Praecox Increasing.—The use of insulin in the treatment of cases of dementia praecox that can be relieved by no other means, is being gradually expanded in the hope that the satisfactory results that have been achieved to date will at least be continued. This statement was made by Dr. C. H. Best, professor of physiology in the University of Toronto, and one of the four codiscoverers of insulin, while on a recent visit to the University of California.

A number of the mental hospitals in Canada are now using the insulin treatment, Doctor Best said. While apparent cures have been effected in a number of cases, and partial relief afforded in others, the percentage of failure is in such volume that no definite conclusions can be made for the treatment at this time. The treatment, which was first tried by Doctor Sokel in Austria, is but two years old. It consists in giving the patient a much heavier dose than would be given in a case of diabetes, causing reactions that directly affect the brain centers.

Doctor Best was one of the first to see the virtue in this new use of insulin, and he is watching developments closely. He is also taking a very direct interest in the development of protamine insulin, a compound which permits a diminution of the usual insulin dosage with generally more satisfactory results.

Working with Dr. Frederick Banting (later knighted), and Dr. J. R. Macleod, Doctor Best produced insulin for the first time in 1921. A few years later Dr. J. B. Collip so refined the substance that it could be used on humans without local irritation. All true insulin now used in the United States is standardized at Toronto before being distributed.

Physical Therapy Seminar at Los Angeles, June 17.—

The fifth annual mid-year session of the American Congress of Physical Therapy, Western Section, and the Pacific Physical Therapy Association will be held in the Los Angeles County Medical Association Building on June 17. All members of the California Medical Association and their technicians are cordially invited to the morning, afternoon, and evening banquet sessions.

National authorities on latest physical therapy developments, including Dr. Frank H. Krusen of the Mayo Clinic, Rochester, Minnesota, will appear on the program. Interesting exhibits will be displayed and topics fully discussed by California practitioners. Reservation may be made through W. W. Worster, M. D., San Gabriel, Chairman, or Clinton D. Hubbard, M. D., Huntington Park, Secretary of the Seminar Committee.

A complete program, now on the press, will be mailed upon application to Clinton D. Hubbard, 2504 Gage Avenue, Huntington Park, California.

Ingenious Medical Mechanic Uses Old Airplane Parts.—

A great many people use airplanes to fly around in, but August Kern, bracermaker in the University of California Medical School, uses them for an entirely different purpose. Within the past few months he has been able to fashion a number of braces and other hospital gadgets out of the fine metal and tubing from discarded airplanes, and there has been a wide demand for his products on the part of both doctors and patients.

Kern has found that airplane tubing, because of its light weight and its high tensile strength, makes particularly satisfactory braces. His working quarters are an odd assortment of vices, punching machines, emery wheels and air blowers, but they also contain many fine tools that Kern can handle with a watchmaker's precision. The brace-maker is himself a graduate physician, having obtained his M. D. from the University of Heidelberg, Germany. He practiced for a short time, but found that his skill in the making of surgical appliances and casts was in considerable demand, and he applied himself thereafter solely to the mechanical side of medical development. It is his hope to return to Germany some time and display some of his many successful appliances before the scientific societies there.

New Department of Visual Instruction Opens in Los Angeles.—

"Education cannot afford to lag behind in the utilization of inventions which experience has proved to be of value. Especially is this true of the motion picture, for there is much evidence to show that its possibilities can be even better realized in education than in the field of entertainment." With these words, Dr. Robert G. Sproul, President of the University of California, recently announced the opening in Los Angeles of a new Department of Visual Instruction, by the University Extension Division.

The new department was established in accordance with a recent action of the regents of the University who appropriated \$27,000 to create and stock a film center containing five thousand films for use by Southern California schools. The new center will be equal in all respects to the one on the Berkeley campus of the University, which has been serving the State for twenty years.

"Motion pictures enable the teacher to picture concretely those facts and ideas which would otherwise be vague abstractions to the student; and they enable teachers to present subjects in the best possible setting rather than in that which the average classroom provides. It is with these facts in mind that the University Extension Division has sought to meet the increasing demand for motion pictures by establishing distribution offices and visual-education libraries at both Los Angeles and Berkeley. The Department of Visual Instruction exists, primarily, to serve the schools of the State, and we hope to keep that service dynamic. Through conferences and discussions it is our desire to meet the needs of the schools as rapidly as they are worked out and reduced to specific terms."

The new department, with offices at 815 South Hill Street, in Los Angeles, is now booking for the fall school term, according to Professor Leon J. Richardson, Director of the Extension Division. The department will serve thirteen southern counties and the states of Arizona and New Mexico, Director Richardson said.

American Documentation Institute.—The American Documentation Institute has been incorporated on behalf of leading national scholarly, scientific and informational societies to develop and operate facilities that are expected to promote research and knowledge in various intellectual fields.

A first objective of the new organization will be to develop and apply the new technique of microphotography to library, scholarly, scientific and other material. It will be able to conduct scholarly publication by various methods as required by cooperating organizations.

Organized as a Delaware corporation "not for profit" but for educational, literary and scientific purposes, the new organization resulted from a meeting attended by delegates from national councils, societies, and other organizations in Washington on March 13.

The board of trustees elected consists of Dr. Robert C. Binkley, Western Reserve University; Dr. Solon J. Buck, Director of Publications, National Archives; Watson Davis, Director, Science Service; Dr. James Thayer Gerould, Librarian, Princeton University Library; Dr. Ludvig Hektoen, Chairman, National Research Council.

Such a national organization was foreseen as an outcome of Science Service's documentation activities when they were begun in July, 1935, implemented with grants from the Chemical Foundation and conducted with the cooperation of the United States Naval Medical School, the United States Department of Agriculture Library, the Bureau of the Census, the Works Progress Administration, the Library of Congress, and other agencies.

Bibliofilm Service has been conducted by Science Service in cooperation with the Library of the United States Department of Agriculture as a service to research workers, and auxiliary publication through microfilm has been conducted by cooperation with leading scholarly and scientific journals. Science Service's documentation activities will be transferred to the new American Documentation Institute.

International Health Congress Scheduled During New York's World Fair in 1939.—

Plans are being made for the holding of an International Health Congress during the New York World's Fair in 1939, it was announced recently by Dr. Donald B. Armstrong, President of the National Health Council, 50 West Fiftieth Street, New York City. In a statement to the press, Doctor Armstrong explained that advantage will be taken of the fact that hundreds of noted medical specialists and public health authorities, representing many countries, will be visiting New York City at the time of the World's Fair. American and foreign specialists will be asked to deliver addresses on subjects of interest not only to professional groups, but to the general public as well.

The last health congress, such as the one scheduled for 1939, was held at Atlantic City in 1926. Plans for the 1939 sessions are being perfected by the National Health Council in collaboration with the World's Fair Advisory Committee on Medicine and Public Health, which is headed by Dr. Louis I. Dublin. The program will be related, as much as possible, to the exhibits on medicine and public health that will be on display at the World's Fair; and it is hoped that a permanent American Museum of Hygiene similar to the German Hygiene Museum in Dresden will be established in New York subsequently.

Arrangements will be made for a series of visits of inspection to the leading hospitals, clinics, health centers, medical organizations, sanitary institutions, and other places of interest in New York City and vicinity. Both the official and private agencies engaged in public health activities throughout the metropolitan area will be invited to assist the National Health Council in the entertainment of its distinguished foreign guests.

It is expected that speakers and exhibits will be concerned more with the problems and methods of preventing ills than with technical aspects of the treatment and cure of disease. Some of the subjects that will be discussed are indicated by the following list of active member agencies in the National Health Council: American Society for the Hard of Hearing, Inc.; American Heart Association; American Public Health Association; American Red Cross; American Social Hygiene Association; American Society for the Control of Cancer; Conference of State and

Provincial Health Authorities of North America; Maternity Center Association, National Committee of Health Council Executives; National Committee for Mental Hygiene; National Organization for Public Health Nursing; National Society for the Prevention of Blindness; National Tuberculosis Association.

The United States Children's Bureau and the United States Public Health Service are advisory members of the Council. The American Nurses' Association and the Foundation for Positive Health are associate members.

LETTERS

Concerning Mussel Quarantine by State Board of Health.

To the Health Officers.

MUSSEL QUARANTINE ORDER

A quarantine of all mussels from the ocean shore of California extending from the southern boundary of Los Angeles County north to the California-Oregon boundary, with the exception of the Bay of San Francisco, is hereby established.

All health officers and food inspectors are hereby instructed to enforce the provisions of this quarantine and to prohibit the taking, sale, or offering for sale, of mussels gathered in the district specified. This quarantine order shall be effective for the period June 1, 1937 to September 30, 1937.

Said action is taken for the preservation of the public health.

W. M. DICKIE, M. D.,
Director of Public Health.

May 26, 1937.

Concerning a proposed federal cancer law.

Los Angeles, May 21, 1937.

To the Editor:—Enclosed you will find a copy of a bill, H. R. 6767, which, after reading, I would explicitly request that you have your office return to me, as it is my only copy.

This bill was brought to our attention by Dr. James Percy, a member of the Executive Committee of the Los Angeles Cancer Society. This bill was discussed in executive meeting by this society last evening, and after an extended debate we felt that this bill, with its implied intent, should be brought definitely to the attention of the State Medical Association and also the Los Angeles County Medical Association. We do not know definitely when this will be presented to the Committee on Interstate and Foreign Commerce; however, newspaper statements three days ago were to the effect that the bill is now, or will soon be, in Committee. This, in turn, makes any action by the regular medical profession an emergency, if such is deemed expedient.

As secretary of the Los Angeles Cancer Society I have been appointed one of a committee of two to bring this bill before the attention of the Los Angeles County Medical Council. This meeting, however, is not to be held until the evening of June 7, and in conversation with Dr. E. Vincent Askey today, he suggests that I write you at once.

The Executive Committee of the Los Angeles Cancer Society feel that this legislation, if enacted and made a bill by Congress, will be another peg in the machine towards socialized and federal medicine. Heart disease could be made the next jump, or we might even say obstetrics, or any other branch of medicine which is not contagious, as is tuberculosis, syphilis and other venereal diseases, which the Government is now beginning to scoop up as they go merrily on their way to the federal control of our patients.

Having spent approximately nine years in the Medical Corps of the Navy, followed by twelve years in the Medical Reserve Corps of the Navy, I feel that I can foresee certain pernicious tendencies in a bill worded as this reads to me. Having seen certain naval dispensaries, situated in different cities in the United States, grow from one officer in charge to as high as twenty officers on duty ashore, in actual competition with the regular practice of medicine, I can easily anticipate another arm of an octopus build on

by performing this National Cancer Act, and placing it completely in control of the Surgeon-General of the Public Health Service. It is well to know that this Act, worded as it is, leaves one individual in complete control, which can, and undoubtedly will, be chiefly political, and the committee of six members appointed by the Surgeon-General will be given, by this Act, only an advisory capacity in the awarding of the \$1,000 gratuity offered annually to some outstanding research or clinical man. This committee apparently only being able to choose the men annually for the award mentioned in Section 6 (a) of the Act.

The bill, as you will note, was introduced by Congressman Maverick of Texas on April 29, 1937, and there will be a similar bill presented to the Senate.

Dr. Dudley Jackson, 1028 Nix Professional Building, San Antonio, Texas, writes to Doctor Percy that he has helped frame this legislation and has conferred with Surgeon-General Parran and other interested parties regarding the bill. Doctor Jackson writes that he is having the Texas State Medical Association endorse this bill. He also writes to Doctor Percy, "It will take outside pressure to put it over, and I know it fits in with your belief in cancer research."

Very truly yours,

C. HIRAM WEAVER, M. D.,
Secretary, Los Angeles Cancer Society.

Concerning a salesman of surgical instruments.

Los Angeles, May 14, 1937.

To the Editor:—Recently I purchased some instruments from a salesman by the name of Klein. At the time of purchasing the instruments I was under the impression, as a consequence of statements by Mr. Klein, that they were stainless steel and not chrome-plated. Subsequently, after further examination, I find that the instruments which I purchased are chrome-plated. I believe that they are of an inferior grade.

I believe this information ought to be brought to the attention of physicians in this State and, therefore, I request that it be published in CALIFORNIA AND WESTERN MEDICINE.

Respectfully yours,

JOHN P. LORDAN, M. D.
2007 Wilshire Boulevard.

Concerning opportunities for physicians to Bolivia.

TREASURY DEPARTMENT
UNITED STATES PUBLIC HEALTH SERVICE

Washington, May 14, 1937.

Dr. Walter M. Dickie
State Director of Public Health
San Francisco, California

Dear Sir:

It has been brought to the attention of the Public Health Service that the National Department of Health of Bolivia is seeking to secure the services of one or more experts in the fields of hygiene, malaria, venereal diseases, and tuberculosis.

Nothing is known as to the amount of salary that might be paid for such services, nor of the tenure of office. It is understood, however, that the salary would be commensurate with the ability of the man or men to be employed. It is also assumed that the Bolivian Government would be willing to make the necessary arrangements with respect to transportation to Bolivia, together with certain guarantees for return to the States in the event of termination of an individual's services. It should be noted, however, that a change in administration in Latin American countries not infrequently results in the abandonment of enterprises of this nature, the same as in other countries, and anyone contemplating the acceptance of such a detail should not give up a satisfactory position here until definite arrangements are made for the one in prospect.

The request of the Bolivian Government is being brought to your attention with the thought that you may wish to refer it to someone within your State who might possess the desired qualifications, together with an ambition for

foreign service. Anyone who might be interested in applying for a position in Bolivia is advised to communicate with Medical Director B. J. Lloyd, United States Public Health Service, Assistant to the Director, Pan-American Sanitary Bureau, Washington, D. C.

By direction of the Surgeon-General.

C. E. WALLER,
Assistant Surgeon-General, Domestic
Quarantine Division.

Concerning Hotel Del Monte appreciation.

Del Monte, May 14, 1937.

Dear Doctor Warnshuis:

It is most gratifying to receive a letter such as yours of May 13 and I wish you to know that I sincerely appreciate the kind expressions contained therein.

I have passed on your words of praise to the Department Heads mentioned in your letter and, naturally, they were all most pleased to know that everything in connection with the California Medical Association went off so successfully.

It was indeed a pleasure to have you all with us, and I hope that you will find it possible to hold another convention here soon.

With many thanks and kindest regards, I am

CARL S. STANLEY, *Manager.*

Hotel Del Monte.

Concerning the impressions of Guest Speakers at Del Monte.

UNIVERSITY OF MICHIGAN: UNIVERSITY HOSPITAL
DEPARTMENT OF OBSTETRICS AND GYNECOLOGY

Ann Arbor, May 14, 1937.

Dr. Frederick C. Warnshuis
450 Sutter Street
San Francisco, California

My dear Doctor Warnshuis:

Now that I am back facing reality again, I have plenty of time to meditate over the delightful meeting at California.

I was certainly impressed with the massive size of the State as well as the California Medical Association. Certainly, you people do things on a big scale.

As I told you just before I left, I am very grateful to the Association for inviting me out and want you to know that I enjoyed every moment of it.

Sincerely,

NORMAN F. MILLER, M. D.

✱ ✱ ✱

New York, May 12, 1937.

Dear Doctor Warnshuis:

I shall always remember with satisfaction the warm reception and cordial hospitality extended to me by the California Medical Association on my visit to Del Monte. You have accomplished a great purpose in uniting the medical profession and I congratulate you on the results of your efforts.

Very sincerely yours,

JESSE G. M. BULLOWA, M. D.

62 West Eighty-seventh Street.

Concerning California Medical Association's contribution to Lane Medical Library.

STANFORD UNIVERSITY SCHOOL OF MEDICINE
OFFICE OF THE DEAN

San Francisco, May 17, 1937.

To the California Medical Association:—This acknowledges the receipt of check for \$1242.75 as the California Medical Association's contribution to Lane Medical Library for 1937. . . .

We are depending a great deal on such contributions, and it really gives us a chance to do things for doctors throughout the State which otherwise we could not do. The whole staff and the University join me in expressing our thanks.

Very truly yours,

L. R. CHANDLER, M. D., *Dean.*

MEDICAL JURISPRUDENCE†

By HARTLEY F. PEART, ESQ.

San Francisco

Requirements of California Minimum Wage Law as Applied to Professional Offices

In 1913, the California Legislature enacted a statute regulating the employment of women and minors and establishing an industrial welfare commission. This statute has subsequently become known as the "Minimum Wage Law."

After the decision of the United States Supreme Court in *Adkins vs. Children's Hospital*, 261 U. S. 525, in which the District of Columbia Minimum Wage Law was held unconstitutional, it was generally assumed that the California Minimum Wage Law was likewise unconstitutional. Last year when the Supreme Court held in *Morehead vs. New York*, 298 U. S. 587, that the New York Minimum Wage Law was unconstitutional, it was generally considered that all minimum wage laws, including the California Act, were beyond doubt unconstitutional.

On March 29, 1937, the United States Supreme Court by a five to four decision overruled the *Adkins* case and held that the Washington Minimum Wage Law is constitutional. This case, *West Coast Hotel Co. vs. Parish*, 81 L. Ed. 455, has received a vast amount of publicity, particularly in connection with a fundamental governmental issue which is now before the Congress of the United States.

The decision of the Supreme Court upholding the constitutionality of the Washington Minimum Wage Law is particularly significant with respect to the California Minimum Wage Law, because the Washington statute was also enacted in 1913 and in general contains practically the same provisions as are found in the California statute. It must, therefore, be assumed that since March 29, 1937, the California Minimum Wage Law has become a constitutional statute in so far as the constitutional questions considered by the United States Supreme Court in the Washington Minimum Wage Law case are concerned. With respect to the California Act, there is an additional constitutional question which has not received judicial construction as yet (in so far as this particular statute is concerned). The additional problem to which we refer is: Has the Legislature delegated legislative powers to the Industrial Welfare Commission? If the California Supreme Court should ever have this question before it and if it should decide that there has been a delegation of legislative power, the California Minimum Wage Law will, of necessity, be held to be in conflict with the California Constitution. However, considering that the California Minimum Wage Law has been in effect since 1913, it is not likely that an adverse decision with respect to delegation of power will be forthcoming. In any event, the powers granted by the Act to the Industrial Welfare Commission are not limitless and there is some precedent to justify the contention that no delegation of legislative power has been made. For all practical purposes, it is necessary to conclude that the decision of the United States Supreme Court in the Washington Minimum Wage Law removes all major doubts with respect to the constitutionality of the California Minimum Wage Law.

The recent turn of events in this field makes appropriate a consideration of the California Minimum Wage Law and a discussion of the rules and regulations issued by the Industrial Welfare Commission thereunder, particularly in so far as the rules and regulations relate to the medical profession. The California Act creates an industrial welfare commission of five members, at least one of whom shall be a woman. The Commission is given very broad powers. Possibly its most important powers are contained in Section 6 of the Act, which reads as follows:

The Commission shall have further power after a public hearing had upon its own motion or upon petition, to fix:

1. A minimum wage to be paid to women and minors engaged in any occupation, trade or industry in this state which shall not be less than a wage adequate to supply to such women and minors the necessary cost of proper living and to maintain the health and welfare of such women and minors.

† Editor's Note.—This department of CALIFORNIA AND WESTERN MEDICINE, containing copy submitted by Hartley F. Peart, Esq., will contain excerpts from the syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

2. The minimum hours of work consistent with the health and welfare of women and minors engaged in any occupation, trade or industry in this state; provided that the hours so fixed shall not be more than the maximum now or hereafter fixed by law.

3. The standard conditions of labor demanded by the health and welfare of the women and minors engaged in any occupation, trade or industry in this state.

The statute contains provisions making it a misdemeanor for any employer to violate orders of the Commission promulgated pursuant to Section 6, and then contains the following broad grant of power:

It shall be the duty of the Industrial Welfare Commission to enforce the provisions of this Act and compliance with its orders, rules and regulations. Full power and authority is hereby vested in the Commission to take such action as may be deemed essential for such purposes.

Stating that it is acting pursuant to the powers granted by it under the California Minimum Wage Law, the Industrial Welfare Commission has promulgated certain rules and regulations relating to employment of women and minors in general and professional offices. Inasmuch as the Commission is of the opinion that these rules and regulations apply to medical offices, a brief statement of the substance of the various rules is set forth herein for the convenience of members of the Association:

1. *"Employee" Defined.*—When the term "employee" is used in connection with the rules and regulations of the Industrial Welfare Commission, it means any woman or any minor, male or female, under eighteen years of age.

2. *Minimum Wage for Experienced Employees.*—The Commission requires employers to pay experienced employees a minimum of \$16 a week for work in any professional office.

3. *"Experienced Employee" Defined.*—An employee is deemed experienced after having worked for six months in any professional office. It is also provided that if an employee is transferred from one branch of an office to another branch of an office that the employee shall be credited with not less than twenty weeks' experience, unless the transfer is made to widely dissimilar branches of work, in which case the employee must be credited with not less than nine weeks' experience.

4. *Minimum Wage for Inexperienced Employees.*—

(a) Apprentices eighteen years of age and over: for the first three months, \$12 a week; for the second three months, \$14 a week; thereafter, not less than \$16 a week.

(b) For apprentices under eighteen years of age: for the first two months, \$10 a week; for the second two months, \$12 a week; for the third two months, \$14 a week; thereafter, not less than \$16 a week.

In connection with inexperienced employees or apprentices (the Commission apparently uses these terms interchangeably) the Commission has adopted the following rule:

No person, firm or corporation shall suffer or permit the employment of over 33½ per cent of the female office workers as apprentices at less than the legal minimum wage of \$16 a week.

5. *Minimum Wage for Part-Time Workers.*—(a) For a part-time employee over eighteen years of age or for a part-time experienced employee under eighteen years of age, the minimum wage is fixed at forty cents an hour. It is also provided that the wages paid in one day of eight hours or less need not exceed \$2.67.

(b) An inexperienced part-time employee under eighteen years of age may be employed as a part-time worker at less than forty cents an hour, but not less than thirty cents an hour. It is provided that the wages paid in any one day of eight hours or less need not exceed \$2.

6. *"Part-Time Worker" Defined.*—A "part-time worker" is defined as an employee who works less than eight hours in any one day.

7. *Minimum Wage for Special or Temporary Workers.* (a) A "special worker" or "temporary worker" is defined by the Commission as a person employed on a temporary basis and for less than two weeks.

(b) Such an employee, if over eighteen years of age or if an experienced employee under eighteen years of age, must be paid at least \$2.67 for a day of eight hours.

(c) Such an employee, if inexperienced and under eighteen years of age, must be paid not less than \$2 for a day of eight hours.

8. *Permit for Handicapped Workers.*—The Commission may, if requested, issue a permit authorizing the employment of a person handicapped by reason of age or disability at a wage less than the minimum wages above set forth.

(a) Female employees over eighteen years of age who receive more than \$30 a week and who are not subject to the provisions of the eight-hour law for women (this statute includes hospitals, but does not include medical offices) may be employed for more than forty-eight hours a week in cases of emergency.

(b) Female employees over eighteen years of age who receive less than \$30 a week and who are not subject to the provisions of the eight-hour law for women, may be employed more than forty-eight hours a week in cases of emergency, provided that all work performed in emergency cases shall be paid at a rate of wages not less than time and one-half the rate paid in regular time.

(c) Persons under eighteen years of age may not be employed before the hour of 6 a. m. or after the hour of 10 p. m. or more than eight hours in any one day or more than six days in any one week.

(9) *Meal Periods.*—A meal period of not less than one-half hour must be given to all employees after not more than five hours of employment. The employer is responsible for seeing that this time is taken.

10. *Records and Reports.*—An employer is guilty of a misdemeanor unless he keeps a record of all employees, showing the hours worked daily, and the wages paid. Male minors under eighteen years shall be marked "M," and female minors under eighteen years of age shall be marked "F" on the pay roll. Upon request of the Division of Industrial Welfare, employers are required to file verified reports containing such information as is required by the Division.

11. *Cash Shortages.*—The rules of the Commission provide that no employer may deduct from the minimum wage of an employee on account of a cash shortage unless it is shown that the shortage is caused by the wilful or dishonest act of the employee, notwithstanding any contract or arrangement to the contrary.

The foregoing rules and regulations are contained in Industrial Welfare Commission, Order No. 9, as amended. Readers who are familiar with the general principles of constitutional law and who are familiar with the political theory of the Republican form of government under which we are supposed to be living, will no doubt be startled by the following rule promulgated by the Industrial Welfare Commission:

The Commission shall exercise exclusive jurisdiction over all questions arising as to the interpretation of this order.

Needless to say, we have not as yet granted all powers of government, viz., legislative, executive and judicial, into the hands of one individual or group of individuals. The Industrial Welfare Commission has promulgated its Order No. 9, i. e., it has legislated, it proposes to enforce the provisions of its order, i. e., it intends to act in an executive capacity, but one may be permitted to doubt that it will be able to sit in final judgment over all disputes arising under its legislation.

Chemical Society Hears of Recent Research by United States Department of Agriculture Scientists.—A new method of chemical analysis, so sensitive that it detects as little as a millionth of a millionth of a gram of potassium in the tissues of plants and animals, was one of several developments described by scientists of the Bureau of Chemistry and Soils, United States Department of Agriculture at the spring meeting of the American Chemical Society at Chapel Hill, North Carolina, April 12-17.

The extreme sensitivity of this method of analysis makes it possible to test the uniformity of atomic weight of potassium in ocean water down to two and one-half miles in depth. Observations by the new method show the atomic weight of potassium in plant tissues to be practically uniform throughout. Kelp is found to contain an abnormal abundance of the radioactive constituent of potassium, while the atomic weight of potato vines becomes heavier as the plant matures. The new method was developed by Dr. A. K. Brewer.

SPECIAL ARTICLES

CUBA: HEALTH-INSURANCE TEST-TUBE.*

Doctors Dislike Mutual-Benefit Societies;
Run Own Clinics

Last week [April 20, 1937] after spirited debate, the New York State Assembly passed the Fite Bill, which entitles every mother, married or unmarried, citizen or alien, to claim a contribution of \$75 from the State toward the expense of childbirth. . . . Passage of the measure by the Senate is problematical, but the bill serves as a straw in the wind blown up by the recent survey of American medicine by the American Foundation,¹ indicates that the reëxamination of problems involved in distributing medical care is reaching the stage of legislative ferment.

* * *

As a phase of social-security agitation, discussion of the relationship between patient and physician usually revolves around the compulsory health-insurance laws of European countries. Conflicting conclusions are drawn from European experience. Less well known is the system of coöperative medicine which has been operating in Cuba for fifty years.

The tight little isle in the Gulf, just a plane's-throw off the Florida Keys, constitutes a medical microcosm which reveals the evolution of medical care along lines of national necessity. Since a weighty section of medical opinion in this country believes that medicine should not be confined by social legislation, but should follow a process of natural evolution, the Cuban experience is worthy of examination as a novel case history of the course evolution sometimes pursues.

ACTION

With a Latin leaning toward direct action, Cuban patients and physicians have fought out their problems in a manner without the remotest American parallel. Drama reached a high pitch which included such startling exhibitions as a march of fifty thousand citizens on the Capital, a walk-out of doctors, the kidnaping of surgeons by frantic relatives who forced them to perform operations at the point of a gun. The situation still seethes and simmers, but overt expression is restrained by the powerful Colonel Fulgencio Batista.

Spanish immigrants flocking to the new and unexploited land of Cuba in the years between 1880 and 1898 were for the most part clerks, laborers, waiters, financially submerged in a strange country with only the most primitive educational and medical facilities. Unable to pay for doctors or hospitals, the people found sickness an overwhelming catastrophe. To meet this situation, colonials hailing from the same provincial regions of Spain formed mutual-benefit societies.

Originally these organizations used their funds merely to buy clubhouses and to send their members to hospitals when they fell ill.

Big three of the mutual-benefit societies are the *Centro Gallego*, oldest of them all, founded by Galicians in 1879; the *Centro Asturiano*, founded in 1886; and the *Asociación de Dependientes del Comercio* (Association of Commercial Employees), organized in 1880 and one of the first to throw its doors open to native Cubans and foreign residents. In addition to these there are a half-dozen smaller regional societies, some twenty-five native Cuban organizations patterned on the same model.

Today these mutual-benefit societies provide much more than medical care. They offer the facilities of a social club,

run employment bureaus, give legal advice, have established schools and libraries.² But, most important, they have built some of the largest and best-equipped hospital centers, or *quintas*. These are small cities in themselves, which may have from one to thirty pavilions, each dedicated to a special branch of medicine. *Quinta Covadonga*, which belongs to the Asturian Center, has thirty pavilions which include a nurses' training school, interns' residence hall, a chapel, carpentry shop, pharmacy, workshop to make uniforms, gowns, and linens.

Centro Gallego spent \$2,000,000 in 1915 erecting an administration building facing the *Parque Central* in the heart of Havana. Across the park, *Centro Asturiano* has a Spanish baroque structure rivaling the Cuban Presidential Palace in architectural swank. The Association of Commercial Employees also has spacious headquarters in Havana, equipped with gymnasium, schoolroom, library, and ballroom.

Whence comes this financial potency? The \$2 monthly fee of members provides the funds. For this, members are entitled more than medical care: After twenty-five years a member can enter the old-age home maintained by most of the societies and be taken care of for the rest of his life. Often burial expenses are defrayed. Patients requiring a change of climate are entitled to third-class passage to any destination a doctor may deem beneficial and \$700 in cash. Members may use game rooms, libraries, attend social functions, send their children to society schools. For minor ailments a member can obtain free medicine when prescribed by a staff doctor.

A typical example of what the member gets for his \$2 a month dues is seen in the case of an appendicitis operation. A nonmember requiring such an operation at one of the *quintas* would pay a minimum fee of \$170, budgeted about as follows: Hospital room for seven days, \$35; operation, \$100; operating room, \$10; food, \$10; nurse, \$15—total, \$170.

This all comes to the member by virtue of his nominal monthly payment. Many members could not possibly meet such a lump-sum payment as \$170; other members, more healthy or wealthy, never demand benefit privileges—a large percentage of well-to-do members pay their contributions year after year, but call a private doctor when they fall ill.

Most Cuban mutual-benefit societies admit anyone not more than fifty years of age, not suffering from an incurable disease, not a Negro or Chinese. Until five years ago, women, more likely to require medical attention, were not admitted by most societies; now several associations exclusively for women exist. The Chinese, of whom there are some 25,000 in Cuba, have their own societies, such as the Kow Kong Association, but Negroes, comprising 27 per cent of the population of the island, must rely on public hospitals for medical care.

Not solely dependent on application of the insurance principle, the democratic managers of the societies are financially canny, augment association funds by commercial enterprise. Funds are carefully invested. *Centro Gallego* runs a savings bank, owns and operates one of the largest theaters in Havana. Barber shops, cigar stores, and restaurant concessions in club buildings bring in rental fees. Industries buy accident insurance for employees from the societies.

Yet, there are several darkening clouds on the financial and political horizons. Membership has been curtailed by the depression. Some smaller societies (such as *La Asociación Canaria*, whose membership dropped from 40,000 to 3,000) are in bankruptcy.³ The larger associations have carried on their work, however, more or less as usual. Last

² Public schools have been closed in Cuba for the last seven years because of political unrest. Mutual benefit societies have performed an important service in educating children of the poorer classes whose parents cannot afford private schools. Primary education, day and night classes for adults, courses in typewriting, accounting, music, art, sewing, etc., are provided.

³ Predepression membership figures were as follows: Centro Gallego, 64,000; Centro Asturiano, 60,000; Association of Commercial Employees, 52,000. Total number of societies runs well over forty. At its peak period, half the population of Cuba belonged to one of the mutual benefit societies.

year the Association of Commercial Employees, with a membership of 25,255, conducted 1,094 operations (with only sixteen deaths); made 12,446 visits to patients' homes; gave 295,460 consultations at the *quinta*; took care of 5,195 hospital cases.

Principal hazards of the mutual-benefit societies are hostile propaganda and doctors' strikes. During the past decade, growing opposition to the societies has arisen within the medical profession; physicians view the benefit associations as an economic threat. In 1934, the population of Cuba was 3,420,184. At that time there were 1,342 physicians, or one doctor for every 2,550 inhabitants. But 1,200 of these were located in Havana, a city whose population is 592,500, so the Capital had one doctor for every 494 persons. There is plenty of medical work to be done in Cuba, but chiefly among people who cannot pay for it. Cuba has more physicians than it can support.

Attributing their economic plight to the existence of the *quintas*, physicians maintain that the societies have wrecked profitable private practice, giving medical service for \$24 a year to patients well able to pay the fees of a private practitioner.⁴

ONE TO FORTY

Quintas are required by law to have at least one doctor for each forty patients. Average staff of doctors in the larger *quintas* is about fifty, working on a part-time basis, two or three hours a day, three or four days a week. The rest of their time is available for private practice. *Quinta Covadonga of Centro Asturiano* has a staff of 350, with the following monthly pay scale:

Director of the *quinta*, \$420; resident doctors, \$105; laboratory head, \$157; bacteriologist, \$62.50; chief doctor of each pavilion, \$157.50; pharmacist, \$132.50; nurses, \$56.45; nose and throat specialist, \$157.50; visiting doctors, \$137.50; chiropodist, \$69.30. The standard of living in Cuba has fallen considerably in recent years and these figures must be considered in the light of the fact that the middle-class white-collar worker earns about \$600 a year, lives comfortably on it; those in well-to-do circumstances manage nicely with incomes of \$1,000 to \$2,000 a year. Food and rents are extremely low.

First inkling that pressure was getting too great for the safety valve came in 1926. Doctors, bent on fighting the mutual-benefit societies, formed the Medical Federation of Cuba, demanded that the societies be limited to lower-income groups—single men with incomes of less than \$1,000, married men earning less than \$1,500. The societies resisted, maintaining that their greatest source of income were wealthier members who paid, but rarely used, *quintas*.

FLOP

A strike was called against *Centro Gallego* in 1926, lasted thirty-three weeks, left a tense situation which cracked in August, 1932, when the Medical Federation issued an ultimatum: All physicians would be withdrawn from the staffs of mutual-benefit society hospitals unless all members capable of paying for medical services were dropped. Five hundred doctors walked out, spurned mediation efforts of the Machado Government, expelled one hundred physicians who disapproved of the strike, left 2,440 hospital patients without medical attention. Public opinion rallied against the doctors and their strike flop.

In 1933, the deep-rooted wound suppurated again. Cuba was torn with disorder, communist agitation; *quintas* were losing membership because strict national labor laws, favoring native Cubans, were driving their Spanish members back to Spain in droves. Again the Medical Federation threatened a general strike. This time, the mutual-benefit societies beat the doctors to the draw. Fifty thousand society supporters paraded to the Presidential Palace on September 27, 1933, stood in a drizzle and gave mannerly protest against President Ramon Grau San Martin's decree requiring all physicians to join the new Medical College of Cuba.

The crowd had its way when the decree was suspended on October 2, but an ugly situation developed in January,

1934, when the closing of all the Spanish mutual-benefit societies seemed imminent. The society presidents had recommended such action to their boards unless the Government restored the right to practice to those sympathizers of the associations who had been expelled from the National Medical College.

CHAOS

Promptly, the doctors called a general strike on January 19. In an amazing demonstration, doctors, nurses, interns, and hospital employees, some 25,000 in number, walked out all over the island. Critically ill patients were abandoned, equipment was destroyed, general panic ensued. Relatives and friends flocked to hospitals to care for suffering and dying patients. Surgeons were kidnapped at gun's point by frantic husbands and fathers, forced to attend patients. The Army occupied the hospitals and strike-breaking physicians, nagged on by the shade of *Esculapius*, risked their lives to save as many patients as they could. Reaction of the public was direct, primitive; doctors were bitterly condemned as bent on destroying the societies for selfish motives, forcing the public to pay exorbitant medical fees. The doctors were supported by the Cuban Conference of Labor, the island's most radical union, by Leftist students, by the faculty of the University of Havana, which resigned in sympathy with the physicians.

Disorder continued; health officers inspecting the hospitals were attacked despite heavy military guard. For three days embattled doctors and public fought lustily until the Army stepped in and forced order. On February 17, President Mendieta dissolved the National Medical College, which had called the strike.

Since then there have been no outbursts, chiefly because Colonel Batista will not tolerate public disorder. The doctors started fighting fire with fire, have established *quintas* of their own. Some two dozen have sprung up within the past two years, patterned after the mutual-benefit societies, but operated by doctors as commercial enterprises.

WHAT CAN A TEACHER DO FOR A CHILD WITH HEART DISEASE*

A child suffering from chronic heart disease is as much crippled as a child who has been partially paralyzed, sometimes more so. The child who is partially paralyzed from infantile paralysis enlists more sympathy from those around him than a child with a heart condition. Still, the child with a heart disease may suffer more disability and nervous strain than any other child, and his parents, teachers, and friends may be unaware of his condition.

For over ten years the Los Angeles City Schools have had a special program for all children with heart disease. A great number of school children with heart conditions have been examined by a board of heart specialists who outline a general program for them in coöperation with the family doctor, the parents, and the teachers. The remaining children are examined by the school physicians.

The parent, the doctor, and the teacher coöperate in guarding these children's activities. Many of the children's lives are prolonged through this guidance. They are educated along the proper vocational lines and become useful citizens in spite of their handicaps.

In the Los Angeles City Schools, children with heart disease are classified into four groups patterned after the classification of the American Heart Association. Most of the children are placed in corrective classes where they are given exercises and rest.

The teacher's part in guarding these pupils from becoming permanently disabled is of the greatest importance. The teacher who has children with heart diseases in her classes should remember that these children are often of a highly nervous temperament, which indirectly affects their heart condition. Therefore, these children should be favored in regard to recitations, coming late to class, and reprimands. The child with heart disease should be asked the first question so that he will not have to sit and wait for the question to be asked, as such suspense indirectly affects the nerve

⁴ The Medical Federation holds that 25 per cent of the membership of mutual benefit societies could pay for medical care; the societies put the figure at 10 per cent.

* By Sven Lokrantz, M. D., Director of the Health Service Section of the Los Angeles School District.

mechanism of his heart. The child with heart disease should never be exposed to ridicule or reprimands. If a child with heart disease needs correction, the teacher should take the child privately aside and talk to him. The teacher should watch and see that the child with heart disease is given his rest period at noon. Special arrangements should be made for tardy slips when the child has to walk to school and where buildings are far apart. In severe cases, programs should be lightened. The health cards should be inspected and checked to see whether the children have infected tonsils that have been recommended for removal or whether any other chronic infections are present.

A very warm or drafty classroom is detrimental to a child with heart disease because this type of child is very susceptible to colds. Every cold means more infection and an infection may mean future weakening of the heart muscle. If a child with heart disease looks ill, the teacher should investigate the circumstances, send the child home and notify the school physician or the school nurse.

In all that you do, try to avoid the suggestion of invalidism. It is a great mistake to make any child too heart conscious, as he may become a chronic neurotic when he becomes an adult and be a burden to himself and to society.

It is far more important to pay attention to the physical condition of the child with heart disease than to his education.

VOLUNTARY HOSPITAL INSURANCE PLANS APPROACH ONE MILLION MEMBERS*

Nonprofit Plans for Budgeting Hospital Bills Report Threefold Increase in Membership and Greater Financial Stability During Past Year

Voluntary hospital insurance plans, by which workers and their families budget their hospital bills through monthly payments equal to two or three cents a day, reported an enrollment of approximately 900,000 subscribers April 1, 1937. This is to be compared with an estimated enrollment of 800,000 persons a year ago.

The membership is distributed among seventy-five different organizations in various parts of the United States, including New York City, Washington, D. C., Chicago, Cleveland, Minneapolis, St. Paul, New Orleans, Sacramento, Buffalo, Rochester, N. Y., Syracuse, Newark, Dallas, Houston, as well as smaller communities in the southern and western states.

Most of the growth has occurred among nonprofit free-choice plans of the type sponsored and recommended by the American Hospital Association. Thirty-three such associations have enrolled 750,000 members in eighteen different states, where they are supervised and regulated by the state departments of insurance or are organized under the general laws covering nonprofit corporations. Plans operated by individual hospitals and private promoters and industrial enterprises report approximately 125,000 subscribers, which is essentially the same number as were enrolled twelve months previously. These figures do not include an additional 75,000 enrolled by industrial firms or labor unions exclusively for their own membership, or the various plans of contract practice or insurance covering both hospital and medical services.

During the past three years many plans have been under discussion, but not actually placed in operation. The files of the American Hospital Association contain information of at least one hundred such plans which were discontinued before they reached the stage of actually enrolling subscribers. Four single-hospital plans have been discontinued because of local professional opposition of lack of community interest. In addition, a number of privately owned plans have stopped their activities because of conflicts with insurance law requirements or difficulties of interesting prospective subscribers.

In no instance has a nonprofit free-choice hospital service association been discontinued. The enrollment in these

organizations is increasing from month to month, hospitals have been paid promptly for services to subscribers, and reserves have been established by initial deposit or accumulation of earnings to meet the requirements of insurance departments or sound business policy.

Voluntary hospital care insurance is not a panacea for the problems of hospital finance; moreover, hospital insurance is not a complete answer to the public's request for a plan of budgeting the costs of sickness. Experience has demonstrated, however, that hospital service plans which are established with primary emphasis upon public welfare have also been economically sound in their relations with subscribers and hospitals.

During the year 1934 the insurance laws of the State of New York were amended to permit the formation of nonprofit hospital service corporations, to be governed by special regulations of the departments of insurance and social welfare. The following year, similar acts were enacted by the legislatures of Alabama, California and Illinois, and in 1937, permissive legislation has been passed in the states of Georgia and Maryland which place nonprofit hospital service corporations directly under the supervision of the departments of insurance.

The American Hospital Association does not recommend the establishment of hospital service associations unless they meet the standards of the Council and trustees of the Association established in February, 1933. These standards are: emphasis on public welfare; nonprofit sponsorship and control; free choice of hospital by subscriber; limitation of benefits to hospital service; representation of community and professional interests; economic and actuarial soundness; dignified promotion and management.

The largest membership has been reached by Associated Hospital Service, Incorporated, of New York, which enrolled more than 350,000 subscribers during the first two years of its life ended May 1, 1937. Next largest is the plan conducted in Minneapolis and St. Paul, which reports 85,000 after four years' activity. Other growing plans have enrollment as follows: Rochester, New York, 65,000; Cleveland, 50,000; New Orleans, 40,000; Washington, D. C., 35,000; Durham, North Carolina, 26,000; Chapel Hill, North Carolina, 23,000; Newark, New Jersey, 20,000; Sacramento, California, 16,000.

April 1 (1937) Enrollment of Non-Profit Hospital Service Plans Which Have Been in Operation Twelve Months or Longer

<i>Location of Headquarters</i>	<i>Employed Subscribers</i>	<i>Dependents</i>	<i>Total</i>

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. X, No. 6, June, 1912

From Some Editorial Notes:

Be Ye Humane.—Doctor Huntington, in the closing paragraphs of his presidential address, says: "... those interested in medicine, as teachers or students, should be admonished regarding a sentiment which is of exceeding import and finds expression in the command, Be ye humane. With propriety these words, which suggest the spirit and the substance of the humanities, might be written upon the portals of every school and hospital." ...

~ ~ ~

A Secretary's Views on Dues.—In view of the fact that membership dues in most of our county societies are payable in advance, it would seem rational to suppose that members would be only too glad to remit the amount of their indebtedness immediately upon receipt of their society's bill. Nevertheless, getting members to pay their dues has been for many years the most arduous task of the county society secretaries. The San Francisco County Medical Society, up to a little over two years ago, employed a regular collector, who made it his business to stir up the careless and hold-back variety until the dues were paid, and he pocketed 20 per cent as his fee. ...

* * *

Eye, Ear, Nose and Throat Section.—C. F. Welty presented the following request from the San Francisco County Society, which was referred to the Reference Committee:

San Francisco, Cal., March 16, 1912.

To the House of Delegates of the Medical Society of the State of California.

Gentlemen—The Eye, Ear, Nose and Throat Section of the San Francisco County Medical Society, respectfully request that you create a section, to be known as the "Eye, Ear, Nose, and Throat Section of the Medical Society of the State of California."

Respectfully submitted,

William F. Blake, *Chairman.*

Approved by San Francisco County Medical Society.

René Bine, *Secretary.*

* * *

Change in Medical Law.—The following was introduced by George H. Kress and referred to the Reference Committee:

April 12, 1912.

To the House of Delegates of the Medical Society of the State of California.

Gentlemen—The Board of Councilors of the Los Angeles County Medical Association respectfully request that the House of Delegates of the Medical Society of the State of California take steps at the Del Monte meeting to consider a plan of action on the following propositions:

1. A state law in California, modeled somewhat after the California Dental and Pharmacy laws whereby an annual tax of two dollars would be levied on all licensed practitioners of the healing art in California, the money so raised from the said tax to be deposited in the State of

(Continued in Front Advertising Section, Page 15)

†This column strives to mirror the work and aims of colleagues who bore the brunt of Association work some twenty-five years ago. It is hoped that such presentation will be of interest to both old and new members.

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By CHARLES B. PINKHAM, M.D.

Secretary-Treasurer

News

"Three members of the asserted illegal operations ring, exposed several months ago, obtained new trials by a ruling on file today in District Court of Appeal. The defendants were James Beggs, M. D., and Jesse C. Ross, M. D., convicted on five counts of conspiracy and performing illegal operations, and Valentine St. John, M. D. William A. Byrne, former special agent for the State Board of Medical Examiners, lost his appeal on four counts, while the fifth was dismissed as defective. The appeal of another defendant, R. L. Rankin, was dismissed recently at his own request. In the cases reversed Justice Marshall F. McComb, writing the opinion, based it upon the law that a conviction cannot be sustained on the testimony of an accomplice unless corroborated by other evidence." (Los Angeles *Herald-Express*, April 24, 1937.)

"Because he assertedly attempted to 'cash in' on the current educational campaign against venereal diseases, Samuel Fendell, forty-eight, health lecturer, today faced a prison term for alleged violation of the State Anti-Birth Control Statute. Constable Donald Hall signed the complaint against Fendell after he attended a Maxwell lecture in which Fendell collected cash for books listing places where 'a safe method of marriage sex relations might be purchased.' Officers said Fendell, before his lecture, passed out cards, proclaiming he would expose the white slave traffic." (Sacramento *Union*, May 6, 1937.)

"Gland products prescribed under the guise of 'food capsules' are illegal, according to a ruling by Attorney-General U. S. Webb, who was asked to rule on the capsules by Dr. C. B. Pinkham, Secretary of the State Board of Medical Examiners, because he said certain California chiropractors were prescribing them as food. Webb ruled them illegal under sections of the State law, saying that medicine may be prescribed only by registered physicians." (Oakland *Tribune*, May 3, 1937.)

"Free on \$3,000 bail, Mrs. Laura Miner, thirty-eight, who surrendered today in Justice Phil Smith's court, today was planning a defense to charges of murder preferred against her yesterday, as the result of the alleged operation death of Mrs. Loretta Hazel Reese, twenty-one, wife of a naval sailor. Warrant for the woman's arrest called for no bail, but it was pointed out to Smith by defense counsel that the woman is the mother of two children, has lived in San Diego for five years, and previously, when charged with merely performing an illegal operation, did not flee when out on \$1,000 bail. ... Mrs. Reese died Wednesday night. She had been in the county hospital since April 21. ... An autopsy performed yesterday by Dr. F. E. Toomey, Coroner's Surgeon, showed that Mrs. Reese's death was caused by an infection resulting from an operation, it was reported." (San Diego *Tribune*, April 30, 1937.)

"'Lack of evidence' was the reason given by Police Judge Joseph A. Kennedy for the dismissal of charges against Dr. J. C. Coleman, negro physician and surgeon, that he had 'conspired to commit an illegal operation' on Mary Lombard, who died some weeks ago. Charges had been brought against Coleman by Raymond Lombard of 1391 Twenty-first Street, father of the 19-year-old girl. James Simpson, 902 Linden Street, a witness, refused to testify on grounds that he might incriminate himself." (Oakland *Post-Inquirer*, April 26, 1937.)

(Continued in Front Advertising Section, Page 20)

†The office addresses of the California State Board of Medical Examiners are printed in the roster on advertising page 6.

**This Vacoliter Is Being Opened for
the First Time . . . The Tamper-proof Seal *Proves* It**

The *all-metal* Vacoliter tamper-proof seal must be torn off . . . destroyed . . . before you can use the Vacoliter. When you open a Vacoliter you record your act unmistakably.

This means when you see the seal intact and firmly in place you know that no one has tampered with the solution you are about to use. Think what this means to you in safety . . . in peace of mind.

The Vacoliter metal seal goes even further. It provides you with positive identification of the solution . . . the metal identification disc tells you what's in the Vacoliter even though the paper label is washed off.

The orifice in the rubber stopper is molded in a pear shape to receive the glass nipple so that accidents, such as the tube and needle set dropping out during the administration, are unknown when the Baxter Vacoliter is used.

In the Vacoliter alone may be found these many obvious points of superiority.

American Medical Association: Nature of the Organization.—This would seem to be an opportune place in this series of articles to explain the nature of the American Medical Association and its organization. All authority in the American Medical Association derives from its members. The organization is diagrammed below. Membership in a local (district or county) medical society carries with it, automatically, membership in the state medical society and the American Medical Association. Fellowship in the American Medical Association is separate from membership, and brings the member THE JOURNAL or one of the special journals, participation in the scientific work of the Association, eligibility to office, and other privileges.

Groups of county societies form councilor districts, varying in number in the several states, from which councilors are elected for the state society. Delegates are elected by the county societies to the House of Delegates

FRANKLIN HOSPITAL

Limited General Hospital with accommodations for 220 patients, located in a seven-acre Park, 14th and Noe streets, San Francisco.

Founded in 1852

The Franklin Hospital is offering hospitalization on a periodic payment plan, with the patient having free choice of physician.

LeROY BROOKS, M. D.
Chief of Staff

FRANK SCHMIDT
Superintendent

of the state society. The delegates determine the policies; the officers carry them out. In similar manner the state societies elect delegates to the House of Delegates of the American Medical Association. The House meets annually at the time of the Scientific Assembly and may be called in special session.

This democratic form of organization, closely resembling that of the United States Government, which is a federation just as is the American Medical Association, is important. It distinguishes the organization of the medical profession from organizations governed in less representative fashions.

Policies of the American Medical Association, determined through the deliberations of the House of Delegates after full and free discussion, are of the utmost importance to the public, because they go far to determine the character of medical practice, of medical education, of hospitalization, of the fight against charlatanism within and without the profession, and of direct services rendered to the public through the service bureaus of the Association. The outlines of the work of the various councils and bureaus which will follow indicate briefly how the fundamental consideration of the medical profession in America, as expressed through the American Medical Association, has been the welfare of the patient.

Responsible directly to the House of Delegates are four principal bodies, the Board of Trustees, the Judicial Council, the Council on Scientific Assembly, and the Council on Medical Education and Hospitals. The other councils and bureaus are also responsible to the House of Delegates, but through the Board of Trustees instead of directly.

The Board of Trustees carries out the policies adopted by the House of Delegates, conducts the business affairs of the Association, and exercises general supervision of the work of the bureaus and councils.

The Judicial Council of the Association interprets the actions of the House of Delegates on matters of policy and procedure, and especially of ethics. Medical ethics, based on the ancient oath of Hippocrates, are modified

ARNOLD BACK BRACE

The Arnold Back Brace consists of a moulded leather pelvic belt with two spinal uprights. The top band is made of duralumin and extends from the top ends of the spinal uprights around under the axillae, terminating on the chest just below the clavicles.

from time to time to meet changing conditions. Such modifications are suggested by the Judicial Council and approved by the House of Delegates. Primary jurisdiction in questions of unethical conduct is local, but the Judicial Council acts as a court of appeal from local and state decisions.—*Journal A. M. A.*

Medical Practice Acts: Prescribing Over the Radio; Prejudice of Members of Board in Revocation Proceedings.—A complaint was filed with the Kansas State Medical Board April 28, 1930, seeking the revocation of Dr. John R. Brinkley's license to practice medicine in that state. The complaint contained eleven specific charges of fraud, immorality and unprofessional conduct. One charge was that Brinkley performed a "compound operation" on patients for the purpose of curing impotence, high blood pressure, epilepsy, dementia praecox, and diseases of the prostate gland and kidneys, and that the operation was of no value to patients. Another charge was that Brinkley gave talks over the radio "for the purpose of enticing patients to his hospital and to induce persons to purchase medicines; that he diagnoses and prescribes for patients over the radio; that he gives prescriptions by numbers which have to be filled by and purchased at certain drug stores, from which he obtains a commission; . . . that such diagnosing and prescribing by radio are necessarily inaccurate and dangerous, carrying too great a hazard of error in misinterpretation of symptoms, inaccuracy or patients' statements of the location and character of complaints, the risk of misunderstanding the respondent's directions and confusion of numbers given of prescriptions, and lacking entirely in the information to be gained by the usual ordinary routine physical and laboratory examination of the patients, without doing which respondent is grossly negligent."

Brinkley was given notice of the charges and a hearing was held July 15, 1930. The hearing, with some adjournments, lasted until September 16 and included a session

at which Brinkley performed the "compound operation" in the presence of the Board. On September 17, 1930, the Board revoked Brinkley's license and on December 30, 1931, he instituted proceedings in the United States District Court, District of Kansas, to set aside the revocation order on the ground that it invaded rights guaranteed to him by the Federal Constitution. The district court, after a long trial, dismissed the action July 15, 1935, and Brinkley appealed to the United States Circuit Court of Appeals, Tenth Circuit.

Does this record disclose, asked the Court, no more than a conflict of opinion among reputable surgeons as to the technique of operative procedure or as to when it is indicated? Or does it disclose that Brinkley was using his license to perpetrate a cruel hoax on the public by exacting extravagant fees for a trivial and worthless operation? Did Brinkley endanger the health of his patients by seducing them into the belief that serious diseases could be cured by a surgical hocus-pocus? Whether it is the one or the other, the Court said, is a question peculiarly for the decision of men skilled in anatomy. There is, observed the Court, a great volume of evidence in the record to support the latter conclusion; and if such is the fact, the Board would have been derelict if Brinkley's license had not been revoked. It is true that the great advances in medical science have come about by the courage of pioneers, whose efforts often met with ridicule from their professional brethren. It is true that physicians even yet disagree. It is also true that charlatans masquerading as physicians defraud the public, to their own enrichment, by promising to cure cancer with innocuous ointments and thus endanger the lives of their patients by depriving them of sound medical advice. Between these two extremes there is a twilight zone where doubts might perplex. But unless it can be said, from the record, that there is no doubt that this is a mere disagreement among physicians, the finding of the Board is not open to review. The Legislature had properly committed the vital question of the fitness of those who administer to the sick to

a skilled board of medical men and not to courts unlearned in the art. The proof here, the Court said, amply supports the conclusion that the "compound operation" was not an honest effort to relieve suffering, but a scheme for Brinkley's unjust enrichment.

Through regular broadcasts, continued the Court, Brinkley diagnosed almost every ailment to which the human flesh is heir. Sometimes he told his patients to consult a physician; much more often he prescribed remedies, by numbers, which could be obtained from drug stores throughout the Middle West, to whom he had furnished the prescriptions and from whom he received a part of the price of some of the prescriptions. These diagnoses were made without an examination of the patient, and on only such symptoms as the patient would give in a letter or telegram. One need not be skilled in medicine, the Court said, to understand the grave dangers to human life involved in diagnosis and prescription on such sketchy facts as are obtainable from a letter or a telegram; nor of the danger to thousands of others listening in who apply such advice to their own self-diagnosed diseases. It is no answer to suggest that the prescriptions were harmless in themselves; to prescribe bread pills to a diabetic patient whom insulin might save is to trifle with human life. The trial court aptly said:

"Those methods are not only in conflict with the ethics of the profession but are, in my opinion, in conflict with the best interests of the public, and that irrespective of the value of the operations performed by him at the hospital for the amelioration of the prostate gland or of the benefits to individuals urging prescriptions given through radio broadcasting, the possibilities of injury to the general public resulting from such methods are so apparent if such practice became general and usual that its mere statement is, I think, sufficient."

It was for men trained in medicine instead of the law to determine whether Brinkley's conduct constituted unprofessional conduct. The Board of Medical Examiners

DOUBLE CHECKED FOR QUALITY AND GOODNESS

Today, more and more physicians are sharing the opinion that the *safest* course to follow in selecting foods for infants and convalescents is to specify the use of Heinz Strained Foods.

That is because each of these 12 outstanding products is *double checked* for purity, flavor and high nutrient content.

First, Heinz Strained Foods bear the Seal of Acceptance of the American Medical Association's important Council on Foods. This means that the claims of high quality and nutrient values made for Heinz Strained Foods are recognized as acceptable.

In addition, they bear the famous Heinz "57" Seal—accepted for almost seven decades as the sterling mark on foods of quality.

Make it a point to recommend Heinz Strained Foods exclusively. You can do so with every assurance that high vitamin and mineral content is present—and that strictest standards of uniformity are maintained at all times. Remember, Heinz gives you and your patients the protection of *two* world-famous Seals!

HEINZ STRAINED FOODS

12 KINDS — 1. Strained Vegetable Soup. 2. Mixed Greens. 3. Spinach. 4. Carrots. 5. Beets. 6. Peas. 7. Prunes. 8. Cereal. 9. Apricots and Apple Sauce. 10. Tomatoes. 11. Green Beans. 12. Beef and Liver Soup.

For Hernia . . .

When you refer a patient to M. J. Benjamin you are assured that a support will be carefully made according to sound principles backed by two generations of experience.

Shaping each pad to conform to the hernial region permits the covering of a broader surface and the use of softer material.

determined that it did so constitute and there was, the Court said, substantial evidence to support its finding.

The members of the board, Brinkley contended, were prejudiced against him before the hearing started, and some of them were active in instigating the complaint. Without detailing the evidence, the Court said, it does appear that some of the members of the board had expressed such prejudice, and doubtless all were in fact prejudiced. The publicity used by Brinkley, in the opinion of the court, made public prejudice well-nigh inevitable. At any moment the program on the radio might change from cowboy songs to the diagnosis of disease and the extolling of the "compound operation." That the members of the board had radios in their homes constituted no constitutional disqualification. One of the issues of the case was whether the radio talks were in fact given and whether they violated professional standards of conduct. The members of the board having radios thus had personal knowledge of the facts alleged, and necessarily formed some opinion as to whether they were in conflict with professional standards. The Medical Practice Act provided only one tribunal with power to revoke a physician's license. If such powers may not be exercised if the members of the board are prejudiced, then any physician who commits an offense, so grave that it shocks every right-thinking person, has an irrevocable license to practice his profession if he can get the news of his offense to the Board before the hearing begins. This will not do, the Court said. The commendable efforts of the medical profession to raise its standards by cleaning its own house cannot be set at naught by any such rule of law. The trial court, after patiently hearing the evidence as to the attitude of mind of the individual members of the board, disposed of the contention in this language:

"Under the general terms of the statute, the Medical Board is empowered to protect the public against conduct which is clearly against public interests and, therefore, necessarily unprofessional, the same as if the Legislature had specifically denounced and prohibits such practice.

The members of the board were not disqualified because they knew of his methods prior to the hearing and condemned them. John R. Brinkley's methods were so notorious that ignorance of them by members of the board was an impossibility and such knowledge compelled condemnation."

With this holding, the Circuit Court of Appeals expressed itself as in entire accord.

After reviewing the entire record, at length, the Circuit Court of Appeals concluded that Brinkley's constitutional rights were not infringed. The judgment of the district court against Brinkley was, therefore, affirmed. (*Brinkley vs. Hassig*, 83 F. (2d) 351.)—*Journal A. M. A.*

Malpractice: Criteria of Standard of Skill and Care Required of Physicians.—The Columbia Health Foundation sold "health and medical services and hospitalization" for a stipulated sum per month. The Angelus Hospital Association, also referred to in the record as R. B. Jenkins, Inc., operated a hospital wherein it "took care of the customers" of the Health Foundation for a stipulated sum. Dr. R. B. Jenkins was the president of the corporation hospital, the principal owner of its stock, and its general surgeon. The plaintiff was apparently a "customer" of the Health Foundation and his wife was admitted to the hospital for her confinement. The baby developed impetigo and subsequently died, whereupon the plaintiff sued the Health Foundation, the hospital corporation, and certain physicians employed by the hospital, alleging negligence in permitting the baby to contract impetigo, in treating it thereafter, and in discharging the plaintiff's wife and her baby at a time when the baby was still suffering from "an acute attack of impetigo." The plaintiff obtained judgment against all the defendants, who, with the exception of those connected with the Health Foundation, appealed to the District Court of Appeal, Second District, Division One, California.

The principal issue raised on appeal had relation to the form in which a certain hypothetical question was put to

(Continued on Page 41)

For prevention and treatment of

IVY POISONING

FOR PROPHYLAXIS, the intramuscular injection of "Poison Ivy Extract *Lederle*" confers a marked degree of protection against the distressing dermatitis which follows the usual accidental, casual contact with the Poison Ivy plant. Comparisons in C.C.C. camps and elsewhere have demonstrated that two small injections (1 cc. each) administered with an interval between them of a few days to two weeks, give protection to a high percentage of susceptible subjects for the entire season.

Young people who are to be sent to summer camps, can be saved from much misery and spoiled vacations by being immunized now.

IN THE TREATMENT of ivy poisoning, "Poison Ivy Extract *Lederle*" has at times performed most spectacularly. A single injection often gives marked relief within a few hours. A second injection 24 hours later is indicated if relief is incomplete or if the itching returns. Such a second injection has an added value in its probable preventive effect in case of later exposure against subsequent attacks of ivy poisoning. A third injection is rarely required.

"Poison Ivy Extract *Lederle*" is potent, stable and economical.

an expert witness for the plaintiff. The vice attributed to the question was that it sought from the witness an opinion as to whether the particular physician whose alleged negligence was at issue had exercised that degree of skill, care and learning ordinarily possessed and exercised by physicians and surgeons practicing in Los Angeles in the treatment of similar conditions. Technically, said the Court, the appellants' objection was correct. When a hypothetical question is put to an expert witness the evidence sought is not what the witness personally thinks of what was or was not done, not whether he would do or omit to do the particular act or omission charged as negligence, not whether the actual physician in the case was negligent in the commission or omission charged, but whether, in the opinion of the witness, a physician of ordinary attainments practicing in the same locality and using ordinary skill and care would have done or failed to do the thing charged. An expert witness, continued the Court, gives his opinion with respect to whether the doing or not doing of a certain thing conforms to what a hypothetical physician, endowed with ordinary skill and learning and exercising ordinary care and prudence, practicing in the locality in question, would or would not do. Such an opinion, in legal supposition, is different from saying that the actual physician in a given case is skilled or unskilled, careless or careful. The expert's opinion sets up for the use of the jury or the court a hypothetical physician, by which the jury or court may test the skill of and the care used by the physician actually involved. While the hypothetical question propounded in this case did seek to elicit from the expert witness an opinion as to whether or not the particular physician exercised the required degree of care, the Court was of the opinion that the objectionable form of the question did not constitute prejudicial error because, in answering the question, the witness stated: "The treatment differs from the usual treatment of these conditions." This answer, the Court said, gave the jury exactly the information that the question should have called for if it had been framed correctly. While the question was incorrectly framed, the answer itself did not constitute an invasion of the province of the jury.

The appellants contended also that the plaintiff's contract called only for obstetric services to the plaintiff's wife and did not require any care for the baby. Such a distinction, the Court said, is too strained to be substantial. When an obstetrician undertakes to deliver a woman of a baby, he may not devote his entire attention at the time and

during the hospital confinement to the mother alone. It should be said, pointed out the Court, in justice to the physicians involved in this case, that they undoubtedly felt under obligation to care for the baby, since they did proceed to look after it.

The record in this case, concluded the Court, substantially supported the jury's verdict for the plaintiff. The judgment of the trial court was, therefore, affirmed. (*Criss vs. Angelus Hospital Association of Los Angeles* (Calif.), 56 P. (2d) 1274.)—*Journal A. M. A.*

Fewer Rats in Large Cities.—Twenty years ago there was one rat for every person in almost all the large cities. Today it is estimated there is not more than one rat to each two persons in such cities, says the United States Department of Agriculture, in a new circular, "The House Rat." In small towns, however, the number of rats is estimated equal to the human population and on farms the ratio is much greater.

There are fewer rats in large cities because of improved sanitary conditions, modern rat-proof construction, fewer horses, improved food packages, and fewer waste food products.

Prepared by James Silver of the United States Bureau of Biological Survey, the circular points out that, because of

the normally abundant food supply and many rat harbors, there are few rat-free farms. In some of the control campaigns several hundreds, and even thousands of rats, have been taken from farms. Some years ago the contestants in a rat-killing campaign in one county in Texas turned in 153,720 rat tails in six weeks. The human population of the county was only 35,000.

Rat control in the smaller agricultural towns is usually more difficult than in large cities because proportionately less concrete is used than in cities, and facilities for disposing of garbage and trash often are lacking.

Both species of the house rat, the brown and black, immigrated from Europe on ships. As the black rat is the common ship rat, it is quite likely it was introduced at the time ships first moored on American shores. It is now found chiefly at seaports and in the Gulf States. The brown rat is reported to have made its first appearance in the United States about the beginning of the American Revolution—in 1775. From various seaports it gradually spread inland, driving out the smaller black rat, until now it is common in every state.

Today it is estimated there are 123,000,000 rats in the United States—almost as many rats as persons. Half the total is estimated to be on farms; 34,000,000 on nonfarm country residences and in towns with less than 10,000 population, and 29,000,000 in cities of 10,000 or more. The circular says rats cause an estimated annual loss of \$189,000,000. Of this sum, \$63,000,000 is lost on farms, an average of \$10 per farm; \$68,000,000 in small towns and on nonfarm residences, and \$58,000,000 in large cities.

Rats carry bacteria and parasites and a number of their own diseases are transmissible to man and domestic animals. In addition, they contract and spread some human and livestock diseases.

Poison bait prepared with red squill is primarily recommended for control, not only because it kills the animals but because it is relatively harmless to humans and domestic animals. Rat killing should be followed by elimination of their harbors and the rat proofing of buildings.

Fight Against Gonorrhea Must Follow Campaign to Stamp Out Syphilis in War on Venereal Diseases.

With the campaign to stamp out syphilis now well under way in the United States, a national effort to control the widespread prevalence of gonorrhea is the next step that must be undertaken in the fight against venereal diseases, in the opinion of Dr. William F. Snow, General Director of the American Social Hygiene Association, 50 West Fiftieth Street, New York.

"The health authorities and the medical profession cannot hope to carry out effectively the necessary practical programs in attacking these diseases unless the general public clearly understands and fully supports them with adequate appropriations and the active cooperation of individual citizens." Doctor Snow emphasizes this fact in a special number of the *Journal of Social Hygiene*, which reviews the findings of the recent Conference on Venereal Disease Control Work held in Washington, D. C., under the chairmanship of Dr. Thomas Parran, Surgeon-General of the United States Public Health Service.

Although the conference in Washington rightly concentrated attention upon syphilis, which is the problem of immediate concern, the public should know that gonorrhea is the next to go, Doctor Snow explains. It has been estimated that approximately six million men, women and children are suffering from syphilis in the United States and that more than twelve million persons have gonorrhea.

An editorial in the *Journal of Social Hygiene* compares the plans for a successful fight against syphilis, and the

(Continued on Page 44)

THERE WAS ONLY ONE *Beethoven!*

Two octaves about cover the range of the human voice. Thus the fact stands out that every song since the crude lullabies of our cave-dwelling ancestors has, with few exceptions, been a combination of only some sixteen notes, with fractional notes.

And in the wide field of human interest there are not more than sixteen elements. Every advertisement is built upon some combination of these elements. Few of the countless millions of music melodies live, endure, and satisfy . . . so, also, few advertisements rise above the commonplace or hold the attention of the readers sufficiently long to make any impression.

As the musical composer indifferently or skillfully makes use of his sixteen notes, so the advertising printer produces the commonplace or the universally appealing advertising precisely in the degree with which he skillfully plays upon the sixteen elements of universal human interest.

Any school child can drum out two octaves on the piano, but it is the Beethovens and Wagners who create the melodies that live.

little being done about gonorrhea, with a baseball game in which the pitcher strikes out the man at bat but loses the game because the men on bases were allowed to make runs.

"It would seem that by the sheer weight of the misery which gonorrhea produces throughout the world, it would force itself upon public notice," says Dr. P. S. Pelouze, Professor of Urology at the University of Pennsylvania, in a report on the medical measures which are needed for adequate control of gonorrhea. These are a few of the points to which he calls attention:

The incidence of gonorrhea is at least twice and probably three or four times that of syphilis. What it may lack in ability to cripple and kill, it makes up easily in numbers. It may be acquired repeatedly and thus become a recurring cause of economic loss and poor health.

The sterility which so frequently follows infection with gonorrhea forever denies parenthood to countless men and women who desire to be fathers and mothers.

There is no treatment known today that lends itself to mass application, and quickly renders the patient non-infectious. In the male the disease is practically one hundred per cent curable, and in the female it should be almost as much so. But no one can predict just how long each case will require treatment to reach the point of cure.

From a public health point of view it is necessary to recognize that gonorrhea is a disease that can be transmitted to others as long as there is a single gonococcus present. It is a disease the cure of which is dependent upon the patient's ability to develop certain curative responses.

At no time has there been greater general medical interest in gonorrhea than exists today. Treatment has improved, so that the complications formerly seen so frequently have been largely eliminated.

Compensation of Physicians: Oral Promise by Daughter to Pay for Services Rendered Father.—The plaintiff, a physician, answered an emergency call from an unknown source to attend a man severely injured in an automobile accident. When he arrived at the scene of the accident, a daughter of the injured man requested him, according to the evidence, to "do everything you can under the sun to see this man is taken care of . . . and what the charges are . . . I will pay for it." The plaintiff did treat the injured man until the following morning, when his services were discontinued at the request of the daughter. The injured man died several days later from the effects of the injury. The plaintiff attempted first to collect his fees from the estate of the deceased. Being unsuccessful, he, about a year after the accident, began sending bills to the deceased's widow. Finally, about a year and a half after the accident, the plaintiff instituted the present suit against the defendant, the daughter of the deceased. The trial court directed a verdict for the defendant and the plaintiff sought a reversal in the Supreme Court of Vermont.

The defendant's relations with her father, said the Supreme Court, were such that she was not liable for the

plaintiff's services unless she became so by reason of what she said or did. The rule is well established that a person who merely calls a physician to render services to another is not liable therefor in the absence of an express agreement, unless the person is legally bound to furnish such services. The defendant in this case did, according to the evidence, promise to pay for the services, and ordinarily, said the court, this promise might make an entirely different case for the plaintiff. It showed not only that the defendant requested the services, but also that she made a direct promise to pay for them. Such a promise is not collateral or secondary, but primary and original. It is not a promise to pay the debt of another, but is a promise to pay the debt of the promisor and does not have to be in writing to be valid. But, said the court, when the defendant made the promise, the plaintiff was at liberty to accept or reject it. He could, if he chose, treat the injured man on his own credit. He could not, however, hold both the injured man and the defendant liable for his fees. If he gave credit to the injured man, he could not collect from the defendant, even though she had tendered an engagement direct in form. The defendant's sole obligation could not be treated by the plaintiff as a joint obligation without her concurrence. If the plaintiff gave any credit to the injured man, he elected to accept the defendant's engagement as collateral to that of the injured man. The plaintiff did, the court pointed out, make his original charges against the injured man and it must be assumed that he did so because he considered the injured man responsible for his fees. Having given credit to the injured man, the plaintiff may not, the court concluded, collect from the defendant. The judgment of the trial court was therefore affirmed. (*Lawrence vs. Anderson* (Vt.), 184 A. 689.)—*Journal A. M. A.*

be operating and thirty-four in the state of established proposals. Fourteen new plans have recently been proposed. Thus the present status may be defined as one of active experimentation in an effort to find out the workable features and thus maintain systems capable of meeting existing needs. Various investigations indicate that somewhere between 500,000 and 700,000 persons are now members of such plans. Incidentally, three plans have 50 per cent of the entire membership, and ten plans have 80 per cent of the entire membership. In Chicago the plan proposed through the Hospital Council involved the setting up of a hospital service corporation as a nonprofit corporation, organized under the Illinois act exempting a nonprofit service corporation from the insurance code of the state. This plan has been under active consideration by a committee of the Chicago Medical Society, which proposed six requirements before it could place the approval of the Chicago Medical Society on the plan. Of these, the chief demand is that all matters of medical administration and medical policy be referred to the Chicago Medical Society, whose decision in these instances shall be final and binding both on the Chicago Hospital Council and on its member hospitals. Unfortunately, the Council of the Chicago Medical Society has not yet accepted the report of its committee, owing to the apparent insistence of one of its members that the medical society do not enter into the arrangement unless it has a guaranty of 51 per cent of the directorate, an insistence to which the Hospital Service Corporation may hesitate to consent. It is interesting to realize that Chicago has already had ten group hospitalization plans besides the Hospital Service Corporation, not one of which has attained even slightly significant proportions. Two of these plans were organized under the same law that created the Hospital Service Corporation and both secured articles of incorporation notwithstanding the fact that they were promoted by hospitals considered to be unable to give first-class service. Another unfortunate aspect of the situation is the fact that the propaganda and promotion associated

Hospital Insurance Plans.—Out of 172 group hospitalization and hospital insurance plans recently addressed by the Bureau of Medical Economics of the American Medical Association, ninety were found active and eighty-two inactive. Of the active plans, fifty-six were found to

with the Hospital Service Corporation have brought into the field various unethical imitators, one of them advancing himself by the circularization of the public in his vicinity with a schedule labeled "the Chicago Hospital Service Plan," a vague imitation of the proposition advanced by the Hospital Service Corporation. It will apparently become the obligation of those who actively promote such plans under legitimate auspices to protect the public at the same time against illegitimate promoters, through exercising the rights of any business group to the protection of their names and style in the courts.—*Journal A. M. A.*

State Medicine in Britain: "An Avalanche of Papers."

Physicians have endeavored repeatedly to convince the public that practice under social insurance interferes with the giving of adequate time and attention to patients. The then becomes his duty to study all the various memorandum suggestion has been ventured that the necessary study and paper work associated with practice under government auspices was in itself a chore and a time-consuming performance. Now concrete evidence of the nature of such work becomes available through a brief item with the title "An Avalanche of Papers" in the supplement of the *British Medical Journal*.* When an insurance practitioner is appointed he receives from the headquarters the following items:

1. Prescription books.
2. Certificate books (three kinds).
3. The National Formulary.
4. The Medical Benefit Regulations.

5. The Drug Tariff.
6. Memorandum on the Keeping of Medical Records.
7. Memorandum on Pregnancy and Parturition of Insured Married Women.
8. Memorandum on Tuberculosis.
9. Memorandum on Medical Certification.
10. Memorandum on the Duties of the Regional Medical Staff.
11. Report on the Definition of Drugs for the Purpose of Medical Benefit.
12. Forms of notification that treatment has been afforded to insured persons presenting traveler's vouchers.
13. Envelopes for the transmission of medical cards.
14. Envelopes for the transmission of forms of medical record.
15. Forms of application for medical cards.
16. Continuation cards for use in connection with medical records.
17. Specimens of nine other forms.
18. Four circular letters addressed to practitioners on various subjects.
19. Requisition form for stationery.

These items are sent to a practitioner who may have had no previous experience of insurance medical practice. It dums and to learn how to fill out all the various forms of application cards, requisition forms, and the nine other forms that are listed.

The *British Medical Journal* comments that "there is no guide or index and we can well imagine a practitioner being bewildered as to which document he should consult to enable him to determine his course of action in relationship to the problem with which he is faced." In fact, the entire business is so complicated that a special form has now been prepared with a view to serving as a guide book through this maze of bureaucratic red tape.—*Journal of the American Medical Association* March 27, 1937.

* An Avalanche of Papers, Brit. M. J. Supplement, March 6, 1937, page 115.

UNTIL another Ehrlich appears on the scene, the arsenicals probably are destined to remain the foundation of antisyphilitic therapy.

Based on extensive investigations of the United States Public Health Service and the Cooperative Clinical Group, a standard and uniform type of treatment procedure in early syphilis is available.

The average physician in office practice prefers

Neoarsphenamine. The Merck brand of Neoarsphenamine is nationally recognized for its high spirocheticidal property, low toxicity, and instant solubility. Its use will go far in cooperating with the nationwide crusade to eradicate syphilis.

Information on the standard treatment, and schemes of treatment for the application of Arsphenamine or of Neoarsphenamine in conjunction with a heavy metal, are available on request.

MERCK & CO. INC. *Manufacturing Chemists* RAHWAY, N. J.

Please send information on the standard treatment of early syphilis, and a suggested schedule of treatment.

Colfax School for the Tuberculous

Colfax, California

(Altitude 2400 feet)

This institution is for the treatment of medical tuberculosis and of selected cases of extrapulmonary (so-called surgical) tuberculosis.

The Colfax School for the Tuberculous consists of five Hospital Units with beds for patients who come unattended and a Housekeeping Cottage Colony for patients and their families.

The Colfax School for the Tuberculous offers the following advantages:

1. Patients are given individual care by experienced tuberculosis specialists. The patient is treated according to his individual needs.
2. Patients are taught how to secure an arrest of their disease, how to remain well when once the disease is arrested, and how to prevent the spread of the disease.
3. Patients have the advantage of modern laboratory aids to diagnosis and of all modern therapeutic agencies.
4. The climate of Colfax enables the patient to take the cure without discomfort twelve months in the year. We believe climate is secondary to medical supervision and rest, but the fact remains that it is easier to "cure" under good climatic conditions than where these climatic conditions are absent.
5. Colfax is accessible. It is on the main line of the Ogden Route of the Southern Pacific R. R. and has excellent train service. It can be reached by paved highway, being on the Victory Highway, with paved roads all the way to Colfax.

INFANT FEEDING PRACTICE

should be in
the private
doctor's
office

IMPROVED economic conditions are returning babies to private practice. Encourage it.

The doctor knows his practice, the mother her economies. When the infant feeding materials prescribed are within the reach of every budget, mothers will appreciate the physician and babies will thrive.

Karo is a most economical milk-modifier. It consists of dextrins, maltose and dextrose (with a small percentage of sucrose added for flavor) and is suitable for every formula.

A tablespoon of Karo gives twice the number of calories (60) in com-

parison with a tablespoon of any powdered maltose-dextrins-dextrose, including Karo powdered. Karo is well tolerated, highly digestible, not readily fermentable and effectively utilized by infants.

For further information, write

CORN PRODUCTS SALES COMPANY
Dept. S. J.-6, 17 Battery Place, New York, N. Y.

★ Infant feeding practice is primarily the concern of the physician, therefore, Karo for infant feeding is advertised to the Medical Profession exclusively.

New Cutter Tetanus Antitoxin Checks Reactions!

For many years Cutter Tetanus Antitoxin has been a leader in greater concentration, but reactions occurred almost as frequently as with the less concentrated antitoxin of older days. Today, as a result of painstaking research, Cutter technicians remove a fraction of the antitoxin which has been found to be the reaction "bugbear." Since this fraction contains a high concentration of antitoxin its removal means a considerable increase in our cost—which we are glad to absorb; because it greatly lessens the chance for serum sickness.
